

EXECUTIVE CHAMBERS

HONOLULU

BENJAMIN J. CAYETANO  
GOVERNOR

May 1, 2002

TO: The Honorable Brian Minaai, Director  
Department of Transportation

SUBJECT: Acceptance of the Final Environmental Impact Statement for the Kihei-  
Upcountry Maui Highway

With this memorandum, I accept the Final Environmental Impact Statement for the Kihei-Upcountry Maui Highway, island of Maui, as satisfactory fulfillment of the requirements of Chapter 343, Hawai'i Revised Statutes. The economic, social and environmental impacts, which will likely occur should this project be implemented, are adequately described in the statement. The analysis, together with the comments made by reviewers, provides useful information to policy makers and the public.

My acceptance of the statement is an affirmation of the adequacy of that statement under the applicable laws but does not constitute an endorsement of the proposed action.

I find that the mitigation measures discussed in the environmental impact statement will minimize the negative impacts of the project. Therefore, if this project is implemented, the Department of Transportation and/or its agents should perform these or alternative and at least equally effective mitigation measures at the discretion of the permitting agencies. The mitigation measures identified in the environmental impact statement are listed in the attached document.

*Benjamin J. Cayetano*

Honolulu, Hawaii 96813  
(808) 587-2150

This report documents environmental impact studies of a proposed two-lane limited-access rural highway from Kihei, an urban area on the southern coast of Maui, to Upcountry, a region on the western flank of Haleakala volcano. Eight alternative alignments and a No Build alternative are currently being considered. The eight alignments consist of all combinations of two Kihei and four Upcountry terminus options. The preferred alternative has been identified as the U1,K1 Alternative, the alignment from the Haliimaile Road / Haleakala Highway intersection in Upcountry to the Kaonoulu / Piilani Highway intersection in Kihei. The project would facilitate transportation between Kihei and Upcountry, thereby addressing growth in regional transportation demand, economic development trends, and coastal evacuation deficiencies. In addition, there is federal interest in the project because it would facilitate transportation between defense-related research activities at Science City atop Haleakala Crater and the Maui Research and Technology Park in Kihei. The project will have both adverse and beneficial impacts. Potential benefits and impacts include substantial travel time savings, loss of open space, interference with agricultural activities, changes in transportation patterns, loss of archaeological resources, and savings in energy consumption. The nature of the impact varies with the alignment alternative.

## **NATIONAL ENVIRONMENTAL POLICY ACT STATEMENT**

The National Environmental Policy Act (NEPA), 42 U.S.C. 4321-4347, became effective January 1, 1970. This law requires that all federal agencies shall prepare a detailed Environmental Impact Statement (EIS) for every recommendation or report on proposals for legislation and other major federal actions significantly affecting the quality of the human environment. The Federal Highway Administration (FHWA) is, therefore, required to have an EIS prepared on proposals funded under its authority if the proposal is determined to be a major action significantly affecting the quality of the human environment.

EISs are required for many transportation projects as outlined in NEPA. The processing of an EIS is carried out in two stages. Draft EISs are first written and forwarded for review and comment to federal, state and local agencies with jurisdiction by law or special expertise and are made available to the public. This availability to the public must occur at least 15 days before the public hearing and not later than the time of the first public hearing notice or notice of opportunity for hearing. Normally, 45 days, plus mailing time, will be allowed for comments to be made on the Draft EIS unless a time extension is granted by the Hawaii Department of Transportation (HDOT). After this period has elapsed, preparation can begin on the Final EIS.

A Final EIS is prepared to reflect the distribution of the Draft EIS by including the following:

1. Basic Content of the Draft EIS as amended due to internal agency comments, editing, additional alternatives being considered, and changes due to the time-lag between the Draft and Final EIS.
2. Summary of public hearing comments.
3. Summary of comments received on the Draft EIS.
4. Evaluation and disposition of each substantive comment.

Administrative action cannot take place sooner than 90 days after circulation of the Draft EIS to the U.S. Environmental Protection Agency (USEPA) or 30 days after submittal of the Final EIS to the USEPA.

Both the Draft and Final EIS are full disclosure documents, which provide a full description of the proposed project, the existing environment, and analysis of the anticipated beneficial or adverse environmental effects.

### **General Reviewer Information**

In compliance with the Metric Conversion Act of 1975 (amended in 1988) and a 1991 Presidential Executive Order, numbers throughout this Final EIS are presented in metric units with the English equivalents in parentheses.

## **SUMMARY**

### **S.1 INTRODUCTION**

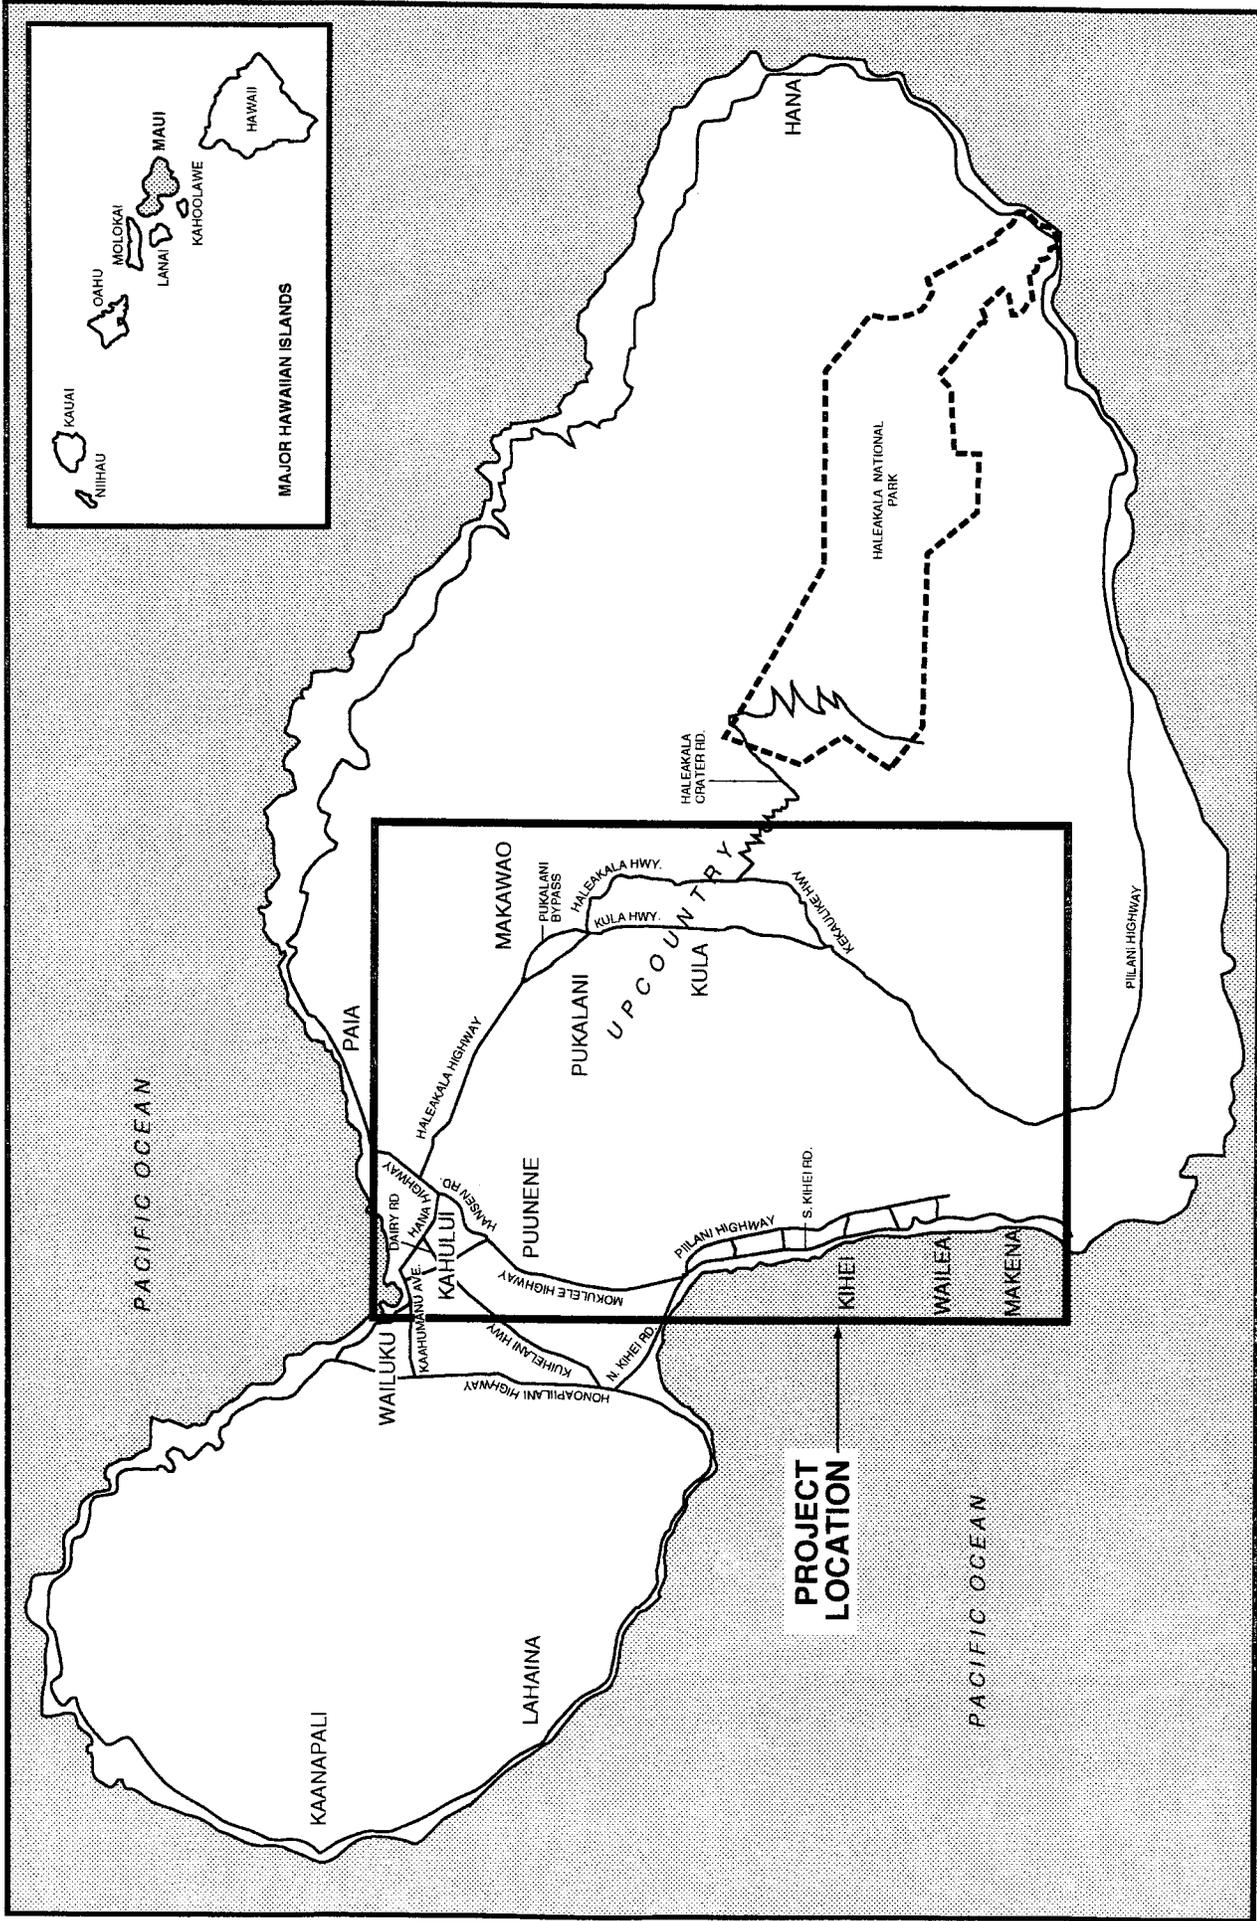

#### **S.1.1 APPLICANT AND PROJECT SUMMARY**

The Federal Highway Administration (FHWA) and the Highways Division of the State of Hawaii Department of Transportation (SDOT) are issuing this Final Environmental Impact Statement (EIS) as the lead federal and local agencies for this project, the proposed Kihei-Upcountry Maui Highway in Maui, Hawaii.

Figure S-1 shows the general project location in the County of Maui. This proposed federal-aid limited access highway would link the Kihei-Makena and Upcountry Maui regions. In its initial phase, the highway will be constructed as a two-lane facility. The right-of-way for a future four-lane facility will be acquired, and in certain sections of the highway, earthwork for a future four-lane facility will be conducted during the initial phase of construction. This document addresses the operational impacts of a two-lane facility, the right-of-way acquisition for a four-lane facility, and, in certain locations, the earthwork for a future four-lane facility.

#### **S.1.2 PLANNING CONTEXT AND HISTORY**

Study of a Kihei-Upcountry Maui Highway began over 25 years ago when, in 1970, the County of Maui studied the feasibility of a road between Upcountry Maui and Kihei. Two later studies, the County of Maui Toll Road Study (1988) and the Maui Long-Range Highway Planning Study (May 1991), also examined a roadway link between Upcountry and Kihei. Subsequently, a task force consisting of State and County officials and private citizens (the Joint State/County Task Force) was formed to recommend an alignment for this roadway. The Task Force met in 1992 and 1993, and produced a report in October 1993. Also in 1993, the SDOT, in cooperation with the FHWA, began an in-depth study of this proposed roadway link, including an evaluation of new alternatives as well as alternatives derived from past efforts. This Final EIS marks the completion of the SDOT planning efforts that began in 1993.

 FIGURE S-1

### **S.1.3 ACCEPTING AUTHORITIES**

At the federal level, the FHWA Hawaii Division Administrator approved this Final EIS. At the State level, the accepting authority of this Final EIS is the Governor of the State of Hawaii. It is expected that the Governor will accept this Final EIS, completing the EIS requirements under Hawaii's EIS Law. It is also expected that the FHWA will issue a Record of Decision (ROD), completing the project's requirements under the National Environmental Policy Act (NEPA). After issuance of the ROD and Final EIS acceptance by the Governor, the design phase of the project may proceed.

### **S.1.4 PURPOSE OF THIS DOCUMENT**

This Final EIS has been prepared to comply with:

- The National Environmental Policy Act (NEPA);
- Chapter 343 of the Hawaii Revised Statutes (HRS);
- FHWA and FTA Joint Regulations, 23 CFR 771;
- Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, 40 CFR 1500-1508; and
- The Hawaii Administrative Rules [Title 11, Chapter 200 (August 1996)].

This document identifies and assesses the environmental and social impacts that could result from the development of the Kihei-Upcountry Maui Highway. The highway would be designed for anticipated traffic demand in the year, 2020, which corresponds to the planning horizon of the Maui Long-Range Land Transportation Plan (February 1996). Therefore, potential impacts are assessed for that year. Construction-phase impacts are also assessed.

The EIS process is designed to enable project sponsors to develop a well-planned project that is sensitive to the physical, natural and social environment within which it would exist, and to identify and evaluate impacts associated with various alternatives under consideration. Required coordination activities with interested and affected parties are also documented in this Final EIS.

## **S.2 PURPOSE OF AND NEED FOR THE PROJECT**

Upon completion, the Kihei-Upcountry Highway would satisfy the following six purposes and needs:

- Establish a roadway system linkage;
- Support economic development;
- Address existing intersection capacity deficiencies;
- Satisfy increased transportation demand;
- Promote the National interest as expressed through legislative directive; and
- Increase coastal evacuation capacity.

### **S.2.1 ROADWAY SYSTEM LINKAGE**

The existing circuitous route between Kihei-Makena, a major employment center along Maui's southern coast, and Upcountry, a popular residential area on Haleakala's western flank, is at least 25 km (16 miles) (the distance between the northern tip of Pukalani to the northern tip of Kihei). In contrast, the straight-line distance between Kihei-Makena and most Upcountry communities is 15 km to 20 km (9 to 12 miles). Travelers between the Maui Research and Technology (R&T) Park in Kihei and scientific facilities at the summit of Haleakala, called Science City, must also use the present circuitous route. The transportation route between the Upcountry communities and West Maui (Lahaina-Kaanapali-Kapalua) is also circuitous. Depending on the alternative selected, a Kihei-Upcountry Maui Highway would provide up to a 50 percent reduction in the length these journeys, substantially reducing travel time and vehicle fuel consumption.

### **S.2.2 ECONOMIC DEVELOPMENT**

Maui's largest industry now and for the foreseeable future is tourism. Kihei-Makena and West Maui (Lahaina-Kaanapali-Kapalua) are expected to remain the principal visitor accommodation areas on the island, as well as the island's second and third largest employment centers. These areas will also continue to have an economic relationship with

Upcountry Maui because Upcountry has tourist attractions, such as Haleakala National Park, and is a major and popular residential area. Another increasingly important industry on Maui is high technology based at the Maui R&T Park in Kihei and Science City on the summit of Haleakala. Improved transportation efficiency would support businesses and federal government personnel at the R&T Park who provide technical assistance to Science City. In addition, road construction would infuse federal funds into the local economy.

### **S.2.3 EXISTING INTERSECTION CAPACITY DEFICIENCIES**

Traffic volumes at nine intersections along the existing route between Kihei and Upcountry were analyzed using methodologies contained in the 1994 Highway Capacity Manual (HCM). The HCM methodologies classify traffic operations by level of service, defined by letters "A" through "F", representing best to worst conditions, respectively. In the morning peak hour, three of these intersections (including the Haleakala Highway / Hana Highway intersection and the Mokulele Highway / Piilani Highway intersection) operated at levels of service "E." In the afternoon peak hour, five intersections (including the Hana Highway / Dairy Road intersection, the Dairy Road / Kuihelani Highway / Puunene Road intersection and the Mokulele Highway / Piilani Highway intersection) operated at levels of service "E" or lower. A Kihei-Upcountry Maui Highway would divert some travel demand to an alternative route, thus relieving existing congestion at these intersections.

### **S.2.4 TRANSPORTATION DEMAND**

Trip generation forecasts reported in the Maui Long-Range Land Transportation Plan (February 1996) indicate that the average number of daily trips on Maui would be over 386,000 in 2020, a 70 percent increase over 1990. A large portion of these trips would be generated by the tourism industry, such as home-based work trips by tourist industry employees and trips made by visitors. Because of this anticipated growth in travel demand and existing deficiencies in roadway capacity (see Section S.2.3), the following improvements are needed:

1. Additional roadway capacity between existing and future residential communities in Upcountry and employment centers in Kihei-Makena and West Maui; and
2. Additional roadway capacity between visitor accommodation regions (Kihei-Makena and West Maui) and Haleakala National Park and tourist attractions in Upcountry.

The proposed road would help satisfy both requirements above.

### **S.2.5 LEGISLATIVE DIRECTIVE**

Federal funding for the planning of this project was appropriated because of the national interest in providing an improved transportation connection between defense-related activities at the Maui R&T Park in Kihei and Science City at the Haleakala summit. Science City receives technical support from key defense contractors in the R&T Park.

### **S.2.6 COASTAL EVACUATION CAPACITY**

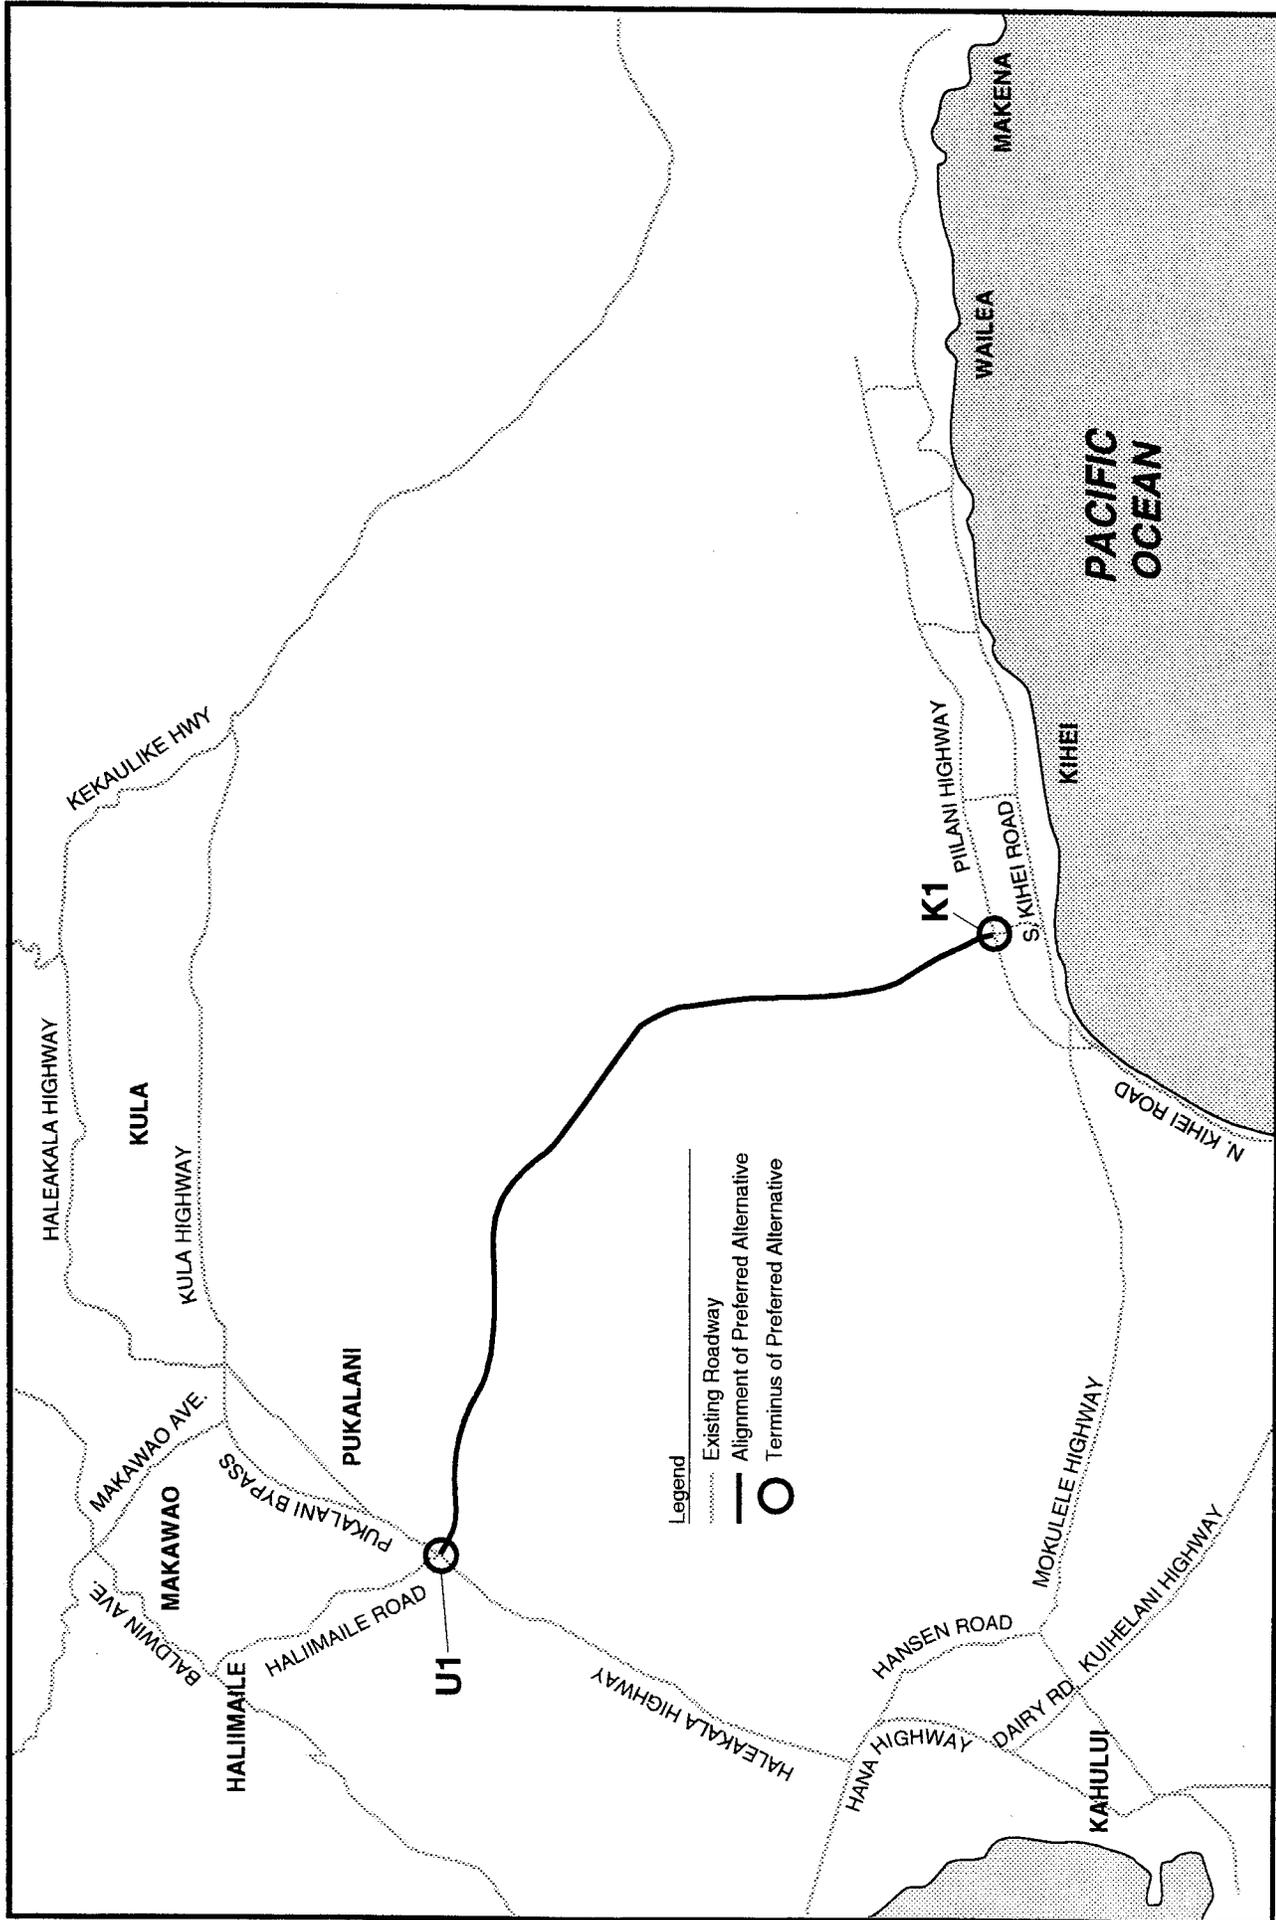

On the southern coast of Maui, the Kihei-Makena urban area is vulnerable to coastal hazards such as tsunami and tropical storms. The only routes out of Kihei-Makena are Mokulele Highway and North Kihei Road. The termini of these roadways are about 90 m (300 ft) from one another at the northern end of Kihei. The limited number of evacuation routes and their close proximity suggest there could be substantial congestion in north Kihei during an evacuation emergency. In addition, there are no alternatives should the evacuation route be blocked. A Kihei-Upcountry Maui Highway would increase evacuation capacity and provide an alternative evacuation route.

## **S.3 ALTERNATIVES AND ALTERNATIVE SELECTION PROCESS**

### **S.3.1 PREFERRED ALTERNATIVE**

The preferred alternative for the Kihei-Upcountry Maui Highway project has been identified as the U1,K1 Alternative, the alignment from the Haliimaile Road / Haleakala Highway intersection to the Kaonoulu Street / Piilani Highway intersection (see Figure S-2). The highway will be a limited access, two-lane arterial roadway, with a length of approximately 15.8 km (9.8 miles). The posted speed limit would vary from 70 km/h (45 mph) in the urban area near Kihei to 90 km/h (55 mph) in the rural area in Upcountry. The width of the right-of-way would be at least 49 m (160 ft) in rural areas and at least 37 m (120 ft) in urban areas. These right-of-way widths are sufficient to accommodate a four-lane divided highway. The acquisition of the right-of-way for a four-lane facility is proposed to allow for the future expansion of the highway to four lanes. However, the proposed action addressed in this EIS is only the construction of a two-lane road because projections indicate that two lanes would be sufficient to accommodate the forecast travel demand in the design year, 2020.

The roadway will include one 3.7 m (12 ft) lane in each direction, and paved shoulders wide enough to accommodate bicyclists. The highway in the urban section will include bike lanes and sidewalks that are in conformance with the Americans with Disabilities Act. The highway termini will be designed with adequate channelization (right- and left-turn lanes) to handle the projected traffic volumes. Both intersections will likely warrant traffic signals. However, this decision will be made during the design phase of the project. Several grade-separation (*i.e.*, interchange) options for the U1 terminus were considered after the selection of the preferred alternative. However, it was determined that the additional cost of a U1 interchange could not be justified since an at-grade signalized intersection would cost substantially less, and be able to acceptably handle projected year 2020 peak hour traffic demand.

GRAPHIC SCALE:

**Preferred Alternative**  
**KIHIKIHI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE S-2

### **S.3.2 OTHER BUILD ALTERNATIVES**

In addition to the preferred alternative, seven build alternatives have been carried forward for detailed analysis in this Final EIS (see Figure S-3). The eight build alternatives, including the preferred alternative, consist of all possible combinations of two Kihei and four Upcountry terminus options. Figure S-3 shows the candidate termini and the alignments that would link them. The Kihei termini and segments are named K1 and K2, and the Upcountry termini and segments are named U1, U2-A, U2-B and U3. The names of the other build alternatives are:

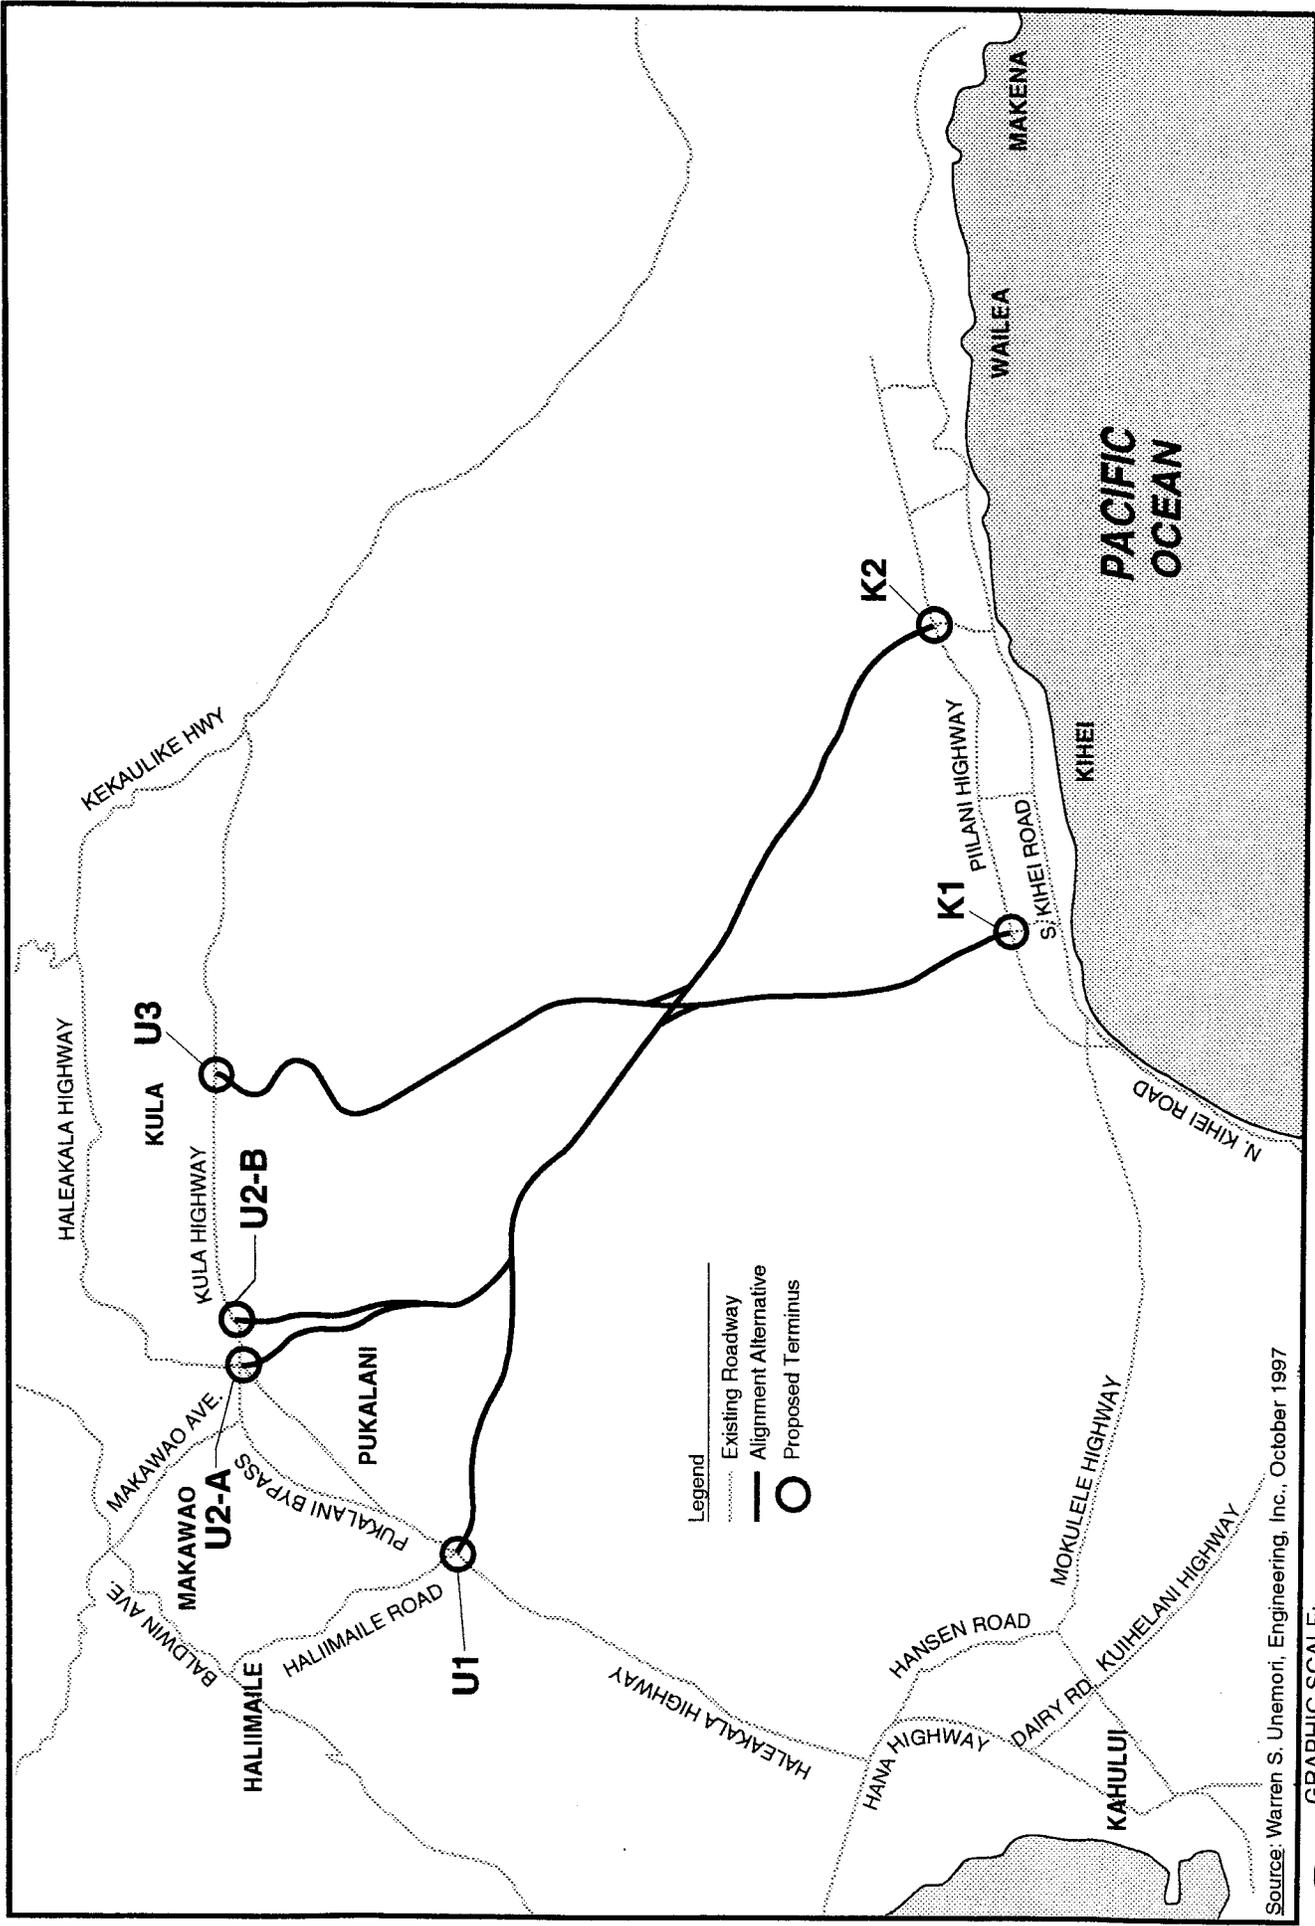

- |            |            |          |
|------------|------------|----------|
| 1. U1,K2   | 4. U2-B,K1 | 7. U3,K2 |
| 2. U2-A,K1 | 5. U2-B,K2 |          |
| 3. U2-A,K2 | 6. U3,K1   |          |

The U2-A alternatives (U2-A,K1 and U2-A,K2) would require the modification of the Pukalani Bypass / Haleakala Highway / Kula Highway “Five Trees” intersection. Kihei-Upcountry Maui Highway would replace the Haleakala Highway leg (Pukalani side) and Haleakala Highway would be re-aligned to link and form a T-intersection with Pukalani Bypass at approximately 370 m (1200 ft) north of the “Five Trees” intersection. The existing segment of Haleakala Highway between the new connection to Pukalani Bypass and the “Five Trees” intersection would be converted to a cul-de-sac to maintain access to future land uses.

The design of the other build alternatives would be similar to the preferred alternative. They would provide a limited access arterial roadway with one 3.6 m (12 ft) lane in each direction, with a roadway right-of-way of at least 49 m (160 ft) wide in rural areas and at least 37 m (120 ft) wide in urban areas to allow for the widening of the facility to four lanes if appropriate in the future. The posted speed limits would vary from 70 km/h (45 mph) in urban areas to 90 km/h (55 mph) in rural areas.

### **S.3.3 NO BUILD ALTERNATIVE**

The No Build alternative consists of those roadway improvements that are expected to be implemented by 2020 as stated in the Maui Long-Range Plan Land Transportation Plan (Final

**Build Alternatives**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE S-3**

Report, February 1997), apart from the proposed project. The No Build alternative is the benchmark reference against which project impacts are assessed in this Final EIS.

### **S.3.4 ALTERNATIVES DEVELOPMENT AND SELECTION OF THE PREFERRED ALTERNATIVE**

#### **S.3.4.1 Development of Project Alternatives**

Three general steps were accomplished to develop the alternatives studied in this Final EIS:

1. A two-tiered alternatives screening analysis;
2. Refinement of Alternative U2; and
3. Additional adjustments to alignments.

A two-tiered alternatives screening analysis was performed to evaluate fourteen alternatives that were developed from prior studies and reports, scoping activities conducted as part of the EIS process, and public involvement activities (see Figures 2-6 and 2-7). Twelve of these alternatives were different alignments. The other two alternatives were "enhanced widening of existing roadways," beyond the widening proposed in the No Build Alternative, and Transportation Systems Management (TSM).

Candidate evaluation criteria were generated and sorted into two groups: Tier One (fatal flaws) and Tier Two. The Tier One (fatal flaw) criteria were developed to eliminate alternatives that are impractical, unfeasible or not fundable to avoid unnecessary analysis of alternatives that would have minimal chance of being selected as the Preferred Alternative. The Tier Two criteria relate primarily to the nature and degree of impact. An alternative not satisfying a Tier Two criterion could be feasible, but would not be advantageous with respect to the criterion in question.

The Tier One screening analysis eliminated from further study six alignment alternatives, the "enhanced widening of existing roadways" alternative, and the TSM alternative (see Section 2.2.1.3a). The Tier Two screening analysis evaluated the remaining six alternatives and eliminated two alignment alternatives (see Section 2.2.1.3b). The remaining four alternatives were then recast as combinations of mauka and makai segments. By combining the two

makai terminus choices (K1 and K2) with the three mauka terminus choices (U1, U2 and U3), it became possible to generate six alternatives comprised of common roadway segments.

Following selection of these six alternatives, it was discovered that Segment U2 would cross a site planned for a Kamehameha Schools / Bishop Estate campus. Also, archaeological reconnaissance surveys found notable sites (potentially eligible for the National and/or State Registers of Historic Places and important for preservation) within the U2 alignment (see Section 3.10.2). Therefore, four modifications of the eastern (mauka) section of the U2 alignment (U2-A, U2-B, U2-C and U2-D) were developed and evaluated based on such criteria as maximum grade, number of gulch crossings, and operational considerations. Following this evaluation, the U2-A and U2-B modifications were selected for further evaluation. The U2-A alignment shifts the eastern (mauka) portion of the U2 alternative northward, creating a terminus at the Pukalani Bypass / Haleakala Highway / Kula Highway "Five Trees" intersection. The U2-B alignment shifts the U2 alternative along the northern boundary of the future Kamehameha Schools campus while maintaining the same terminus (as the original U2 alternative) on Kula Highway.

Finally, the results of archaeological reconnaissance surveys (see Section 3.9) required minor re-alignments of Segments U2-A and U3. The alternatives shown on Figure S-3 reflect all of the changes described above.

#### **S.3.4.2 Selection of the Preferred Alternative**

The eight build alternatives described in Section S.3.1 and S.3.2 were evaluated to determine the preferred alternative using transportation performance, cost, and agricultural impact criteria. In addition, community plan preferences were used. The purpose of this comparison was to determine how well each of the alternatives fared with respect to these criteria and in comparison to one another. Other criteria that relate to environmental and social impacts were considered for this analysis, but were not used because, while important, they did not differentiate between the build alternatives. This analysis of build alternatives to select the preferred alternative does not include the No Build alternative, because the No Build alternative remains under consideration until the Record of Decision is issued.

In evaluating the transportation performance of the alternatives, all of the U3 and K2 alternatives were eliminated from further consideration because they would not serve the major travel markets as well as the U1, U2 (A or B) and K-1 alternatives. The U3 terminus is furthest away from the Upcountry population centers, and the K2 alternatives would not serve the Upcountry – West Maui travel market. Although the K2 alternatives are better in augmenting the evacuation capacity of South Maui, this advantage was not judged to override the disadvantage of not serving the Upcountry - West Maui travel market. The remaining alternatives, U1,K1, U2-A,K1 and U2-B,K1, were then evaluated using the other criteria.

Of these remaining alternatives, the U1,K1 alternative would be the least expensive to construct. However, the costs of the three alternatives are all within 7 percent of one another. Therefore, cost was only a minor factor in the decision to select the preferred alternative.

The U2-A, and U2-B alternatives would cause less of an impact to agriculture than the U1,K1 alternative. However, Alexander & Baldwin, the parent company of Hawaiian Commercial and Sugar Company, indicated a willingness to work with the SDOT on appropriate mitigation to lessen the impact to their agricultural operations (see Volume Two: Draft EIS Comments and Responses). Therefore, like the cost factor, agricultural impacts were only a minor factor in the decision to select the preferred alternative.

All the remaining alternatives would be consistent with the Kihei-Makena Community Plan, and therefore, this plan does not help discriminate among the remaining alternatives. On the other hand, the Makawao-Pukalani-Kula Community Plan indicates a strong preference for a No Build alternative. However, this plan goes on to state a preference for a U1 alternative, if the highway project moves forward. This preference for a U1 alternative, among all the build alternatives, was reiterated by several Upcountry commentators throughout the EIS process. The community plan preference for a U1 alternative, if constrained to select among the three remaining alternatives, was highly influential, and was a major determining factor that led SDOT and FHWA to select the U1,K1 alternative as the preferred alternative.

## **S.4 IMPACTS AND MITIGATION**

Table S-1 summarizes the environmental and social impacts, including construction-phase impacts, of the No Build and build alternatives, including the preferred alternative. A summary of mitigation measures for each adverse impact of the build alternatives is also provided in this table. In general, the build alternatives' impacts are similar. However, the following differences do exist:

### Alternatives with a U1 alignment (U1,K1 (preferred alternative) and U1,K2)

- These alternatives would have the most severe cropland impacts.

### Alternatives with either a U2-A or U2-B alignment (U2-A,K1; U2-A,K2; U2-B,K1; and U2-B,K2)

- These alternatives would have the second most severe cropland impacts.

### Alternatives with either a U1, U2-A or U2-B alignment (U1,K1 (preferred alternative); U1,K2; U2-A,K1; U2-A,K2; U2-B,K1; and U2-B,K2)

- These alternatives would increase the use of Omaopio and Pulehu Roads as a through route. These roads were not designed for such a purpose, although the County is planning to improve them.

### Alternatives with a U3 alignment (U3,K1 and U3,K2)

- These alternatives would be within visual distance of a cattle corral potentially affecting ranch operations. These alternatives would also cross two pineapple fields and the Kula Agricultural Park, County land that is leased to small-scale farmers at comparatively low rates. Remnant agricultural parcels that may be difficult to work may be created at one of the pineapple fields affected by this alternative.
- These alternatives may lead to the use of local residential roads between Kula and Haleakala Highways as a route to the Haleakala summit.

### Alternatives with a K1 alignment (U1,K1 (preferred alternative); U2-A,K1; U2-B,K1 and U3;K1)

- These alternatives may affect adjacent ranching operations. Proper measures will need to be implemented to minimize the conflicts between cattle and roadway operations. For example, cattle will need to be herded across the highway right-of-way several times a year, and these crossings may take ten to fifteen minutes.

**Table S-1  
Summary of Environmental Impacts and Mitigation**

Build Alternatives	
No Build Alternative	Common
Alignment-Specific	
<b>LAND USE</b>	
<p>Construction Impacts. Construction impacts associated with the various roadway widening projects contained in the <u>Maui Long-Range Land Transportation Plan (February 1997)</u>.</p>	<p>Construction Impacts. Introduction of a roadway to agricultural areas (sugarcane, pineapple and ranching), leading to an irrevocable loss of open space and interference with existing, adjacent agricultural practices (see Farmland below). No outright residential or business displacements.</p>
<p>Operational Impacts. Kulamalu, the Department of Hawaiian Homelands' Keokea Homesteads, the Alexander &amp; Baldwin (A&amp;B) housing development in <u>Haliimaile</u>, the expansion of the Maui R&amp;T Park and other developments would continue as planned.</p>	<p>Operational Impacts. The highway would have minimal influence on long-term regional land use trends because other factors, such as water availability, health of the visitor industry, and pace of development of "high-tech" industry control the speed and extent of land use development.</p>
<p>Mitigation. None required.</p>	<p><u>U1 Alternative (including the preferred alternative)</u>. Will facilitate development beyond Pukalani's urban growth boundary as defined by the community plan. <u>Will support planned A&amp;B development in Haliimaile.</u> <u>U2-A or U2-B Alternative</u>. Would support the planned Kulamalu development. U2-B was the suggested alignment contained in the Kulamalu Master Plan. <u>U3 Alternative</u>. Not expected to influence land use development in Kula because water availability would continue to be the major constraint. <u>K1 or K2 Alternative (including the preferred alternative)</u>. May promote in-fill development in Kihei, which would be a beneficial impact.</p>
<b>FARMLAND</b>	
<p>Construction Impacts. <u>Farmland impacts associated with various roadway widening projects contained in the Long-Range Plan.</u></p>	<p><u>Construction Impacts</u>. Will convert agricultural lands to a transportation use, cause crop damage, disturb sugarcane and pineapple operations, and affect cattle grazing. Will damage existing</p>
<p><u>Mitigation</u>. Landowners affected by right-of-way acquisition will be compensated based on the guidelines of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.</p>	
<p><u>U1 Alternative (including the preferred alternative)</u>. In addition to direct conversion of cropland to a transportation use, will isolate approximately 400 ha (1000 acres) of sugarcane land from a larger field,</p>	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
FARMLAND (cont.)	Common	Alignment-Specific
<p>Construction Impacts (cont.): See above.</p>	<p>Construction Impacts (cont.): agricultural infrastructure (haul roads, and irrigation and drainage systems), adversely affecting current operating practices.</p>	<p>U1 Alternative (cont.): and cross a pineapple field. In addition to direct conversion of cropland to a transportation use, will isolate approximately 400 ha (1000 acres) of sugarcane land from a larger field, and cross a pineapple field.</p> <p>U2-A or U2-B Alternative. In addition to direct conversion of cropland to a transportation use, would isolate approximately 25 ha (60 acres) of sugarcane land from a larger field, and cross two pineapple fields.</p> <p>U2-A Alternative: The realigned Haleakala Highway in Pukalani would cross a pineapple field, converting some of this land to a transportation use.</p> <p>U3 Alternative. In addition to direct conversion of cropland to a transportation use, would cross two pineapple fields, and a County agricultural park, which is used to lease parcels to small-scale farmers at comparatively low rates.</p>
<p>Construction Impacts (cont.): Per the Farmland Protection Policy Act, Land Evaluation and Site Assessment scores for each alternative were calculated, and are shown to the right. No alternative has a score equal to or greater than 160, the threshold at which alternatives that avoid farmland impacts must be evaluated.</p>		<p>U1.K1 Alternative (preferred alternative): 151 points                      U1.K2 Alternative: 148 points                      U2-A.K1 Alternative: 141 points                      U2-A.K2 Alternative: 142 points                      U2-B.K1 Alternative: 139 points                      U2-B.K2 Alternative: 139 points                      U3.K1 Alternative: 140 points                      U3.K2 Alternative: 137 points</p>

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<p><b>FARMLAND (cont.)</b></p> <p><u>Operational Impacts.</u> Sugarcane, pineapple, ranching and small farm agriculture in the study area would remain viable. They would, however, continue to be adversely affected by external forces such as world market conditions and suburban encroachment.</p>	<p><u>Operational Impacts.</u> Will interfere with sugarcane and pineapple cultivation because the highway will cross active fields, which will make working the fields more difficult. Will improve access to cattle grazing areas.</p>	<p><u>U3 Alternative.</u> Would be within visual distance of a major cattle corral and water system. The corral may not operate normally if the highway is within visual distance.</p> <p><u>K1 Alternative (including the Preferred Alternative).</u> Without mitigation, adjacent landowner would herd cattle across the roadway several times a year. Crossing the highway would take 10 to 15 minutes.</p>
<p><u>Mitigation.</u> None required.</p>	<p><u>Mitigation.</u> A "Maintenance of Agricultural and Ranching Activities Plan" will be prepared during design and implemented during construction. Measures to offset adverse impacts to agricultural production include allowance for haul road crossings and grade separation of selected haul roads, and replacement and relocation of other existing agricultural infrastructure, such as irrigation and drainage systems. Farmers (owners and leaseholders) will be compensated for crop damage and lease losses, if necessary. Sections of the roadway crossing pastureland will require stock-proof fencing along both sides of the highway. Cattle crossing locations at certain bridges will be designated to avoid the need for cattle to cross the roadway.</p>	
<p><b>SOCIAL AND ECONOMIC</b></p>		
<p><u>Construction Impacts.</u> <u>Socio-economic impacts associated with the various roadway widening projects contained in the Long-Range Plan.</u></p>	<p><u>Construction Impacts.</u> The project will infuse up to \$66 million of federal funds into the local economy, increasing short-term employment and the purchase of local goods and services.</p>	
<p><u>Operational Impacts.</u> Implementation of community plans would affect existing communities by increasing population and traffic, and have environmental impacts, such as agricultural encroachment.</p>	<p><u>Operational Impacts.</u> No alternative will cut through or isolate existing neighborhoods. Therefore, existing social activities will be unaffected. With the exception of Kahului, the new highway does not function as a bypass roadway. Therefore, adverse</p> <p><u>U2-B alternative.</u> This alignment will be adjacent to a planned shopping center in the Kulamalu development. Depending on the type of shops at this center, visitor-related establishments in Makawao, and perhaps Pukalani, may suffer a loss.</p>	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>SOCIAL AND ECONOMIC (cont.)</b>		
Operational Impacts (cont.). Implementation of community plans would affect existing communities by increasing population and traffic, and have environmental impacts, such as agricultural encroachment.	Operational Impacts (cont.). impacts to existing business districts in Pukalani, Makawao, and Kihei are not anticipated. Adverse impacts to business districts in Kahului are also not expected because it is the island's principal commercial center. The potential for long-term employment opportunities will depend on how well the alternatives facilitate employment-producing land uses in areas approved by the County, such as Kulamalu or in-fill development in Kihei. Property tax revenues to the County would decrease by about \$13,000 to \$46,000 per year depending on the alternative because of the conversion of taxable real estate to public right-of-way.	<u>U2-B alternative (cont.) of business from this market. This impact may also occur to a lesser extent under the U2-A and U3 alternatives.</u>
Mitigation: None required.	Mitigation: None required.	
<b>TRANSPORTATION</b>		
Construction Impacts: <u>Construction delays associated with various roadway widening projects contained in the Long-Range Plan.</u>	Construction Impacts. Impacts to traffic flow will occur at construction site ingress and egress areas on Haleakala, Kula and Pilihi Highways, and during work at intersections with existing roadways.	
Operational Impacts. Travel between Upcountry and Kihei-Makena / West Maui would continue to use the existing circuitous route. Transportation level of service would continue to deteriorate.	Operational Impacts. The proposed project will divert Kihei-Upcountry and some West Maui-Upcountry travel demand from its current circuitous route to the new highway. This traffic diversion will <u>U1, U2-A or U2-B Alternative (including the preferred alternative).</u> Will encourage some motorists traveling between Kula and Kihei to use the substandard Omaopio or Pulehu Roads.	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>TRANSPORTATION (cont.)</b>  Operational Impacts (cont.). See above.	Operational Impacts (cont.). reduce total regional vehicle-miles-traveled (VMT), fuel consumption and travel time. Transportation level of service will improve on the existing route. The new highway will operate at acceptable levels of service (D or better).	U1, U2-A or U2-B Alternative (cont.). Increasing use of these roads will interfere with farm vehicle movements and local traffic, and may increase traffic related noise. This impact will be greatest under a U1 alternative, including the preferred alternative, because its Upcountry terminus is furthest away from the Omaoio and Pulehu Roads' intersections with Kula Highway.  U3 Alternative. Would encourage some motorists traveling to the Haleakala summit to use local residential roads running between Kula and Haleakala Highways. This may increase traffic related noise along these roads and interfere with local traffic.
Mitigation. None required.	Mitigation. "Maintenance of Traffic Plan" will be prepared during the design phase to minimize impacts on traffic flows during construction.	U1, U2-A or U2-B Alternative (including the preferred alternative). Traffic conditions at the intersections of the proposed highway with Omaoio and Pulehu Roads will be monitored after completion of the project to determine whether one or both require signalization.  U3 Alternative. Signage would be provided directing motorists to the proper route to the Haleakala summit.
<b>AIR QUALITY</b>		
Construction Impacts. Dust and mobile source emissions will be generated during the construction	Construction Impacts. Air quality impacts during roadway construction will consist of fugitive dust and mobile source emissions from construction equipment.	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>AIR QUALITY (cont.)</b>		
Construction Impacts (cont.). <u>of the various roadway widening projects contained in the Long-Range Plan.</u>	Construction Impacts (cont.). See above.	
Operational Impacts. No violations of State or federal air quality standards are anticipated.	Operational Impacts. None of the alternatives will cause a violation of the applicable State or federal air quality standards.	
Mitigation. None required.	Mitigation. Dust control measures will be implemented during construction, such as minimizing land disturbance, using watering trucks and windbreaks, limiting vehicular paths, and stabilizing temporary roads. Following construction, any disturbed land not permanently in use will be revegetated.	
<b>NOISE AND VIBRATION</b>		
Construction Impacts. <u>Noise will be generated during the construction of the various roadway widening projects contained in the Long-Range Plan.</u>	Construction Impacts. Construction will normally occur during daylight hours when occasional loud noises are more tolerable, and construction activities will generally be in isolated areas away from noise sensitive land uses. Unacceptable noise and vibration impacts at sensitive sites are not anticipated.	
Operational Impacts. Predicted future traffic noise levels are expected to be no more than 1 dBA over the existing noise levels. The Noise Abatement Criteria (NAC) would be approached at one noise receptor site located along Kula Highway.	Operational Impacts. Predicted traffic noise levels at 12 of the 13 selected noise receptor sites are predicted to increase 1 dBA to 11 dBA over existing ambient levels. These predicted increases are not considered "substantial" according to the SDOT Noise Analysis and Abatement Policy.	<p><u>U3 Alternative.</u> Although the predicted noise level at a site located on Kula Highway would be slightly below the predicted noise level under the No Build alternative, an impact, per the <u>Noise Policy</u>, would occur because the future noise level would approach the NAC.</p> <p><u>K1 Alternative (including the preferred alternative).</u> Early morning noise impacts from vehicles traveling to the Haleakala summit were specifically mentioned as a potential concern during scoping.</p>

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

<b>No Build Alternative</b>		<b>Build Alternatives</b>	
		<b>Common</b>	<b>Alignment-Specific</b>
<b>NOISE AND VIBRATION (cont.)</b>			
<p><u>Operational Impacts (cont.)</u>. See above.</p>	<p><u>Operational Impacts (cont.)</u>. See above.</p>	<p><u>K1 Alternative (cont.)</u>. However, early morning noise levels at the most affected neighborhood would increase only by 3 dBA, which is barely perceptible and is well below a substantial increase.</p> <p><u>K2 Alternative</u>. A substantial increase in noise, per the Noise Policy, is predicted to occur at a site in the future Kihei Regional Park adjacent to the highway.</p>	<p><u>U3 Alternative Mitigation</u>. A noise barrier at the site along Kula Highway was considered, but was found not to be reasonable and feasible because it would block viewplanes from the affected residence and would be inappropriate in a rural setting.</p> <p><u>K2 Alternative Mitigation</u>. The SDOT and FHWA would work with the County of Maui to mitigate impacts to noise sensitive activities at the future park. Measures could include buffer zones and berms along the highway.</p>
<b>WATER RESOURCES</b>			
<p><u>Construction Impacts</u>. Erosion and sedimentation may occur during construction from various roadway widening projects contained in the Long-Range Plan.</p>	<p><u>Construction Impacts</u>. Water resource impacts could occur from erosion and sedimentation associated with the project's earthmoving and stockpiling activities, and construction of gulch crossings.</p>		

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>WATER RESOURCES (cont.)</b>		
<p><u>Operational Impacts.</u> Increase in regional pollutant loading of surface waters from roadway drainage because of increases in regional VMT.</p>	<p><u>Operational Impacts.</u> Highway runoff containing automobile-related pollutants (petroleum, oil, rubber) would percolate into the ground. During heavy rain, runoff will drain into the gulches on the side of Haleakala. However, since total regional VMT will decrease (see Transportation), the highway's impact on total regional pollutant loading of surface waters from roadway drainage will be reduced in comparison to the No Build alternative. Inadvertent spills of petroleum-based fuels or chemical products could infiltrate groundwater sources underlying the highway.</p>	
<p><u>Mitigation.</u> None required.</p>	<p><u>Mitigation.</u> Storm water runoff and erosion during project construction will be mitigated through the use of Best Management Practices (BMPs) established before construction begins in coordination with the SDOH and Maui County. In the event of a petroleum or hazardous materials release, established incident response procedures will prevent impacts to groundwater sources. The depth of the water table from the ground will also help protect the aquifer under these conditions.</p>	
<b>FLORA</b>		
<p><u>Construction Impacts.</u> <u>Vegetational communities will be cleared in association with the construction of various roadway widening projects contained in the Long-Range Plan.</u></p>	<p><u>Construction Impacts.</u> Vegetational communities will be cleared for the roadway (see right). None of these communities contain threatened or endangered species, consisting mostly of existing and former cultivated lands, kiawe forests, buffelgrass and gulch vegetation. Therefore, construction will not threaten the region's botanical resources, which consists of non-native species in the areas to be directly affected by construction.</p>	<p>Amount of Vegetation cleared by alternative:  <u>Alternative U1.K1 (preferred alternative).</u> 97 ha (240 acres)  <u>Alternative U1.K2.</u> 112 ha (277 acres)  <u>Alternative U2.A.K1.</u> 99 ha (245 acres)  <u>Alternative U2.A.K2.</u> 113 ha (280 acres)  <u>Alternative U2.B.K1.</u> 99 ha (246 acres)  <u>Alternative U2.B.K2.</u> 114 ha (282 acres)  <u>Alternative U3.K1.</u> 89 ha (220 acres)  <u>Alternative U3.K2.</u> 102 ha (252 acres)</p>
<p><u>Operational Impacts.</u> None.</p>	<p><u>Operational Impacts.</u> The new highway will increase the possibility of fires in the region due to enhancing public access to dry areas.</p>	<p><u>K2 Alternative.</u> This alignment would be approximately 1.5 km (1 mile) from Puu O Kali, a dry land forest containing three endangered plant</p>

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>FLORA (cont.)</b>		
Operational Impacts (cont.). See above.	Operational Impacts (cont.). See above.	K2 Alternative (cont.). species. This alignment would not directly affect the forest or these endangered species, however.
Mitigation. None required.	Mitigation. Landscaping will be provided, which would include native trees and shrubs wherever practicable. The Maui Native Plant Society and the State Department of Land and Natural Resources will be consulted. Details of the landscaping plan will be developed during the design phase. Existing SDOT specifications, such as proper use of mulch and cleaning and maintenance of construction vehicles and equipment, will help control the spread of alien species. Signage will alert motorists of possible fire conditions and warn them to take measures to minimize fire risk.	
<b>FAUNA</b>		
Construction Impacts. <u>Animals associated with the vegetation to be removed would be displaced from the construction of various roadway widening projects contained in the Long-Range Plan.</u>	Construction Impacts. Some existing faunal habitats will be converted into roadway and embankment. However, this change will not threaten the relatively common faunal communities in the region.	
Operational Impacts. None.	Operational Impacts. <u>Use of Kihei-Upcountry Maui Highway will increase the number of vehicle collisions with axis deer. It is unlikely that the highway will increase the incidence of vehicle-cattle collisions because cattle can be prevented from entering the highway right-of-way by well-maintained stock-proof fencing.</u>	U1, U2-A or U2-B Alternative (including the preferred alternative). Will be in proximity to a reservoir that may be used by migratory and resident water birds, including the endangered Hawaiian coot. However, there is sufficient horizontal and vertical buffer between the alignment and the reservoir so that the highway will not affect the waterbirds using the reservoir. U1.K1 Alternative (preferred alternative). <u>Alternative that is furthest away from the maximum</u>

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative		Build Alternatives	
		Common	Alignment-Specific
<b>FAUNA (cont.)</b>			
Operational Impacts (cont.). See above.		Operational Impacts (cont.). See above.	U1.K1 Alternative (cont.). concentration of deer, and therefore is the build alternative least likely to increase the rate of vehicle-deer collisions. U3.K2 Alternative. Most likely alternative to increase the rate of vehicle-deer collisions.
Mitigation. None required.		Mitigation. Well-maintained stock-proof fencing at cattle grazing areas will prevent cattle from wandering onto the highway. However, such fencing will not prevent deer from getting onto the highway if they so wish. Frequent signage will be provided warning motorists of the danger of deer on the highway.	
<b>SOLID AND HAZARDOUS WASTE</b>			
Construction Impacts. Wastes would be generated in association with the construction of various roadway widening projects contained in the Long-Range Plan.		Construction Impacts. The volumes of cut and fill will be balanced across the project so there will be no requirement for fill material to be disposed of or imported from outside the construction site. Excavated material is expected to be free of contamination. Construction activities will generate solid and hazardous waste.	
Operational Impacts. None.		Operational Impacts. None.	
Mitigation. None required.		Mitigation. Solid and hazardous waste generated during construction will be properly handled and disposed of per SDOH and Maui County requirements.	
<b>NATURAL HAZARDS</b>			
Construction Impacts. None.		Construction Impacts. None.	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>NATURAL HAZARDS (cont.)</b>		
<p><u>Operational Impacts.</u> Evacuation capacity of the Kihei-Makana region would continue to be limited due to the lack of roadway capacity and alternative routes.</p>	<p><u>Operational Impacts.</u> An additional egress route and roadway capacity will be provided in the event of an evacuation from Kihei-Makana. The new highway will not result in additional exposure to natural hazards.</p>	
<p><u>Mitigation.</u> None required.</p>	<p><u>Mitigation.</u> None required.</p>	
<b>HISTORIC AND ARCHAEOLOGICAL RESOURCES</b>		
<p><u>Construction Impacts.</u> <u>Historic properties could be affected by the construction of various roadway widening projects contained in the Long-Range Plan.</u></p>	<p><u>Construction Impacts.</u> Construction activities will eliminate archaeological sites that require data recovery, but do not require preservation. The number of these type of sites affected by each alternative is provided on the right. <u>Only the preferred alternative (U1,K1) underwent an archaeological inventory survey. The information about the other alternatives was based on reconnaissance surveys. It is likely that the number of sites that would be affected by the other alternatives would change if they were to undergo inventory surveys.</u></p>	<p><u>Number of archaeological sites requiring data recovery by alternative:</u>  <u>Alternative U1,K1 (preferred alternative), three (3) sites</u>  <u>Alternative U1,K2, seven (7) sites</u>  <u>Alternative U2-A,K1, three (3) sites</u>  <u>Alternative U2-A,K2, seven (7) sites</u>  <u>Alternative U2-B,K1, three (3) sites</u>  <u>Alternative U2-B,K2, seven (7) sites</u>  <u>Alternative U3,K1, six (6) sites</u>  <u>Alternative U3,K2, ten (10) sites</u></p>
<p><u>Operational Impacts.</u> None.</p>	<p><u>Operational Impacts.</u> None.</p>	
<p><u>Mitigation.</u> None required.</p>	<p><u>Mitigation.</u> A mitigation measure that has already been implemented is the modification of alignments to avoid sites that require preservation. <u>In accordance with Section 106 of the National Historic Preservation Act, a Memorandum of Agreement (MOA) was prepared and signed by the FHWA and the State Historic Preservation Officer (SHPO), with which the SDOT has concurred. The MOA specified that a data recovery plan be prepared and implemented, in coordination with the State Historic</u></p>	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>HISTORIC AND ARCHAEOLOGICAL RESOURCES (cont.)</b>		
Mitigation (cont.). None required.	Mitigation (cont.). Preservation Division, before construction. During construction, buffer zones would be fenced around known archaeological sites that require preservation. If additional sites are uncovered during construction, work would stop immediately and the SHPO would be notified and consulted on the appropriate treatment measures.	
<b>PARKLANDS</b>		
Construction Impacts. Parklands could be affected by the construction of various roadway widening projects contained in the Long-Range Plan.	Construction Impacts. None.	
Operational Impacts. None.	Operational Impacts. The highway will enhance access to Haleakala National Park, the Kihei Aquatic and Community Center and the future Kihei Regional Park, among others. No parks or other recreational resources will be directly or indirectly adversely affected.	K2 Alternative. Would enhance access to the future Kihei Regional Park to a greater degree than a K1 alternative. However, this alternative would cause a substantial increase in noise from existing levels at areas in the future park adjacent to the alignment. The future park site is currently used for pasture.
Mitigation. None required.	Mitigation. None required. K2 Alternative. See Noise above.	
<b>VISUAL AND AESTHETIC RESOURCES</b>		
Construction Impacts. Vegetation along roadway shoulders would be removed from the construction of various roadway widening projects contained in the Long-Range Plan. This could potentially affect existing viewsheds.	Construction Impacts. Imposition of a linear construction site on mauka viewsheds.	

**Table S-1  
Summary of Environmental Impacts and Mitigation  
(continued)**

No Build Alternative	Build Alternatives	
	Common	Alignment-Specific
<b>VISUAL AND AESTHETIC RESOURCES (cont.)</b>		
<p><u>Operational Impacts.</u> None.</p>	<p><u>Operational Impacts.</u> Regardless of the alternative selected, the visual quality of Upcountry watersheds will not be affected because the terrain drops away towards Central Maui and the ocean. However, the intactness of the eastern (mauka) Haleakala watershed from Kihei will be affected by a paved roadway and associated embankments climbing the slope. Viewpoints may be created by the proposed highway, offering motorists using the highway mauka and makai watersheds.</p>	
<p><u>Mitigation.</u> None required.</p>	<p><u>Mitigation.</u> Landscaping consistent with the climatic conditions of the area will be provided to improve the appearance of the roadway. Opportunities to establish scenic overlooks will be explored.</p>	
<b>ENERGY</b>		
<p><u>Construction Impacts.</u> Energy would be expended in constructing the various roadway widening projects contained in the Long-Range Plan.</p>	<p><u>Construction Impacts.</u> Energy will be expended in constructing the highway.</p>	
<p><u>Operational Impacts.</u> Would have higher overall vehicle fuel consumption when compared to any of the build alternatives, as travelers experience increasing congestion between Upcountry and Kihei-Makena / West Maui along the existing indirect route.</p>	<p><u>Operational Impacts.</u> Will have lower overall vehicle fuel consumption when compared to the No Build alternative because the highway will provide a more direct route between Upcountry and Kihei or West Maui. As shown to the right, the trip length between the "Five Trees" intersection and the Lipoa Street / Pihani Highway intersection will be reduced for each alternative when compared to the No Build alternative.</p>	<p><u>Trip length reductions by alternative:</u>                      U1.K1 Alternative (preferred alternative). 13 km (36%) trip reduction                      U1.K2 Alternative. 11 km (31%) trip reduction                      U2-A.K1 Alternative. 18 km (50%) trip reduction                      U2-A.K2 Alternative. 15 km (42%) trip reduction                      U2-B.K1 Alternative. 17 km (47%) trip reduction                      U2-B.K2 Alternative. 14 km (39%) trip reduction                      U3.K1 Alternative. 14 km (39%) trip reduction                      U3.K2 Alternative. 12 km (33%) trip reduction</p>
<p><u>Mitigation.</u> None required.</p>	<p><u>Mitigation.</u> None required.</p>	

Alternatives with a K2 alignment (U1,K2; U2-A,K2; U2-B,K2; and U3;K2)

- These alternatives would cause noise impacts at the future Kihei Regional Park.

Cumulative impacts in the project area would be caused by implementation of the County's Community Plans, and other actions by governmental and private interests (see Section S.5). However, these impacts would be tempered by the large size of the project area. For example, the loss of some uncultivated lands would not affect the biological diversity of the region because the plant species affected are abundant, and are mostly not native. However, continuing encroachment on agricultural land is a concern. If not controlled, continued urban encroachment could adversely affect the sugarcane and pineapple industries on Maui, as well the small-scale farmers in Kula. The planned residential and commercial developments in Upcountry are also a concern because they would substantially increase the population of a region that is largely based on rural and agricultural lifestyles. Many Upcountry residents expressed concern that large population growth could change the "country" ambience of Upcountry.

Secondary impacts from highway projects often occur because they can induce development. These secondary impacts can include effects on open space, air quality, water quality, natural vegetation, historic sites, social environment and demands on infrastructure. However, in this case, secondary impacts from the proposed project are not anticipated because the highway would have little influence on those proposing development because other factors, such as a severely limited water supply, appear to be controlling development. The exception would be the U1 alternatives, which may facilitate a westward (makai) expansion of Pukalani and additional growth in Haliimaile, beyond what is designated in the Community Plan.

## **S.5 MAJOR ACTIONS PROPOSED BY GOVERNMENTAL AGENCIES IN THE PROJECT VICINITY AND COMPATIBILITY WITH LAND USE PLANS AND POLICIES**

Kihei-Upcountry Highway would be consistent with most of the governmental plans, policies and projects in the area. Specifically:

- Kihei-Upcountry Maui Highway would fulfill the recommendations of the Island of Maui-Long Range Land Transportation Plan (February 1997) to construct a new highway from Upcountry to Piilani Highway.
- The SDOT and the County of Maui are planning to make improvements to the highway and roadway system in the project area. Most SDOT improvements consist of widening existing highways. Most planned new roadways are in Kihei to improve local circulation. These other roadway improvements are consistent with the proposed Kihei-Upcountry Highway.
- The proposed Kihei-Upcountry Maui Highway would support the goals of the Hawaii State Plan (June 1991) dealing with economic, physical and natural environment, and transportation objectives and policies.
- The proposed project would be consistent with the objectives and policies of the State's Coastal Zone Management (CZM) Program. The Department of Business, Economic Development and Tourism (DBEDT), the agency administering the State's CZM program, is presently reviewing project consistency.
- Kihei-Upcountry Maui Highway would be consistent with the County of Maui's General Plan 1990 dealing with economic, environmental, and transportation objectives and policies.
- All of the alternatives are consistent with Kihei-Makena Community Plan (1998), which included the proposed highway. However, only the No Build alternative is fully consistent with Makawao-Pukalani-Kula Community Plan (July 1996). The Makawao-Pukalani-Kula Community Plan did not support the highway, but indicated a preference for the U1 terminus if the road were to be built.

Public and private interests are developing the following projects in the general vicinity of the proposed road:

- The State of Hawaii Department of Hawaiian Home Lands will be developing homesteads in Keokea.

- The County of Maui Board of Water Supply (BWS) is planning additional reservoirs and other improvements in the Upcountry water supply systems (Makawao, and Upper and Lower Kula). The purpose of these improvements is to support planned developments as specified in the Makawao-Pukalani-Kula Community Plan and to minimize the need to implement water use restrictions during drought conditions.
- A private developer will be constructing Kulamalu, an approximately 93 ha (230 acre) residential, recreational, cultural and commercial development located south of Pukalani. A Kamehameha Schools campus has already been built on this site.
- Alexander & Baldwin is planning a 27 ha (67 acre) residential housing development in Haliimaile.
- The Maui R&T Park may eventually encompass 168 ha (415 acres). Per County ordinance, fifty percent of the R&T Park must be dedicated to research and development, forty percent to support facilities and ten percent to light manufacturing and general industrial.
- The Maui Electric Company, Ltd., is planning to construct a 232-megawatt electrical generating station on Pulehu Road, approximately two miles east (mauka) of Mokulele Highway.
- Two parcels along Mokulele Highway, Mokulele Baseyard and the old Puunene Airport, are planned to be redeveloped for light industrial and other uses.

## **S.6 UNRESOLVED ISSUES**

The major planning-level issues associated with the proposed highway have been addressed and resolved during the EIS process. There are no unresolved issues that need to be addressed at this phase of project planning. Several project mitigation measures must be tracked and implemented starting in the design phase of the project, including the preparation of detailed mitigation plans for archeological and agricultural impacts. Various design details must be investigated in the next phase of project planning, including the

provision of signals at the project termini and scenic overlooks. Various permits and approvals (see Section S.7) must be obtained before construction starts.

## **S.7 APPROVALS AND PERMITS**

The following permits or approvals would be required prior to the construction of the highway.

### Federal

- Army Corps of Engineers - Section 404 permit (Nationwide)

### State

- State Department of Health (SDOH) - National Pollutant Discharge Elimination System (NPDES) permit (storm water from construction site)
- SDOH - Noise permit (if noise levels are expected to exceed allowable levels as stated in HAR 11-46-6(a), which would be determined during the design phase)
- SDOH - Water Quality Certification

### County

- Department of Public Works (DPW)- Grading, Grubbing, Stockpiling and Excavation permit
- DPW - Permit for Excavation of Highway

# **CHAPTER ONE**

## **Purpose of and Need for Action**

## **CHAPTER 1 PURPOSE OF AND NEED FOR ACTION**

### **1.1 PLANNING CONTEXT**

The Federal Highway Administration (FHWA) and the Highways Division of the State of Hawaii Department of Transportation (SDOT) are issuing this Final Environmental Impact Statement (EIS) as the lead federal and local agencies for the Kihei-Upcountry Maui Highway Project. This proposed federal-aid, two-lane limited access rural highway would directly link Kihei-Makena, an urban area on the southern coast of Maui, to Upcountry, a suburban and rural region on the western flank of Haleakala Volcano (see Figure 1-1). The highway would connect Piilani Highway (Kihei-Makena) with either Haleakala Highway or Kula Highway (Upcountry). This project is included in the current, federally-approved Statewide Transportation Improvement Program.

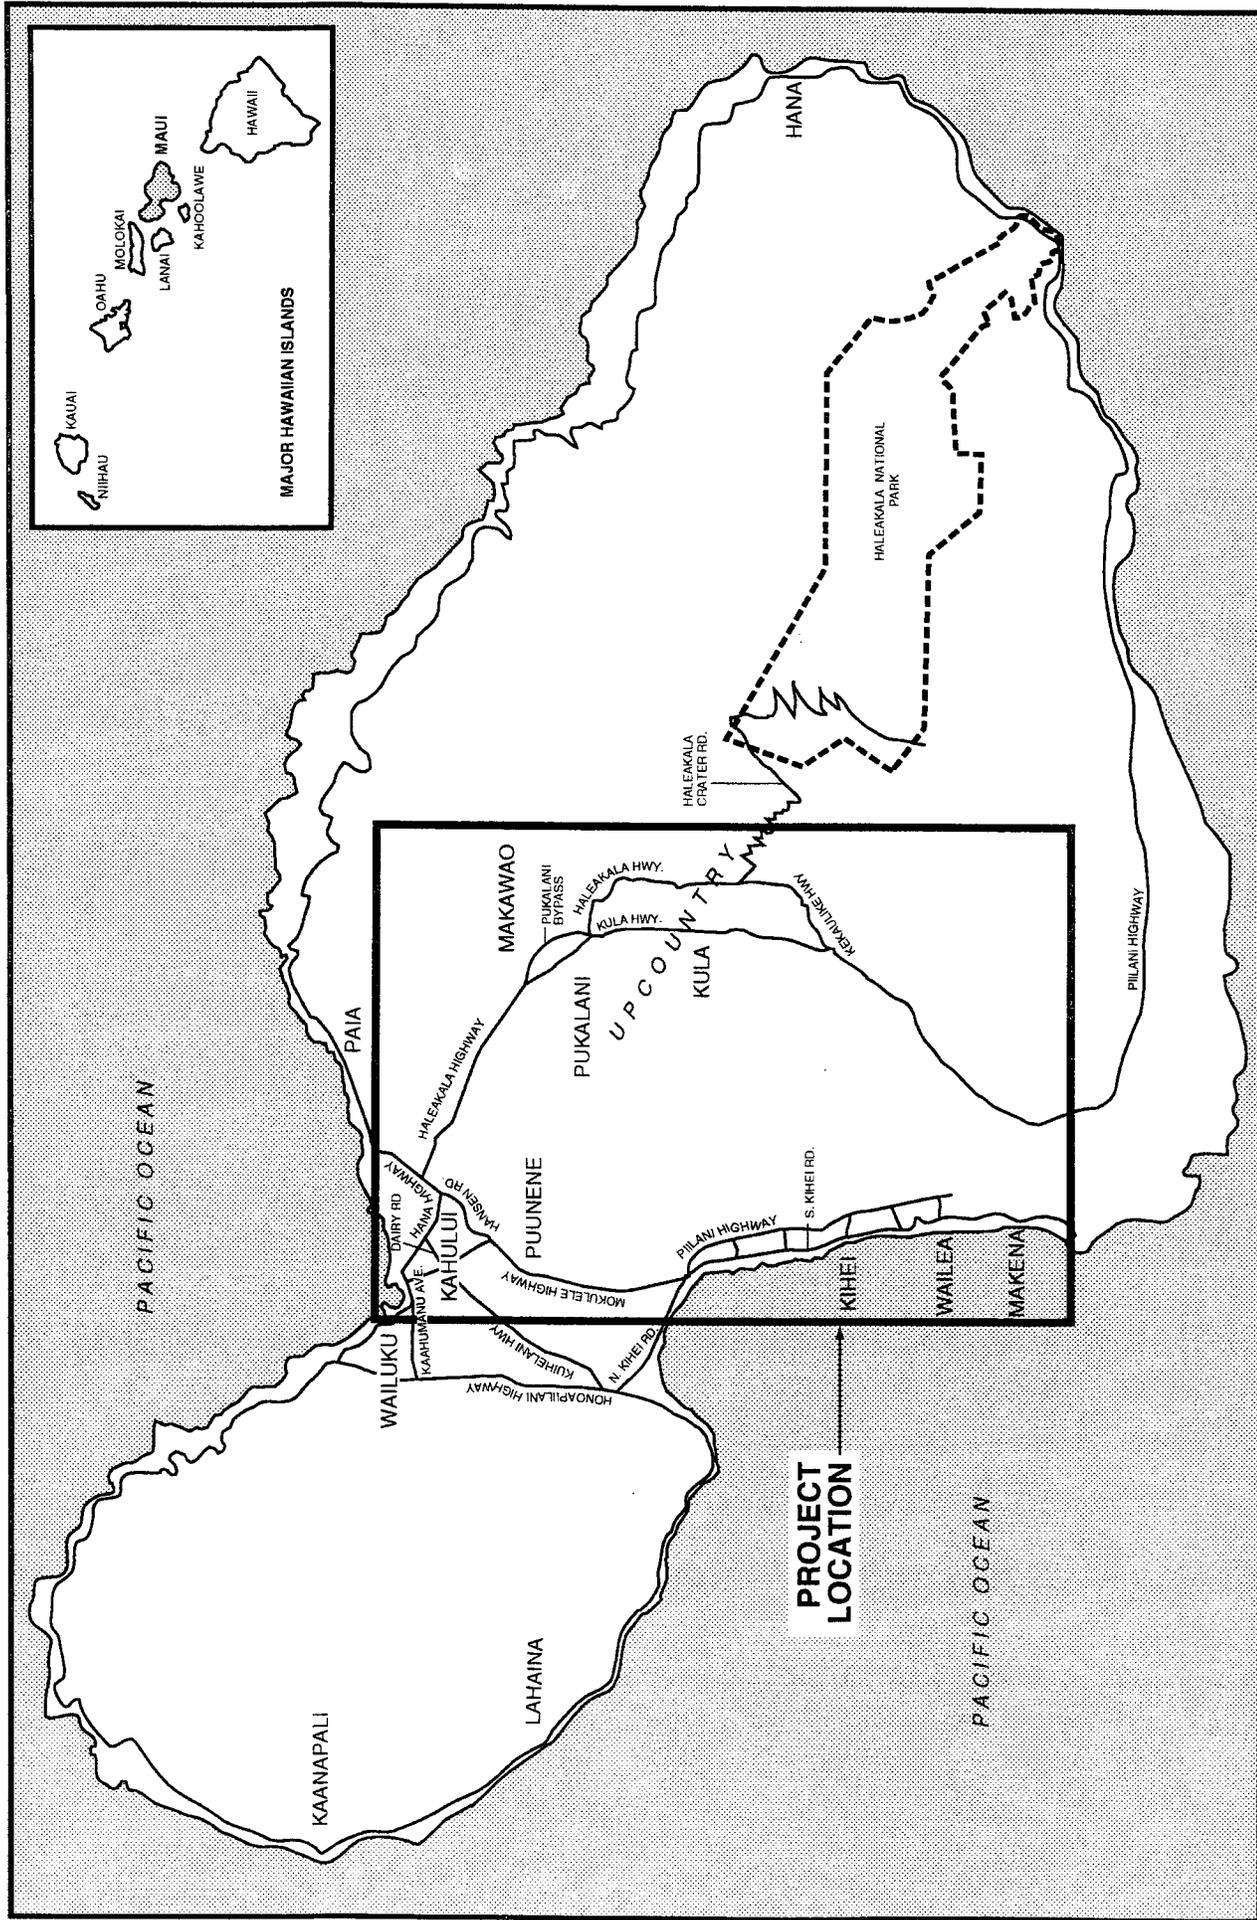

#### **1.1.1 ACCEPTING AUTHORITIES**

At the federal level, the FHWA Hawaii Division Administrator approved this Final EIS. At the State level, the accepting authority of this Final EIS is the Governor of the State of Hawaii. It is expected that the Governor will accept this Final EIS, completing the EIS requirements under Hawaii's EIS Law. It is also expected that the FHWA will issue a Record of Decision (ROD), completing the project's requirements under the National Environmental Policy Act (NEPA). After issuance of the ROD and Final EIS acceptance by the Governor, the design phase of the project may proceed.

#### **1.1.2 PURPOSE OF THIS DOCUMENT**

This Final EIS has been prepared to comply with:

- the National Environmental Policy Act (NEPA);
- Chapter 343 of the Hawaii Revised Statutes (HRS);

**Project Location**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE 1-1**

- FHWA and FTA Joint Regulations, 23 CFR 771;
- Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, 40 CFR 1500-1508; and
- the Hawaii Administrative Rules [Title 11, Chapter 200 (August 1996)].

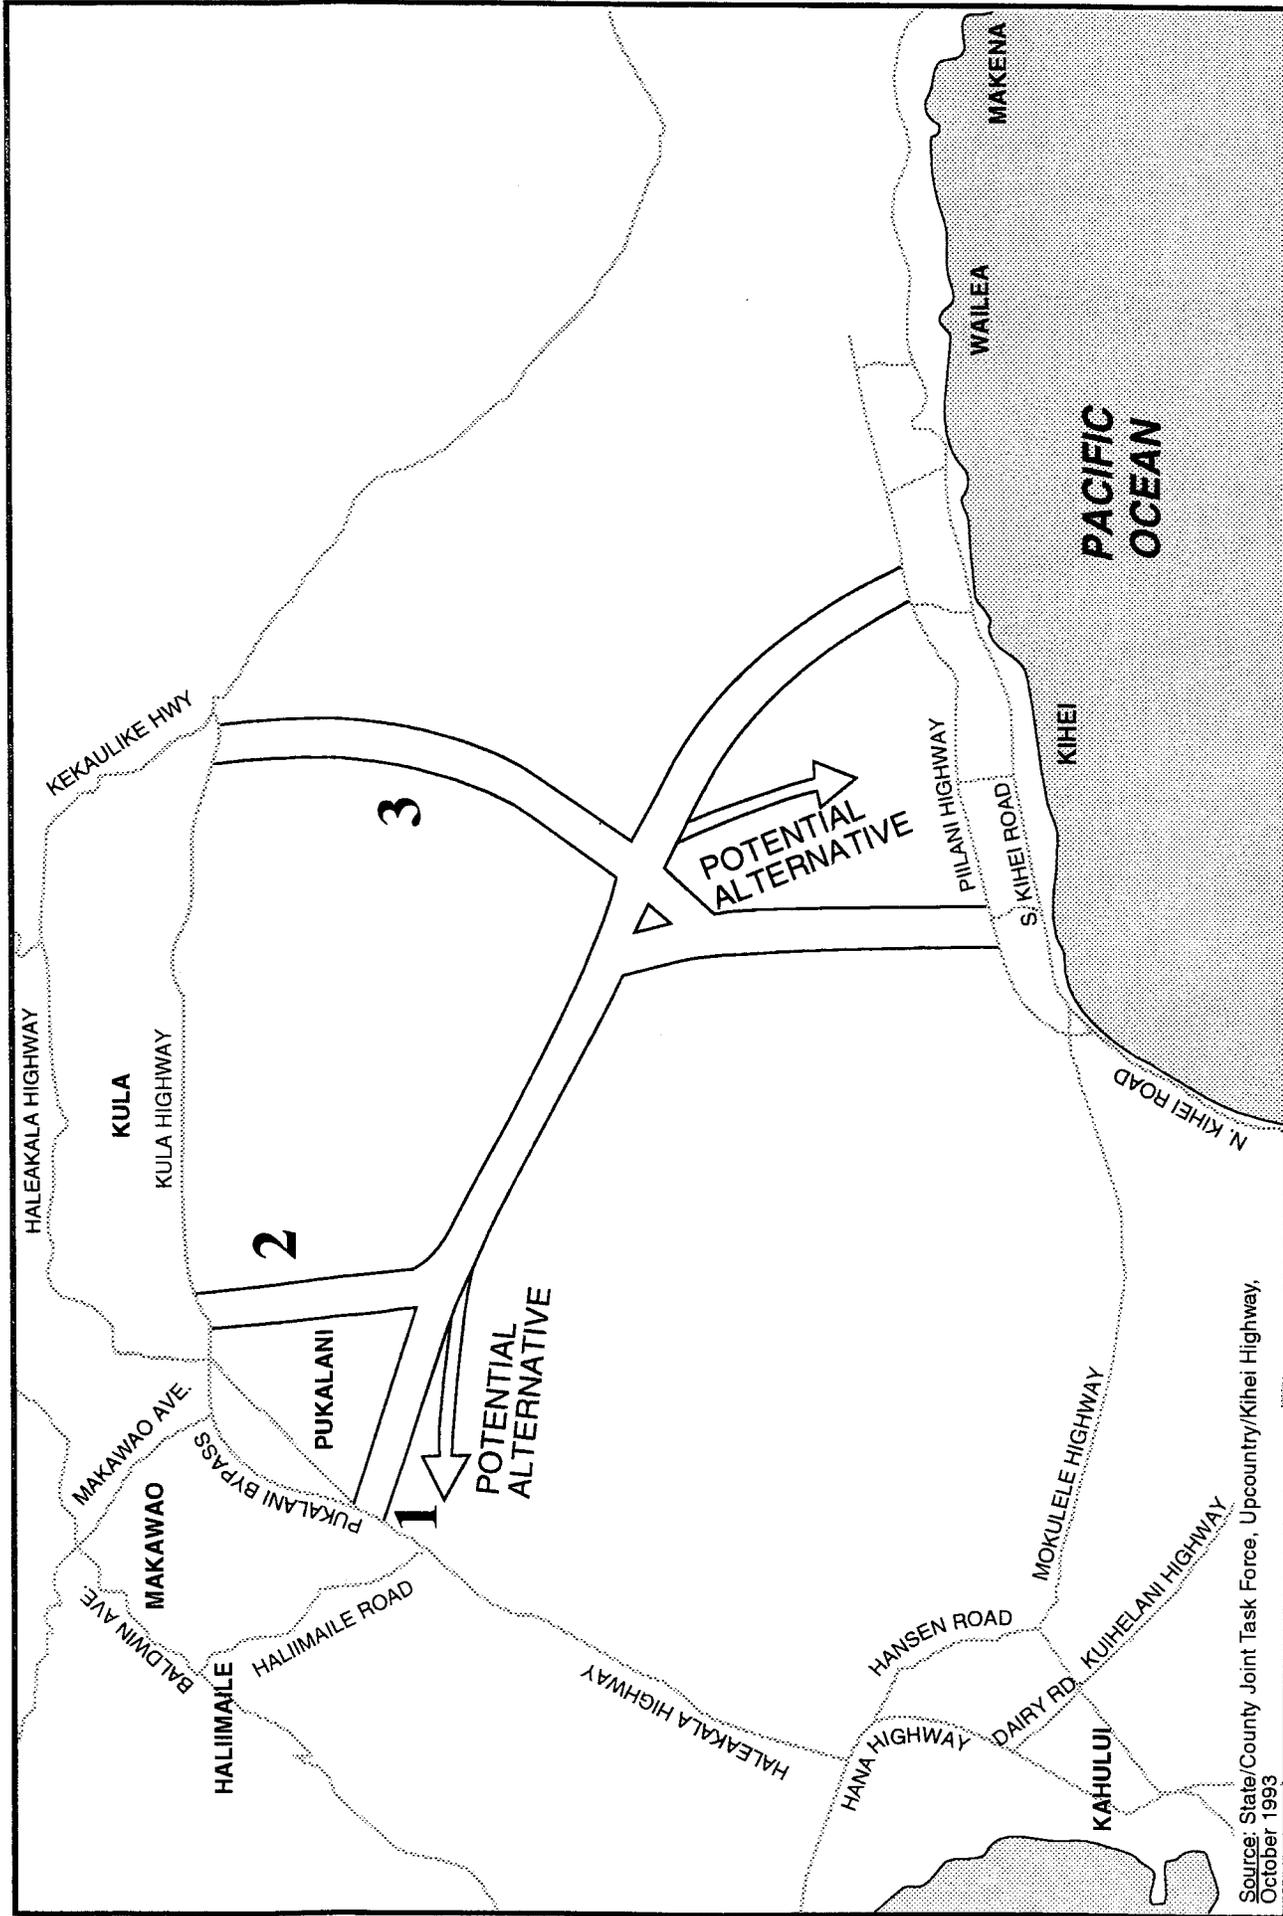

This document identifies and assesses the environmental and social impacts that could result from the development of the proposed highway. The highway would be designed for anticipated traffic demand in the year 2020, which corresponds to the planning horizon of the Maui Long Range Land Transportation Plan (February 1997). Therefore, potential impacts are assessed for that year. Construction-phase impacts are also assessed.

The EIS process has been designed to enable project sponsors to develop a well-planned project that is sensitive to the physical, natural and social environment within which it would exist, and to evaluate and set forth the impacts associated with various alternatives under consideration. Coordination with interested and affected parties is also required and must be documented.

### **1.1.3 HISTORY**

Study of a Kihei-Upcountry Highway began over 30 years ago when, in 1970, the County of Maui studied the feasibility of a road between Upcountry and Kihei. In 1988, the County of Maui Toll Road Study developed three possible alternative alignments. In 1991, the Maui Long-Range Highway Planning Study was completed and again identified a link between Upcountry and Kihei as a needed transportation improvement.

More recently, in 1993, the Mayor of the County of Maui created a State/County Joint Task Force for an Upcountry/Kihei Highway (Task Force). Its membership consisted of State and County officials and private citizens. The Task Force's mission was to recommend an alignment between the coastal urban center of Kihei and the rural residential communities of Upcountry. The Task Force produced a report in October 1993, which recommended possible alignment corridors (see Figure 1-2). When SDOT and FHWA began in-depth study of this proposed roadway link, they considered the alignment corridors recommended by the Task Force as well as alternatives derived from other past efforts (see Section 2.2).

## **1.2 PURPOSE OF AND NEED FOR THE PROJECT**

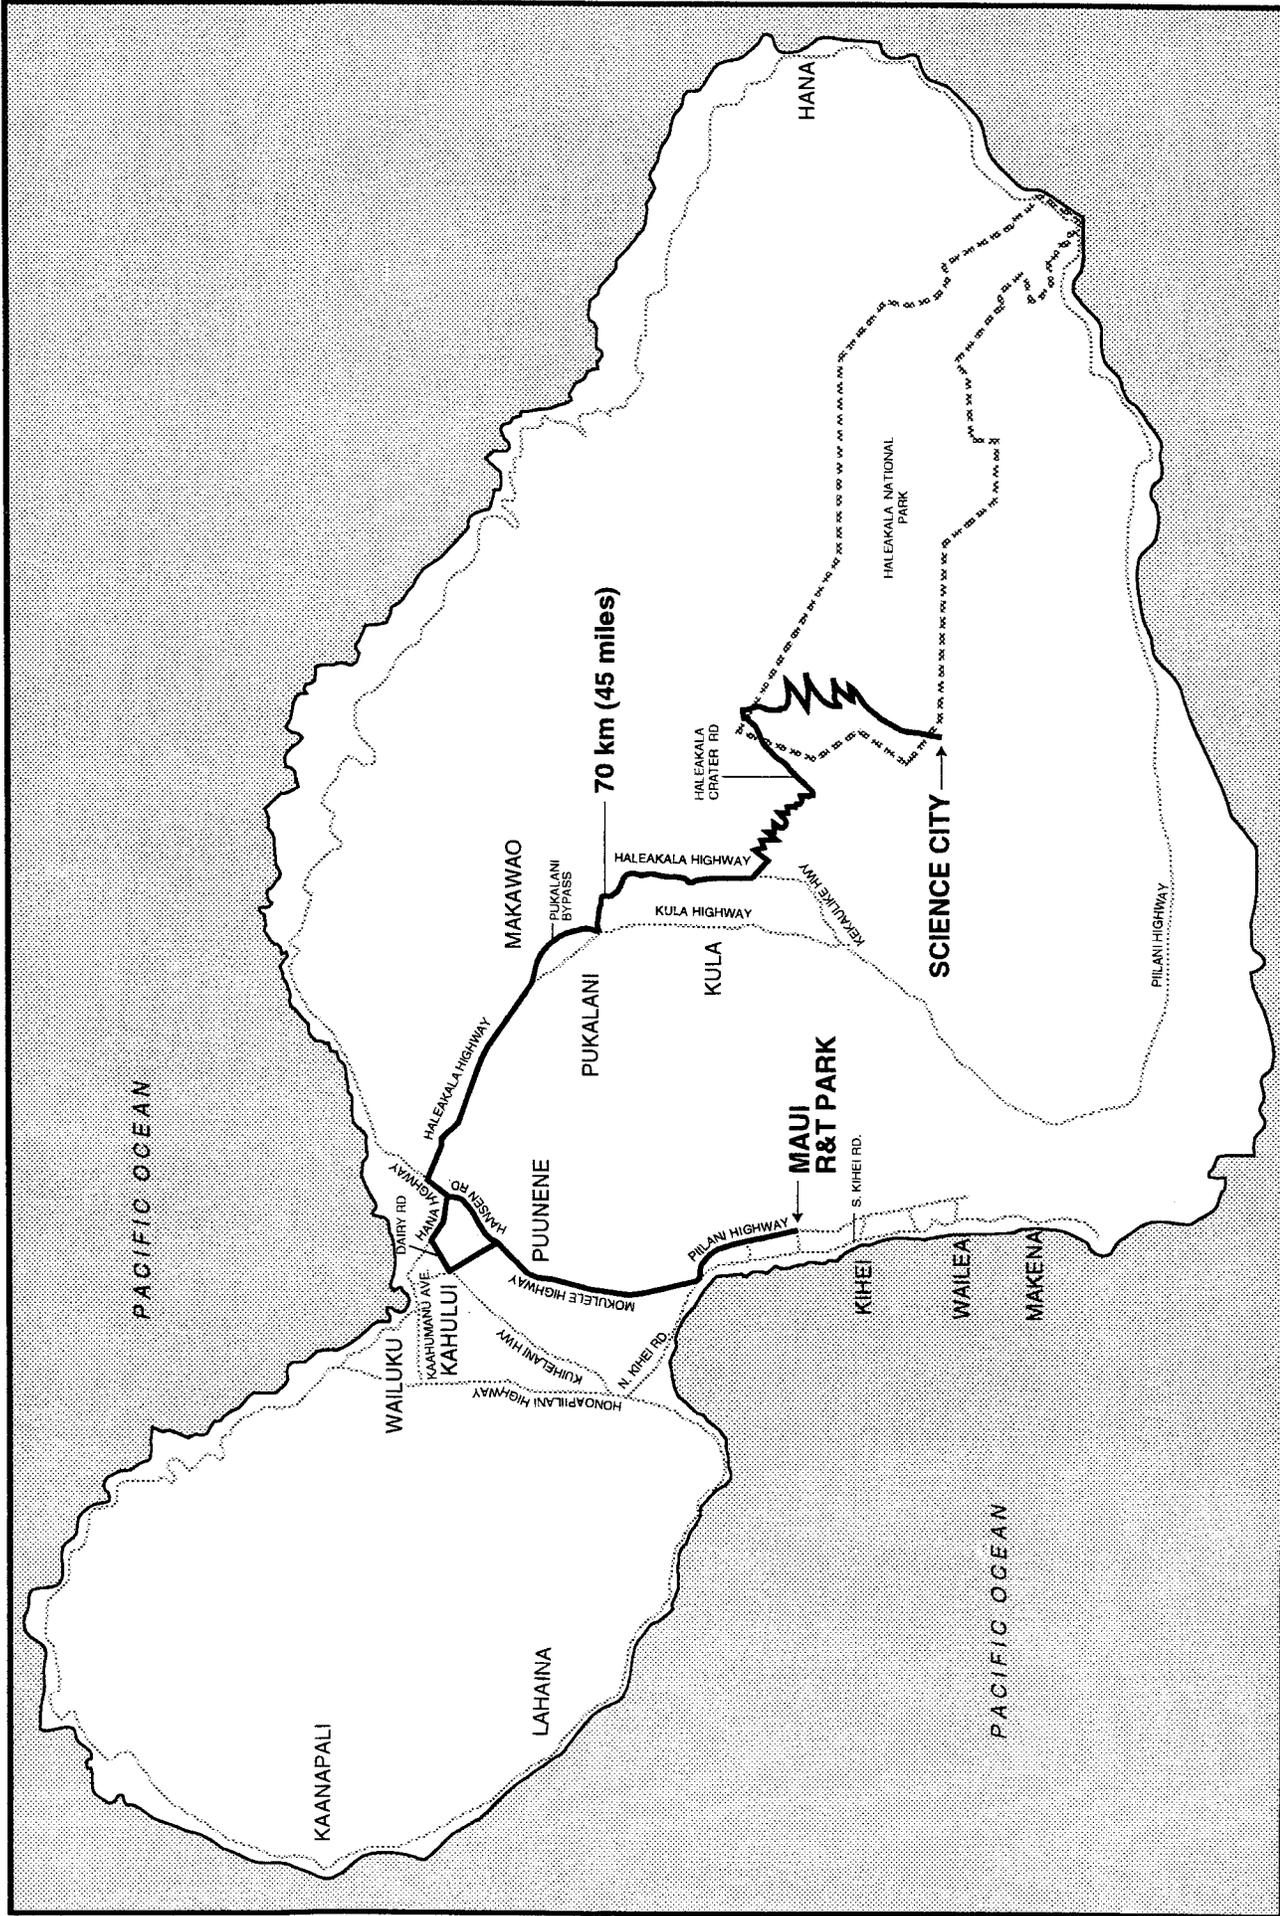

The project ("the proposed action") is being designed to satisfy the following six purposes and needs:

- establish roadway system linkage;
- support economic development;
- address existing intersection capacity deficiencies;
- satisfy increased transportation demand;
- promote the National interest as expressed through legislative directive; and
- increase coastal evacuation capacity.

### **1.2.1 ROADWAY SYSTEM LINKAGE**

The travel distance between Kihei-Makena, a major employment center located along Maui's southern coast, and Makawao or Pukalani, the larger Upcountry residential communities, is 30 km to 35 km (19 to 22 miles). However, the straight-line distance between the two areas is substantially less, at 15 km to 20 km (9 to 12 miles). The large difference between distance by roadway and direct distance is due to the circuitous transportation route the traveler must presently take to get from one area to the other. Starting from Upcountry, the route includes Haleakala Highway, Hana Highway, Dairy Road, Hansen Road, Puunene Avenue, Mokulele Highway and Piilani Highway. In addition to other purposes, the Kihei-Upcountry route is used for travel between the Maui Research and Technology (R&T) Park in Kihei and scientific facilities at the summit of Haleakala, called Science City. The travel distance between the two interrelated facilities is presently about 70 km (45 miles) (see Figure 1-3). The transportation route between the Upcountry communities and West Maui (Lahaina-Kaanapali-Kapalua) is also circuitous.

A Kihei-Upcountry Maui Highway would establish a direct route for these journeys, substantially reducing travel distances, thereby saving both travel time and vehicle fuel consumption.

 Final Environmental Impact Statement  
**FIGURE 1-3**

### **1.2.2 ECONOMIC DEVELOPMENT**

Maui's largest industry now and for the foreseeable future is tourism. According to socioeconomic projections prepared for the county (Maui County Community Plan Update Program, Socio-Economic Forecast, January 1994), the number of Maui visitors is expected to be close to four million by the year 2010, a daily average of over 66,000. In 1990, visitor arrivals numbered approximately 2.3 million, a daily average of 38,000. In other words, almost three out of ten persons, on a daily average, is a visitor. Independent projections prepared by the State of Hawaii Department of Business, Economic Development and Tourism (DBEDT) indicate that the daily average visitor count will be 64,900 by the year 2010, which is close to the County of Maui projections.

In 1990, West Maui and Kihei-Makena contained approximately 53 percent and 42 percent of the island's hotel rooms, respectively. These two regions are expected to continue to be the primary visitor accommodation areas for the island, maintaining their 95 percent share of the island's hotel rooms in the future. In contrast to the hotel accommodation concentration in these two regions, tourist-related attractions are spread throughout the island: from the historic Lahaina town on the west side of the island, to Iao Needle near Wailuku, to Hana and Oheo Gulch (Seven Pools) on the east side of the island, to the new Maui Ocean Center in Maalaea on the south side of the island, to the National Park on the summit of Haleakala.

Along with visitor growth, the number of tourism-related jobs in Kihei-Makena and West Maui is also expected to increase. In 1990, these regions contained over 7,500 and 15,400 jobs, respectively, accounting for over 44 percent of the island's total. Socioeconomic projections contained in the Maui Long-Range Land Transportation Plan (February 1996) indicate by 2020 an increase to over 13,000 (73 percent) and 23,000 (49 percent) jobs in these two regions, respectively. Residential population is projected to grow by over 60 percent from 1990 to 2020. New housing to accommodate this growth would generally be concentrated at existing residential areas of Kahului-Wailuku, West Maui, Kihei-Makena and Upcountry. Upcountry would continue to be a popular residential area because of its spectacular vistas and cool climate.

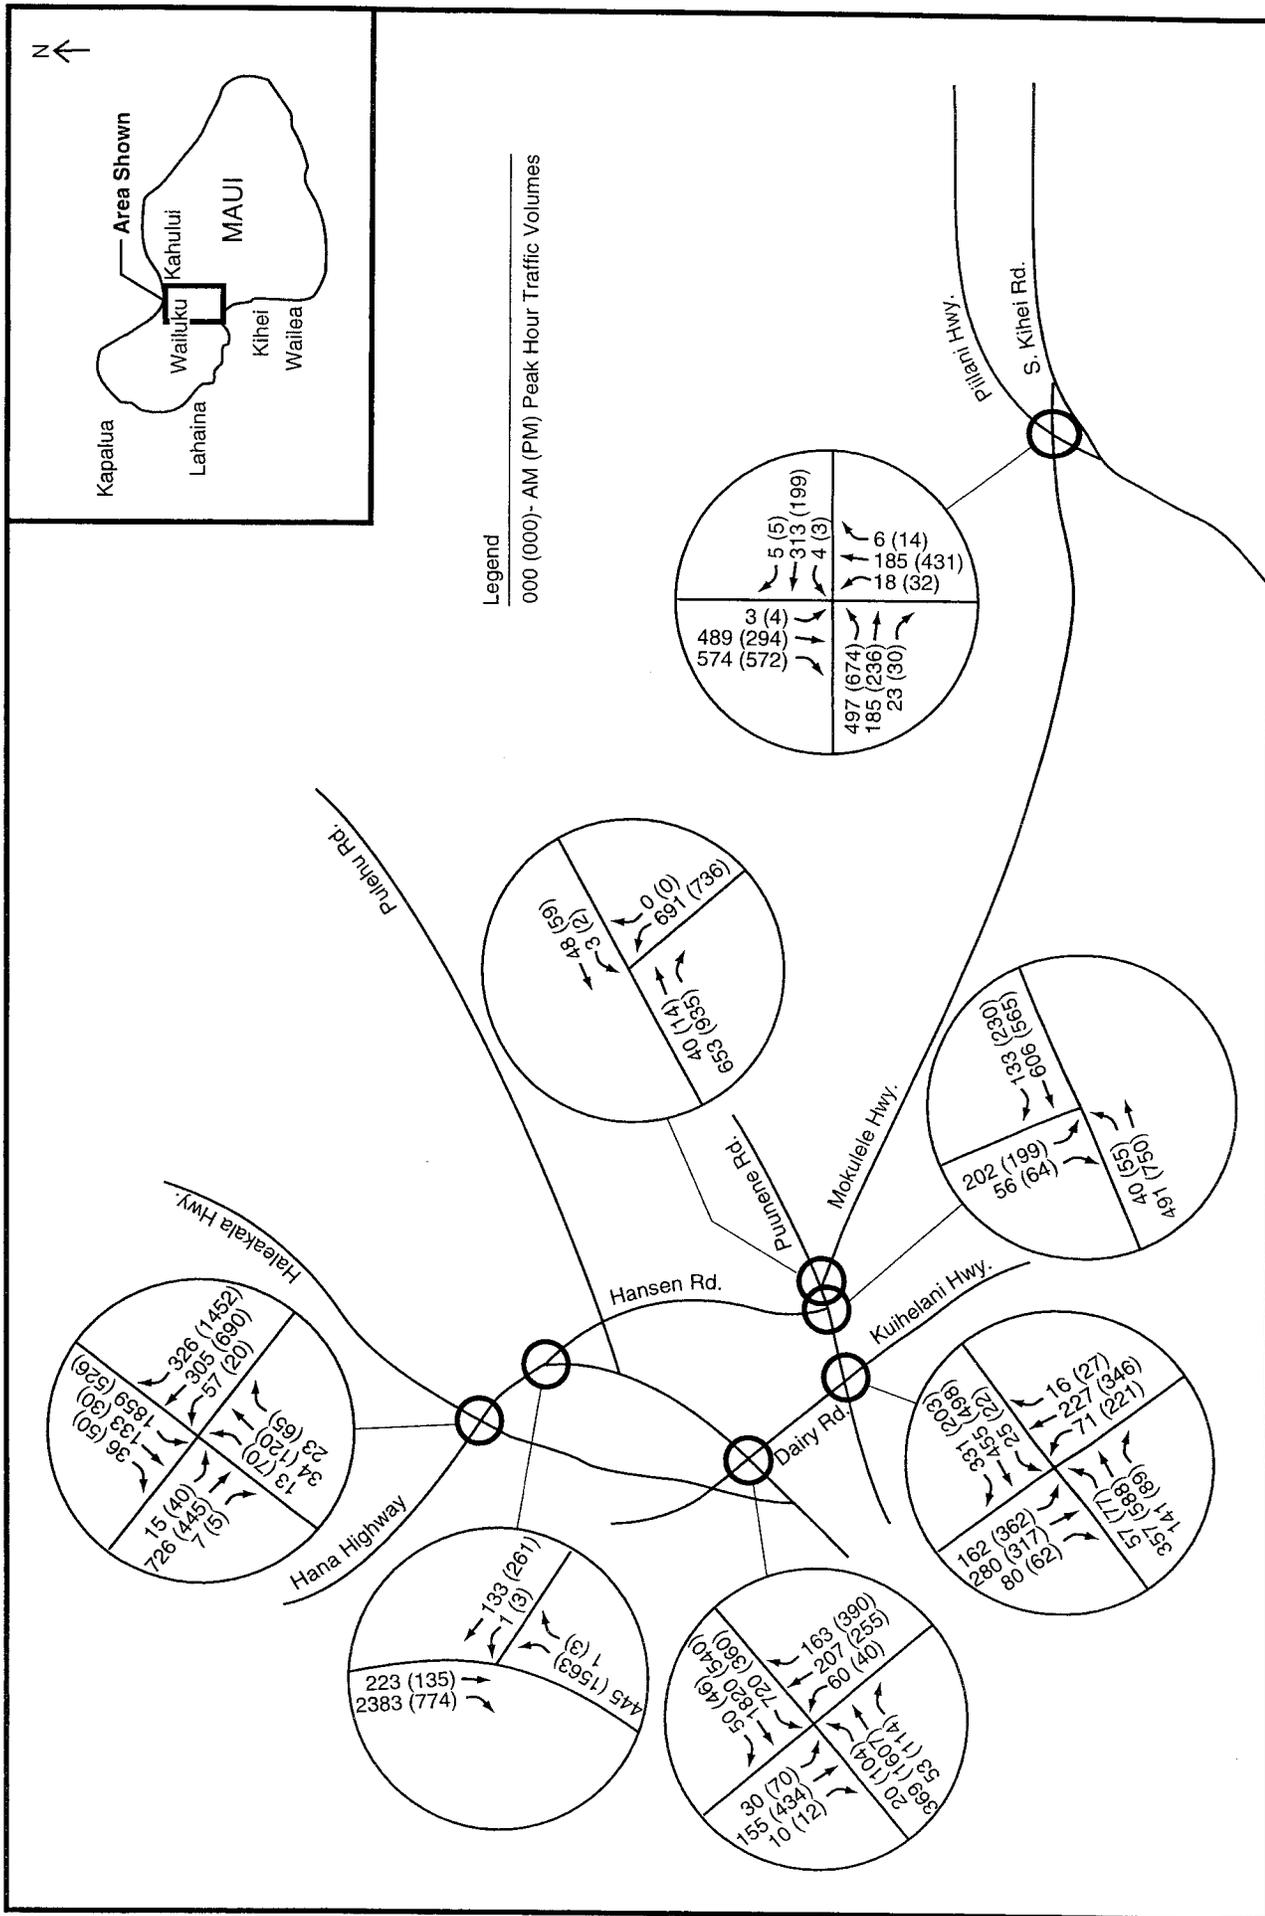

Maui's high technology industry, located primarily at the Maui R&T Park in Kihei and Science City on the summit of Haleakala, is contributing to the diversification of Maui's economy. The Maui R&T Park currently houses the Maui High Performance Computing Center, Boeing-Rocketdyne, Sunsource, the U.S. Air Force, the Pacific Disaster Center, Lockheed Martin, the University of Hawaii, the University of New Mexico, and a number of small companies. Currently about eight percent built-out, the Park may eventually encompass 168 ha (415 acres) and include major new industries such as bio- and medical-technology; arts and entertainment; environmental, earth and ocean sciences; information processing and exchange; defense missions; and education and international training and technology conferencing. Science City, a federal facility, is used for space- and defense-related research and development. Science City receives technical support from defense contractors occupying space in the R&T Park.

A Kihei-Upcountry Maui Highway would support economic development initiatives by facilitating tourist travel between hotel accommodation regions and Haleakala National Park and other tourist-related attractions in Upcountry; linking the growing residential areas of Upcountry with growing labor markets in Kihei-Makena and West Maui; and providing improved transportation mobility between the R&T Park and Science City, which would support businesses and federal government personnel at the R&T Park who provide technical assistance to Science City.

### **1.2.3 EXISTING INTERSECTION CAPACITY DEFICIENCIES**

Figures 1-4 and 1-5 present the morning and afternoon peak hour turning movement volumes at the following intersections between Kihei-Makena and Upcountry Maui.

- Pukalani Bypass and Makawao Avenue
- Haleakala Highway and Haliimaile Road
- Haleakala Highway and Hana Highway
- Hana Highway and Hansen Road
- Hana Highway and Dairy Road
- Dairy Road and Puunene Road and Kuihelani Highway

Source: Parsons Brinckerhoff, June and August 1996

**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE 1-4

- Puunene Avenue and Hansen Road
- Puunene Avenue and Mokulele Highway
- Mokulele Highway and Piilani Highway

Operating conditions at these intersections were analyzed using the methodologies contained in the 1994 Highway Capacity Manual (HCM). The HCM methodologies classify traffic operations by "level of service" (LOS). LOS is designated "A" through "F", representing best to worst conditions. The levels are based on user delays, which is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. LOS C or D are generally considered the lowest levels that are still acceptable.

Table 1-1 summarizes the existing levels of service at the intersections identified above. In the a.m. peak hour, three intersections are experiencing levels of service "E" or lower. In the p.m. peak hour, five intersections are experiencing levels of service "E" or lower.

A Kihei-Upcountry Maui Highway would divert some travel demand from these intersections to a new, more direct route; relieving existing congestion at these intersections.

#### **1.2.4 TRANSPORTATION DEMAND**

In 1990, daily average trip generation on the island exceeded 233,000 trips. According to the Maui Long-Range Land Transportation Plan (February 1996), daily trip generation is projected to increase to over 386,000 trips in the year 2020. Kihei-Makena and West Maui presently generate a large portion of these trips as major employment centers and primary hotel accommodation regions. The concentration of trip generation is expected to remain in these regions. Since Maui's population is expected to grow by over 60 percent from 1990 to 2020, home-based work trips are projected to exceed 69,000 in 2020; 26,000 more than in 1990. Many home-based work trips would be between residential areas and the employment centers of Kihei-Makena and West Maui. Many workers in these two regions live in other parts of the island, including Upcountry, which is one of Maui's most popular residential regions because of its cool climate and spectacular vistas.

**Table 1-1  
Existing Levels of Service at  
Critical Intersections**

Location	Peak Hour	
	A.M.	P.M.
Haleakala Hwy./Pukalani Bypass (Signalized)	C	B
Haleakala Hwy./Haliimaile Road(Unsignalized)	A	B
Major Street Left Turn	D	B
Minor Street Left Turn	F	F
Haleakala Hwy./Hana Hwy. (Signalized)	E	C
Hana Hwy./Hansen Road (Unsignalized)	A	F
Major Street Left Turn	B	F
Minor Street Left Turn	F	F
Hana Hwy./Dairy Road (Signalized)	C	E
Dairy Rd./Kuihelani Hwy./Puunene Road (Signalized)	D	E
Puunene Ave./Hansen Road (Unsignalized)	E	F
Major Street Left Turn	B	B
Minor Street Left Turn	F	F
Puunene Ave./Mokulele Highway (Unsignalized)	A	A
Major Street Left Turn	B	B
Minor Street Left Turn	D	F
Mokulele Hwy./Piilani Highway (Signalized)	E	E

**Notes:** LOS A: describes operations with very low delay, i.e., less than 5.0 seconds per vehicle, and most vehicles do not stop at all.  
LOS B: describes operations with delays in the range of 5.1 to 15.0 seconds per vehicle.  
LOS C: describes operations with delays in the range of 15.1 to 25.0 seconds per vehicle. The number of vehicles stopping become more noticeable, however, many vehicles still pass through the intersection without stopping.  
LOS D: describes operations with delays in the range of 25.1 to 40.0 seconds per vehicle. Many vehicles stop, and the proportion of vehicles not stopping declines.  
LOS E: describes operations with delays in the range of 40.1 to 60.0 seconds per vehicle. This is considered to be the limit of acceptable delay.  
LOS F: describes operations with delay in excess of 60.0 seconds per vehicle. This is considered to be unacceptable to most drivers.

Source: Parsons Brinckerhoff Quade & Douglas, November 1997

Maui's heavy reliance on the tourist industry also generates a high percentage (15 percent) of daily trips made by visitors. Trip generation by visitors is projected to increase from over 35,000 in 1990 to close to 60,000 (approximately a 70 percent increase) in 2020 based on projections of visitor arrivals. Many Maui tourists would visit Haleakala National Park, arriving by rental car, tour bus or shuttle, or bicycle tour. Currently, approximately one million people visit the Haleakala summit annually. A Park official indicated that the number of visitors to the summit correlates with the number of visitors to the island, including seasonal variations (telephone conversation, December 8, 1997). Therefore, a visitor count projection of four million in the year 2010 (made by the County of Maui) would increase the number of visitors to the summit to approximately 1.7 million. Since approximately 95 percent of the visitors stay at Kihei-Makena and West Maui (based on these regions' share of hotel rooms on the island), a large number of trips would be made between accommodation regions and the summit.

Based on the transportation demand projections and intersection capacity deficiencies described in Section 1.2.3, the following improvements are needed:

1. additional roadway capacity between existing and future residential communities in Upcountry and employment centers in Kihei-Makena and West Maui; and
2. additional roadway capacity between visitor accommodation regions in Kihei-Makena and West Maui, and Haleakala National Park and tourist attractions in Upcountry.

The proposed project would help satisfy both requirements.

### **1.2.5 LEGISLATIVE DIRECTIVE**

Federal funding for the planning of this project was appropriated because of the national interest in improved mobility between defense-related activities at the Maui R&T Park in Kihei and Science City at the Haleakala summit (see Section 1.2.2). Science City does and will continue to receive technical support from defense contractors in the R&T Park. The construction of the proposed highway would address the national interest as expressed by this legislative directive.

### **1.2.6 COASTAL EVACUATION CAPACITY**

Located on the southern coast of Maui, Kihei-Makena is vulnerable to coastal hazards such as tsunami or tropical storms. In the event of an evacuation, the only routes presently available are Mokulele Highway and North Kihei Road. Both roads are near sea level, making them vulnerable to flooding during a heavy storm, and may become impassable. In addition to the limited number of lanes these roads provide (two each), their north Kihei termini are approximately 90 m (300 ft) from one another. The close proximity of Mokulele Highway and North Kihei Road, their limited number of lanes, and the vulnerability of these roads to flooding could become sources of evacuation delay.

A Kihei-Upcountry Maui Highway would improve evacuation capacity by providing two additional lanes out of Kihei-Makena approximately 2.4 km (1.5 miles) or 7.6 km (4.7 miles) from the Piilani Highway / Mokulele Highway intersection (2.4 km (1.5 miles) for the preferred alternative). These two additional lanes would relieve some of the evacuation congestion at the northern end of Kihei, and provide an alignment for evacuation that would be geographically separated from the existing routes.

## **CHAPTER TWO**

### **Alternatives**

## **CHAPTER 2 ALTERNATIVES**

This chapter describes the alternatives that receive detailed analysis in Chapter 4 of this Final EIS (eight build alternatives and the No Build alternative). It also describes the alternative development and screening processes that led to the selection of these alternatives.

### **2.1 DESCRIPTION OF ALTERNATIVES**

#### **2.1.1 NO BUILD ALTERNATIVE**

The No Build alternative consists of roadway improvements that are expected to be implemented by 2020, according to the Maui Long-Range Land Transportation Plan (Final Report, February 1997), except for the Kihei-Upcountry Maui Highway Project. Proposed roadway improvements in the vicinity of the proposed project include:

- South Kihei Road. Widen from two to four lanes with a continuous left turn lane from Longs Drug Store to Lipoa Street, and widen from two to four lanes from Kupuna Street to Welakahao Road;
- North-South Collector. Construct a two lane collector road from Uwapo Road to Road F;
- Road C. Construct a four lane connector road from South Kihei Road (at Azeka Commercial Center) to Piilani Highway;
- Piilani Highway. Widen from two to four lanes from Mokulele Highway to Wailea Ike Road;
- Mokulele Highway / Piilani Highway Intersection. Reconfigure intersection making Mokulele Highway to Piilani Highway the through movement;
- Mokulele Highway. Widen from two to four lanes from Puunene Avenue to North Kihei Road;
- Puunene Avenue. Widen from two to four lanes from Kaahumanu Avenue to Mokulele Highway;

- Kuihelani Highway. Widen from two to four lanes from Puunene Road to Honoapiilani Highway, and construct an access road to Kahului Airport, bypassing Dairy Road;
- Hana Highway. Widen from four to six lanes from Kaahumanu Avenue to Haleakala Highway, and widen from two to four lanes from Haleakala Highway to Baldwin Avenue;
- Haleakala Highway. Widen from three to four lanes from Hana Highway to Haliimaile Road;
- Pukalani Bypass. Widen from three to four lanes from Haliimaile Road to Kula Highway; and
- Kula Highway. Widen two to four lanes from Haleakala Highway to Pulehu Road.

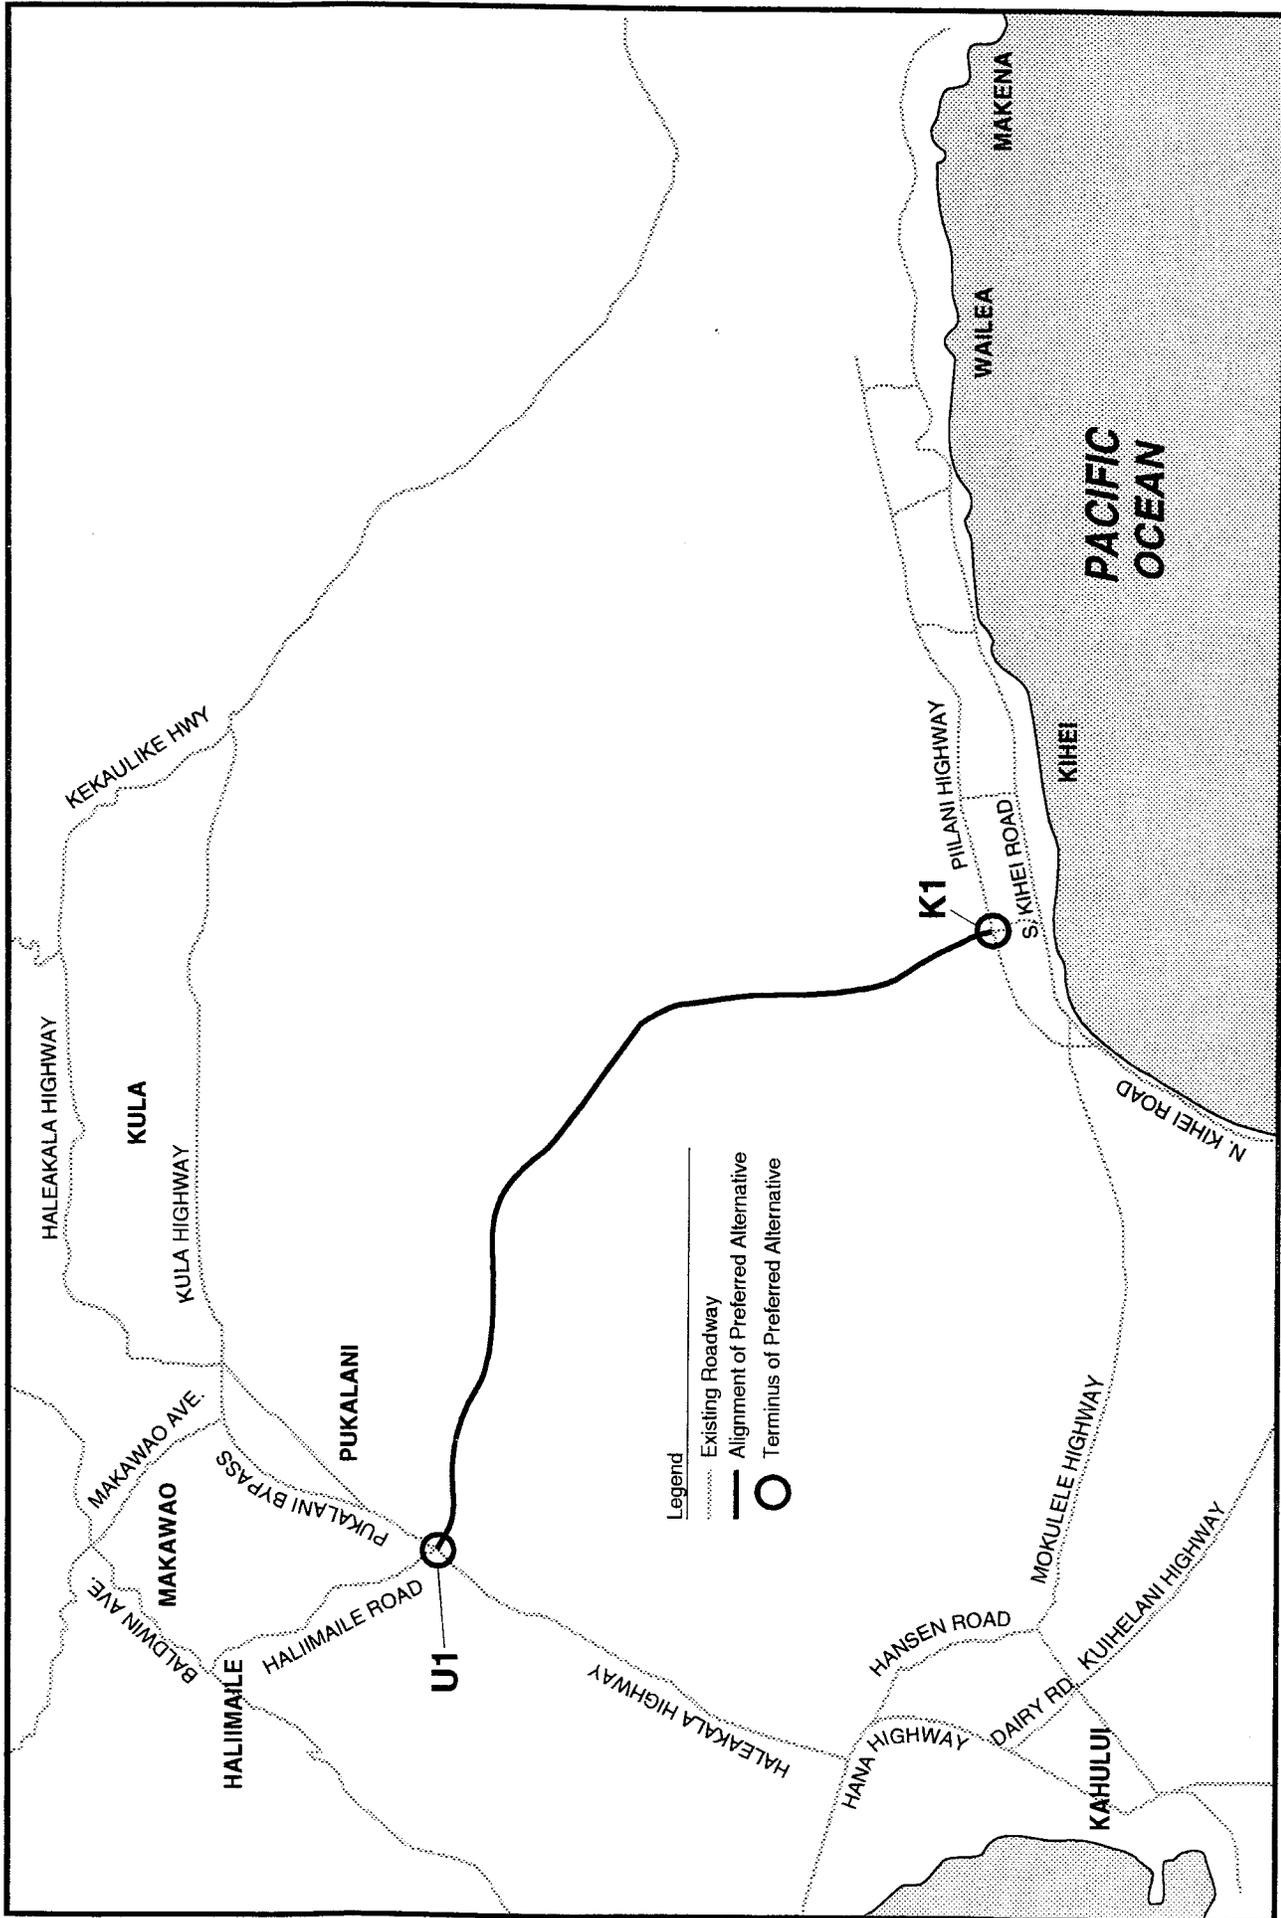

The Maui Long-Range Land Transportation Plan (1996) also references the construction of Ke Alii Alanui Street. This project was completed in 1997.

In summary, the No Build alternative consists primarily of widening to varying degrees the existing roads along the present route from Kihei to Upcountry. The No Build alternative (the projects listed above) serves as the reference against which project impacts are assessed in Chapter 4.

### **2.1.2 PREFERRED ALTERNATIVE**

The preferred alternative is the alignment from the Haliimaile Road / Haleakala Highway intersection to the Kaonoulu Street / Piilani Highway intersection (see Figure 2-1). This alternative is called U1,K1. (As discussed in more detail below, the alternative Kihei termini and segments are named K1 and K2, and the alternative Upcountry termini and segments are named U1, U2-A, U2-B and U3.)

The proposed highway will be a limited access, two-lane arterial roadway, with a length of approximately 15.8 km (9.8 miles). A two-lane highway is proposed because projections indicate that two lanes would be sufficient to accommodate travel demand in the design year, 2020. A truck climbing lane is not proposed because the number of loaded trucks heading uphill is expected to be small, and cars would have opportunities to pass.

Source: Warren S. Unemori, Engineering, Inc., October 1997

GRAPHIC SCALE:

**Preferred Alternative**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE 2-1

The roadway will include one 3.7 m (12 ft) lane in each direction, and paved shoulders (see Figure 2-2). The shoulders will be wide enough to accommodate bicyclists. A rural design, shown on Figure 2-2, will generally be used where the highway traverses rural areas presently used for crop production, pasture or open space. The urban design, which includes bike lanes and sidewalks that are in conformance with the Americans with Disabilities Act (see Figure 2-2), will be used for the section of highway that passes through Urban-designated land (in accordance with the State land use classification system) in the vicinity of the Kaonoulu Street / Piilani Highway intersection (K1 terminus).

Under the rural design, roadway drainage structures will consist of a partially concrete-lined swale along one side of the road and a grated inlet catch basin on the other side at or near the right-of-way center line. Roadway runoff will be discharged to the nearest gulch. The urban design's drainage facilities will be storm drains or grated catch basins along the curbs. Runoff will again be discharged to the nearest gulch or drainage canal.

The width of the right-of-way needed for Kihei-Upcountry Maui Highway would be at least 49 m (160 ft) in rural areas and at least 37 m (120 ft) in urban areas. Although only a two-lane highway is being proposed initially, the acquisition of right-of-way for a four-lane divided highway will be conducted to allow for the future expansion of the highway to four lanes (two lanes in each direction). The preferred alternative assessed in this document involves construction and operation of a two-lane road, and the necessary earthwork for a four-lane, divided highway where the highway crosses some gulches (see below), and where the urban design roadway section will be provided (see Figure 2-2). During the detailed design of the earthwork, the cut and fill volumes will be balanced so that excess fill material will not need to be disposed outside the construction area, nor will fill material need to be imported from other areas. If the road is widened in the future, additional earthwork will only be required in rural areas and those gulches not addressed in the initial phase of construction.

The precise width of the right-of-way at a given point will depend on local terrain features, which will affect the amount of earthwork required (i.e., cut and fill to achieve the desired roadway profile).

The amount of land estimated for the preferred alternative's right-of-way is approximately 97.6 ha (241 acres), which will be obtained from three property owners: Alexander & Baldwin (42.4 ha), Haleakala Ranch (47.5 ha) and Kaonoulu Ranch (7.7 ha).

At the termini, Kihei-Upcountry Highway will be designed with adequate channelization (right- and left-turn lanes) to handle the projected traffic volumes. Both the mauka and makai termini will probably warrant traffic signals. However, this decision will be made during the design phase of the project based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices, published by FHWA. Lighting will be provided at the termini, but will not be provided along the length of the highway.

Four grade-separated (i.e., interchange) options were evaluated for the U1 terminus in comparison to an at-grade signalized intersection. Under each of the following options Haliimaile Road / Kihei-Upcountry Maui Highway would pass underneath Haleakala Highway: 1) diamond; 2) single point urban (a signalized intersection is provided directly underneath Haleakala Highway at the point where Haliimaile Road transitions to Kihei-Upcountry Maui Highway); 3) partial cloverleaf (single cloverleaf for the Haleakala Highway to Kihei-Upcountry Maui Highway makai bound movement); and 4) diamond with flyover (ramp for the Haleakala Highway to Kihei-Upcountry Maui Highway makai bound movement). An at-grade signalized intersection is estimated to cost roughly \$800 thousand not including right-of-way, and an additional \$250 thousand if double left-turn lanes are provided. The interchange options would cost between \$20.3 million (diamond) and \$29.8 million (diamond with flyover) not including right-of-way. None of the interchange options were found to warrant further consideration because the additional cost could not be justified, especially since the at-grade signalized intersection would be able to acceptably handle projected year 2020 traffic volumes.

The posted speed limit would vary from 70 km/h (45 mph) in urban areas to 90 km/h (55 mph) in rural areas.

Kihei-Upcountry Maui Highway will cross several gulches. These crossings will either be by bridge or embankment (fill) within the gulches. The decision to construct a bridge or embankment depended in part on the storm water flow in the gulch being spanned. Culverts

at the base of an embankment could handle up to 100 m<sup>3</sup>/s (3,500 cfs) of storm water flow. Flow volumes above this amount require a bridge crossing. Another factor affecting the type of gulch crossing was construction considerations, such as ease of access into the gulch and location of the gulch in relation to source of available borrow material. Based on these criteria, the preferred alternative will require five bridges (see Figure 2-3). Those bridges crossing Pulehu (#2), Kolaloa (#3), Keahuia (#4), and Waiakoa (#5) Gulches will be shorter spans, approximately 30 m (100 ft), with clearances ranging from 3 m (9 ft) to 8 m (25 ft). The bridge crossing Kalialinui Gulch (#1) will be approximately 100 m (340 ft) long.

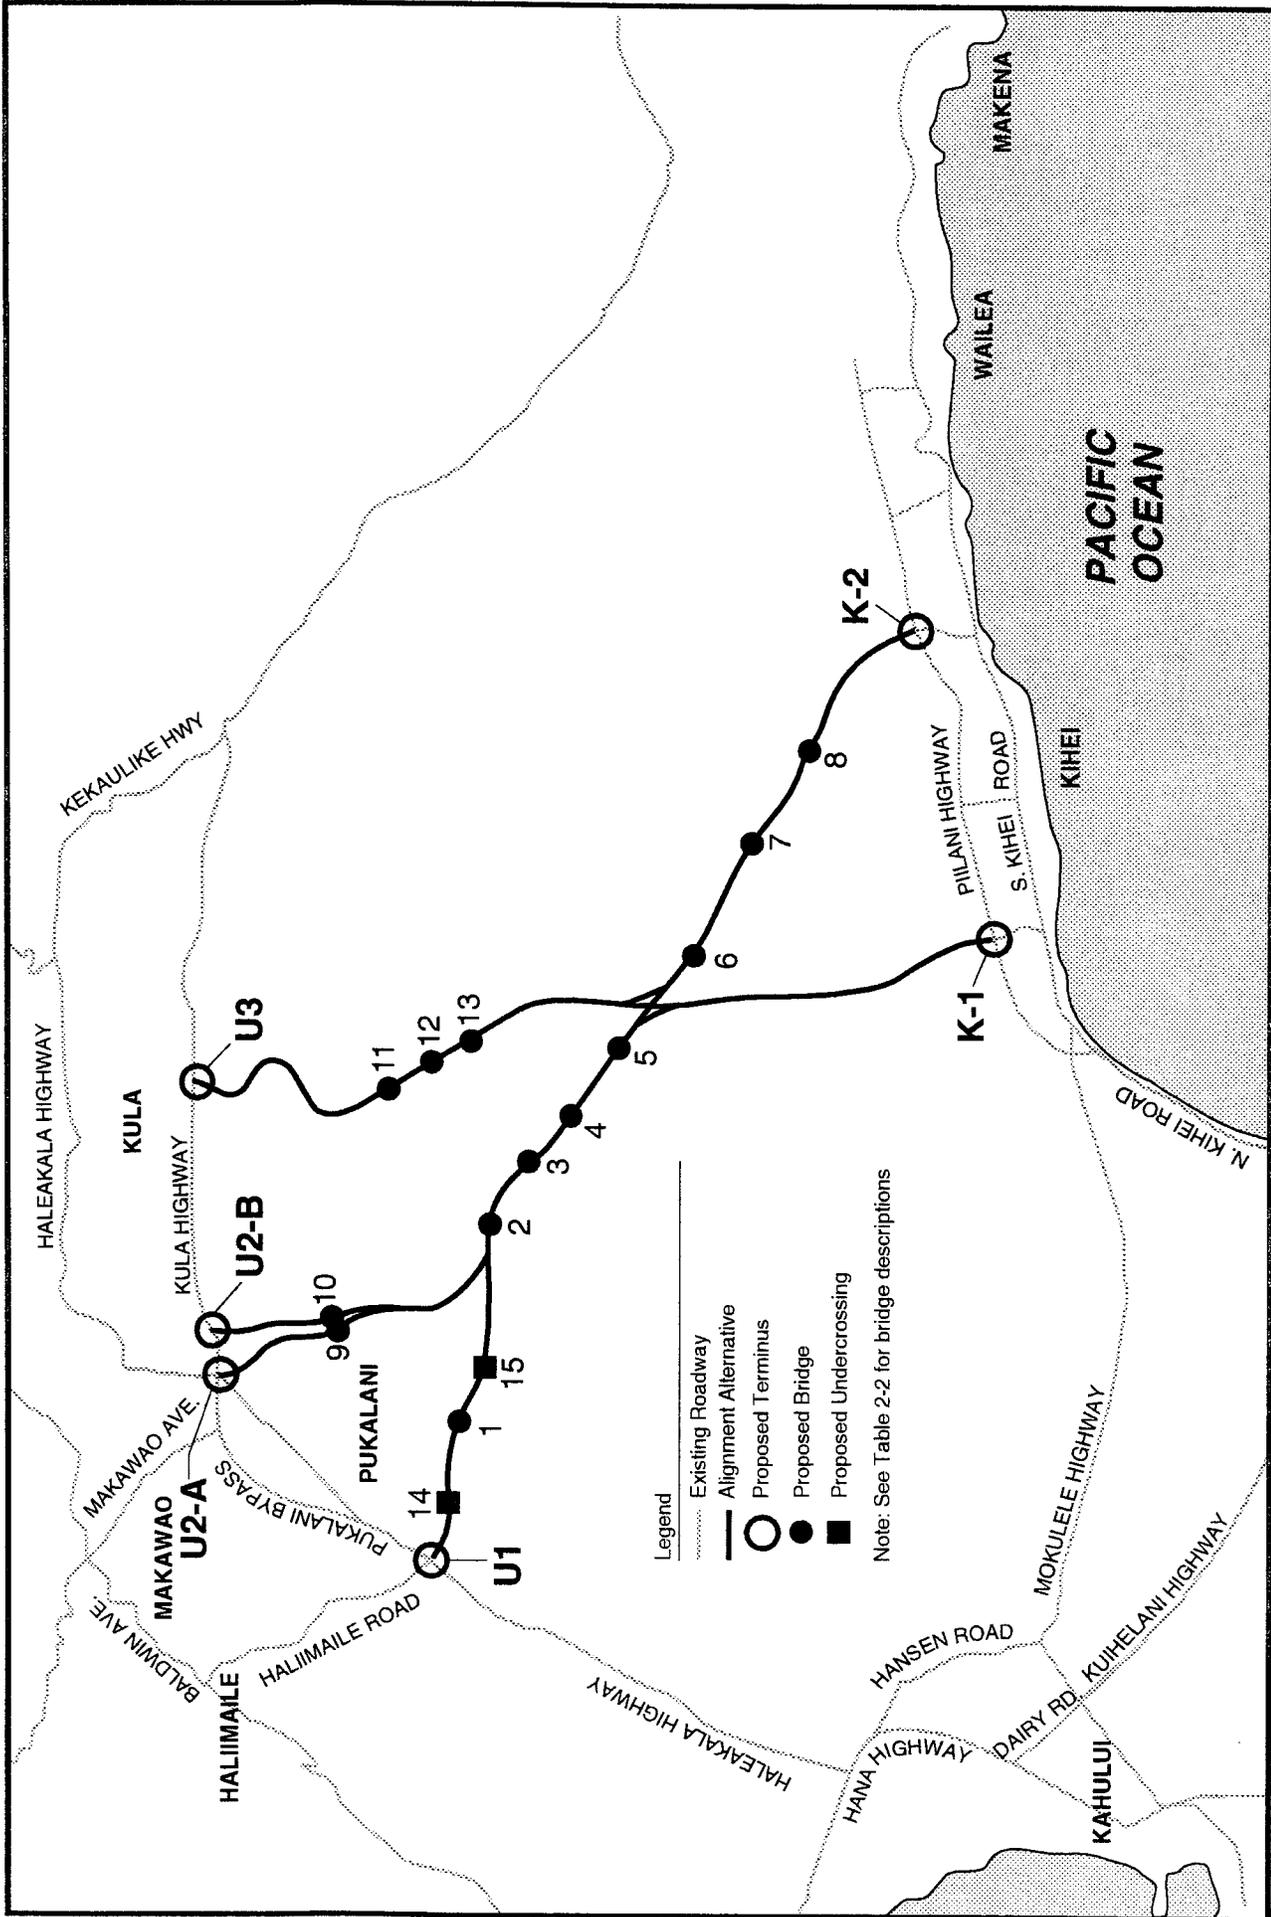

All the bridges will be two lanes. If the highway is expanded to four lanes in the future, additional two-lane bridges would be constructed at the gulch crossings.

The four shorter span bridges may not require piers, whereas the Kalialinui Gulch bridge may require piers (see Figure 2-4). If piers are required for the Kalialinui Gulch bridge, their placement will be designed to not impede storm water flow, and scour protection will be provided where necessary in accordance with federal and State requirements. Details of the bridges will be determined during the design phase of the project.

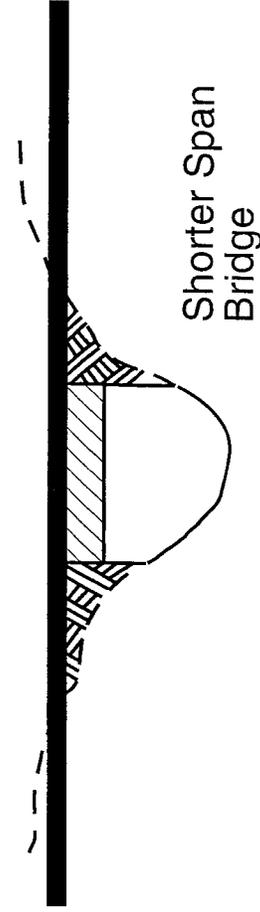

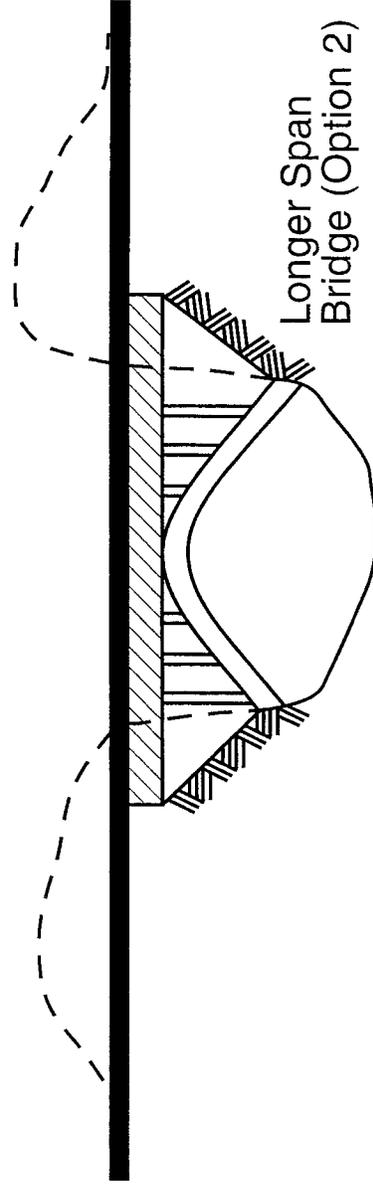

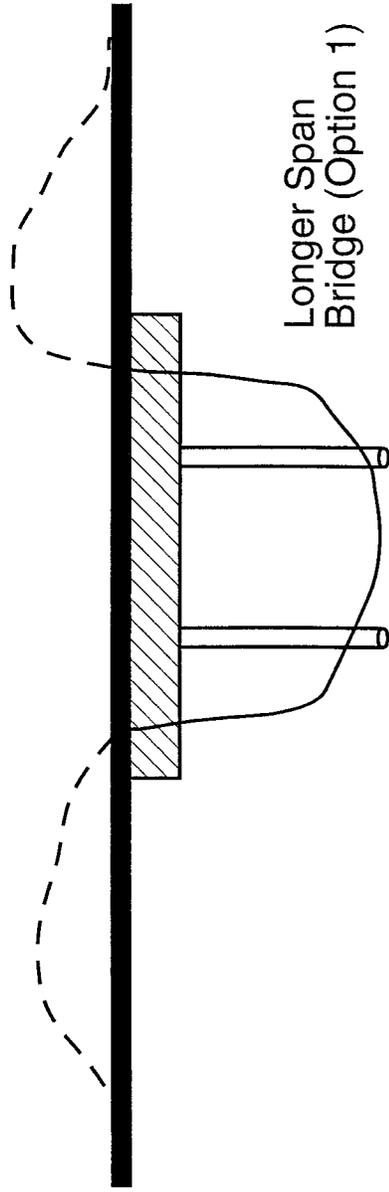

Embankment crossings will require placing fill material in the affected gulch and providing suitable scour protection. Excess material from grading to establish the roadway profile will be used to construct the embankments. The amount of borrow material created by establishing the roadway profile will be sufficient to construct all of the required embankments. Culverts will be placed at the base of the embankments to convey the storm water flow.

The preferred alternative also includes environmental mitigation measures to lessen the degree of unavoidable adverse impact. Major mitigation elements are listed below:

- Construction of grade-separated intersections (undercrossings) where the highway will cross two existing cane haul roads (see Figure 2-3; #14 and #15). The steepness of the terrain at these locations would make it difficult for the 136 000 kg (300,000 lb.) cane hauling trucks to stop if at-grade intersections are used, such as those along

 Final Environmental Impact Statement  
 FIGURE 2-4

Haleakala, Hana and Mokulele Highways. These undercrossings will be approximately 12 m (40 ft) long, with 10.7 m (35 ft) clearance.

- Landscaping will be provided wherever practicable, which will include native trees and shrubs adapted to the site climatic conditions. Details of the landscaping plan will be developed during the design phase.
- Signage will be provided to alert motorists to possible fire conditions, and axis deer that may be on the highway.
- Scenic overlooks may be provided. This will be explored during the design phase.
- A "Maintenance of Agricultural and Ranching Activities Plan" will be prepared during the design phase and implemented during construction to minimize the adverse impact of construction-phase activities on adjacent agricultural and ranching activities. The Plan will address such items as repair and replacement of affected agricultural infrastructure systems, provision of stock-proof fencing, and designation of cattle crossings.
- A "Maintenance of Traffic Plan" will be prepared during the design phase and implemented during construction to minimize impacts on existing traffic flows during construction.
- Appropriate archaeological mitigation will be implemented at historic sites affected by the preferred alternative.

### **2.1.3 OTHER BUILD ALTERNATIVES**

In addition to the preferred alternative, seven build alternatives receive detailed analysis in this Final EIS (see Figure 2-5). All eight alternatives, including the preferred alternative, consist of all possible combinations of two Kihei terminus options and four Upcountry terminus options. Figure 2-5 shows the Kihei and Upcountry termini and the roadway segments that would link the termini. The Kihei termini and segments are named K1 and K2, and the Upcountry termini and segments are named U1, U2-A, U2-B and U3 (the evolution of U2-A and U2-B from U2 is explained in Section 2.2.2). All these alternatives would address the purposes and needs described in Chapter 1.

Source: Warren S. Unemori, Engineering, Inc., October 1997

GRAPHIC SCALE:

**Build Alternatives**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE 2-5

Descriptions of the alternatives excluding the preferred alternative, which was described in Section 2.1.2, follow:

1. Alternative U1,K2. This alternative is the same as the preferred alternative from the Upcountry terminus to where the alternative alignments cross. However, this alternative would proceed southwest to the Ke Alii Alanui Street / Piilani Highway intersection. The length of Alternative U1,K2 is approximately 17.5 km (10.9 miles). Table 2-1 shows the land requirement for this alternative.
  
2. Alternative U2-A,K1. This alternative would extend from the existing Pukalani Bypass / Haleakala Highway / Kula Highway "Five Trees" intersection in Upcountry, and follow a generally west to southwest alignment to the Piilani Highway / Kaonoulu Street intersection in Kihei. The length of this alternative is approximately 15.8 km (9.8 miles). The U2-A terminus connection to the "Five Trees" intersection would require the realignment of the Haleakala Highway leg (Pukalani side) of the intersection (see Figure 2-6). The modification of the "Five Trees" intersection would consist of the following, as shown in Figure 2-6:
  - The Haleakala Highway leg (Pukalani side) would curve in an eastern direction to Pukalani Bypass, and a new Haleakala Highway / Pukalani Bypass T-intersection would be provided approximately 370 m (1200 ft) north of the "Five Trees" intersection (see Figure 2-6). At the T-intersection, only right turns would be allowed (eastbound traffic on the realigned Haleakala Highway turning southbound on Pukalani Bypass; and southbound traffic on Pukalani Bypass turning westbound on the realigned Haleakala Highway) for safety reasons. Left turns for northbound traffic on Pukalani Bypass onto the realigned Haleakala Highway would not be allowed.
  - The existing segment of Haleakala Highway between the new connection to Pukalani Bypass and the "Five Trees" intersection would remain open to traffic, maintaining access to future land uses in this area. Access to this cul-de-sac would be from the Northwest. A physical barrier would be erected to prevent automobile access between this cul-de-sac and the "Five Trees" intersection. The

GRAPHIC SCALE:

roadway between the cul-de-sac and intersection will be converted to a pedestrian walkway.

3. Alternative U2-A,K2. This alternative would extend from the existing Pukalani Bypass / Haleakala Highway / Kula Highway "Five Trees" intersection to the Ke Alii Alanui Street / Piilani Highway intersection. The length of this alternative is approximately 17.5 km (10.9 miles). This alternative also includes the realignment of the Haleakala Highway leg (Pukalani side) of the "Five Trees" intersection as described above for U2-A,K1. (see Figure 2-6). Table 2-1 shows the land requirement for this alternative.
4. Alternative U2-B,K1. This alternative would extend west from Kula Highway at approximately 700 m (2300 ft) south of the "Five Trees" intersection. The alignment runs parallel with Segment U2-A for about 3000 m (10,000 ft), and then shares the same U2-A alignment. This alternative's Kihei terminus is at the Piilani Highway / Kaonoulu Street intersection. The length of this alternative is approximately 15.5 km (9.6 miles).
5. Alternative U2-B,K2. This alternative would extend west from Kula Highway at approximately 700 m (2300 ft) south of the "Five Trees" intersection. The alignment runs parallel with Segment U2-A for about 3000 m (10,000 ft), and then shares the same U2-A alignment. This alternative's Kihei terminus is at the Piilani Highway / Ke Alii Alanui Street intersection. The length of this alternative is approximately 17.3 km (10.8 miles).
6. Alternative U3,K1. This alternative would extend west from Kula Highway, south of Pulehu Gulch in Kula, to the Piilani Highway / Kaonoulu Street intersection in Kihei. The length of this alternative is approximately 14.5 km (9.0 miles). Table 2-1 shows the land requirement for this alternative.
7. Alternative U3,K2. This alternative would extend west from Kula Highway, south of Pulehu Gulch in Kula, to the Ke Alii Alanui Street / Piilani Highway intersection in Kihei. The length of this alternative is approximately 16.1 km (10.0 miles). Table 2-1 shows the land requirement for this alternative.

Like the preferred alternative, the other build alternatives would provide a limited access, two-lane arterial roadway, but would reserve right-of-way for a future four-lane divided roadway (see Figure 2-2). Since most of the roadway would be in rural areas, primarily the rural design would be used. Those alternatives with U2-A, U2-B or K1 alignments would pass through State Urban-designated lands, which may require an urban design for these segments.

The other build alternatives would also be designed with adequate channelization (right- and left-turn lanes) to handle the projected traffic volumes at the Upcountry and Kihei termini. If either a U2-A or K2 alternative were selected as the preferred alternative, the existing traffic signals at the U2-A terminus (Five Trees Intersection) and K2 terminus (Piilani Highway / Ke Alii Alanui Street intersection) would be modified. At the other termini (U1, U2-B, U3, and K1), the decision to place traffic signals would be made during the design phase, and would be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices.

The other build alternatives would have the same posted speed limit, and similar roadway drainage structures as the preferred alternative.

The same criteria for selecting a bridge or embankment crossing of particular gulches that applied to the preferred alternative, also applied to the other build alternatives. Table 2-2 displays the bridges anticipated along each build alternative other than the preferred alternative, and their locations are shown on Figure 2-3. The number of bridge crossings for each these alternatives is shown on Table 2-3. The shorter span bridges may not require piers, whereas longer span bridges (e.g., 60 m (200 ft) or more) may require at least one pier within the gulch (see Figure 2-4). The placement of any piers in the gulches would be done in a manner to not impede storm water flow, and scour protection would be provided where necessary.

The other gulch crossings would be by embankments, and excess material from grading other sections of the roadway would be used to construct the embankments. Culverts would be placed at the base of the embankments to convey storm water flow.

**Table 2-2

13	Waiakoa Gulch #2	U3	80 (260)	9.8 (32)

Note: Locations of bridges are shown on Figure 2-3.

\* These bridges will be constructed under the preferred alternative.

Source: Warren S. Unemori Engineering, Inc., December 1997

The other build alternatives would also include environmental mitigation measures, similar to those described for the preferred alternative. If a U2-A or U2-B alternative were selected as the preferred alternative, the project would have included pedestrian facilities at or near King Kekaulike High School or Kamehameha School. For example, under a U2-A alternative, the segment of the Haleakala Highway at the Five Trees intersection, which would have been replaced by Kihei-Upcountry Maui Highway, would be converted to a pedestrian walkway. In addition, sidewalks would be provided between the modified Five Trees Intersection and the high school. Also, an archaeological inventory survey would need to be conducted if another alignment were selected as the preferred alternative. Depending on the results, appropriate mitigation would need to be conducted.

Source: Warren S. Unemori Engineering, Inc., December 1997

#### **2.1.4 ESTIMATED COST AND SCHEDULE**

The preferred alternative, U1,K1, is currently (year 2001) estimated to cost \$80.3 million, which includes approximately \$4.9 million for right-of-way and \$75.4 million for construction. The cost of the preferred alternative includes the cane haul undercrossings (see Section 2.1.2). Estimated right-of-way acquisition and construction costs (year 1997 dollars) for the other build alternatives are provided in Table 2-4. The lowest cost build alternative is U3,K1 because it would be the shortest, have the fewest bridges and have lower right-of-way acquisition cost. The most expensive alternative is U2-A,K2. Design normally costs approximately ten percent of the construction cost.

The present schedule of the project is shown on Table 2-5. Design is scheduled to commence in 2002, and construction could begin in 2004. Kihei-Upcountry Maui Highway could open for service in 2007.

**Table 2-4  
Estimated Cost by Alternative**

Alternative	Estimated Cost (1997 Dollars) <sup>1</sup>		
	Construction <sup>4</sup>	Right-of-Way <sup>4</sup>	Total <sup>4</sup>
U1,K2 <sup>2</sup>	\$75,000,000	\$3,800,000	\$78,800,000
U2-A,K1 <sup>3</sup>	\$63,500,000	\$5,600,000	\$69,100,000
U2-A,K2 <sup>3</sup>	\$77,200,000	\$5,600,000	\$82,800,000
U2-B,K1 <sup>5</sup>	<u>\$61,400,000</u>	<u>\$6,600,000</u>	<u>\$68,000,000</u>
U2-B,K2 <sup>5</sup>	<u>\$75,800,000</u>	<u>\$6,500,000</u>	<u>\$82,400,000</u>
U3,K1	\$49,600,000	\$3,500,000	\$53,100,000
U3,K2	\$63,000,000	\$3,400,000	\$66,400,000

Notes: <sup>1</sup> Costs are based on acquiring right-of-way for a four-lane divided highway; conducting earthwork for a two-lane highway in rural areas and a four-lane highway in urban areas, earthwork for a four-lane highway within major gulches where bridges would not be used, and construction of a two-lane highway (see Figure 2-2) and two-lane bridges (see Tables 2-2 and 2-3).

<sup>2</sup> Includes two undercrossings where the road crosses cane haul roads.

<sup>3</sup> Includes the re-alignment of Haleakala Highway in Pukalani.

<sup>4</sup> Estimates are rounded to the nearest 100 thousand.

<sup>5</sup> Reflects reduced cost with credit for portion constructed as part of Kulamalu development.

## **2.2 ALTERNATIVES DEVELOPMENT**

Three steps were accomplished to develop the alternatives described in Section 2.1.2.1. The first step was a two-tiered screening analysis used to eliminate some of the alternatives developed during the project's scoping phase. This resulted in the selection of two Kihei terminus options and three Upcountry terminus options. The second step was an evaluation of alternatives evolving from the original U2 alignment, after it was found to impact a future private school site (the school has since been constructed) and two archaeological sites likely to require preservation in place. The third step involved minor alignment shifts of U2-A and U3 to avoid important sites identified in archaeological reconnaissance surveys.

### **2.2.1 SCREENING ANALYSIS**

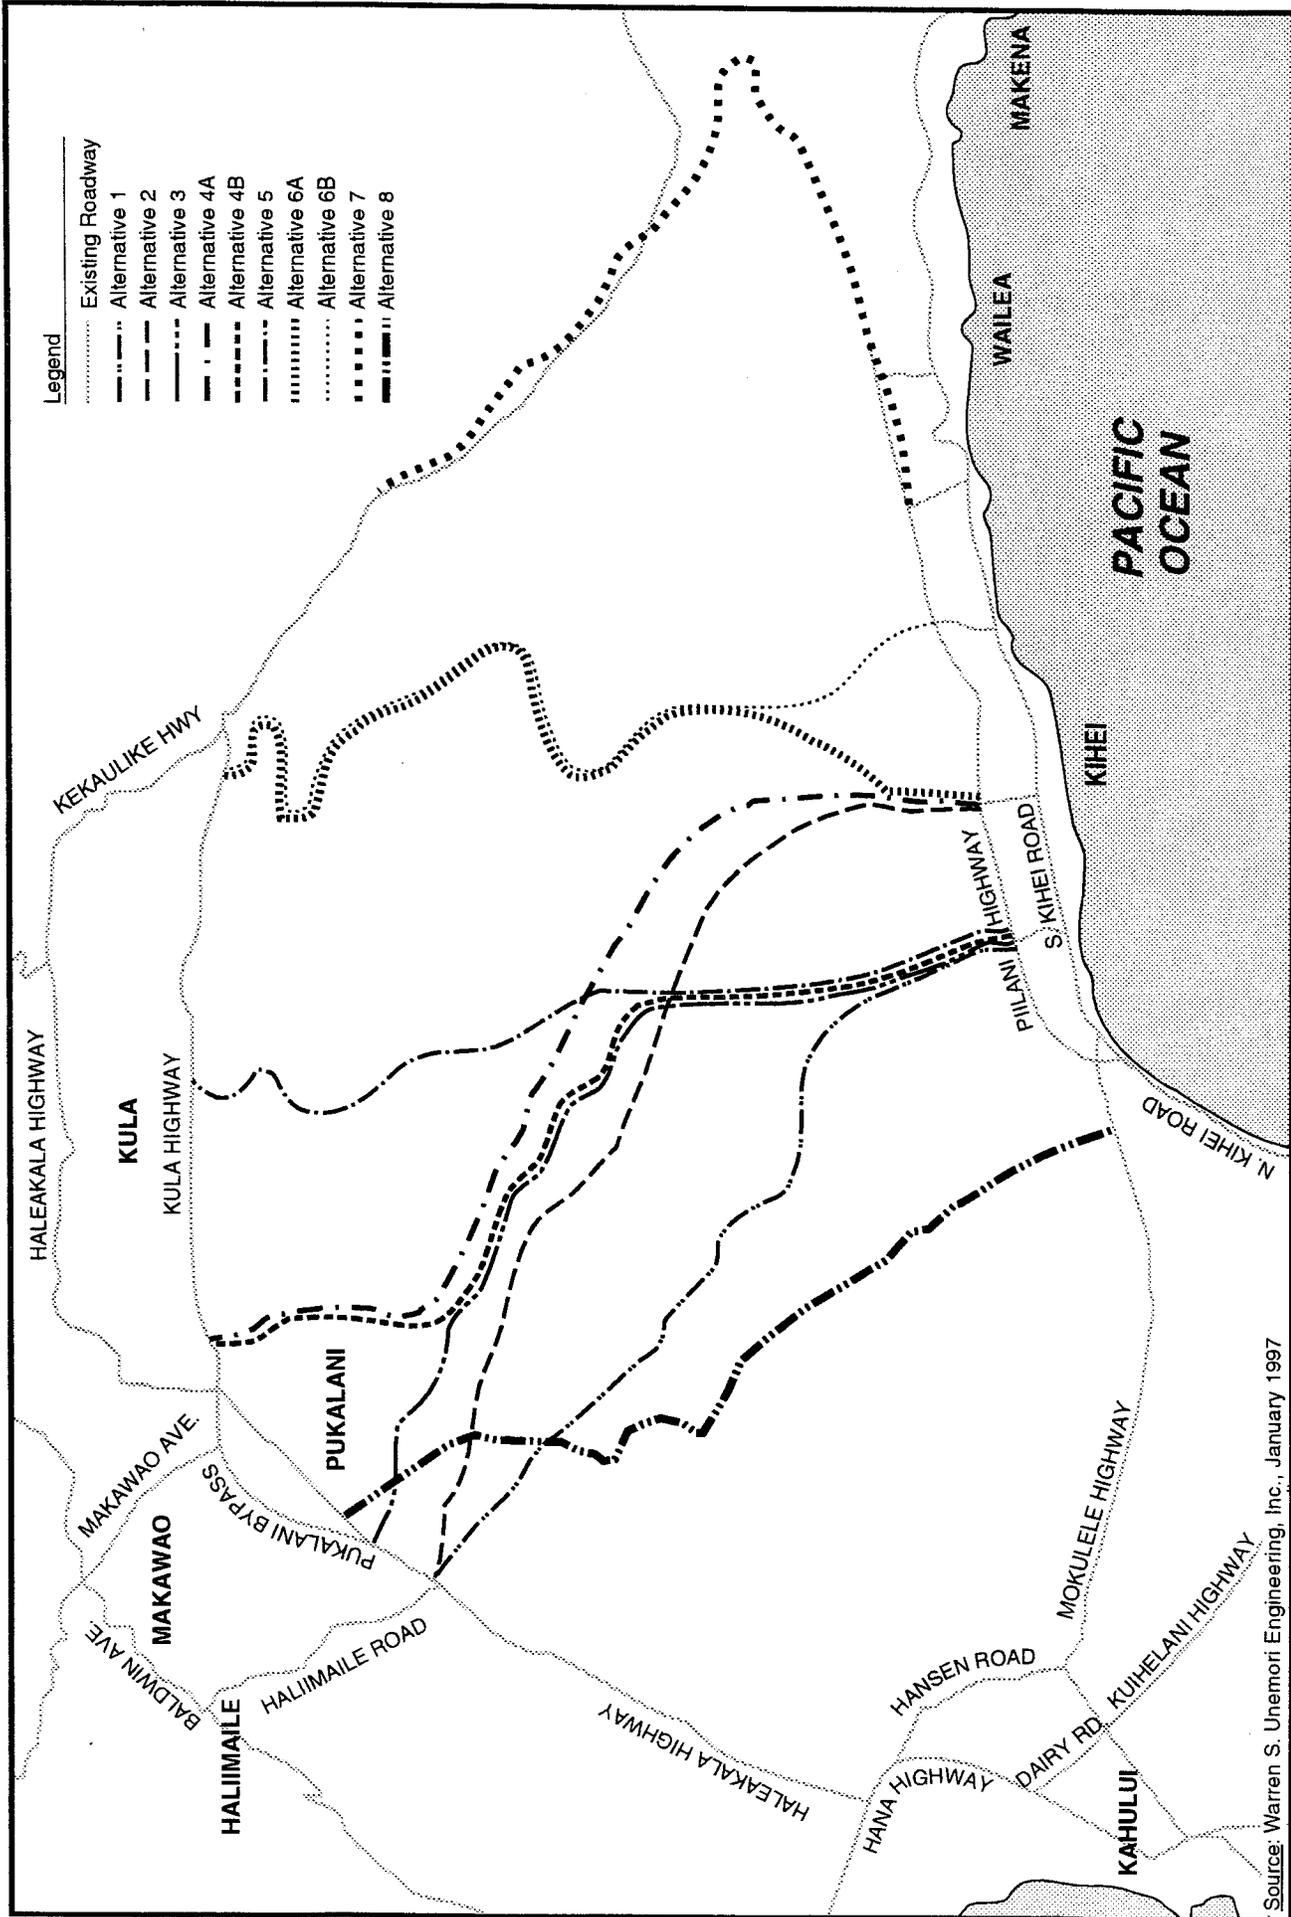

A two-tiered alternatives screening analysis was performed to evaluate a wide range of candidate alternatives and eliminate those with the fewest benefits or overriding adverse characteristics so that a manageable number of alternatives would be evaluated in detail in the Draft and Final EIS (see Chapter 4). The No Build alternative was not evaluated in this screening analysis because it is automatically included in the Draft and Final EIS as a viable option.

This section summarizes the screening analysis. The Alternatives Analysis Report that was prepared after the screening analysis appears in Appendix D.

#### **2.2.1.1 Alternatives Considered in the Screening**

Ten alignment alternatives (see Figure 2-7 and Table 2-6) were developed during the public and agency scoping process that preceded the issuance of the project's Environmental Assessment (EA) (see Chapter 5.0). The alternatives were introduced to the public through distribution in September 1995 of an EA addressing the project (see Chapter 5). After publication of the EA, public comments were received through the channels listed below, and were used to develop additional alternatives:

- written comments generated in response to the EA;

**Alternatives Entering Screening Analysis**

- oral testimony given at two public information meetings held in October 1995;
- testimony provided during a second round of public information meetings held in May 1996 (one Upcountry and one in Kihei); and
- written comments following the May 1996 information meetings.

**Table 2-6  
Original Alignment Alternatives**

<b>Alternative</b>	<b>Upcountry Terminus</b>	<b>Kihei Terminus</b>	<b>Length</b>
Alternative 1	Haleakala Highway / Haliimaile Road inter.	Piilani Highway / Kaonoulu Street inter.	14.3 km (8.9 miles)
Alternative 2	Haleakala Highway / Haliimaile Road inter.	Maui R&T Park	16.3 km (10.1 miles)
Alternative 3	Haleakala Highway, between Haliimaile Road and Pukalani	Piilani Highway / Kaonoulu Street inter.	15.5 km (9.6 miles)
Alternative 4A	Kula Highway, east of the Pukalani Bypass Road	Maui R&T Park	16.6 km (10.3 miles)
Alternative 4B	Kula Highway, east of the Pukalani Bypass Road	Piilani Highway / Kaonoulu Street inter.	15.5 km (9.6 miles)
Alternative 5	Kula Highway, south of Pulehu Gulch in Kula	Piilani Highway / Kaonoulu Street inter.	14.0 kilometer (8.7 miles)
Alternative 6A	Kula Highway, near Kekaulike Highway / Kula Highway inter.	Maui R&T Park	17.0 km (10.6 miles)
Alternative 6B	Kula Highway, near Kekaulike Highway / Kula Highway inter.	Piilani Highway, next to the future Kihei Regional Park	16.3 km (10.1 miles)
Alternative 7	Kula Highway south of Kula Sanitarium	southern section of Piilani Highway	14.4 km (8.9 miles)
Alternative 8	Haleakala Highway in Pukalani	Mokulele Highway	14.6 km (9.1 miles)

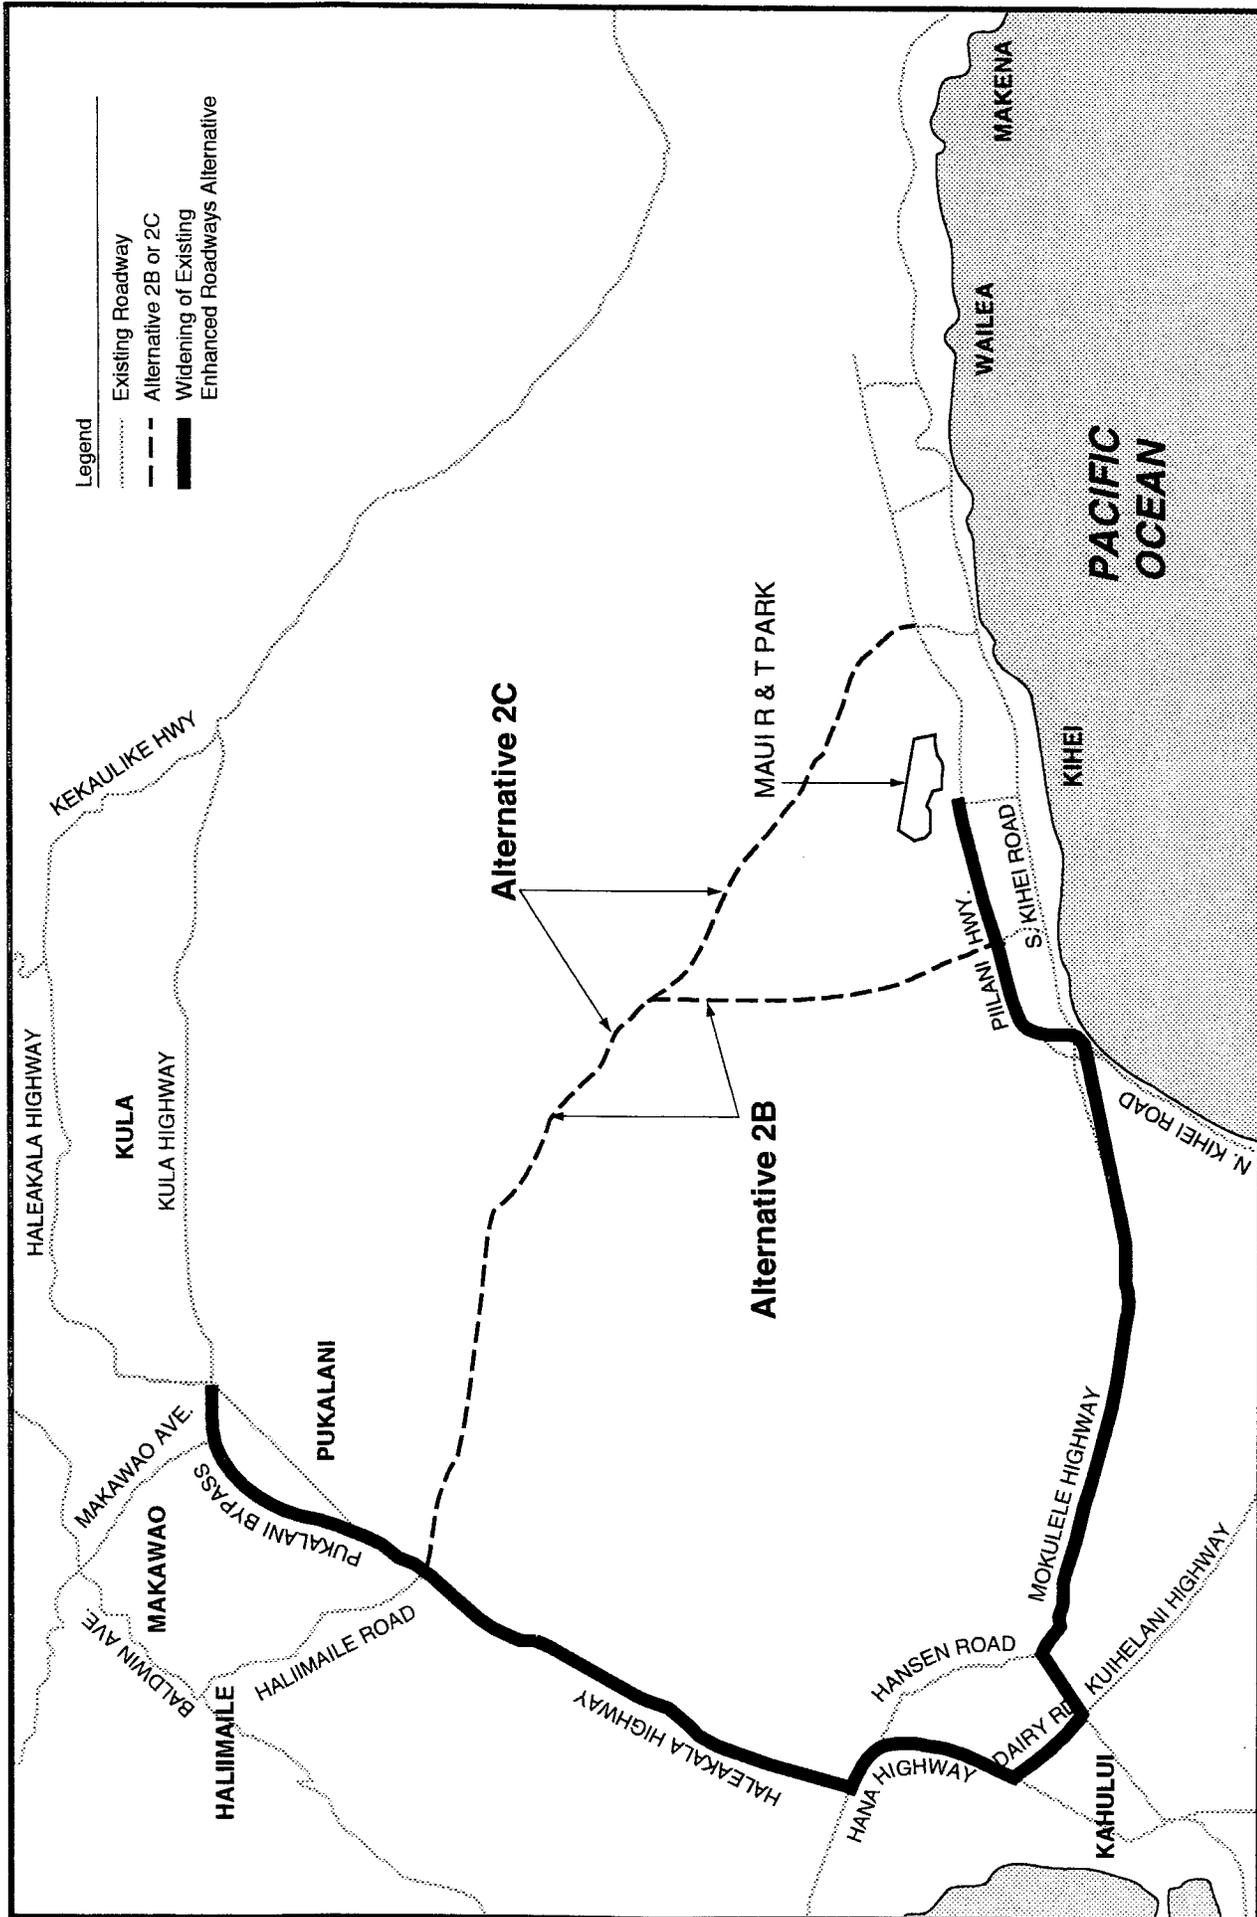

Sources: Warren S. Unemori Engineering, Inc. derived from State/County Joint Task Force Upcountry / Kihei Highway Final Report, October 1, 1993; County of Maui Toll Road Study, 1988; and Maui Long-Range Highway Planning Study, 1991

Based on these comments, conceptual engineering was prepared for three additional alternatives: Alternatives 2B and 2C (modifications of Alternative 2) and the “enhanced widening of existing roadways” alternative (see Figure 2-8).

- Alternative 2B. This alternative would extend from Haleakala Highway / Haliimaile Road intersection in the Upcountry area, (as Alternative 2), but would then share portions of Alternative 4B's mauka alignment near the Hawaiian Commercial & Sugar Company (HC&S) land to Kihei at Kaonoulu Street. The length of this alternative is approximately 15.6 km (9.7 miles).
- Alternative 2C. This alternative would maintain the Haliimaile Junction Upcountry terminus and share Alternative 4B's alignment near the HC&S land. However, its Kihei terminus would be located at the intersection of Piilani Highway and the proposed Road F. The length of Alternative 2C is approximately 17.5 km (10.9 miles).

Alternatives 2B and 2C were developed in response to comments asking that impacts to Hawaiian Commercial and Sugar (HC&S) Company land be minimized, the Maui R&T Park not be bisected, and the Kihei terminus be moved as far south as possible to create an alternative evacuation route for South Kihei and to support hotels and resorts in Wailea / Makena.

- The “enhanced widening of existing roadways” alternative. This alternative would provide an additional lane in each direction on the existing roads between Kihei and Upcountry beyond the widening improvements already proposed in the Maui Long-Range Land Transportation Plan (February 1996) (see Section 2.1.1). Enhanced widening of the following roadways is included in the “enhanced widening of existing roadways” alternative:
  - Haleakala Highway (12.4 km (7.7 miles));
  - Hana Highway (3.2 km (2.0 miles));
  - Dairy Road (1.3 km (0.8 miles));
  - Puunene Avenue / Mokulele Highway (10.5 km (6.5 miles)); and
  - Piilani Highway (4.8 km (3.0 miles)).

0 1 km 2 km 3 km 0 1 mi. 2 mi.

Finally, FHWA participation in this project requires that Transportation Systems Management (TSM) be considered among the alternatives. TSM is the application of construction, operational, and institutional actions to make the most efficient and cost effective use of existing transportation infrastructure. TSM actions are categorized as being either "demand-side" or "supply-side". As is explained below, TSM can be an attractive solution to many types of transportation problems. However, TSM would not satisfy a purpose such as provision of a system linkage between two localities, such as this project, that is intended to connect Kihei and Upcountry. Therefore, a TSM alternative was eliminated from further consideration.

Demand-side TSM actions, often referred as Transportation Demand Management (TDM), are intended to reduce congestion by decreasing the number of vehicles traveling at the same time by such measures as increasing vehicle occupancy, lowering the peak travel demand by shifting the time of travel, or making the use of single-occupant vehicles less attractive. Demand-side actions include high-occupancy vehicle (HOV) lanes, ride-sharing programs, parking management, and transit service improvements. Except for HOV facilities, demand-side actions tend to be more appropriate within the context of a metropolitan area.

TSM actions are intended to increase the capacity of existing infrastructure (e.g., a roadway) using relatively "low cost" and localized solutions, such as use of contraflow lanes, intersection channelization, improved pavement or signage, and synchronization of traffic signals. Supply-side actions are most effective when alleviating traffic problems at spot locations. Supply-side TSM actions would not be used when a project's intent is to provide a transportation connection between two localities.

### **2.2.1.2 Methodology**

Criteria for evaluating the project alternatives described in Section 2.2.1.1 were developed from the following sources:

- Federal Highway (FHWA) Technical Advisory Guide (October 1987);
- State/County Joint Task Force Upcountry / Kihei Highway Final Report (October 1993);

- Federal, State, County, and local comments to a project initiation letter issued by SDOT on September 1, 1994;
- An agency scoping meeting held on October 26, 1994;
- Engineering standards (Hawaii Statewide Uniform Design Manual for Streets and Highways, American Association of State Highway and Transportation Officials (AASHTO), and American Society for Testing and Materials (ASTM));
- Kihei-Upcountry Maui Highway Environmental Assessment (EA) (May 1995);
- Written comments received in response to publication of the EA; and
- Comments (oral and written) made at the public information meetings held on Maui on October 17 and 18, 1995, and on May 15 and 16, 1996.

The evaluation criteria were then sorted into two groups: Tier One (fatal flaws) and Tier Two.

#### **2.2.1.2a Tier One Criteria**

Tier One (fatal flaw) criteria identify alternatives that are impractical, unfeasible or cannot be funded given the constraints associated with federal participation in project construction. Eliminating alternatives with "fatal flaws" avoids unnecessary analysis of alternatives that are extremely unlikely to be selected as the Preferred Alternative. For this project, the Tier One criteria were:

- Satisfaction of project goals;
- Conformance with engineering design criteria;
- Benefit/cost ratio; and
- Bifurcate Maui R&T Park.

#### Satisfaction of Project Goals

The alternatives were evaluated with respect to whether they satisfied the project goals stated in Chapter 1, such as establishing a roadway linkage between the Kihei and Upcountry areas. An alternative received a "Y" (yes) score if it would satisfy the project goals. A "N" (no) score means the alternative would not satisfy the project goals.

### Design Feasibility

The alternatives were evaluated to determine whether they met engineering design criteria for a rural, limited access arterial roadway, such as minimum curve radius and design speed. A "Y" (yes) signifies that the alternative would have a conforming design, whereas a "N" (no) would mean that its design would not conform to the criteria.

### Benefit-Cost Ratio

A preliminary benefit-cost analysis to the year 2023 (completion of construction plus 20 years) was performed to eliminate alternatives that would clearly not be cost-effective in achieving the goal of linking Kihei and Upcountry Maui. Calculation of the benefit-cost ratio (BCR) for each alternative was based on a comparison of travel time between two centroids, one located at the Maui R&T Park in Kihei and the other in Pukalani, Upcountry Maui, under the future No Build Alternative. Other factors used to calculate the BCRs included:

- cost of each alternative, consisting of initial cost (construction, right-of-way acquisition, design) and annual roadway maintenance;
- user costs for vehicle operation and maintenance; and
- economic factors, such as the expected long-term inflation rate and discount rate.

The methodology conformed to procedures described in the Manual On User Benefit Analysis of Highway and Bus Transit Improvements (AASHTO, 1977). Normally, an alternative's BCR would have to be greater than one (the benefits of the project exceed its cost) for the investment to be economically justified. However, because of the preliminary nature of the analysis and the limited definition of what is considered a benefit, an alternative would have to have an extremely low BCR to have a "fatal flaw."

### Bifurcate Maui R&T Park

The master plan for the Maui R&T Park was revised in 1996 to create a more campus-like atmosphere, in contrast to the light industrial park atmosphere that was originally envisioned. Its central roadway element is a large roundabout or "green" located at the core of the Park. Any alignment that divides the Maui R&T Park would be inconsistent with the Park's proposed campus-like roadway system. Because the Maui R&T Park is intended to be one of the major beneficiaries of the proposed highway, conformance with the master plan's proposed

campus-like roadway system was elevated to a Tier One level of significance. Those alternatives that bifurcate the R&T Park were given a "Y" (yes), while those that did not were given a "N" (no). A "Y" score for this criterion indicates that the alternative has a "fatal flaw."

### **2.2.1.2b Tier Two Criteria**

The Tier Two criteria were developed to further screen the alternatives passing the first tier criteria. These criteria relate primarily to the nature and degree of adverse impact or benefit. An alternative not satisfying these criteria could be feasible, but would not be advantageous with respect to the criterion in question. A large number of candidate Tier Two criteria were developed, but many of them were rejected. The Alternatives Analysis Report (November 1996) (see Appendix C) contains the rationale for their rejection. Many criteria were not used in the Tier Two analysis because they would not discriminate among alternatives. The omission of a criterion from the Tier Two analysis does not imply that the criterion is not important. In the final analysis, the following Tier Two criteria were used:

- Adverse agricultural impact;
- Cost;
- Conformance with community plans;
- Highway operations;
- Potential impact on endangered and threatened species;
- Enhancement of access to Hawaiian Home Lands (HHL) parcel (TMK 2-02-002:014);  
and
- Visual impacts.

#### Adverse Agricultural Impact

The number of hectares presently used for crop production (pineapple or sugarcane cultivation or Upcountry truck farms) which each alternative would displace was calculated. Impacts on pasture lands were not considered as important because of the abundance of pasture land in the area and the substantially reduced level of investment in irrigation, drainage and other infrastructure for pasture in comparison to cropland. The following five-point scale was defined based on the acreage of encroachment for each alternative:

(1): less than 10 hectares

(2): 10 to 20 hectares

(3): 20 to 30 hectares

(4): 30 to 40 hectares

(5): over 40 hectares

### Cost

This criterion compares the estimated cost of land acquisition, site work, roadway construction, and drainage for each alternative. The following four-point scale was used to score these costs:

(1): less than \$45 million

(2): \$45 to \$55 million

(3): \$55 to \$65 million

(4): over \$65 million

### Conformance with Community Plans

There are nine planning regions in Maui County for which community plans have been prepared. The plans report current and anticipated conditions, and stipulate advance planning goals, objectives, policies and implementation considerations to guide decision making for each region. The study area overlaps planning areas addressed by the Kihei-Makena Community Plan and the Makawao-Pukalani-Kula Community Plan. Although the community plans are not official until adopted by the County Council and the Mayor, it is customary on Maui to use the most recent proposed update to the community plans to assess conformance with county planning.

The most recent proposed update for the Kihei area is the Kihei-Makena Community Plan (1998). This proposed plan recommends a roadway that would link the primary residential area of Upcountry with job centers within the Kihei region. The Plan, therefore, favors those alternatives with mauka termini near Pukalani, and makai termini at or north of the Maui R & T Park. The Kihei-Makena Community Plan was approved by the County Council and the Mayor in early 1998.

The Community Plan Update of Makawao-Pukalani-Kula (July 1996) “files” (removes from the active list) the proposed Kihei-Upcountry Maui Highway, and states that the No Build alternative is favored over any build alternative. However, the recommendations also include provisions that if the roadway is built, the preferred Upcountry terminus is in the vicinity of Haliimaile Road.

The alternatives that best conform to the community plans were scored “Y” (yes). Alternatives that did not conform as well were scored “P” (poor). Alternatives that do not conform to the plans were scored “N” (No).

### Highway Operations

While all of the alternatives entering the Tier Two screening can be designed to conform with applicable engineering standards (see Section 2.2.1.3), there may be operational problems with certain alternatives when connected to the existing roadway network. Those alternatives that would connect well with the existing roadway network were scored a “B” (better); those that would not were scored a “W” (worse).

### Impact on Endangered and Threatened Species

A botanical reconnaissance was conducted to rank the alternatives in terms of their relative potential adverse impact on areas where endangered or threatened plant species might exist. The survey included:

- a helicopter reconnaissance of the project area;
- government agency interviews and literature search;
- a comparative ranking of the alternatives for potential botanical impacts, emphasizing impacts on rare species; and
- a general assessment of the level of potential impact of each alternative.

Based on the botanical reconnaissance, alternatives were scored numerically, from “1” (alternatives that were least likely to threaten endangered species) to “5” (alternatives with a higher possibility of displacing endangered species). Potential impact on endangered species was not considered a “fatal flaw” because at this stage of project planning, the

alignment alternatives are considered general enough to allow some latitude to bypass particularly sensitive locations, if warranted.

#### Enhancement of Access to Hawaiian Home Lands Parcel

The Kihei-Upcountry Maui Highway State/County Joint Task Force's Final Report (October 1, 1993) identified access to the Hawaiian Home Lands parcel (TMK 2-02-002:014) as a desirable benefit of this project. Alignment alternatives that would enhance future access to the HHL parcel received a "B" (better), while those alternatives that would not enhance access received a "W" (worse).

#### Visual Impact

Since all of the alternatives share a common typical design (see Figures 2-2 and 2-3) and a similar setting (agricultural lands on the western flank of Haleakala), the amount of earthmoving (cut plus fill) required for roadway construction was used as an approximate indicator of the project's long-term aesthetic impacts. It is assumed that the more material moved during construction, the greater the potential for visual disturbance of the existing landscape, even after the establishment of new plantings.

A four-point scale was developed to score the total amount of cut and fill material required for each alternative. Alternatives requiring less earthmoving received lower scores, while those requiring the most activity received a "4."

- (1): less than 1.5 million cubic meters
- (2): 1.5 to 2.0 million cubic meters
- (3): 2.0 to 2.5 million cubic meters
- (4): over 2.5 million cubic meters.

### **2.2.1.3 Alternatives Evaluation**

#### **2.2.1.3a Tier One Screening**

Table 2-7 summarizes the outcome of the Tier One evaluation. Scores not satisfying the criteria are shaded. In summary, Alternatives 4A, 6A through 8, the enhanced widening of existing roadways alternative, and the TSM alternative were eliminated from further study.

**Table 2-7  
Tier One Screening**

Criteria	Alternative													
	1	2	2B	2C	3	4A	4B	5	6A	6B	7	8	EWR	TSM
Satisfies Project Goals	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
Design Feasibility	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	Y	N.A.
Benefit-Cost Ratio	1.00	1.00	1.06	0.67	1.01	0.94	1.34	1.53	0.42	0.28	0.04	1.10	Low	N.A. <sup>2</sup>
Bifurcate Maui R&T Park	N	Y	N	N	N	Y	N	N	Y	N	N	N	N.A.	N.A.

Notes: EWR: Enhanced Widening of Existing Roadways Alternative

TSM: Transportation Systems Management Alternative

Y: Yes

N: No

Does not satisfy criterion.

N.A.: Not Applicable.

<sup>1</sup> The BCR for the EWR Alternative was not calculated because it failed to satisfy the project goals criterion. If the BCR for the EWR Alternative was calculated, it would be quite low because the method of calculating BCRs is based on a comparison with the future No Build Alternative of travel time between Kihei and Upcountry Maui. When compared to the No Build Alternative, the EWR Alternative would offer a slight decrease in travel time because of marginally less congestion along the same circumferential route. This travel time savings, however, would not compare favorably to the decrease in travel time that would be achieved by substantially shortening the distance between Kihei and Upcountry Maui through a new roadway. Therefore, along with its large capital cost (\$78 million), its BCR, as calculated here, would be small.

<sup>2</sup> The BCR for the TSM Alternative was not calculated because it failed to satisfy the project goals criterion.

Source: Warren S. Unemori Engineering, Inc. and Parsons Brinckerhoff Quade & Douglas, Inc., January 1997

Non-satisfaction of project goals eliminated the enhanced widening of existing roadways and TSM alternatives. The enhanced widening of existing roadways alternative would not establish a roadway linkage between Kihei and the Upcountry area. The TSM alternative would also not satisfy this goal, nor other goals, such as providing additional roadway capacity and infrastructure to meet existing and future travel demand in the region.

The design feasibility criterion eliminated Alternative 8 because it is constrained to an existing government right-of-way that does not conform to modern highway design standards.

The preliminary benefit-cost analysis generated BCRs ranging from -0.04 to 1.53 (see Table 2-7). After noting the spread of the results and considering the preliminary nature of the analysis, the allowable threshold was set at 0.67, which eliminated Alternatives 6A, 6B, and 7. To affect these results (pass some alternatives eliminated by this criterion), the minimum passing BCR would have to be lowered to 0.42. However, lowering the BCR to this threshold would not affect the overall screening because Alternative 6A, with its 0.42 BCR, would have been eliminated anyway because it bifurcates the Maui R&T Park, the last Tier One criterion. This last criterion also eliminated Alternatives 2 and 4A.

### **2.2.1.3b Tier Two Screening**

Table 2-8 summarizes the Tier Two screening analysis. An alternative did not have to satisfy every criterion to pass the screening. However, in certain instances, a particular score or group of scores disqualified an alternative from moving forward. These disqualifying scores are shaded.

Based on the Tier Two criteria, Alternatives 1 and 3 were dropped from future study in the Draft EIS for the following reasons:

- Alternative 1. This alternative would produce a substantially greater displacement of cultivated fields. It would displace approximately 56.2 ha (139 acres), while the alternative with the next largest impact, Alternative 3, would displace approximately 32.6 ha (81 acres), 42 percent less.
- Alternative 3. This alternative was eliminated because of its poorer operational aspects, particularly at its mauka terminus at the intersection of Haleakala Highway

and Pukalani Bypass Highway where there is a seven percent grade. Because of this steep grade, a very long left turn storage lane would be required for makai-bound traffic on Haleakala Highway turning left onto Kihei-Upcountry Highway. The length of this left turn lane, plus the proximity of the two intersections, would cause a conflict in turning movements. Furthermore, this alternative scored a four (4) in terms of displacement of cultivated acreage.

**Table 2-8  
Tier Two Screening**

Criteria	Alternative					
	1	2B	2C	3	4B	5
Adverse Agricultural Impact Score Encroachment (hectares)	5 56.2	3 27.1	3 27.1	4 32.6	3 21.6	2 13.3
Cost Score Estimated Cost (\$ millions)	3 57	2 47	3 57	2 54	2 52	1 40
Conformance with Community Plans Kihei-Makena Makawao-Pukalani-Kula	Y N	Y N	Y N	Y N	Y N	P N
Highway Operations	B	B	B	W	B	B
Potential Impact to Endangered & Threatened Species	1	1	2	2	3	5
Enhancement of Access to HHL	W	W	B	W	W	W
Visual Impacts Score Est. Earthmoving (millions of cubic meters)	3 2.1	1 1.4	2 1.7	2 1.9	2 1.8	1 1.4

Notes: B: Better      Y: Yes  
P: Poor              N: No  
W: Worse

Source: Warren S. Unemori Engineering, Inc. and Parsons Brinckerhoff Quade & Douglas, Inc., January 1997

Alternatives 2B, 2C, 4B and 5 passed the screening evaluation for the following reasons:

- Alternative 2B. The advantages of Alternative 2B are its cost (the second cheapest alternative) and its relatively minimal environmental impacts in those disciplines selected for the screening analysis. Although this alternative scored a three (3) in the agricultural impact criterion, the alignment was coordinated with HC&S to minimize adverse impacts to their sugarcane operations.
- Alternative 2C. Since this alternative is similar to Alternatives 2B and 4B, it too passed the Tier Two screening. The major disadvantage of this alternative, in comparison to these other two alternatives, is its cost (21 percent greater than Alternative 2B and 10 percent greater than Alternative 4B). Its advantages are that it is the only remaining alternative that may facilitate access to the HHL parcel, and it provides another Kihei terminus option (Alternatives 2B, 4B and 5 all have the same Kihei terminus at Kaonoulu Street).
- Alternative 4B. This alternative compares favorably against other alternatives regarding cost, impacts to cultivated fields and visual environment. It scores relatively high (3) under the “potential impact to endangered and threatened species” criterion. However, because the botanical reconnaissance was done from the air and because there is some latitude in modifying alternatives to avoid sensitive locations, this moderately high score did not warrant eliminating this alternative at this stage.
- Alternative 5. The primary benefits of this alternative are its cost (the least expensive alternative) and it would have the least impact on cultivated fields. The disadvantages of this alternative are its higher probability of encountering endangered species habitats, and its “P” (poor) score in regards to conformance to the Kihei-Makena Community Plan (1998). However, these factors did not warrant eliminating this alternative.

In general, the alternatives passing Tier Two would generate comparatively fewer adverse environmental impacts in the topics selected for the screening analysis, and would not

present operational difficulties interfacing with the existing roadway network. Only one of the passing alternatives would facilitate access to the HHL parcel.

#### **2.2.1.4 Conclusion**

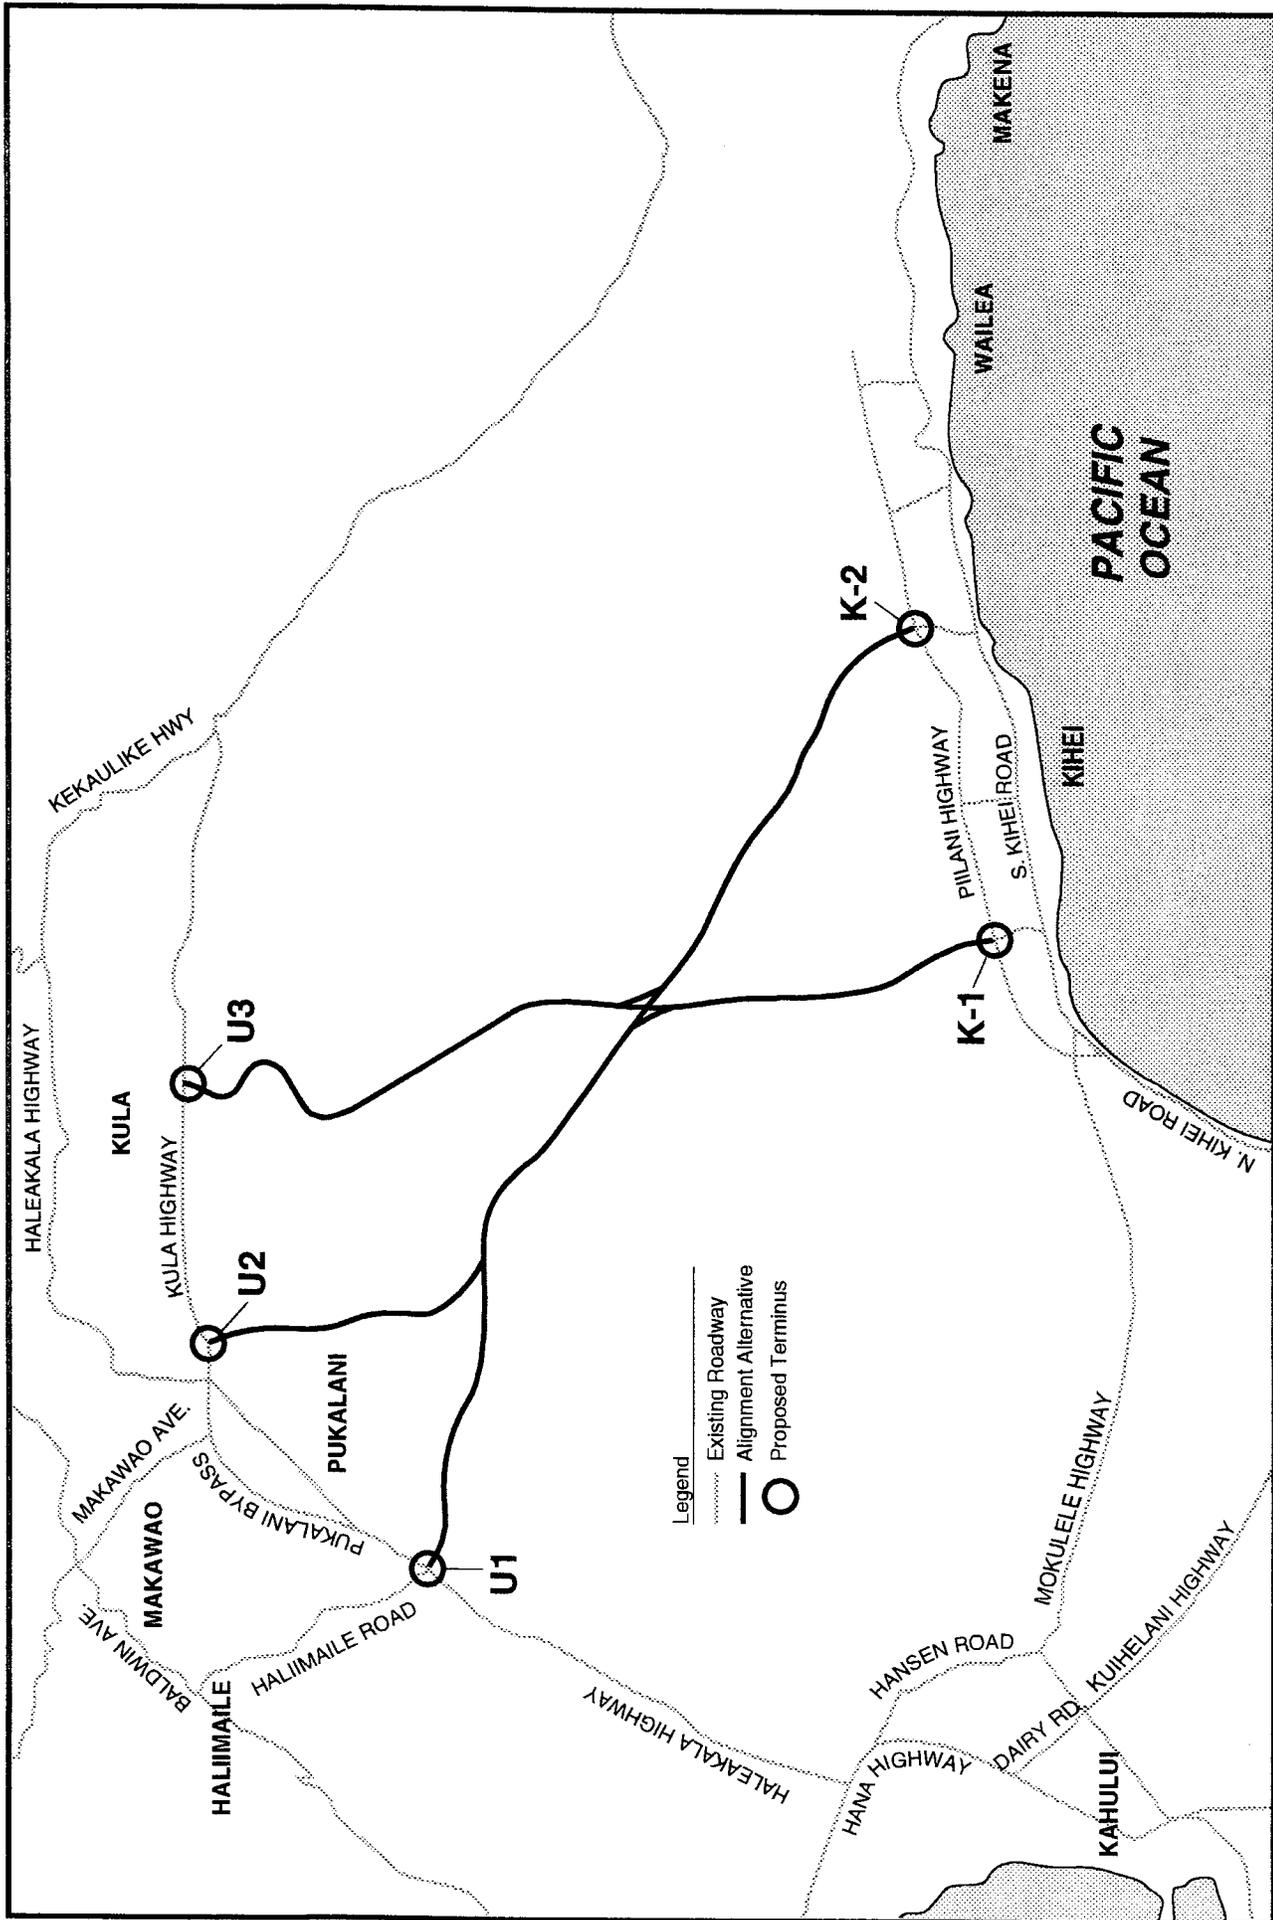

The four alternatives that passed the screening analysis (2B, 2C, 4B and 5) were recast as combinations of mauka and makai segments. By combining their two Kihei terminus choices with their three Upcountry terminus choices, it became possible to generate six alternatives comprised of common roadway segments.

Figure 2-9 shows the Upcountry and Kihei termini choices and the alignment segments that would be used by the six alternatives. As shown on this figure, the Kihei termini and segments were named K1 and K2, and the Upcountry termini and segments were named U1, U2 and U3.

### **2.2.2 MODIFICATION OF SEGMENT U2**

Following selection of the six alternatives described in Section 2.2.1.4, it was discovered that the eastern (mauka) portion of Segment U2 would bisect a Kamehameha Schools / Bishop Estate campus (portions of the campus have been developed). Furthermore, the U2 alignment would potentially affect two archaeological sites that were likely to require preservation (see Section 3.10.2). Therefore, the following four variations to the U2 described in Section 2.2.1.4 were developed (see Figure 2-10):

- U2-A. This modification would shift the U2 terminus 685 m (2250 ft) north to the Pukalani Bypass / Haleakala Highway / Kula Highway “Five Trees” Intersection. The Haleakala Highway (Pukalani side) leg of this intersection would be modified to join Pukalani Bypass north of the “Five Trees” intersection.
- U2-B. This modification would maintain the original U-2 terminus on Kula Highway. It would shift the alignment to the north, running along the northern boundary of the Kamehameha School campus and a future commercial district that would be located west (makai) of Kula Highway.

KIHEI-UPCOUNTRY MAUI HIGHWAY**  
Final Environmental Impact Statement  
FIGURE 2-10

- U2-C. This modification is similar to U2-B in maintaining the original U-2 terminus on Kula Highway. However, instead of shifting the alignment to the north, it would shift the alignment to the south, bisecting a pineapple field and two vacant agricultural lots in the Kula Estates subdivision.
- U2-D. This modification is similar to U2-C. However, instead of terminating at the original U-2 terminus, it would terminate at the intersection of Kula Highway and Ohana Street, one of the access roads to the Kula 200 residential subdivision, 335 m (1100 ft) south of the original U2 terminus. It would also bisect the pineapple field and two different agricultural lots in the Kula Estates subdivision.

Table 2-9 compares the four alternative modifications to U2 against ten criteria based on design and engineering considerations.

U2-A has several advantages over the other U2 options, including: termination at an established signalized intersection; a 6.8 percent maximum grade; no residential displacements with proper advance planning and coordination; minimal proximity impacts (air quality and noise) to the Kamehameha School campus, which opened in August 1999; and conformance with future widening of Pukalani Bypass. The disadvantage of this alternative is that it would have the highest right-of-way cost because of its length through urban designated land.

U2-B is the suggested alignment of the Kulamalu master plan, a future commercial, housing and institutional development just south (mauka) of Pukalani (see Section 3.1.3). Therefore, U2-B would be consistent with this development, and the private developer would not have to modify its master plan and has offered to donate the right-of-way. U2-B's disadvantage is that it does not meet AASHTO's recommended seven percent maximum grade for a limited access rural highway. U2-B's maximum grade is 10 percent. All the other U2 modifications (U2-A, U2-C and U2-D), alignment alternatives (U1, U3, K1 and K2), and federal-aid highways in the project vicinity (Haleakala Highway, and Pukalani Bypass) meet this criterion.

U2-C and U2-D require little or no right-of-way acquisition in State urban designated land, minimizing their right-of-way costs. The disadvantages common to both alternatives are

**Table 2-9  
Comparison of U2 Modifications**

Criterion	Alternative Modification			
	U2-A	U2-B	U2-C	U2-D
Maximum Grade	6.8%	10.0%	6.8%	6.8%
Number of Bridges	1	1	1	1
Length of Bridge Required	76 m (250 ft)	215 m (700 ft)	76 m (250 ft)	76 m (250 ft)
Maximum Pier Height	20 m (65 ft) ±	32 m (105 ft) ±	11 m (35 ft) ±	11 m (35 ft) ±
Number of Gulch Crossings	3	3	5	6
Maximum Height of Fill	17 m (55 ft)	15 m (50 ft)	21 m (70 ft)*	21 m (70 ft)
Maximum Height of Cut	9 m (30 ft)	11.5 m (38 ft)	12 m (40 ft)*	12 m (40 ft)
Length Through State Urban Land	2100 m (6900 ft)	1740 m (5700 ft)	460 m (1500 ft)	0
Distance from Kamehameha School Campus	120 m (400 ft)	Abuts Northern Boundary	106 m (350 ft)	106 m (350 ft)
Distance from Kula Highway/ Haleakala Highway Intersection	0	685 m (2250 ft)	685 m (2250 ft)	1020 m (3350 ft)

Note: \* Includes the 900 m (3000 ft) of roadway already constructed for Kulamalu development.

Source: Warren S. Unemori Engineering, Inc., May 1997

adverse impact to two vacant agricultural lots in the Kula Estates subdivision and an active pineapple field, and bisection of a future commercial site that is inconsistent with site's master plan.

In conclusion, U2-A and U2-B were selected as the preferred U2 option. U2-A's operational advantage (termination at an established signalized intersection) outweighed its higher right-of-way cost. U2-B was selected because of its consistency with Kulamalu development.

### **2.2.3 ADJUSTMENTS TO PROJECT ALTERNATIVES**

The results of archaeological reconnaissance surveys (see Section 3.10.2) required the realignments of Segments U2-A and U3. The U2-A and U3 alignments shown on Figure 2-5 avoid direct impacts to all significant archaeological sites found during the surveys. For more information, see Section 3.10.2.

The results of the archaeological inventory survey on the preferred alternative (see Section 3.10.3) required the realignment of the highway at Waiakoa Gulch to avoid potentially affecting petroglyphs approximately 15 m (50 ft) to the west of the alignment's centerline. The alignment was shifted 45 m (150 ft) to the east.

### **2.2.4 SELECTION OF THE PREFERRED ALTERNATIVE**

Following public release of the Draft EIS on August 8, 1999, a public and agency review period followed, which lasted to October 14, 1999. During this period, the public and government agencies provided a great deal of information on the facts and analyses presented in the Draft EIS, as well as opinions about which alternative was preferred by the commenter. The Draft EIS public and agency review process is described in more detail in Chapter 5.

The SDOT and FHWA reviewed and considered all of the information provided during the Draft EIS review period, which helped in the selection of the preferred alternative. The No Build alternative was not included in this analysis because it remains a viable alternative until

the Record of Decision is issued by FHWA. In the selection process, the following criteria were used:

- cost;
- transportation performance;
- agricultural impact; and
- consistency with community plans.

These criteria were found to be relevant and useful in discriminating among the build alternatives. This does not mean that other criteria that were considered, which are listed below, are not important. They were not selected because they did not help in drawing distinctions among the build alternatives. Chapters Three and Four include discussions of these environmental resources and potential impacts from Kihei-Upcountry Maui Highway.

- residential and business displacement
- traffic safety
- parks and recreational impacts
- threatened and endangered species impacts
- flora and habitat displacement
- energy impacts
- air quality and noise impacts
- changes to visual and aesthetic conditions
- geological and site contamination impacts
- employment and economic effects
- provision of bicycle and pedestrian facilities
- historic, archaeological, and traditional cultural properties / practices impacts

#### **2.2.4.1 Cost Comparison**

The estimated capital cost comparison of Build alternatives (right of way and construction) is reported in Sections 2.1.4. The ranking of the alternatives from least to most costly is provided below.

- |                   |                   |
|-------------------|-------------------|
| 1. <u>U3,K1</u>   | 5. <u>U2-A,K1</u> |
| 2. <u>U1,K1</u>   | 6. <u>U1,K2</u>   |
| 3. <u>U3,K2</u>   | 7. <u>U2-B,K2</u> |
| 4. <u>U2-B,K1</u> | 8. <u>U2-A,K2</u> |

#### **2.2.4.2 Transportation Performance**

The transportation performance of the alternatives was determined by evaluating how well they would serve major travel markets, and their traffic impacts on the regional roadway system.

##### **2.2.4.2a Travel Markets**

The major travel markets that would be served by a Kihei-Upcountry Maui Highway include travel between:

- Upcountry - Kihei;
- Upcountry - West Maui;
- Maui R&T Park - Science City; and
- Emergency evacuation from South Maui.

Other travel markets, such as local circulation in Kihei or Upcountry, and commuter travel to Wailuku/Kahului, would not be directly served by a Kihei-Upcountry Maui Highway, although these travel markets could be indirectly affected by decreases in overall congestion and an increase in the capacity of the regional roadway system. Such indirect impacts were considered under traffic impacts.

Several assumptions were used to evaluate how well each alternative would serve these major travel markets. First, the evaluation considered the distance between the proposed termini and major residential centers and commuter destinations. For example, the U3 terminus is not near a major population center, and therefore, would not serve travel markets as effectively as the other three Upcountry termini. Second, travel between the Maui R&T Park and Science City would be most convenient via a U2-A or U2-B alignment, and moderately convenient via U1 and U3. The choice of a Kihei terminus for this travel market would not have much impact on the effectiveness of the route. Third, K2 would not serve the Upcountry

– West Maui travel market due to its location in South Kihei. On the other hand, K2 would provide a better evacuation route for South Maui because of its physical separation from the existing evacuation route through North Kihei.

The ranking of the alternatives in terms of effectiveness in serving the major travel markets (in decreasing order of effectiveness) is as follows:

1. U2-A,K1 and U2-B,K1 (tie);
2. U1,K1, U2-A,K2 and U2-B,K2 (tie);
3. U1,K2; and
4. U3,K1 and U3,K2 (tie).

The U2-A,K1 and U2-B,K1 alternatives were considered equal in terms of their effectiveness in serving the target travel markets because their Upcountry termini are relatively close to one another. Both alternatives would serve the Upcountry travel markets to and from Kihei-Makena and West Maui, and both would facilitate travel between the Maui R&T Park and Science City. However, these alternatives would only moderately improve evacuation capacity from Kihei.

The U2-A,K2 and U2-B,K2 alternatives were also considered equal in effectiveness in serving the target travel markets. Both alternatives would serve the Upcountry – Kihei travel market, and facilitate travel between the Maui R&T Park and Science City. However, these alternatives would not serve the Upcountry – West Maui travel market.

The U1,K1 alternative was evaluated as being approximately equal in effectiveness in serving travel markets to the U2-A,K2 and U2-B,K2 alternatives. It would serve the both the Upcountry travel markets to and from Kihei and West Maui, and serve moderately well travel between the Maui R&T Park and Science City, and provide some South Maui evacuation capacity.

The U3 alternatives (K1 and K2) were evaluated as being the least effective in serving the target travel markets. They would serve the Upcountry – Kihei travel market and travel between the Maui R&T Park and Science City only moderately well. The K1 alignment would serve the Upcountry – West Maui travel market only moderately well because of its Upcountry

terminus being so far from population centers. The K2 alignment would only marginally serve this market. The K2 alignment would, however, provide the better South Maui evacuation capacity because of the proximity of K1 to the existing evacuation route.

#### **2.2.4.2b Regional Traffic Impacts**

Three primary traffic impacts may result from the Kihei-Upcountry Maui Highway:

- reduction in traffic volumes on Haleakala Highway (in comparison to the No Build);
- increase in the amount of through traffic on Omaopio and Pulehu Roads; and
- increase in the amount of through traffic on local Kula residential roads.

Although many public comments stated a perception that the U2-A alternatives would adversely affect traffic operations and safety at the Haleakala Highway / Kula Highway, or "Five Trees" intersection, all proposed alternatives would provide terminus intersections with appropriate capacity and channelization for turning and through movements, signalization, sidewalks, crosswalks and other safety and pedestrian and vehicular traffic capacity features. Therefore, an adverse impact at the Five Trees intersection is not anticipated, and was not considered in the evaluation.

Public comments on the Draft EIS also indicated the mistaken belief among Pukalani residents that there would be a direct connection between the U2 (A or B) alternatives and Pukalani Terrace. These commentors were concerned about traffic passing through their neighborhood to access Kihei-Upcountry Maui Highway if a U2 alternative were selected. Since this impact would not occur under a U2 alternative, the evaluation of regional traffic impacts did not consider this issue.

The ranking of the alternatives in terms of their potential regional traffic impacts is as follows:

1. U2-A,K1, U2-A,K2, U2-B,K1 and U2-B,K2 (tie);
2. U1,K1 and U1,K2 (tie); and
3. U3,K1 and U3-K2 (tie).

The U2 (A and B) alternatives were considered to have the most favorable and least adverse regional traffic impacts. First, the U2 alignments would give Pukalani, Kulamalu, and

Makawao residents two choices for traveling between Upcountry and the coastal areas (Haleakala Highway or Kihei-Upcountry Maui Highway). Therefore, traffic volumes on Haleakala Highway would decrease, thereby improving operations on this highway. The U2 alternatives would also not affect Kula residential roads because their termini are at or near the Five Trees Intersection. However, it is anticipated that some of the motorists traveling between Kula and Kihei would use Omaopio and Pulehu Roads as an access route to the new highway, instead of traveling to either the U2-A or U2-B terminus. This was seen as the only adverse regional traffic impact of the U2 alternatives.

Like the U2 alternatives, the U1 alternatives would not affect the Kula residential roads because of the large distance between the U1 terminus and Kula. Also like the U2 alternatives, some motorists would use Omaopio and Pulehu Roads as a through route to access the new highway. More motorists would use Omaopio and Pulehu Roads as shortcuts with the U1 alternatives than under the U2 alternatives because the shortcut would save more time with the U1 alignment.

In comparison to the U2 alternatives, the U1 alternatives would not reduce the traffic volume on Haleakala Highway between Makawao Avenue and Haliimaile junction. During the morning peak period, all makai bound traffic would travel along this section of Haleakala Highway under the U1 alternatives. The U2 alternatives would remove a portion of this makai bound traffic, switching them to the less congested mauka bound direction to the U2 terminus. The opposite would occur during the afternoon peak period. Therefore, operations on Haleakala Highway would be worse with the U1 alternatives than with the U2 alternatives.

The regional traffic impacts of the U3 alternatives would include motorists using the residential roads between Haleakala Highway and Kula Highway inappropriately as a through route. Also, the U3 alternatives would only moderately reduce traffic volumes on Haleakala Highway, and not to the extent of the U2 alternatives. However, unlike the U1 and U2 alternatives, the U3 alternatives would not encourage motorists to use Omaopio and Pulehu Roads as a through route.

### **2.2.4.3 Agricultural Impacts**

Because the potential alignments traverse agricultural areas over most of their length, and the agricultural parcels are very large, substantial adverse environmental impacts are not anticipated. None of the alternatives would bisect or pass immediately adjacent to existing residential communities, or require business or residential relocations. There are no threatened or endangered floral species along the alternative alignments. None of the alignments would traverse or be near a critical habitat, valuable water body or wetland. Archaeological sites were found within the corridors, but the alignments were modified to avoid the significant sites requiring preservation. The land uses that would sustain significant adverse impacts from the proposed highway are agricultural and ranching activities. Since the level of this impact varies by alternative, these impacts were evaluated to determine the differences between alternatives.

Total land evaluation and site assessment scores from Form AD-1006, which are calculated by the U.S. Department of Agriculture and FHWA (see Section 4.2.3), were used to assess the difference in agricultural impact between the alternatives. In accordance with the Farmland Protection Policy Act, this form is used to determine whether alternatives that avoid farmland impacts need to be considered. The threshold land evaluation and site assessment score for this determination is 160 points. None of the alternatives reached 160 points, but scores ranged between 137 and 151 points. Based on the land evaluation and site assessment scores, the alternatives were ranked in the following manner (from least adverse agricultural impact to most):

1. U3,K2: 137 points;
2. U2-B,K1 and U2-B,K2 (tie): 139 points;
3. U3,K1: 140 points;
4. U2-A,K1: 141 points;
5. U2-B-K2: 142 points;
6. U1,K2: 148 points; and
7. U1,K1: 151 points.

As shown in these rankings, the land evaluation and site assessment scores generally decrease from U1 to U3. The Kihei terminus options were not as influential in the scores. The U1 alternatives had the highest scores (most adverse impact) because they would traverse a large parcel of sugarcane land and a pineapple field. Therefore, the agricultural impacts of the U1 alternatives would be most severe.

#### **2.2.4.4 Community Plan Preference**

The Kihei-Makena and Makawao-Pukalani-Kula Community Plans provided divergent positions regarding Kihei-Upcountry Maui Highway. The Kihei-Makena Plan supported a highway providing improved access to Upcountry. While not identifying preferred locations for an Upcountry or Kihei terminus, the Plan indicated a preference for an alignment that connects major population centers and travel destinations (“trip attractors” and “trip generators”). In its assessment of a transportation link with the Upcountry area, the Kihei-Makena Plan stated “[t]he focus should be on improving transportation services for island residents and thus the chosen route should be located to minimize travel times for the maximum number of island residents.” This statement was interpreted in the following manner:

- the U3 alternatives, with a terminus relatively far from the population center of Upcountry, would not fulfill this objective statement;
- the U1 and U2 alternatives are clustered in a higher population area near Pukalani, Makawao and Haliimaile; and
- although there is not much difference between the K1 and K2 alignments in terms of proximity to the center of Kihei, the K1 alignment would be favored because it would serve the West Maui region, thereby helping to decrease travel times for the greatest number of travelers.

Unlike the Kihei-Makena Plan, the Makawao-Pukalani-Kula Community Plan clearly states that the Kihei-Upcountry Maui Highway is undesirable. However, the Plan also stated that given no other recourse, a U1 terminus is preferred. A preference for the Kihei terminus was not specified. It is therefore assumed that, if constrained to select a Build alternative, a U1 alternative would be most consistent with the Makawao-Pukalani-Kula Community Plan.

In combining the preferences inferred from the two relevant community plans, the following ranking was determined (from most favored to least):

1. U1,K1;
2. U1,K2, U2-A,K1 and U2-B,K1;
3. U2-A,K2 and U2-B,K2; and
4. U3,K1 and U3,K2.

The U1,K1 alternative rated the highest in terms of community preference. First, this alternative serves population, employment and visitor centers, an objective of the Kihei-Makena Community Plan. In particular it would serve West Maui travel markets. Second, the Upcountry terminus would be at the preferred terminus stated in the Makawao-Pukalani-Kula Community Plan, U1.

The U1,K2 and U2 alternatives were all rated second and third in terms of community preference. All of these alternatives would serve population, employment and visitor centers. However, the U1,K2 alternative was marked down by having a Kihei terminus at K2, which would not serve West Maui. The U2 alternatives would have an Upcountry terminus in an area not favored in the Makawao-Pukalani-Kula Community Plan.

The U3 alternatives rated the worst in terms of community preference. Not only would these alternatives not serve population, employment and visitor centers, but the Upcountry terminus would be located in an area not favored in the Makawao-Pukalani-Kula Community Plan.

#### **2.2.4.5 Conclusion and Selection of Preferred Alternative**

The Build alternatives were compared using cost, transportation performance, agricultural impacts and community plan preference criteria. The purpose of this comparison was to help identify a preferred build alternative. The No Build alternative did not enter into this analysis because it remains a viable alternative until the Record of Decision is issued by FHWA. Other criteria were considered for the evaluation but were not used because, while important, they did not differentiate between the alternatives.

In evaluating the transportation performance of the alternatives, all the U3 and K2 alternatives were eliminated from further consideration. The U3 terminus is located about 6 km (4 miles) from the Upcountry population centers and would therefore serve the target travel markets poorly. The K2 alternatives would not serve the Upcountry – West Maui travel market, and is therefore, at a severe disadvantage to the K1 alternatives. The benefit of K2's superior evacuation potential for South Maui did not override the disadvantage of not serving the Upcountry - West Maui travel market. The U2-A and U2-B alternatives, with a slight edge to the U2-A alternatives because of their direct connection to the Five Trees intersection, were judged to be superior to the U1 alternatives in transportation performance. These alternatives would best serve the target travel markets and maximize congestion- relief on Haleakala Highway. The top-ranking alternatives from the perspective of transportation performance are: 1) U2-A, K1; 2) U2-B,K1; and 3) U1,K1. All the other alternatives were eliminated from further consideration.

The U1,K1 alternative would be the least expensive to construct among the three alternatives remaining. However, the costs of the three remaining alternatives are within 7 percent of one another, and therefore, unlike transportation performance, was only a minor factor in the decision to select the preferred alternative.

The U2-A and U2-B alternatives would have less of an adverse impact on agriculture than the U1,K1 alternative. However, Alexander & Baldwin (see Draft EIS Comments and Responses), the parent company of Hawaiian Commercial and Sugar Company, indicated a willingness to work with the SDOT on appropriate mitigation to lessen the impact to their agricultural operations. Therefore, agricultural impacts became less of a factor in the identification of the preferred alternative.

The U1,K1, U2-A,K1 and U2-B,K1 alternatives would all be consistent with the Kihei-Makena Community Plan. Therefore, this Plan does not help discriminate among the remaining alternatives. On the other hand, the Makawao-Pukalani-Kula Community Plan indicated a strong preference for a U1 alternative. This preference for U1 was repeated by several Upcountry commentators, each asking that the project respect the preference stated in their community plan. The Makawao-Pukalani-Kula Community Plan preference for a U1 alternative

was highly influential, and became the major determining factor that led SDOT and FHWA to select the U1,K1 alternative as the preferred alternative.

# **CHAPTER THREE**

## **Affected Environment**

## **CHAPTER 3 AFFECTED ENVIRONMENT**

This chapter describes the existing environmental conditions in the project area. Impacts of the proposed Kihei-Upcountry Maui Highway project on these conditions are discussed in Chapter 4.

### **3.1 LAND USE**

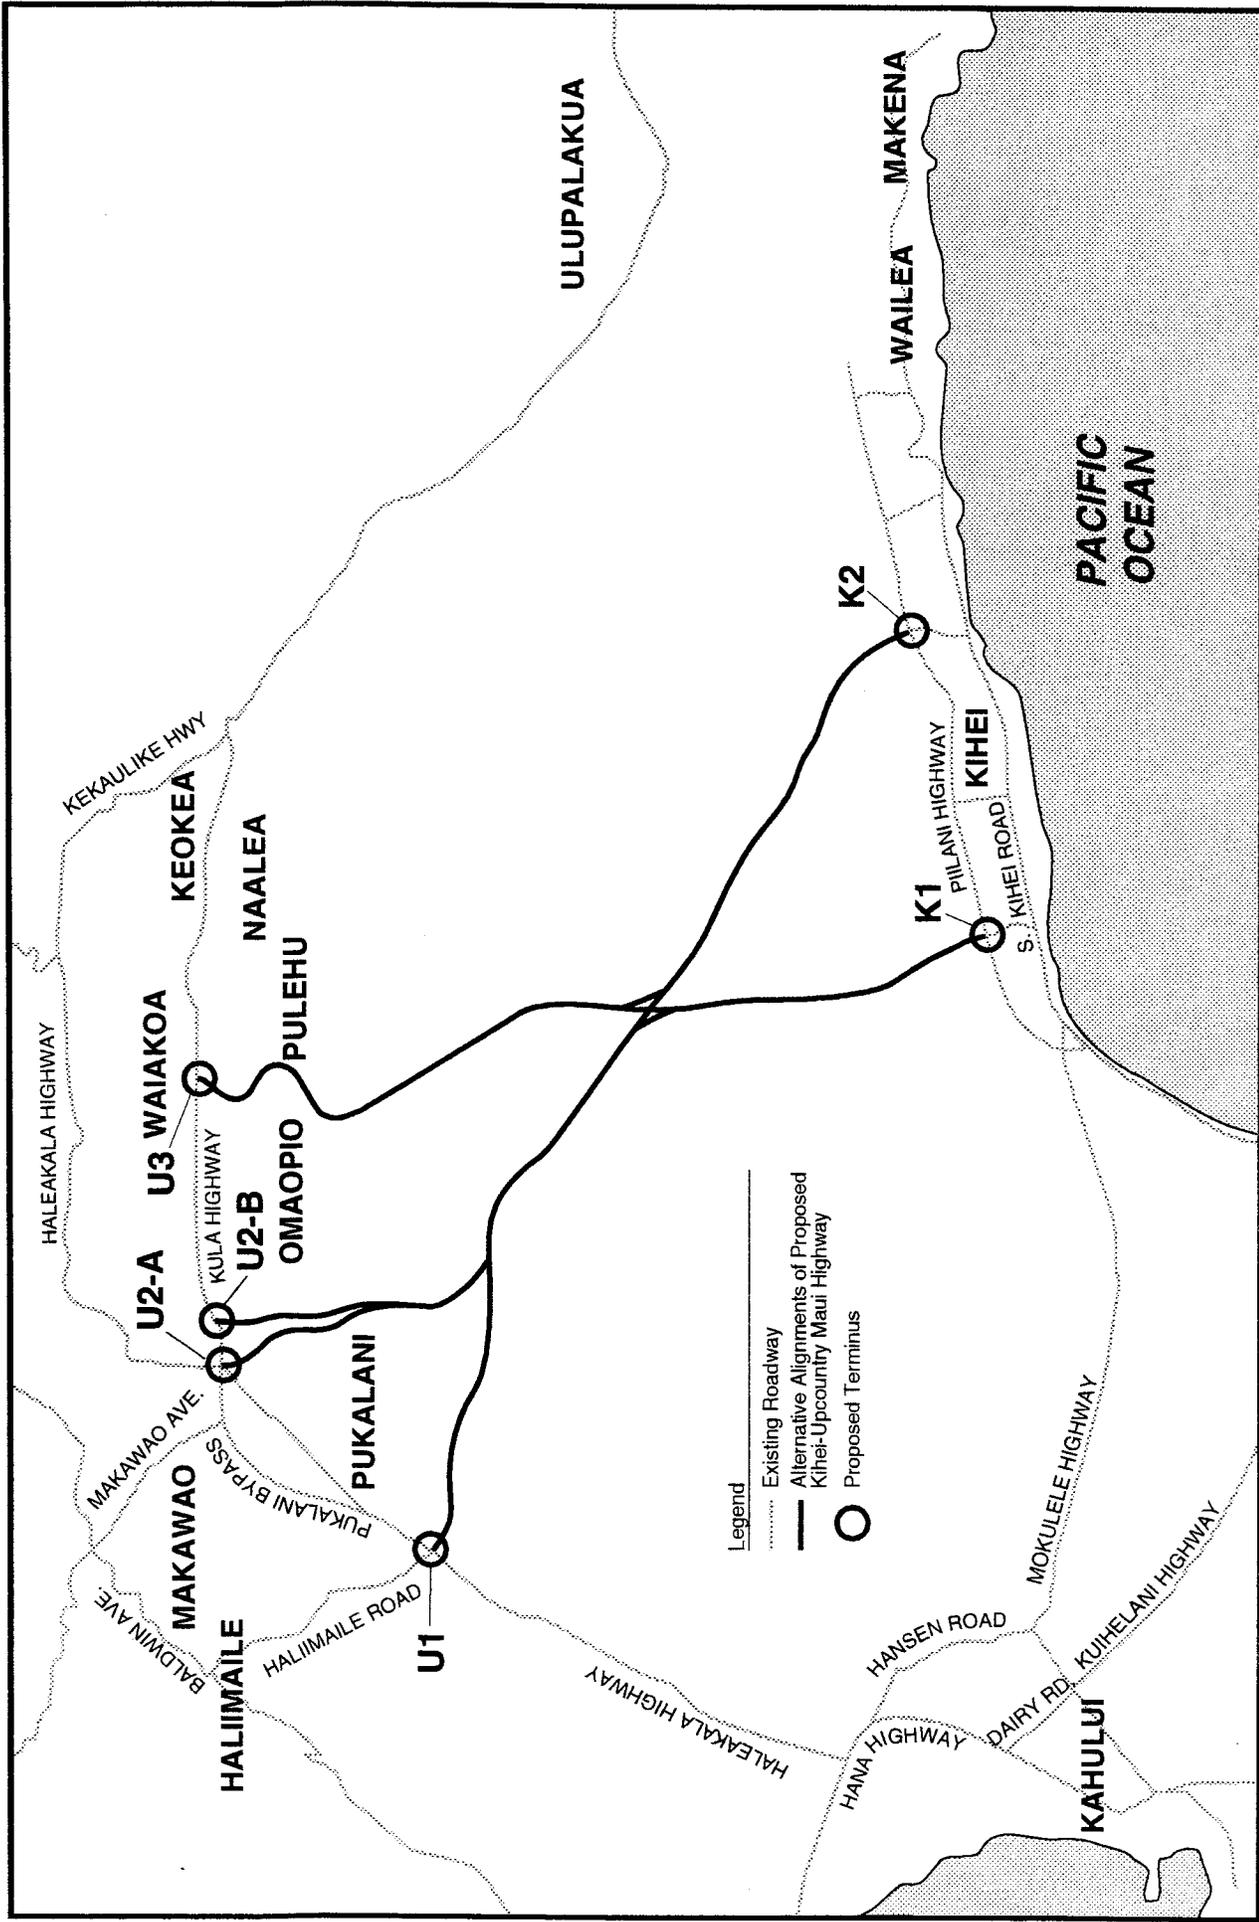

#### **3.1.1 REGIONAL SETTING**

The County of Maui consists of four major islands, Maui, Lanai, Kahoolawe, and most of Molokai (Kalawao, located on the northern side of Molokai, is officially designated a separate county). The county is the second largest in the State with a total land area on four islands of 4190 km<sup>2</sup> (1,160 square miles), and it ranks third in population (estimated 122,000 in 1999). Maui island is the second largest in the Hawaiian Archipelago, with an area of approximately 1890 km<sup>2</sup> (729 square miles).

The project would be located on Maui island between the coastal community of Kihei-Makena and an area on the western slope of Haleakala known as Upcountry Maui (see Figure 1-1). Defined neighborhoods or communities in the vicinity of the proposed project include Makena, Wailea, Kihei, Pukalani, Haliimaile, Makawao, and the Kula communities of Omaopio, Pulehu, Naalea, Waiakoa and Keokea. The locations of these neighborhoods and communities are shown on Figure 3-1.

#### **3.1.2 EXISTING LAND USES**

The Kihei-Makena region is comprised of the urban mixed-use community of Kihei and the resort land uses of Wailea and Makena. Development of the Kihei-Makena region has occurred primarily because of the phenomenal growth of Maui's visitor industry since the 1960s. Coastal communities in this region are essentially linear, extending from Kaelia Pond

**Existing Neighborhoods and Communities**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE 3-1**

**Legend**

- Existing Roadway
- Alternative Alignments of Proposed Kihei-Upcountry Maui Highway
- Proposed Terminus

to Makena. This region is the second largest visitor accommodation area on Maui (behind the Kapalua-Kaanapali-Lahaina region on the western side of the island). Kihei, the largest and most populous of these coastal communities, consists of a wide mix of housing types from single-family to multi-family low to medium density units, small to medium-sized commercial malls, and small to medium sized hotels along South Kihei Road. The Wailea-Makena area is a resort community, similar in size and scale to other resort communities on Maui, such as Kapalua and Kaanapali located in West Maui. In terms of urban design and socio-economic conditions, Wailea-Makena is vastly more “upscale” than Kihei, which is a working class community. Wailea-Makena contains some of Maui's most luxurious condominiums and resort hotels, such as the Grand Wailea Resort & Spa, the Maui Inter-Continental Resort, the Four Seasons Resort, and the Maui Prince Hotel.

The Upcountry Maui communities of Makawao, Pukalani and Haliimaile are a mixture of suburban and rural, with Pukalani being the most suburban of the three. Pukalani and Makawao contain most of Upcountry's commercial land uses. Pukalani's businesses are mostly located along Haleakala Highway and are typical of a suburban community (neighborhood shopping center, convenience stores, small offices, etc.). Businesses in Makawao, centered around the intersection of Makawao and Baldwin Avenues, are generally smaller, more pedestrian-oriented, and some preserve the town's historic architecture. These businesses consist of restaurants, gift stores, and art galleries.

The Kula region contains a mixture of rural and agricultural land uses with human settlement most concentrated at Waiakoa. Single-family residences on lots up to 0.4 ha (1 acre) are generally found between Haleakala Highway/Kekaulike Avenue and Kula Highway. This area and the area west (makai) of Kula Highway are also used for small truck farms and agricultural lots. The small two to four hectare (five to ten acre) farms produce vegetables, such as the famous Maui onions, and flowers. Large-scale sugarcane and pineapple activities extend from the west slopes of Haleakala, generally west (makai) of the small truck farms, to central Maui. Cattle ranching occurs in the area east (mauka) of Haleakala Highway/Kekaulike Avenue, and on the lower west and south slopes of Haleakala. On the summit is Haleakala National Park (see Figure 1-1). The few commercial activities in Kula are primarily along the route to Haleakala National Park and in central Kula around Waiakoa.

### **3.1.3 PROPOSED DEVELOPMENT PROJECTS**

Major proposed development projects in the study area (see Figure 3-2) include:

- Kulamalu;
- Alexander & Baldwin housing development in Haliimaile
- Department of Hawaiian Home Lands homesteads in Keokea;
- Maui Research and Technology Park;
- Waena Generating Station;
- Mokulele Baseyard; and
- redevelopment of the old Puunene Airport.

The Kulamalu development is proposed south (mauka) of Pukalani and would consist of 32 ha (80 acres) of single-family housing, 3 ha (7 acres) of multi-family housing, 2 ha (5 acres) of elderly housing, 8 ha (19 acres) of business and commercial uses, 2 ha (5 acres) for an amphitheater, 2 ha (5 acres) for public uses, 6 ha (15 acres) for parks, and 38 ha (94 acres) for a Kamehameha Schools campus. The commercial area would be designed in compliance with Business Country Town design guidelines (Kulamalu Project, Draft Environmental Assessment, April 1997). The U2-B alignment is consistent with the Kulamalu master plan (see Section 2.2.2).

Alexander & Baldwin (A&B) is planning to develop approximately 200 single-family housing units on 27 ha (67 acres) in Haliimaile about 1.6 km (1 mile) from the U1 terminus (intersection of Haleakala Highway and Haliimaile Road). According to A&B, the development is consistent with the Community Plan (see Section 3.4.1.2d), but needs to obtain the proper zoning (telephone conversation on January 31, 2001).

The Department of Hawaiian Home Lands (DHHL) plans to develop homesteads for qualified individuals and families in Keokea. DHHL land holdings are approximately 2450 ha (6,100 acres). Water system and other site improvements to serve a portion of this area will be built over the next two to five years (see Appendix C).

The Maui Research and Technology (R&T) Park, in Kihei east (mauka) of Piilani Highway, is the center of Maui's efforts to develop its high technology industry. Current tenants include

the Maui High Performance Computing Center, Boeing-Rocketdyne, Sunsource, the U.S. Air Force, the Pacific Disaster Center, Lockheed Martin, the University of Hawaii, the University of New Mexico, and a number of small companies. Currently about eight percent built-out, the R&T Park may eventually occupy a total of 168 ha (415 acres). Major new industries expected to locate in the park include bio- and medical-technology; arts and entertainment; environmental, earth and ocean sciences; information processing and exchange; defense missions; and education and international training and technology conferencing.

Maui Electric Company, Limited is planning to construct and operate a 232-megawatt electric generating station on a 65 acre parcel along Pulehu Road (see Figure 3-2). The first phase of this project, 58-MW of generating capacity, is scheduled to be completed by the year 2006. The timing of future phases would be dependent on future load growth, power availability from independent power purchase agreements and unit retirements. Site preparation for future phases would be completed in the first phase.

Two parcels on Mokulele Highway, Mokulele Baseyard and the old Puunene Airport site, are being planned for redevelopment (see Figure 3-2). The existing baseyard would be expanded for light industrial use, and the old airport site would be redeveloped for various uses, such as light industrial, a raceway park, recreational facilities, a heliport or a general aviation airport.

### **3.1.4 GOVERNMENTAL PLANS, POLICIES AND CONTROLS FOR THE AFFECTED ENVIRONMENT**

#### **3.1.4.1 Hawaii State Plans and Controls**

##### **3.1.4.1a Hawaii State Plan**

The Hawaii State Plan (June 1991) consists of comprehensive goals, objectives, policies and priorities in all areas of government functions. These functions include the protection of the physical environment, the provision of public facilities, and the promotion and assistance of socio-cultural advancement.

#### **3.1.4.1b Hawaii State Land Use Controls**

Chapter 205, Hawaii Revised Statutes (HRS), relating to the State Land Use Commission (SLUC), regulates land use through classification of State lands into four districts: Urban, Agriculture, Conservation and Rural. The intent of the land classification is to accommodate growth and development while retaining the natural resources of the area. Each district has specific land use objectives and development constraints.

Figure 3-3 shows the State land use districts in the study area. Urban-designated land in the study area is primarily in Kihei-Makena, the Upcountry communities of Pukalani and Makawao, and in relatively small areas in Kula along Kula, Haleakala and Kekaulike Highways. Much of the built-up areas (i.e., residences) in Upcountry have a Rural designation.

The Kihei-Upcountry Highway would traverse Agricultural lands along most of its length. The U2-A and U2-B alternatives would traverse vacant Urban land south of Pukalani, which is being developed as part of the Kulamalu development (see Section 3.1.3). The K1 alternative would pass through vacant Urban land at its terminus at Piilani Highway.

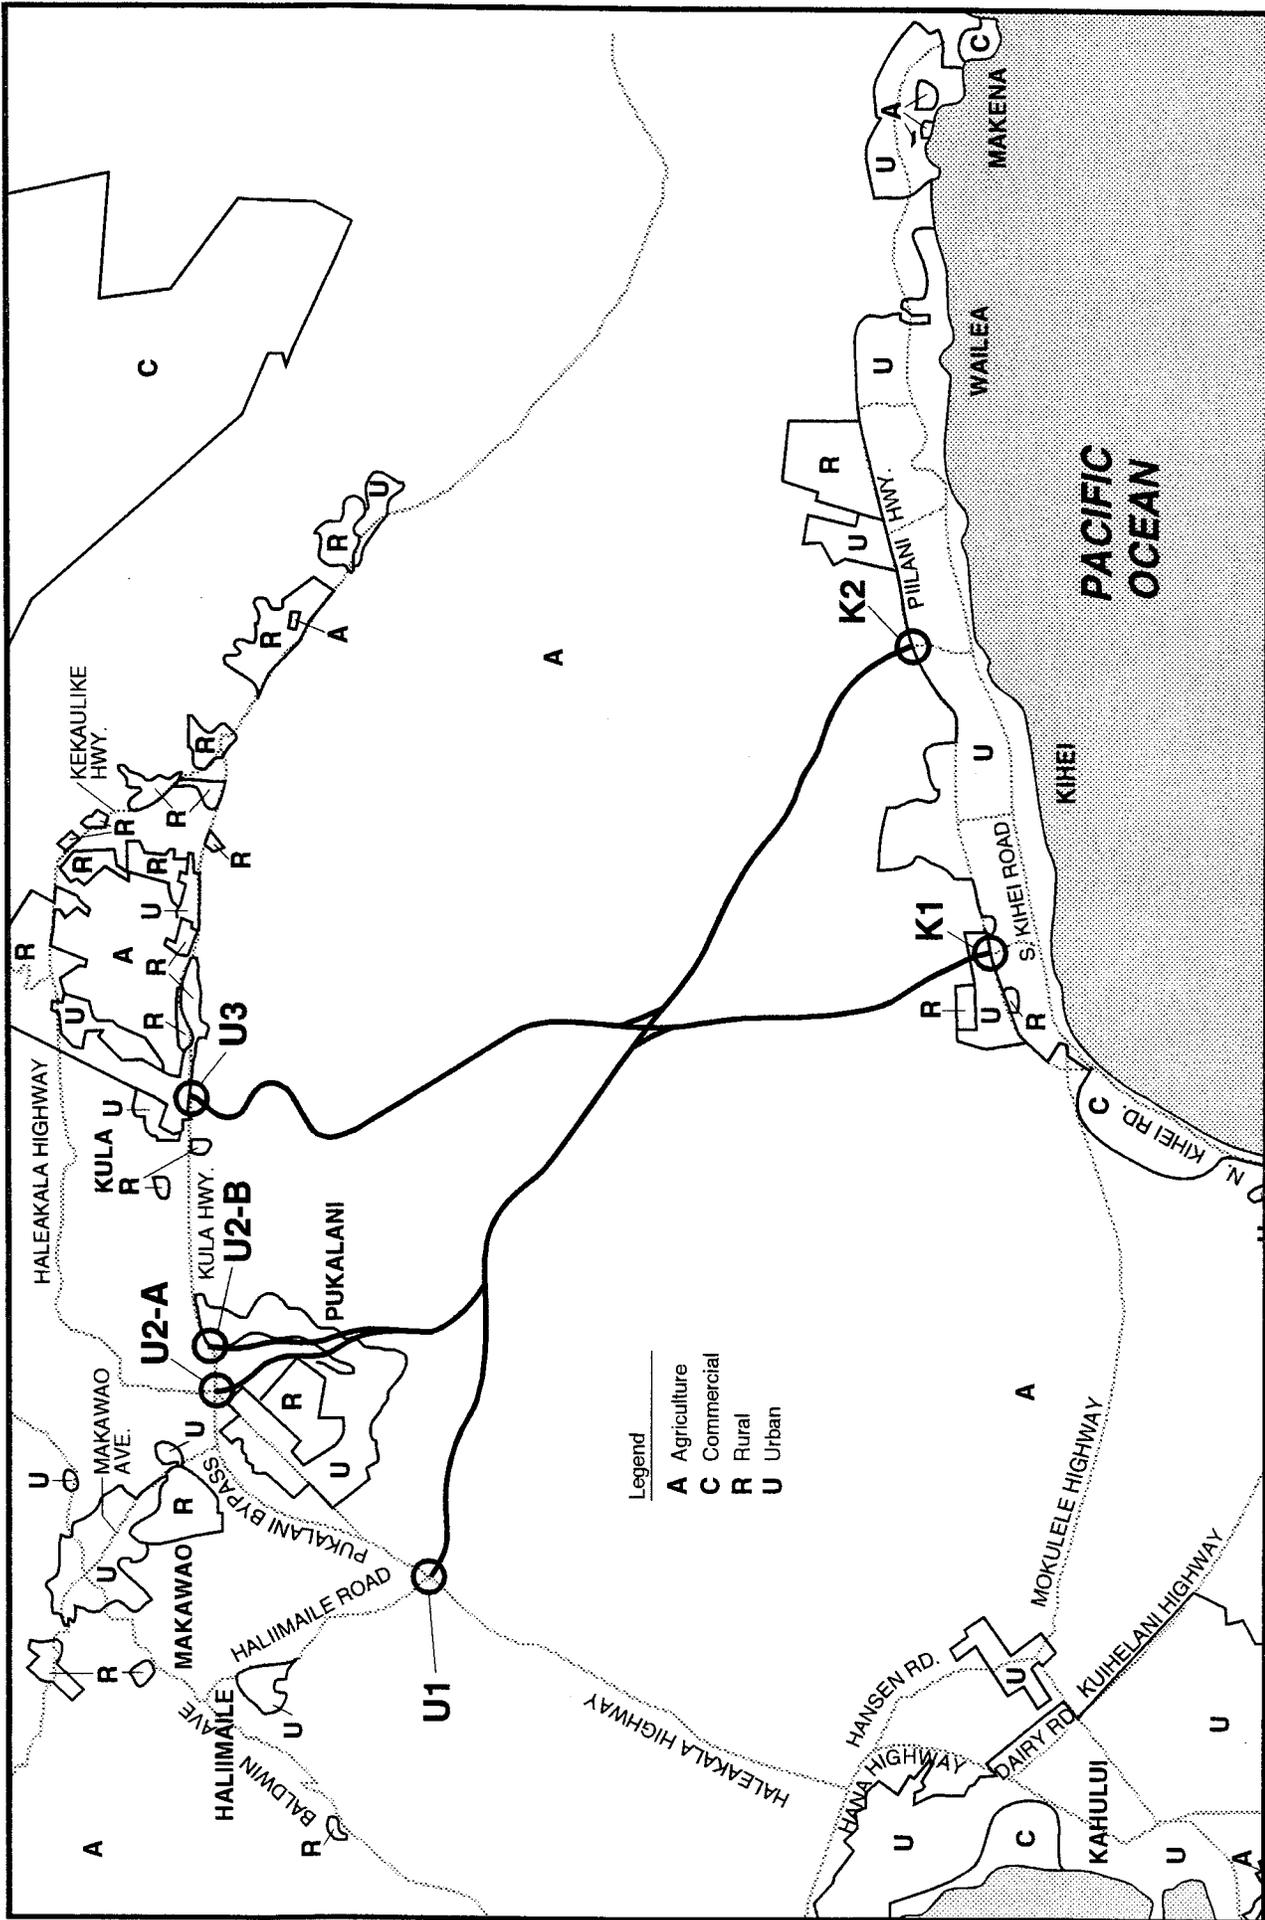

#### **3.1.4.1c Coastal Zone Management Act (CZM) (Chapter 205A, HRS)**

The Kihei-Upcountry Highway would be within the State's Coastal Zone Management (CZM) area. The objectives and policies of the Hawaii CZM Program are intended to protect and manage Hawaii's coastal resources. Federally assisted activities affecting Hawaii's coastal zone, such as the Kihei-Upcountry Highway, must be consistent with the CZM objectives and policies.

#### **3.1.4.1d Maui Long Range Land Transportation Plan**

The Maui Long Range Land Transportation Plan (February 1997) was prepared through a cooperative effort of the State Department of Transportation and the County of Maui. The Plan serves as a guide for the development of major surface transportation facilities and programs in the County of Maui. It identifies both short-range and long-range (year 2020) strategies and actions that will lead to an integrated intermodal transportation system.

A range of alternative investments in transportation infrastructure was developed to address deficiencies in the transportation system identified during the plan's development. A

**State Land Use Districts**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE 3-3**

methodology to evaluate these alternatives was developed and applied, based on the following criteria:

- congestion relief effectiveness;
- service effectiveness;
- cost effectiveness;
- planning objective effectiveness; and
- environmental impacts (land use, noise, visual, resource conservation, air quality, energy).

Following the evaluation, a list of improvements, including new highways, bypass highways (relief routes), roadway extensions, roadway widening and improvements to intersections (e.g., including signals, reconfigurations and grade separations) were recommended. Among the recommended improvements was an Upcountry-Kihei highway.

### **3.1.4.2 County of Maui Plans and Controls**

#### **3.1.4.2a General Plan**

The County of Maui's General Plan 1990 was adopted by Ordinance No. 2039, which took effect on September 27, 1991. The General Plan consists of objectives and policies to meet Maui residents' needs and desires. The following major themes were incorporated in the General Plan: protect Maui County's agricultural land and rural identity; prepare a directed and managed growth plan; protect Maui County's shoreline and limit visitor industry growth; maintain a viable economy that offers diverse employment opportunities for residents; and provide for needed resident housing.

The General Plan's transportation objectives were the following:

1. To support an advanced and environmentally sensitive transportation system which will enable people and goods to move safely, efficiently and economically.
2. To develop a program for anticipating and enlarging the local street and highway systems in a timely response to planned growth.
3. To develop a Maui County Transportation system linked to land use planning that is less dependent on the automobile as its primary mode of moving people.

#### **3.1.4.2b County of Maui Zoning**

Zoning in the County of Maui is administered by its Planning Department. Since most of the study area is designated Agriculture by the SLUC (see Section 3.1.4.1b), the County also zones this land Agriculture. The State Urban land in Kihei-Makena is zoned for residential, business and hotel land uses. A portion of the residential land is for higher density apartment uses. In Upcountry, the State Urban lands are mostly in Pukalani and Makawao. In these areas, the County zoning is mostly residential. However, there are areas zoned "business" and "parks", including golf courses. Also, much of the built-up areas in Upcountry have a State Rural designation.

#### **3.1.4.2c County of Maui Special Management Area**

Chapter 205A outlines special controls, policies and guidelines for development within the area along the shoreline designated by the 1975 Shoreline Protection Act as the Special Management Area (SMA). This Act gave the counties authority to issue permits for development activities proposed within the SMA. In the study area, the landward limit of the SMA is Piilani Highway (see Figure 3-4).

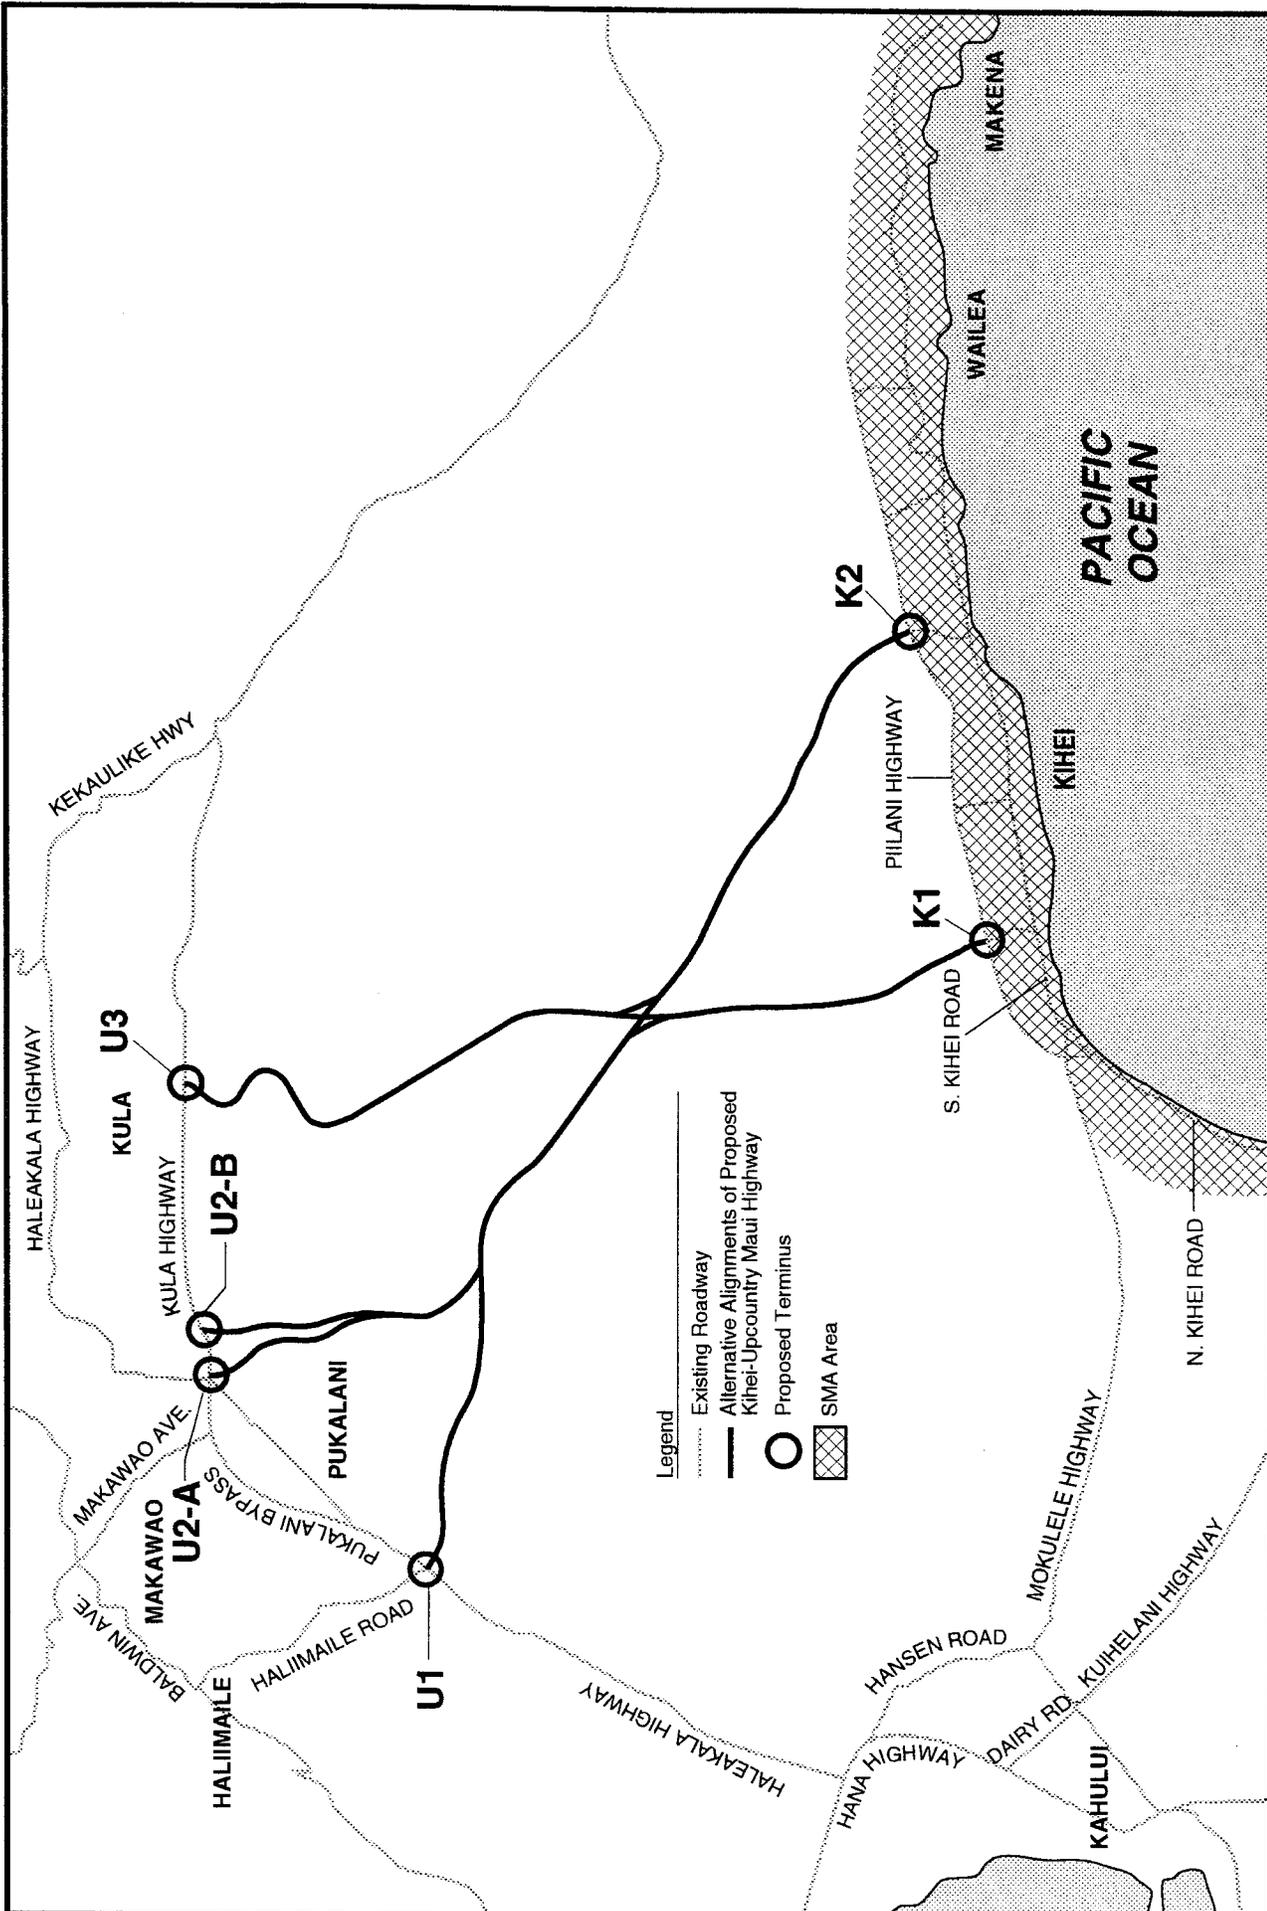

#### **3.1.4.2d Community Plans**

The County prepares nine Community Plans to help guide its decisions regarding development. Two of these plans are of relevance to the proposed project--the Kihei-Makena Community Plan (1998) and the Makawao-Pukalani-Kula Community Plan (July 1996). Their planning areas are displayed on Figure 3-5.

##### Kihei-Makena Community Plan

The Kihei-Makena Community Plan was approved by the County Council and Mayor in early 1998. The Kihei-Makena Plan addressed Kihei-Makena's physical and social infrastructure, emphasizing that community facilities are not keeping up with growth. Therefore, objectives were established to limit hotel and residential development until adequate public facilities and services, such as schools, are established to meet existing needs. The exception to this recommendation is encouragement of appropriate commercial and light industrial activities to diversify the region's economic base.

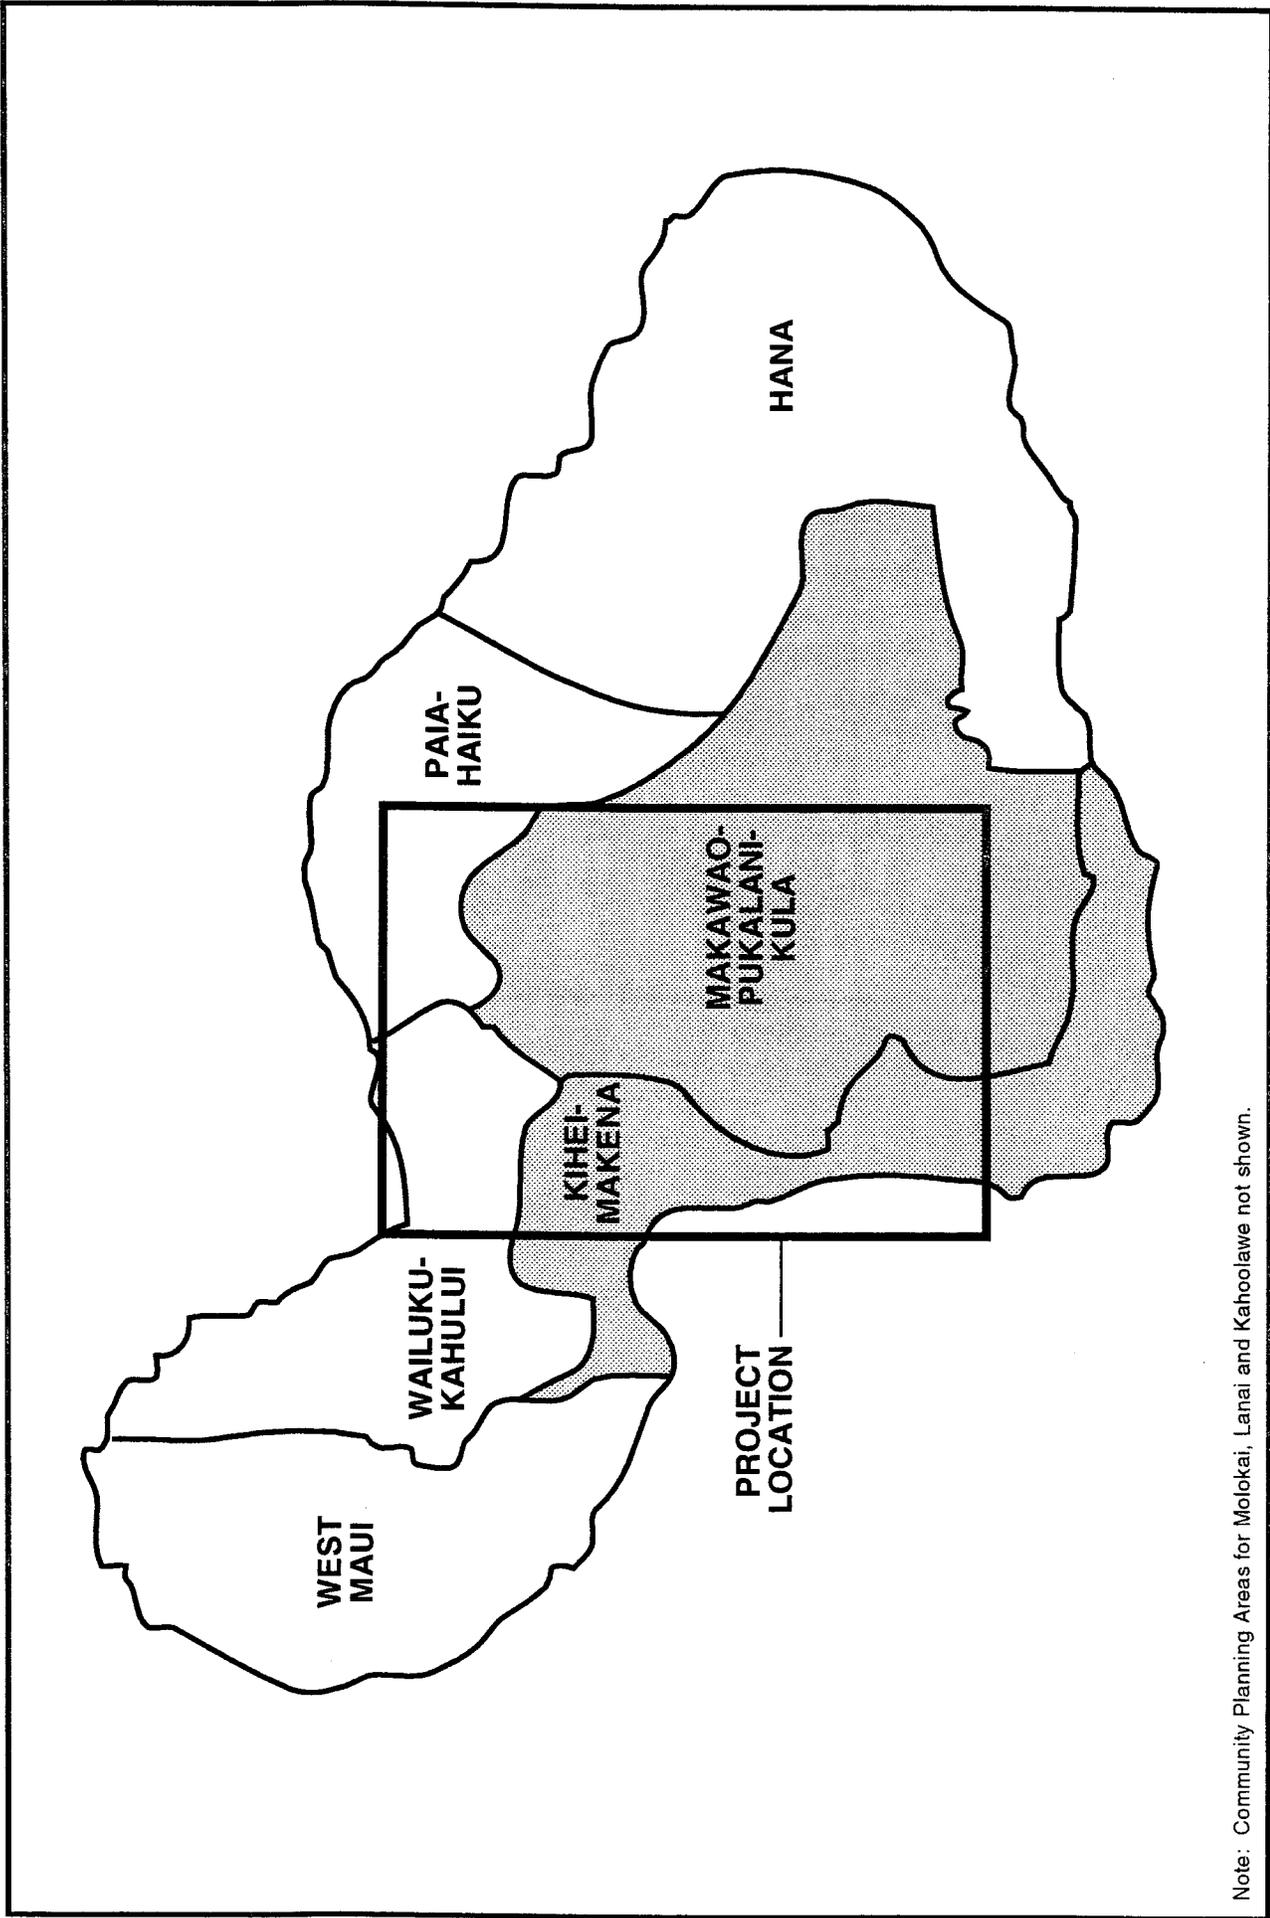

The Kihei-Makena Plan seeks the following land use patterns:

Source: County of Maui

GRAPHIC SCALE:  
 0 1 km 2 km 3 km 0 1 mi. 2 mi.

**Special Management Area**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE 3-4

Note: Community Planning Areas for Molokai, Lanai and Kahoolawe not shown.

Source: County of Maui

GRAPHIC SCALE:

0 5 km. 10 km.

0 4 mi.

0 8 mi.

- Vacant land between Piilani Highway and South Kihei Road / Kilohana Road to be developed as an urban mix, such as single-family and multi-family residences and commercial land uses (shopping centers, hotels, etc.).
- Limited commercial/light industrial development mauka of Piilani Highway, such as the Kaonoulu parcel and the build-out of the Maui R&T Park.
- Resorts and resort-related activities (some residences, retail, commercial, etc.) to continue to be developed in the resort area of Wailea and Makena.

The Kihei-Makena Plan recommended a transportation connection to the Upcountry area. This connection would save commuter time between the residential area of Upcountry and job centers within the Kihei region. In choosing the alignment for this connection, the Kihei-Makena Plan recommended that preference be given to improving transportation service for the maximum number of residents.

#### Makawao-Pukalani-Kula Community Plan

The Makawao-Pukalani-Kula Community Plan (July 1996) seeks to protect and enhance the unique qualities of this region through policies and recommendations to expand the region's agricultural base and enhance the rural qualities associated with Upcountry Maui. The Plan seeks to accomplish this by directing growth to already established urbanized centers. For example, Pukalani would be the region's "hub" for business, commercial and housing land uses. Makawao's and Waiakoa's unique town ambiance and Kula's rural and agricultural atmosphere would be maintained. The Community Plan seeks the following land use patterns:

- Agriculture and open space would be maintained.
- Residential growth would be directed to the established urbanized communities of Pukalani, Makawao and Haliimaile.
  - In Makawao:
    - \* businesses would develop around the established central core; and
    - \* the country town ambiance would be maintained.
  - In Pukalani:

- \* residential growth would be within (in-fill) and to the north (makai) and south (mauka) of the community;
  - \* multi-family residences (for senior housing in the Kulamalu development) would be consistent with the community's size and character; and
  - \* Pukalani would be developed as Upcountry's geographic, public service and commercial hub.
- In Haliimaile:
- \* some small-scale commercial uses would serve existing and proposed residences; and
  - \* limited single-family residential growth would be contiguous with existing residences.
- Small-scale agriculture in Kula, particularly on the west (makai) side of Kula Highway, would be preserved.
  - Waiakoa would be developed as Kula's town center:
    - some low density residential uses;
    - some small scale commercial; and
    - no urban sprawl.
  - Residences in Kula would generally be allowed between Kula Highway and Haleakala Highway. Lot sizes would be no larger than 0.2 ha (1/2 acre).
  - The Keokea area would be developed for homesteads by the Department of Hawaiian Home Lands (DHHL).
  - No large-scale retail or heavy industrial land uses.
  - Existing communities would remain separated with no in-fill development between communities.

With regards to the proposed project, the Makawao-Pukalani-Kula Community Plan stated a preference for the No Build alternative. If the road is built, however, the Plan recommended the U1 alternatives.

## **3.2 FARMLAND**

Large-scale sugarcane and pineapple cultivation and cattle ranching are the major economic activities in Upcountry. Other agricultural activities include small-scale vegetable and flower production. Sugarcane and pineapple activities are located from the west slopes of Haleakala to central Maui. Cattle ranching generally occurs in the area east (mauka) of Haleakala Highway/Kekaulike Avenue and on the lower west and south slopes of Haleakala. In Kula, smaller scale agricultural crops include vegetables, such as head cabbage, lettuce and round onions; and flowers, such as carnations and protea. Unlike sugarcane and pineapple cultivation, agricultural activities in Kula are on much smaller farm lots of about two to four hectares (five to ten acres).

Hawaiian Commercial and Sugar Company (HC&S) cultivates approximately 14 000 ha (35,000 acres) of sugarcane (see Figure 3-6). HC&S operates a sugar mill in Puunene, which also exports electricity to the Maui electrical grid. HC&S's Paia mill was recently closed. Other highways, such as Haleakala and Hana Highways, already cross HC&S fields (see Figure 3-6), and these highways adversely affect productivity for several reasons. For example, only some public road-haul road intersections are signalized, and these crossings delay the transport of sugarcane to the mills. In addition, suburban encroachment interferes with certain agricultural operations, such as cane burning and aerial spraying.

The other large-scale agricultural business in the study area is Maui Land & Pineapple Company (ML&P), the last pineapple processor in the State. ML&P's pineapple fields are located around Haliimaile, Makawao and Pukalani, and in lower Kula (see Figure 3-6). ML&P selected these areas to cultivate pineapple because they have good soil conditions and access to water. Similar to HC&S, urban encroachment has adversely affected ML&P productivity.

Small farms are located in Kula around Omaopio, Pulehu, Naalea, Waiakoa, and Keokea (see Figure 3-1). As described in Section 3.1.2, these two to four hectare (five to ten acre) farms cultivate vegetables and flowers. One of these farming areas is the Kula Agricultural Park, owned by the County of Maui. The Agricultural Park leases parcels to small-scale farmers at low rents. Kula farmers face problems similar to those expressed by HC&S and ML&P: urban

encroachment and periodic water use restrictions during drought conditions. Urban encroachment affects Kula farmers through speculation (increasing land values), neighbor complaints of chemical use by farmers, and increased traffic.

Cattle ranching generally occurs east (mauka) of Haleakala Highway/Kekaulike Avenue and on the lower west and south slopes of Haleakala. The ranching enterprises in the study area are the Haleakala and Kaonoulu Ranches. Similar to HC&S and ML&P, urban encroachment has adversely affected these ranches because of complaints about noise and cattle crossing public roadways.

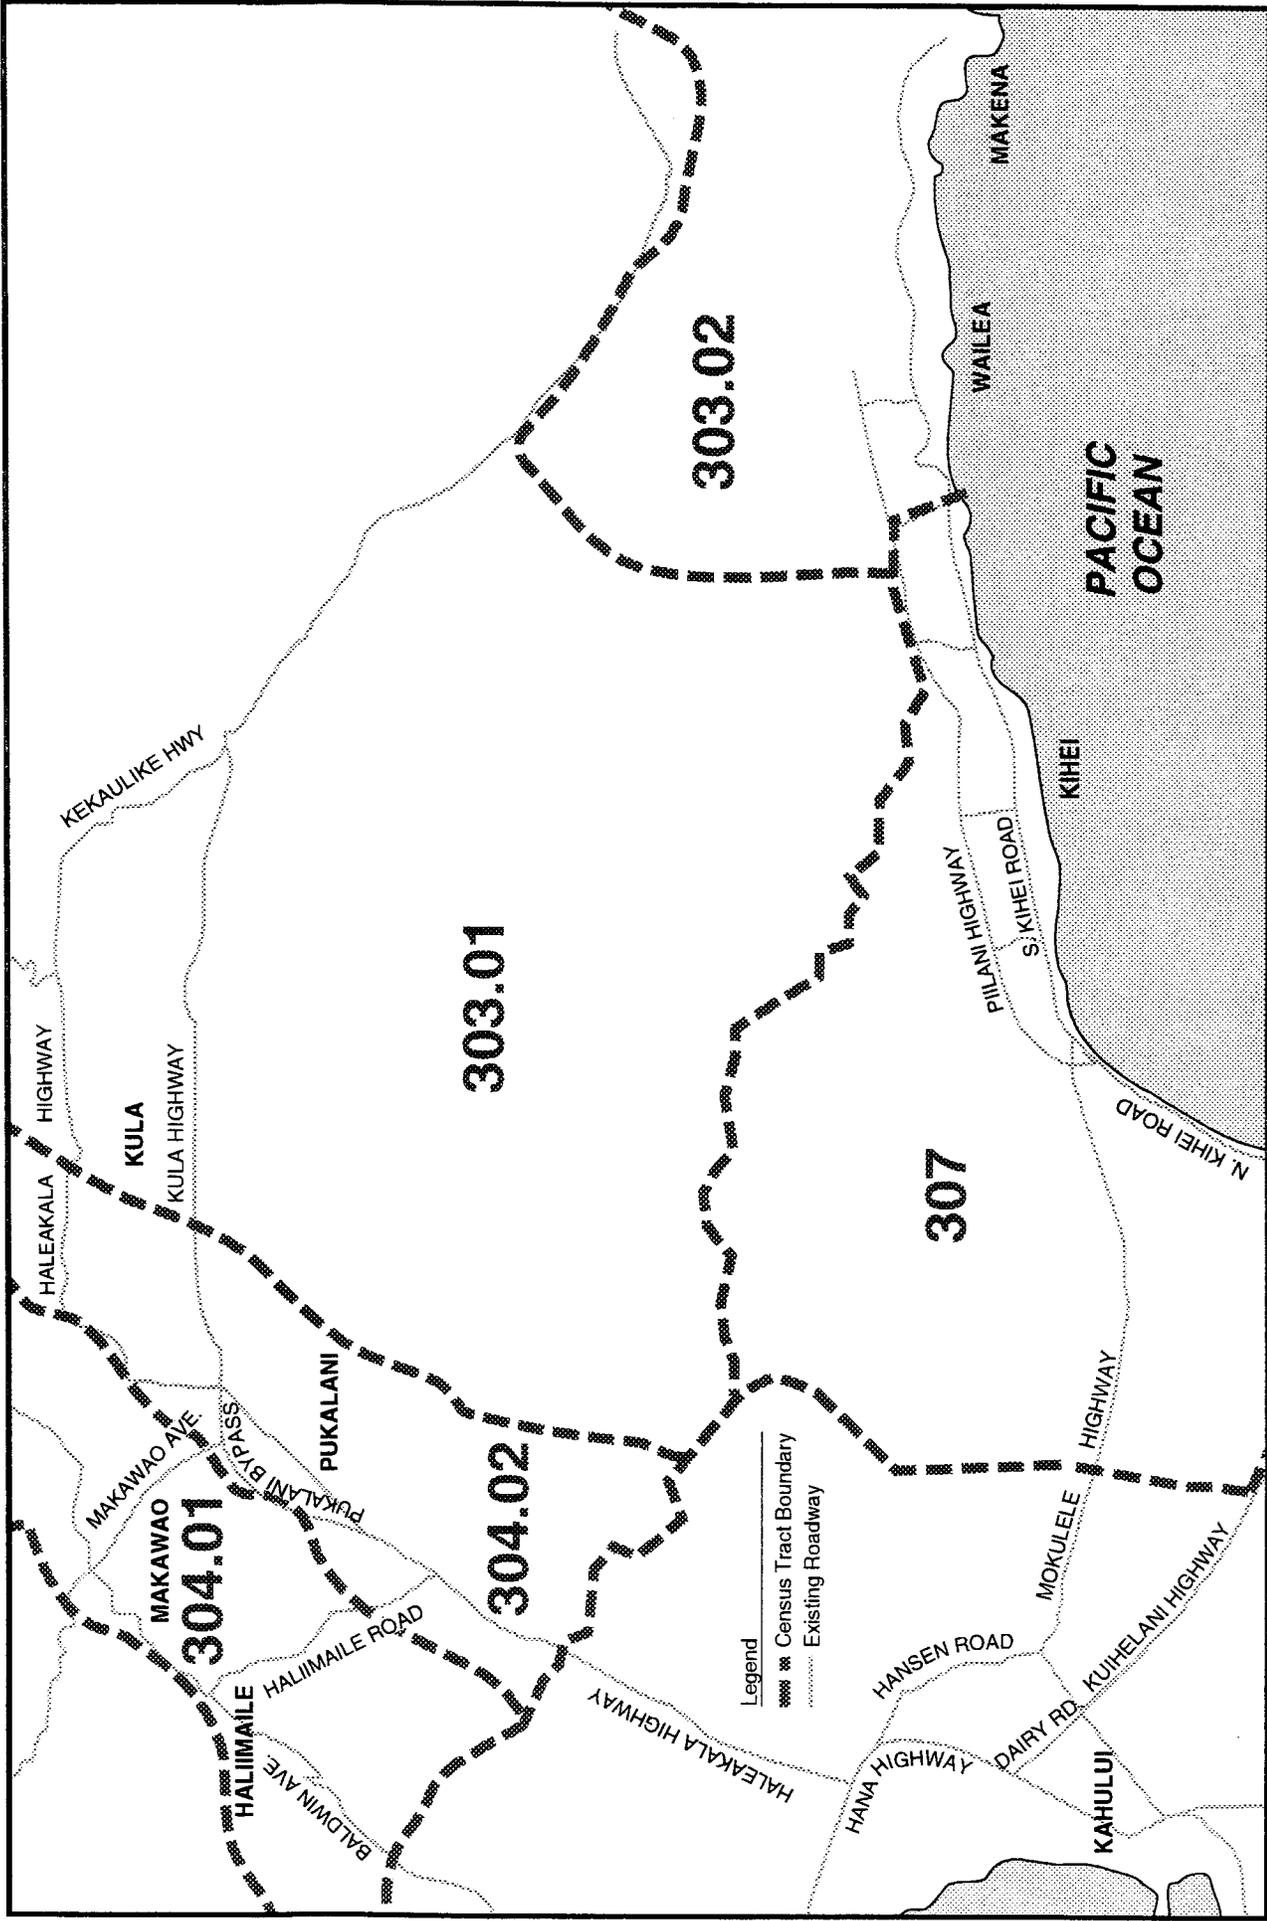

### **3.3 SOCIAL AND ECONOMIC ACTIVITY**

As shown on Figure 3-7, U.S. census tracts (CTs) 303.01, 303.02, 304.01, 304.02, and 307 encompass the study area. CT 303.01 covers the Kula neighborhoods (see Figure 3-1); CT 303.02 includes Wailea and Makena; CT 304.01 includes Makawao and Haliimaile; CT 304.02 includes Pukalani and parts of Kula; and CT 307 includes Kihei.

#### **3.3.1 DEMOGRAPHIC CHARACTERISTICS**

Table 3-1 exhibits selected demographic characteristics of the Kihei-Upcountry Maui study area. In 1990, the population of the study area as delineated by the above CTs was 34,171, or 34 percent of the County population. Population growth in the study area was rapid during the 1980s (annual average growth of 5.6 percent). In comparison, County and State annual average population growth in the same period was 3.5 percent and 1.4 percent, respectively. The Kihei area (CT 307) experienced the greatest population increase both in absolute terms (6,863) and by percentage--an average of 7.9 percent per year. The Pukalani-Kula area (CT 304.02 -- partial) had the smallest average annual growth rate within the study area of 3.5 percent per year. Kula (CT 303.01), Wailea-Makena (CT 303.02) and Makawao-Haliimaile (CT 304.01) had annual growth rates of 3.8 percent, 7.3 percent, and 5.1 percent, respectively.

Table 3-1 also displays the number of households, families, ethnicity and age distributions for the study area in 1990. Overall whites made up 60 percent of the total population of the study

Source: U.S. Census Bureau, 1990 Census of Population and Housing, Hawaii

area, which is 20 percentage points greater than their county-wide proportion (see Table 3-1). Japanese, Filipinos and Hawaiians were the second, third and fourth next most common ethnic groups, respectively. Within the study area, the proportion of whites as compared to the total ranged from a high of 80 percent in the Wailea-Makena area to a low of 43 percent in the Pukalani-Kula area. The age distribution of residents in the study area does not appear to be substantially different from the age distribution of the entire county.

### **3.3.2 HOUSING CHARACTERISTICS**

Table 3-2 exhibits certain housing characteristics of selected Kihei-Upcountry areas in 1990. Overall, 54 percent of the housing units were one-unit structures. However, this ratio varied by community within the study area. In the Upcountry areas, such as Kula (CT 303.01), Makawao-Pukalani (CT 304.01), and Pukalani-Kula (partial) (CT 304.02), one-unit housing types made up more than 90 percent of all housing units, consistent with Upcountry's suburban and rural characteristics. The coastal areas of Wailea-Makena (CT 303.02) and Kihei (CT 307) have a mix of housing types consistent with these areas' more urban characteristics.

The age ratios of structures (see Table 3-2) is a good indicator of the ages of the neighborhoods within the CTs. From the information presented in Table 3-2, Wailea-Makena (CT 303.02) and Kihei (CT 307) are relatively young communities in comparison to all communities combined on the island. Very few of the houses in these areas are older than 20 years. In terms of age of their communities, Kula (CT 303.01) and Pukalani-Kula (partial) (CT 304.02) are very similar to the island overall. The age ratios of Haliimaile-Makawao indicate that they are older communities that have recently experienced surges in residential growth.

Overall the owner versus renter occupancy ratio for the study area was 58:42 in 1990, roughly the same as the owner-renter occupancy ratio for the county. Within communities of the study area, this ratio varied from 65:35 in Makawao-Pukalani to 51:49 in Kihei. According to the Maui County Data Book (December 1994), approximately 32 percent of the housing units in the Kihei to Makena area were used for seasonal or recreational purposes in 1990. In the Upcountry areas, only two to three percent of the housing units were used for such purposes.

**Table 3-2  
Housing Characteristics of Selected Kihei-Upcountry Areas, 1990**

	Kula	Wailea- Makana	Haliimaile- Makawao	Pukalani- Kula (Part)	Kihei	Total	Maui County

### **3.3.3 INCOME AND EMPLOYMENT CHARACTERISTICS**

Table 3-3 exhibits certain income characteristics for selected Kihei-Upcountry areas in 1990. Median household incomes in the study area were higher than the median for the County, which was \$38,771 in 1989. Incomes varied from a low of \$40,483 in Kula (CT 303.01) to a high of \$45,694 in Wailea-Makena (CT 303.02). The poverty rates of residents in Kihei-Upcountry areas were slightly higher than the rate for the County. The percentage of households with incomes below the poverty level ranged from a low of six percent in Pukalani-Kula (partial) (CT 304.02) to a high of 12 percent in Wailea-Makena (CT 303.02).

From 1980 to 1993, the unemployment rate for Maui island ranged from 2.2 percent in 1989 to 7.6 percent in 1992. The average in this period was 4.9 percent. The Kihei to Makena region is one of the island's major employment centers (see Sections 1.2.2 and 3.3.4).

### **3.3.4 ECONOMIC CHARACTERISTICS**

Maui's most important industry is tourism. From 1989 to 1993, an average of over 2.3 million visitors arrived on Maui per year. The peak for this period was 1989 when there was over 2.5 million visitors. In 1998 and 1999, the island supported 2.24 and 2.28 million visitors, respectively. Most of Maui's hotels, resorts, and visitor-related businesses are in West Maui from Lahaina to Kapalua, and in South Maui from Kihei to Makena. In the latter area, there were 84 visitor-accommodation facilities in 1993 providing a total of 7,318 visitor rental units, approximately 40 percent of all visitor-related units on Maui. In contrast, the Upcountry areas had only 63 visitor-related units. The Kihei-Makena region held about 14.6 percent of the employment on Maui, ranking third behind West Maui and Wailuku-Kahului in the number of jobs on the island.

Unlike Kihei-Makena, agriculture is Upcountry Maui's prime economic activity. Agricultural activities in Upcountry Maui include large-scale sugarcane and pineapple cultivation, ranching and small-scale farming in Kula (see Section 3.2). Upcountry Maui also has small to medium-scale (e.g., supermarket) commercial activities, mostly in Pukalani and Makawao. The medium sized commercial land uses are exclusively within Pukalani. Makawao's

**Table 3-3  
Income Characteristics of Selected Kihei-Upcountry Areas, 1990**

	Kula	Wailea- Makena	Haliimaile- Makawao	Pukalani- Kula (Part)	Kihei	Maui County

Note: CT: Census Tract

Source: U.S. Census Bureau, 1990 Census of Population and Housing, Hawaii

business district contains pedestrian-oriented small retail stores and restaurants. Kula has very few commercial activities.

Scientific research is becoming an increasingly important industry on Maui. This industry is centered at the Maui R&T Park in Kihei and Science City on the summit of Haleakala. Science City, a federal research campus, is used for space- and defense-related research and development. Information about the Maui R&T Park can be found in Sections 1.2.2 and 3.1.3.

### **3.3.5 PUBLIC FACILITIES AND SERVICES**

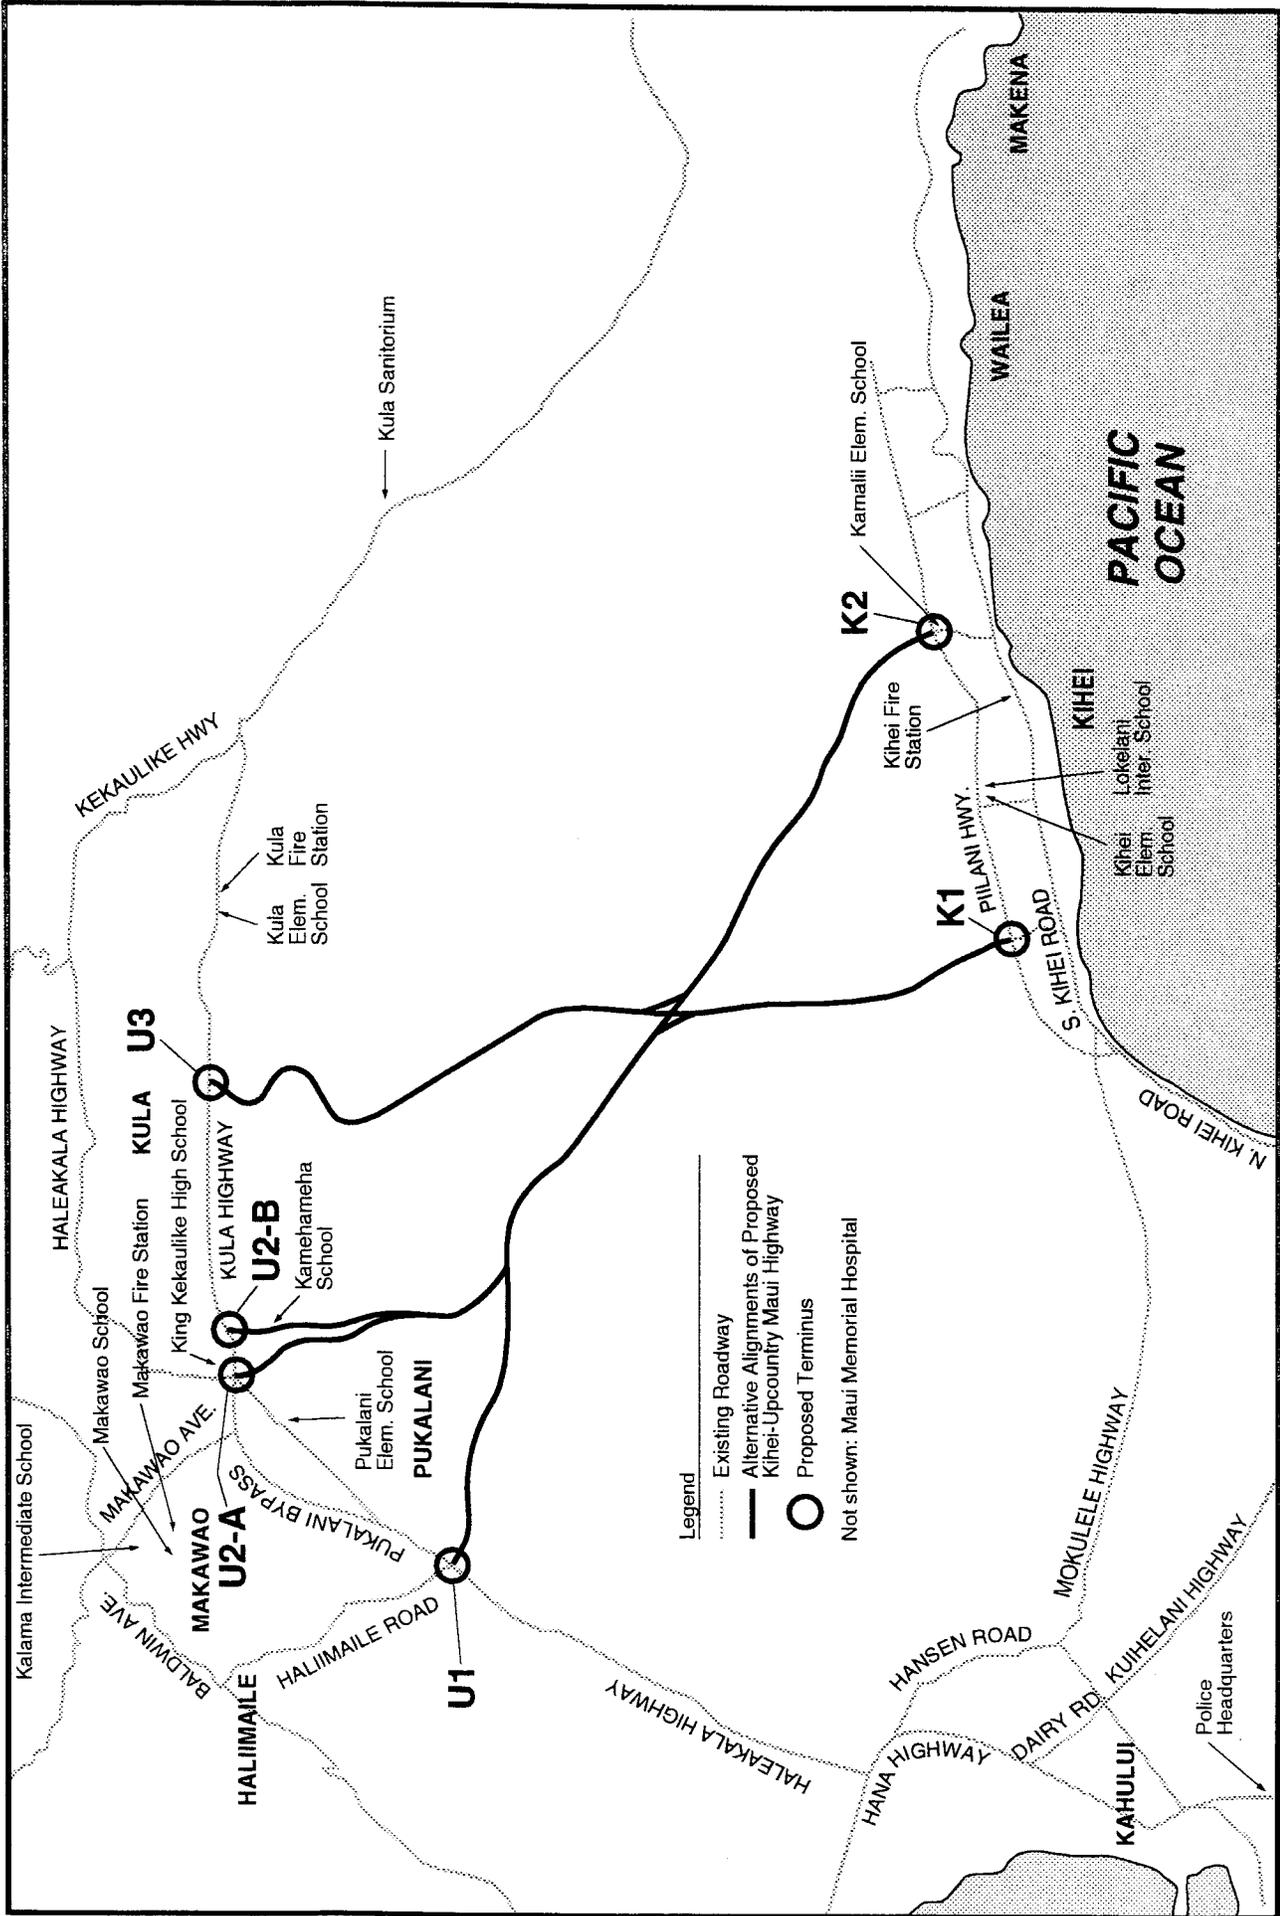

Community facilities and services in the Kihei-Upcountry Maui study area include community centers, schools, police and fire stations and medical facilities (see Figure 3-8).

There are three schools in the Kihei-Makena region: Kihei Elementary School, Lokelani Intermediate School, and the new Kamalii Elementary School. Schools in Upcountry Maui include Makawao School, Pukalani Elementary, Kula Elementary, Kalama Intermediate, Seabury Hall (private), King Kekaulike High School, and Kamehameha School, which opened in 1999.

Police patrols for Kihei-Makena and Upcountry Maui operate out of the main police headquarters in Wailuku. The Makawao Community Police Officer maintains an office in the town. There are plans to construct a police sub-station in Kihei. Fire stations are located on South Kihei Road near Kalama Park, in Makawao, and in Kula near Waiakoa.

Maui Memorial Hospital in Wailuku is the principal hospital on Maui. Smaller hospitals are in Hana and Kula (Kula Sanatorium). The Kula Sanatorium provides care for tubercular, mental and long-term patients. An ambulance stationed in Makawao provides emergency service between the Upcountry area and Maui Memorial Hospital. There is no 24-hour ambulance service in Kula. Emergency medical service in Kihei is provided by Maui Memorial Hospital.

Section 3.11 contains information about community parks and recreational facilities in the project area.

**Public Facilities**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
Final Environmental Impact Statement  
FIGURE 3-8

### **3.3.6 CRIME**

Table 3-4 exhibits the crime rates of the communities in the study area for selected offenses for the years 1993 to 1996. The table indicates that the property crime rate (e.g., burglary and theft) in the Kihei to Makena communities is two to four times the rate of Upcountry communities. The crime rate differences for other offenses, such as criminal property damage, are not as great, or the Upcountry communities have higher rates than the Kihei-Makena communities.

## **3.4 INFRASTRUCTURE**

### **3.4.1 ROADWAY SYSTEM**

#### **3.4.1.1 Roadway Network**

Figure 3-9 displays the major transportation facilities in Kihei-Makena and Upcountry, and the roadways that connect the two regions.

The major roadways in Kihei-Makena are South Kihei Road, Piilani Highway, Wailea Alanui and Makena Alanui (see Figure 3-9). South Kihei Road, Wailea Alanui and Makena Alanui, which are two-lane arterials running along the Kihei-Makena coastline, are County facilities. They are the main roadway spine providing access to all land uses in Kihei, Wailea and Makena. Piilani Highway is a limited-access two-lane State facility that runs parallel to and east (mauka) of South Kihei Road, beginning at its intersection with Mokulele Highway and terminating at Wailea Iki Drive in Wailea. It has paved shoulders with left- and right-turn deceleration lanes at major intersections. South Kihei Road becomes North Kihei Road north of its intersection with Mokulele Highway, providing access to West Maui.

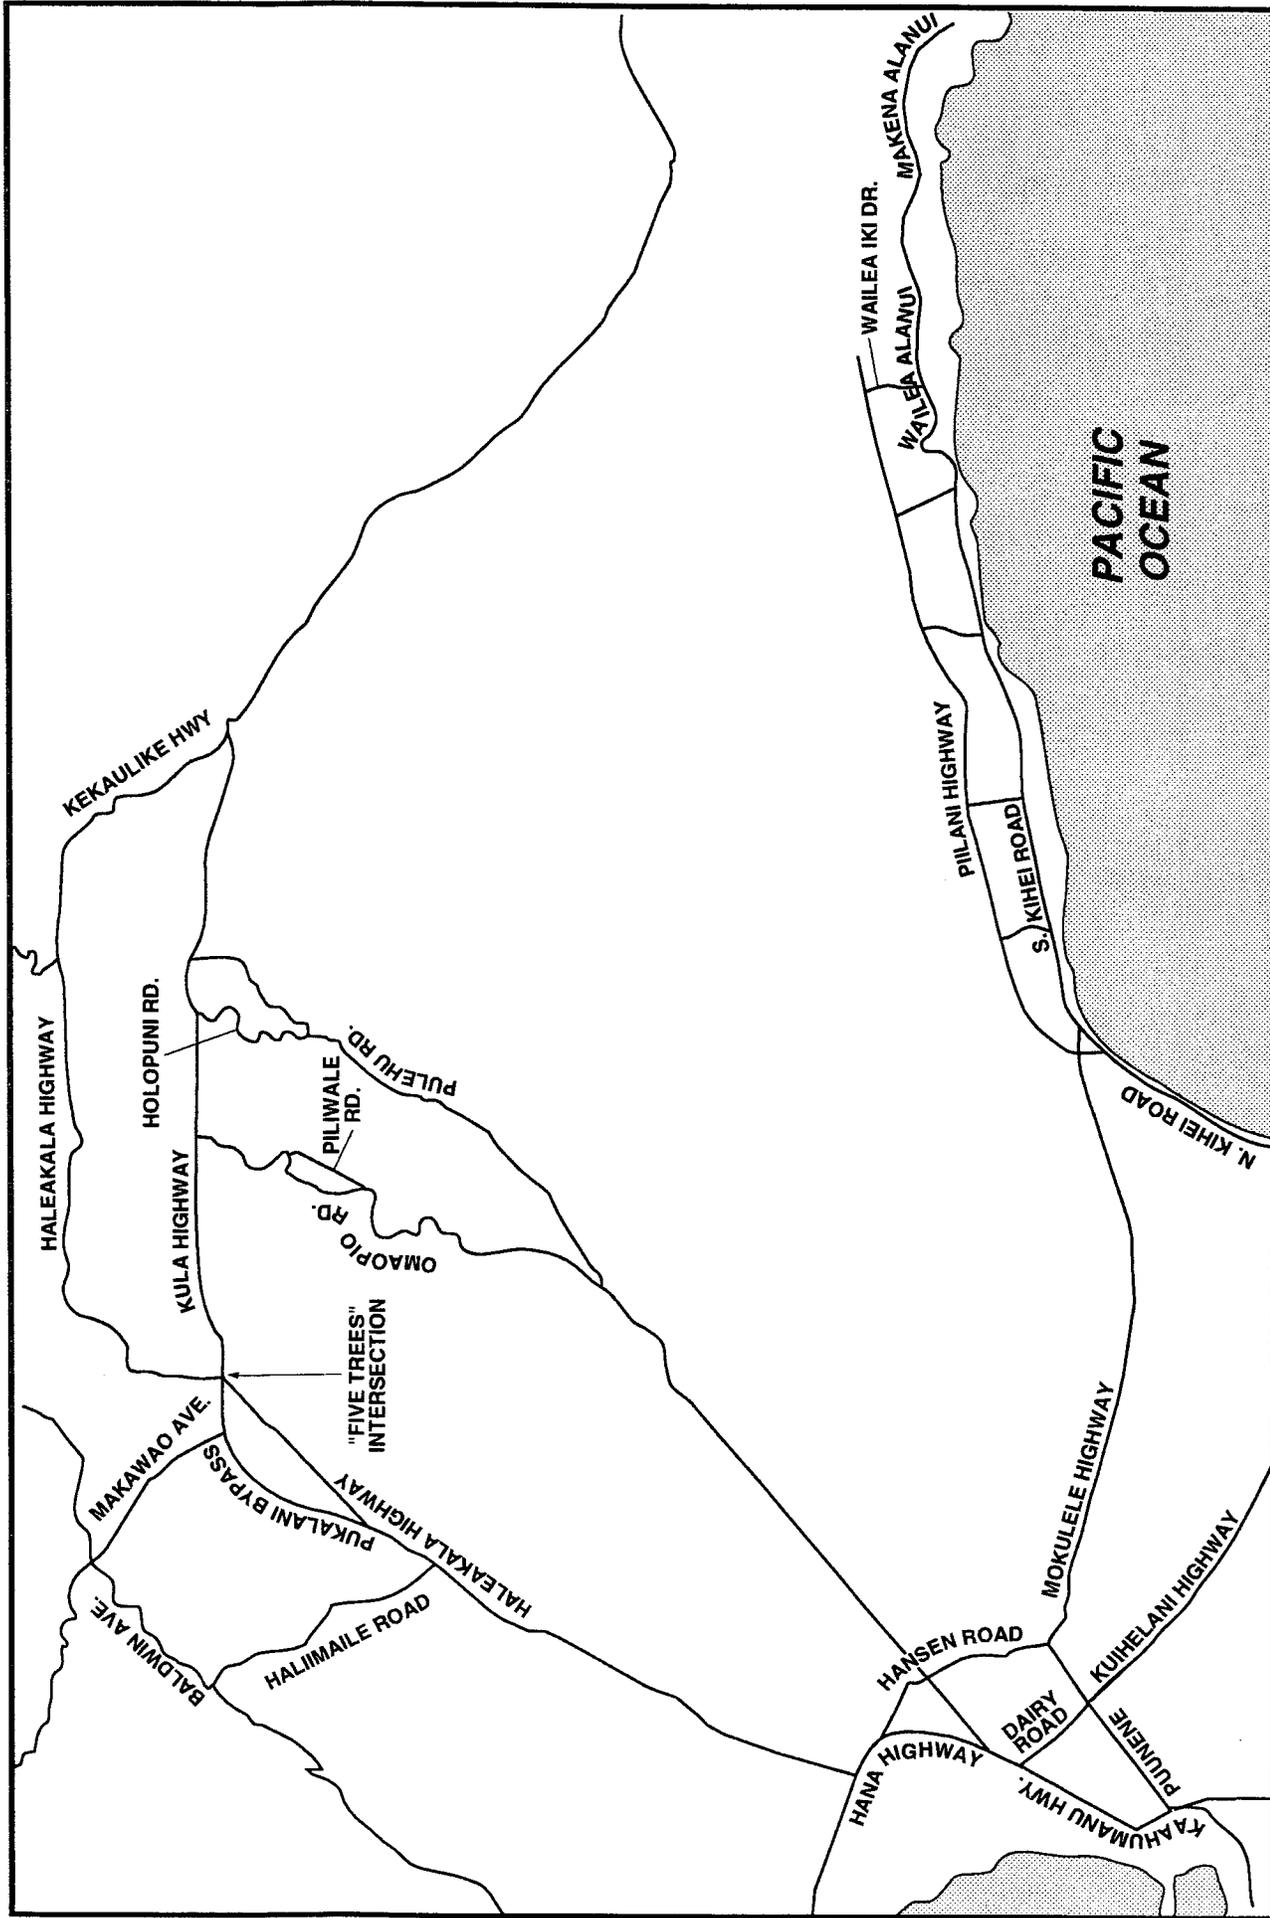

**Table 3-4  
Crime Rate for Selected Offenses Per 10,000 Residents**

Offense/Location	Year			
	1993	1994	1995	1996
<b>Burglary</b>

Source: Police Department, County of Maui, July 14, 1997

Upcountry Maui's major highways are Haleakala Highway, Pukalani Bypass and Kula Highway (see Figure 3-9). Haleakala Highway and Pukalani Bypass are three-lane (two lanes east (mauka) and one lane west (makai) bound) limited-access facilities with paved shoulders. At the north (makai) side of Pukalani, Haleakala Highway extends into Pukalani where it becomes

**Major Roadways**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE 3-9

a two-lane roadway with signalized intersections and driveway access to adjacent land uses. During the a.m. peak period, the middle south-bound (mauka) lane on Haleakala Highway/Pukalani Bypass is contra-flowed to the north-bound (makai) direction. At the "Five Trees" intersection, Haleakala Highway extends east (mauka) to the summit of Haleakala, and is the southeastern (mauka) terminus of Pukalani Bypass. The "Five Trees" intersection is the northern terminus of Kula Highway, which provides access to most of the Kula communities. This State highway terminates at Ulupalakua.

Omaopio and Pulehu Roads (see Figure 3-9) are County facilities used by Kula farmers to move equipment from field to field and transport agricultural products to Kahului Harbor. Although these roads are narrow and winding, they are used by some motorists as an alternative to Haleakala Highway to travel to Kahului or other parts of Maui.

The transportation infrastructure between the Kihei-Makena and Upcountry regions consists of Mokulele Highway, Puunene Avenue, Hansen Road, Dairy Road and Hana Highway (see Figure 3-9). Mokulele Highway and Puunene Avenue are two-lane arterials running north-south between Kahului and Kihei, and are one of the primary connections between the north and south coasts. Hana Highway begins in Kahului and runs along the north coast terminating at the southeast end of the island. Between Kahului and Haleakala Highway, it is a four-lane divided roadway. There are two alternative routes between Puunene Avenue and Hana Highway. The first and most popular route is Dairy Road, a recently widened four-lane roadway. The second is Hansen Road, a two-lane roadway with numerous curves and a low design speed.

#### **3.4.1.2 Roadway Accidents**

Table 3-5 presents information on the number of accidents on roadways between Kihei-Makena and Upcountry Maui between September 23, 1992 and June 26, 1997.

As indicated on Table 3-5, Pulehu Road, Omaopio Road, Dairy Road, Mokulele Highway and Hansen Road have experienced a high number of vehicle accidents. Pulehu, Omaopio and Hansen Roads carry much smaller volumes of traffic in comparison to Dairy Road and Mokulele Highway. Presently, Dairy Road is probably a safer facility than indicated on Table

3-5 because it has recently been widened to four lanes. Mokulele Highway is planned to be widened to four lanes, which should improve safety on this roadway.

**Table 3-5  
Motor Vehicle Accidents**

### **3.4.2 BICYCLE AND PEDESTRIAN FACILITIES**

The Bike Plan Hawaii: A State of Hawaii Master Plan (April 1994) recommended improvements to the State's bikeway systems. This plan serves as guidance to the SDOT and County transportation agencies when new roadway construction or improvements to existing roadways are contemplated. Within the study area, there is an existing bike route on Piilani Highway from Mokulele Highway to Wailea-Makena (see Figure 3-10). Recommended

**Existing and Proposed Bikeways**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE 3-10**

Source: Bikeplan Hawaii, April 1994.

GRAPHIC SCALE:

bikeways are also shown on Figure 3-10. Recommended bikeways include facilities on South Kihei Road, Mokulele Highway, and Haleakala Highway.

Bicycle tours are a popular tourist activity on Maui. Tours normally start from the summit of Haleakala, run through Crater Road, Haleakala Highway and Baldwin Avenue, and end in Paia.

Pedestrian facilities within the Kihei area exist along South Kihei Road and the side streets, and at points where there is public access to the beaches and shoreline. Because of its rural environment, existing pedestrian facilities in Upcountry are limited to some of the residential neighborhoods.

### **3.4.3 WATER SUPPLY SYSTEM**

Maui is served by five major water supply systems: Central Maui, Makawao, Kula, Hana, and Lahaina; and 15 individual sub-systems. The Iao Aquifer in the West Maui Mountains is the water source for Kihei-Makena and other areas. Water is transmitted from the West Maui Mountains through transmission lines running along South Kihei Road, Piilani Highway, and Wailea Alanui Drive. The Maui Board of Water Supply (BWS) is planning to develop groundwater resources in East Maui for Kihei and other areas.

Unlike Kihei-Makena, Upcountry's water supply is from surface sources along the north and east side of the island that feed into the Makawao and Kula systems. Makawao and Pukalani receive their water from the Makawao system. Surface water is treated at the Kamole Weir Water Treatment Plant near Haliimaile, and pumped up to the two communities. This system has no reservoir. The Maui BWS is planning to construct a 760 000 m<sup>3</sup> (200 million gallon) reservoir to support the planned developments specified in the Makawao-Pukalani-Kula Community Plan (see Section 3.1.4.2d). The East Maui groundwater resource, once developed, would be used by the Makawao system during droughts when surface water resources are dry.

The Kula system operates as two separate systems (Upper and Lower), with each having its own separate surface water intakes, treatment plant, and distribution system (lines run along

the upper portion of Haleakala Highway for the Upper system, and along Kula Highway for the Lower system). However, water can be pumped up (lower to upper) or gravity-fed (upper to lower) between the two systems, if required. Also, during droughts, water is sometimes pumped to the Kula systems from the Makawao system, and customers are required to reduce water use. The Maui BWS has recently constructed two 190 000 m<sup>3</sup> (50 million gallon) reservoirs in the Upper Kula System, but there are no other immediate plans for a new reservoir in this system. A reservoir similar in size to the planned Makawao system reservoir (760 000 m<sup>3</sup> (200 million gallon)) is being planned for the Lower Kula System. The Maui BWS is also planning to convert the Upper system to a dual system, in which non-potable water would be made available to Kula farmers in the Upper area for irrigation purposes.

The Kulamalu developer (see Section 3.1.3) drilled a well in Haiku to supply water to this development (The Maui News, September 5, 1997, correspondence from the Maui BWS, May 4, 1998, and letter from Kulamalu, Inc. dated September 20, 1999). The pump installed at this well will produce 6200 m<sup>3</sup> (1.64 million gallons) per day of which 45 percent, or 2800 m<sup>3</sup> (7.38 million gallons) per day, will be allocated to the Kulamalu project. The remaining water will not require treatment, and will remain in Haiku. Initially, this water will provide an additional supply during drought conditions, and improve the reliability of the Upcountry systems. The Kulamalu developer will provide storage tanks and new or improved mains within the development.

#### **3.4.4 DRAINAGE**

Because it is an urban community, Kihei-Makena requires drainage collection systems. The system consists of lined and unlined channels, drain lines, pipe or box culverts, and road-side ditches.

The Upcountry area contains limited drainage collection infrastructure because of its low development density, well-draining soils and its low to moderate rainfall. When it rains enough to produce overland flow, sheet flows enter the numerous gulches on the west flank of Haleakala.

## **3.5 CLIMATE AND AIR QUALITY**

### **3.5.1 LOCAL METEOROLOGY**

Maui's climate varies according to altitude and leeward/windward location. Lowland areas tend to have a semi-tropical climate, while higher elevations are characterized by temperate climates. Maui is cooled by northeast trade winds approximately 70 percent of the year. These winds are constant during the spring and summer months. Trade winds are affected by local topographic conditions. The northeast trade winds become northerly as they are funneled between the West Maui Mountains and Haleakala. Areas in the "wind shadows" are shielded.

The climate of Upcountry Maui is conducive to farming, being mild with warm days and cool evenings. Pukalani and Kula are relatively dry with rainfall ranging between 50 to 100 cm (20 to 40 inches) annually. The amount of rainfall increases northeastward towards Makawao and Haiku to approximately 125 to 250 cm (50 to 100 inches) annually. Temperatures range from around 15 (C) (60s (F)) during the winter to the high 20s (C) (mid 80s (F)) in the summer.

Kihei-Makena is on the south side of the island, in the rain shadow of Haleakala. The region is generally sunny, warm and dry the entire year. Temperatures range from a minimum of 17 degrees (C) (62 degrees (F)) in February to a maximum of 32 degrees (C) (90 degrees (F)) in July. Average annual precipitation is less than 38 cm (15 inches) per year. Most of this precipitation occurs during the winter months when storms are usually accompanied by south winds.

### **3.5.2 AMBIENT AIR QUALITY STANDARDS**

As required by the Clean Air Act, National Ambient Air Quality Standards (NAAQS) were established by the U.S. Environmental Protection Agency (EPA) for seven major air pollutants: carbon monoxide (CO), nitrogen oxides (NO<sub>x</sub>), ozone (O<sub>3</sub>), particulate matter smaller than 10 microns (PM<sub>10</sub>), PM<sub>2.5</sub> (particulate matter smaller than 2.5 microns), sulfur oxides (SO<sub>x</sub>), and lead. Current standards for ozone and PM<sub>2.5</sub> were established in September 1997. The State

of Hawaii has also established its own standards for these pollutants. Both the National and State Ambient Air Quality Standards are listed in Table 3-6. The "primary" standards have been established to protect the public health with an "adequate margin of safety." The "secondary" standards are intended to protect the nation's welfare and account for air pollutant effects on soil, water, visibility, materials, vegetation, and other aspects of the general welfare. The State of Hawaii issues its ambient air quality standards in terms of a single standard that is designed "to protect public health and welfare and to prevent the significant deterioration of air quality."

**Table 3-6  
National and State Ambient Air Quality Standards**

Pollutant	Standard		
	Hawaii State	Federal Primary	Federal Secondary
<b>Carbon Monoxide (CO)</b>			
1 Hour	10 mg/m <sup>3</sup> (9 ppm)	40 mg/m <sup>3</sup> (35 ppm)	40 mg/m <sup>3</sup> (35 ppm)

Source: State of Hawaii, Department of Health, Clean Air Branch.  
EPA NAAQS, Updated July 1997.

### **3.5.3 ATTAINMENT STATUS OF STUDY AREA**

Section 107 of the 1977 Clean Air Act Amendments requires the EPA to publish a list disclosing whether geographic areas are in compliance with the NAAQS. Areas not in compliance with the NAAQS are termed nonattainment areas. Areas which have insufficient data to make a determination are unclassified, and are treated as attainment areas until proven otherwise. The designation of an area is made on a pollutant-by-pollutant basis.

The State of Hawaii is designated as an attainment area for all of the applicable pollutants.

### **3.5.4 MONITORED AIR QUALITY**

Air pollutant levels in Hawaii are monitored by a network of sampling stations under the supervision of the State of Hawaii Department of Health (SDOH). On Maui, there are only two stations. They are strategically located in Kihei and Paia to be downwind of several sugarcane fields (cane fields are burned before harvest). Established in 1996, these stations monitor sugarcane burning activities, sampling PM<sub>10</sub>. Sugarcane operations also generate fugitive dust from cane haul vehicles traveling on dirt roads within the fields, and other activities. Fugitive dust can travel a few hundred meters.

Additional ambient air quality data for other pollutants was obtained from an air quality study for the proposed Kahului Airport Improvements, which obtained its data from the Maui Electric Company (MECO) (Prevention of Significant Deterioration Permit Application for Maalaea Combined Cycle Project, August 1990).

A summary of the SDOH and MECO air quality data in the study area is provided in Table 3-7. As indicated on this table, monitored levels are well below the applicable State and federal standards.

**Table 3-7  
Air Quality Summary for Study Area  
(SDOH and MECO Monitoring Stations)**

Pollutant	Location		
	Maalaea (MECO Site #233)	Kihei (SDOH Site)	Paia (SDOH Site)
<b>Carbon Monoxide (CO)</b>			
1 Hour	14 ug/m <sup>3</sup> (.012 ppm)	NM	NM
8 Hour	6 ug/m <sup>3</sup> (.005 ppm)	NM	NM
<b>Nitrogen Dioxide (NO<sub>2</sub>)</b>

December 1995

### **3.6 NOISE**

#### **3.6.1 CHARACTERISTICS AND MEASUREMENT OF SOUND**

Several characteristics of sound affect its impact. These include the sound level (loudness), the frequencies involved, the period of exposure to the noise, and changes or fluctuations in the noise levels during exposure.

Loudness is measured in decibels. Since the human ear does not perceive all pitches or frequencies equally, noise levels are adjusted, or weighted, to correspond to human hearing. This adjusted unit is known as the A-weighted decibel, or dBA.

Since dBA describes a noise level at just one moment, and very few noises are constant, ways of describing noise over extended periods are needed. One way is describing fluctuating noise heard over a period as if it were a steady, unchanging sound. This type of an average is called the equivalent sound level,  $L_{eq}$ .  $L_{eq}$  is the constant sound level that, for a given situation and time period (e.g., 1-hour,  $L_{eq}(1)$ ; hourly,  $L_{eq}(h)$ ; or 24 hours,  $L_{eq}(24)$ ), conveys the same sound energy as the actual time varying sound.

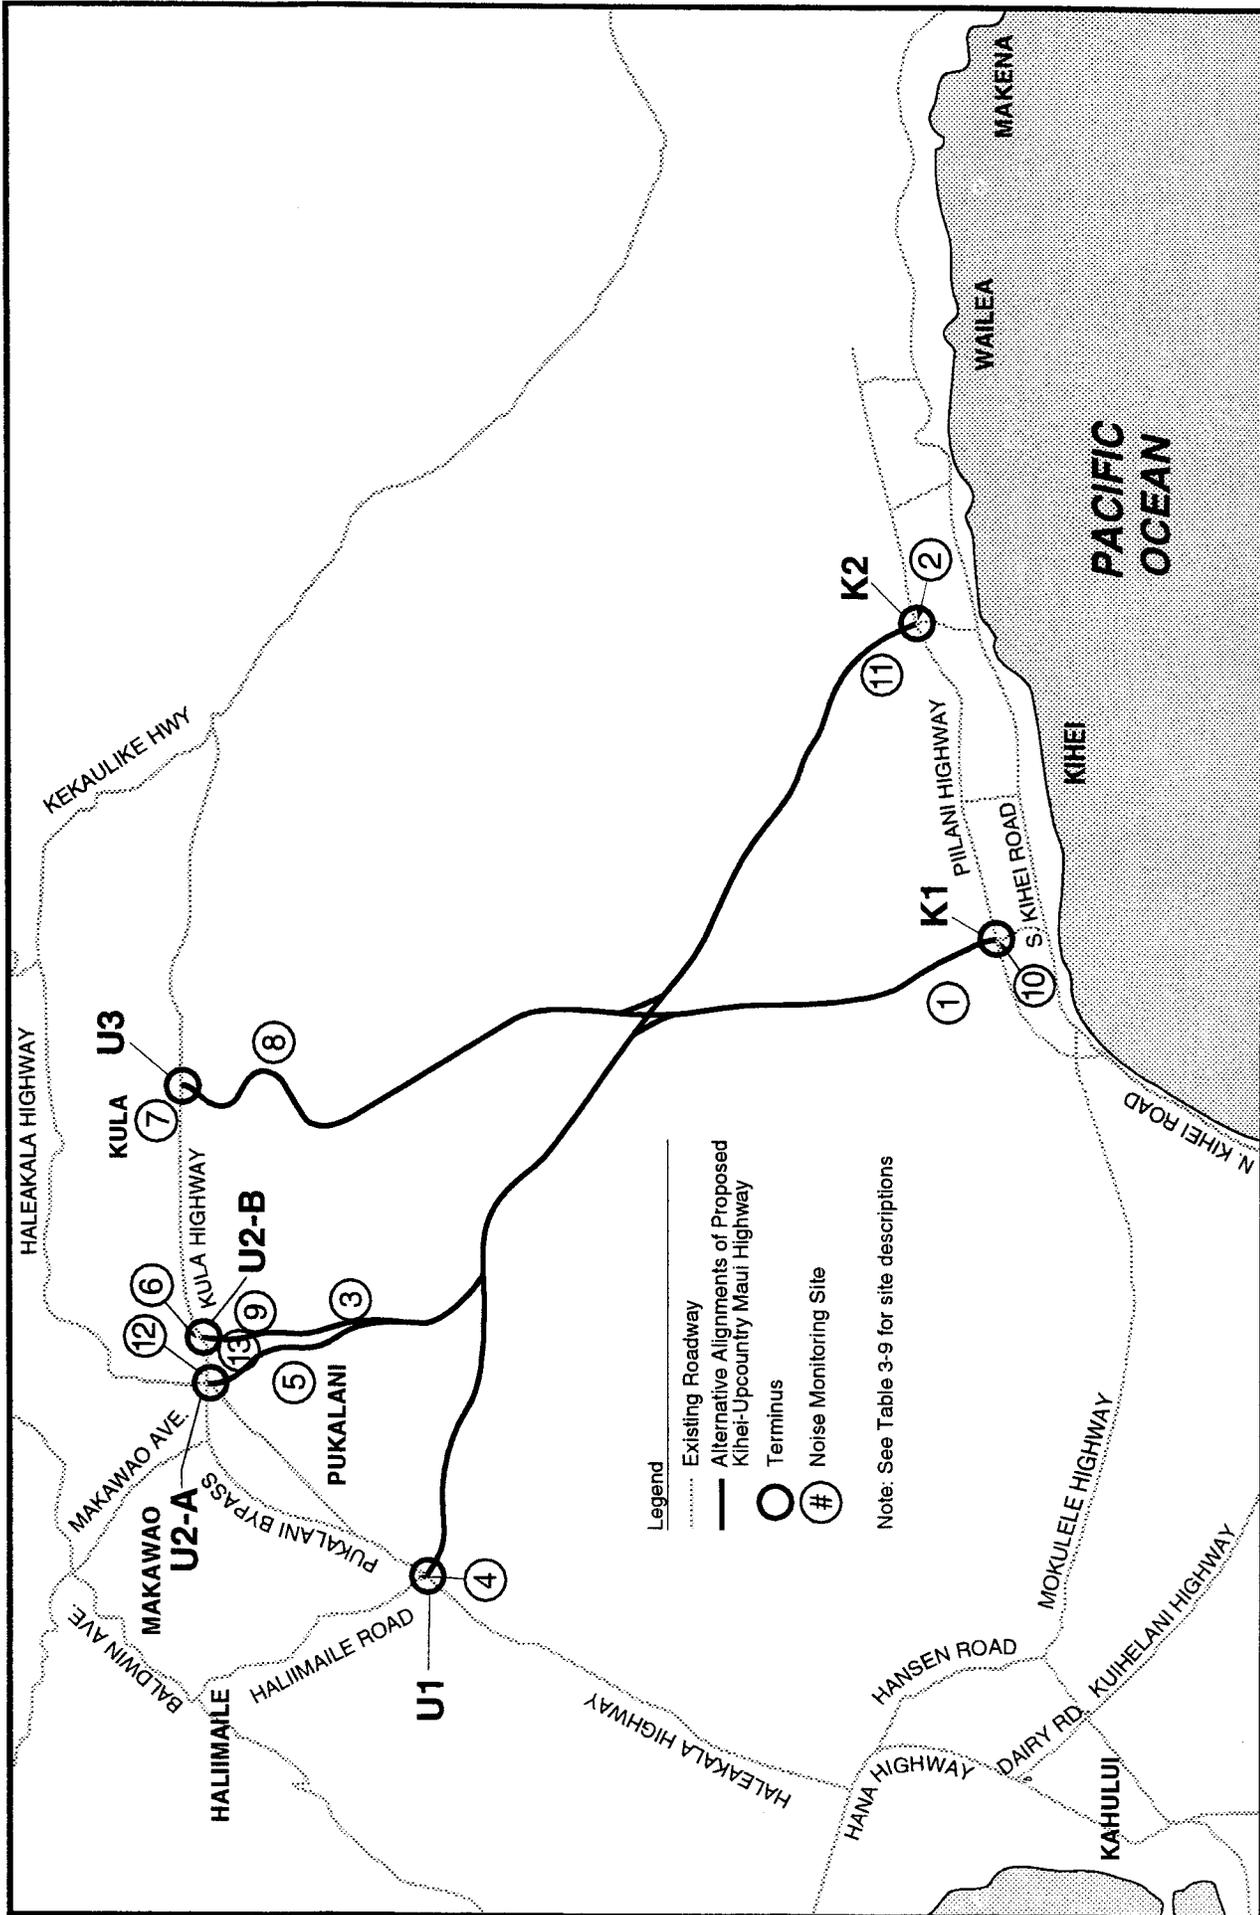

### **3.6.2 NOISE ABATEMENT CRITERIA**

The FHWA has developed noise impact criteria, and the State of Hawaii has adopted these criteria as its standard. Table 3-8 lists the FHWA Noise Abatement Criteria (NAC). A noise impact occurs when predicted traffic noise levels approach or exceed the NAC, or when predicted traffic noise levels substantially exceed the existing noise level. The NACs set thresholds for determining when noise abatement has to be considered.

Most of the land in the study area is used for agriculture and ranching, and therefore falls under Activity Category D. Some land uses near the east (mauka) and west (makai) ends of the alternatives are residences, and therefore fall under Activity Category B.

### **3.6.3 MEASUREMENTS AND EXISTING CONDITIONS**

Field measurements of existing noise levels were taken from June 18 to 20, 1997 at thirteen sites, as shown on Figure 3-11. These sites were considered representative of sensitive noise receptors in the area. The noise measurements were taken when traffic volumes were high, yet vehicles operated at the allowable speed limit. However, Site 1, a residential community east (mauka) of Piilani Highway near the K1 alignment, was not measured during these traffic conditions. This site was selected because of public comments made during the environmental scoping phase that noise impacts would occur at this site from early morning

**Noise Monitoring Sites**  
**KIHAI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE 3-11**

Source: Parsons Brinckerhoff Quade & Douglas, Inc., June 1997

GRAPHIC SCALE:

vehicles (buses, vans, cars) traveling to the Haleakala Summit (see Section 1.2.4). Noise measurements at this site were taken at 5:00 a.m.

**Table 3-8  
FHWA Noise Abatement Criteria (NAC)**

<b>Activity Category</b>	<b><math>L_{eq}(h)</math> for Noisiest Traffic Hour</b>	<b>Description of Activity Category</b>
A	57 (Exterior)	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B	67 (Exterior)	Picnic areas, recreation areas, playgrounds, active sports areas, parks, residences, motels, hotels, schools, churches, libraries, and hospitals.
C	72 (Exterior)	Developed lands, properties, or activities not included in Categories A or B.
D	----	Undeveloped lands
E	52 (Interior)	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums.

Notes:  $L_{eq}(h)$  is the one-hour energy equivalent sound level.

Interior noise level standards apply to:

1. Indoor activities for those parcels where no exterior noise sensitive land use or activities have been identified; and
2. Situations where the exterior activities are either remote from the highway or shielded so that while the exterior activities remain undisturbed, noise nevertheless affects interior activities.

Source: Federal Aid Highway Program Manual (FHPM), 23 CFR Part 772 "Procedures for Abatement of Highway Traffic Noise," 1982.

All the sites, except Site 4, are in NAC Activity Category B areas. Site 4 is considered Activity Category D.

Noise measurements and traffic counts taken during the noise measurements were used to calibrate the computer model discussed in Section 4.6. Existing counts from the traffic analysis were then utilized in the model to determine the peak noise under current conditions. Existing peak hour  $L_{eq}(h)$  levels are reported on Table 3-9. As indicated on this table, noise levels at the receptor sites are generally below the NAC. The only site that approaches the

NAC of  $L_{eq}(h)$  67 dBA is Site 7. The high noise level at this site, and the noise level at many of the other sites, is primarily caused by traffic on nearby roadways.

**Table 3-9

### **3.7 WATER RESOURCES**

#### **3.7.1 SURFACE WATERS**

Surface water resources in the study area consist primarily of intermittent streams or gulches. The more prominent gulches are:

- Kalialinui
- Kaluapulani

- Pulehu
- Kolaloa
- Keahuia Iwi
- Waiakoa
- Kulanihakoi
- Waipuilani
- Kaonoulu
- Waiohuli

These gulches collect rainfall and direct flows toward the ocean. However, the gulches are usually dry, and in many places their stream beds have eroded to bedrock. The U.S. Army Corps of Engineers has regulatory jurisdiction over the gulches since intermittent streams are technically considered “waters of the U.S”.

### **3.7.2 GROUNDWATER**

Maui has four principal types of groundwater reserves: fresh basal water, brackish basal water, dike-confined water, and perched water. Most of Maui's groundwater extraction infrastructure is at lower elevations where groundwater resources are more accessible and abundant. Dike complex formations in the Upcountry area may also contain abundant groundwater. However, Upcountry groundwater resources are largely unexploited because of exploring, drilling and operating costs. There is no U.S. Environmental Protection Agency-designated principal or sole-source aquifer in the project area (under the provisions of the Safe Drinking Water Act).

### **3.7.3 WETLANDS**

As defined by 40 CFR 230.41(a)(1), wetlands are those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions. According to U.S. Fish and Wildlife Service National Wetlands Inventory Maps, wetlands near the project area occur at Kealia Pond on the south coast of the central Maui valley, and along the Kihei-Makena coast. These wetlands are not within the project area. The Inventory Map identifies wetlands within some of the gulches crossed by the proposed alignments. However, botanical surveys conducted for the project (see Section 3.8.1 and Appendix J) found no evidence (vegetation, soils or hydrology) of wetlands in any

of the gulches where they would be crossed by the alternatives. Therefore, field observations indicate that there are no wetlands within the study area, even though wetlands are identified on the Inventory Map.

### **3.7.4 FLOODPLAINS**

According to Flood Insurance Rate Maps (FIRM), the project area is contained within Zone C, indicating that the land is prone to minimal flooding.

## **3.8 ECOSYSTEMS**

### **3.8.1 FLORA**

The alternatives pass through actively cultivated lands at higher elevations and uncultivated lands at lower elevations. Botanical field surveys were conducted in January, February and September, 1997 to assess the botanical resources along the alternative alignments (see Appendix J). An area 60 m (200 ft) wide (30 m (100 ft) on each side of the centerline) was surveyed along each alignment. Where the alignments cross large gulches, the survey corridor was widened to 150 m (500 ft) because remnant populations of native plants are more likely to occur on steep, inaccessible areas such as gulch walls and rocky outcroppings, away from agricultural or animal grazing disturbances.

Sugarcane fields and their associated networks of cane haul roads and irrigation systems are found along the U1 alignment.

The U2-A alignment crosses three vegetational types:

- abandoned pineapple fields characterized by scattered remnant patches of pineapple (*Ananas comosus*) in overgrown fields of Rhodes grass (*Chloris gayana*) and other weedy species;
- Christmas berry/mixed shrub land; and
- actively cultivated pineapple fields.

The U2-B alignment crosses three vegetational types: Kikuyu/mixed grass pasture land, gulch vegetation, and cultivated lands. The vegetational types found along both U2-A and U2-B alignments are dominated by introduced species.

The U3 and U1/U2-A,-B alignments both cross pineapple fields and uncultivated lands. A portion of the U3 alignment crosses the Kula Agricultural Park.

The uncultivated lands are covered primarily by kiawe/buffelgrass association. Kiawe trees (*Prosopis pallida*), native to tropical America, and buffelgrass (*Cenchrus ciliaris*), native to Africa and tropical Asia, are the dominant components of this vegetational type. The kiawe/buffelgrass association occurs along the K1 and K2 alignments, most of the U3 alignment, and portions of the U1/U2-A alignment. The remaining smaller sections of uncultivated land support Kikuyu (*Pennisetum clandestinum*), mixed grass pasture land along the U2-A,-B and U3 alignments, and gulch vegetation along all the segments crossing large, steep-walled gulches, such as Waiakoa, Pulehu, and Kalialinui Gulches. Most of the uncultivated lands are used for grazing cattle and horses.

Three small clusters of the endangered Ko'olua'ula (*Abutilon menziesii*), a member of the mallow or hibiscus family, were found between the 210 m and 230 m (690 foot and 750 foot) elevation within Kalialinui Gulch, nearest to the U1 alignment. The clusters are estimated to be between 820 m (2700 ft) to 1100 m (3600 ft) from the U1 alignment, which is at the 255 m (840 foot) elevation at the Kalialinui Gulch crossing.

The vegetation along the alignments is dominated by introduced or alien plant species. Very few native species were identified along the alignments, and most were found in or adjacent to the gulches.

None of the plant species found within the 60 m (200 feet) wide corridors are listed, proposed, or candidate threatened and endangered species; nor is any plant a species of concern. There are no areas on or adjacent to the termini or alignments that support sensitive native plant-dominated communities.

Appendix J contains the botanical survey reports prepared for this project.

### **3.8.2 FAUNA**

Faunal species in the study area consists of introduced species that are common throughout the Hawaiian islands, such as rats, mice, bats, goats, mongoose, cats, and dogs (Final Environmental Impact Statement for the Site Selection for the New Kihei Public Library, Kihei, Maui, June 1991; Site Selection Study and Final Environmental Impact Statement New Kihei Elementary School, Kihei, Maui, April 1992; and Site Selection Report and Final Environmental Impact Statement for the Proposed Upcountry Maui High School, December 1991).

The project area also contains a relatively large axis deer population. Figure 3-12 illustrates the density of the deer population in the project area. The deer tend to prefer dry kiawe forest areas, such as in Ulupalakua, and are less abundant in the agricultural areas (e.g., sugarcane and pineapple fields), such as Pukalani and Haiku.

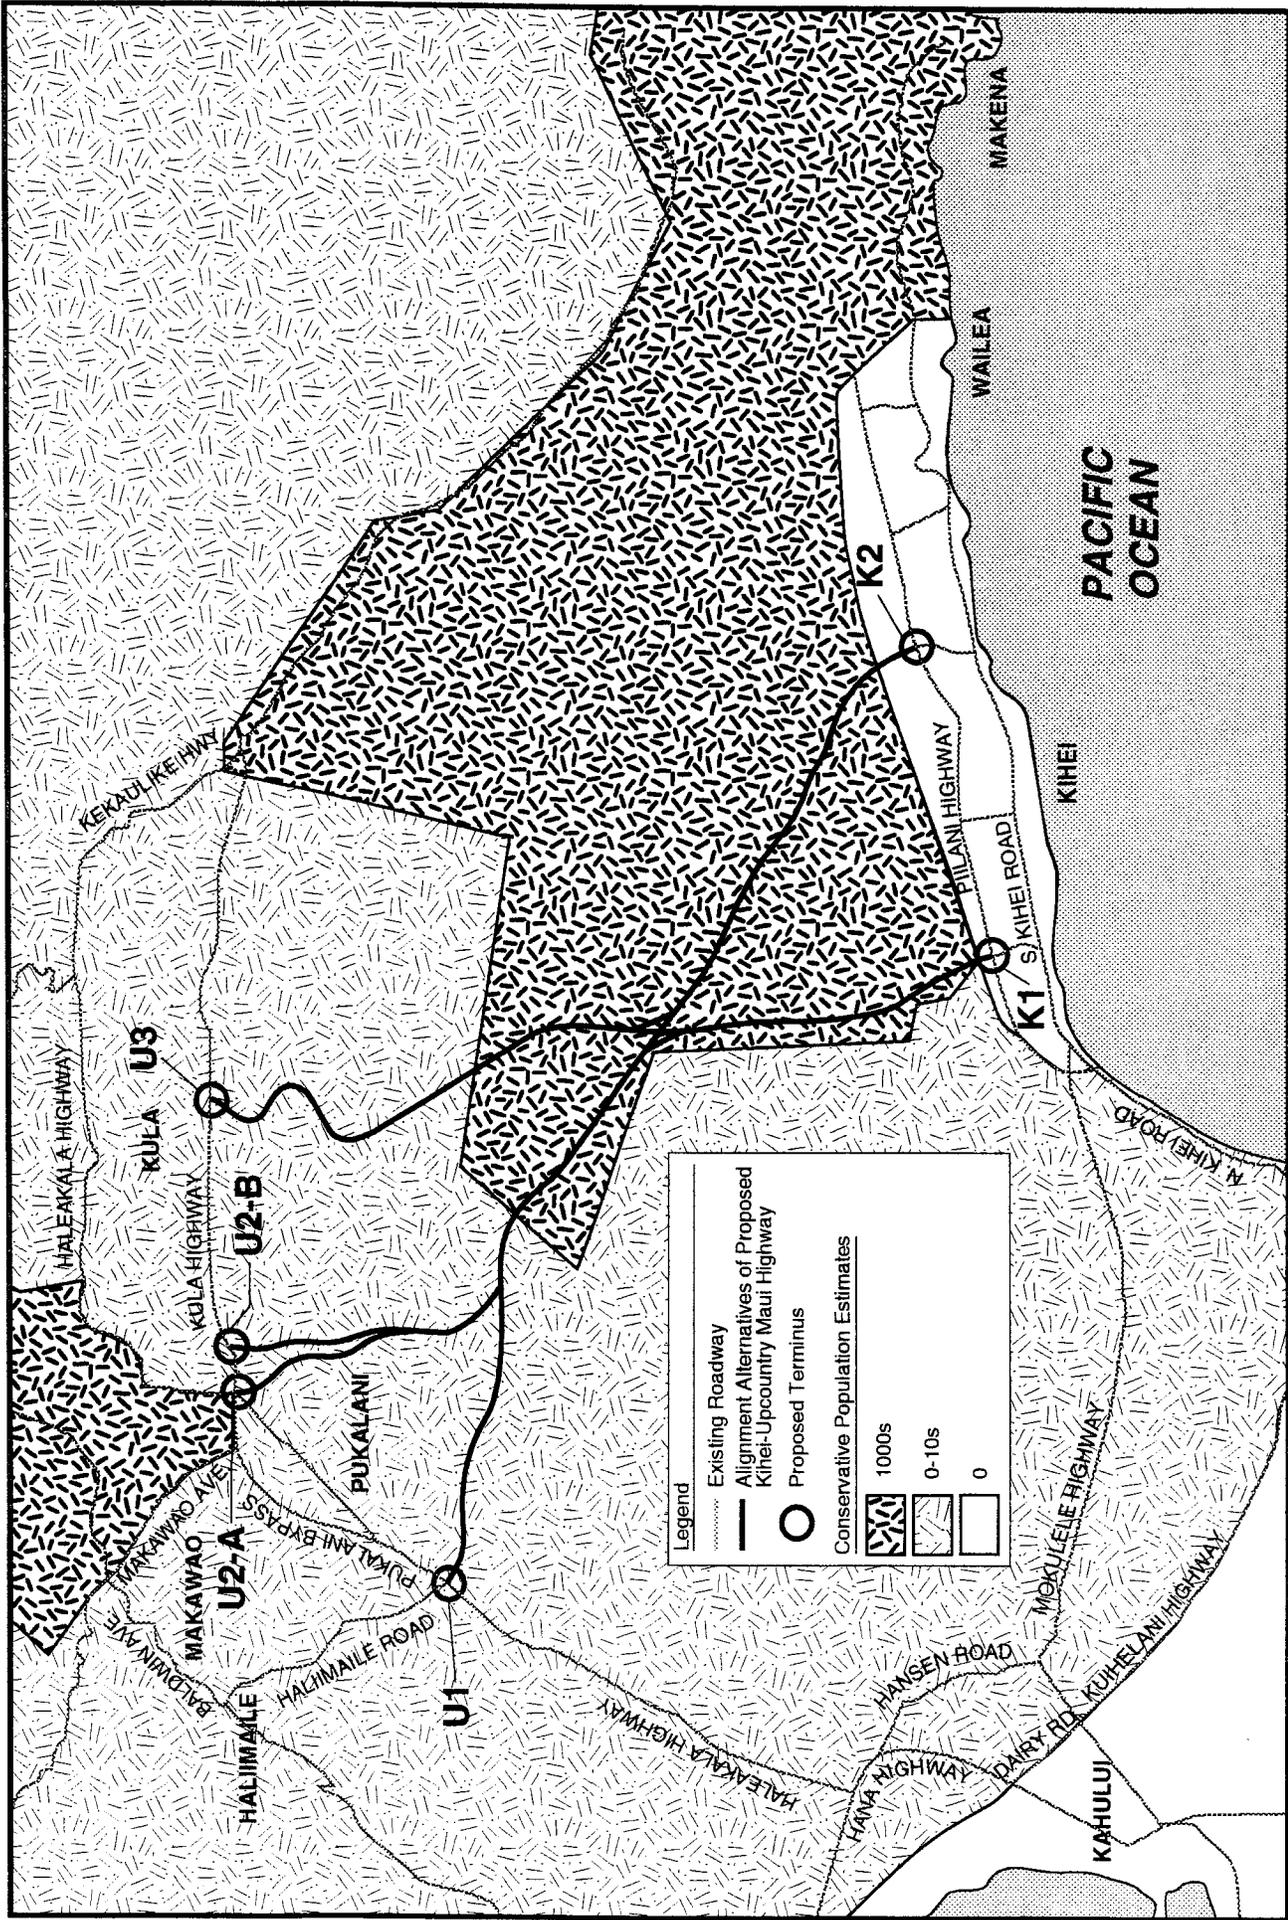

Birds found in the study area include the cardinal, barred dove, spotted dove, mockingbird, ricebird, white eye, myna, house sparrow, and two native species, the Hawaiian pueo and the golden plover (same sources as above).

### **3.8.3 ENDANGERED AND THREATENED SPECIES**

Consultation with the U.S. Fish and Wildlife Service (Service) and the Department of Natural Resources (DLNR), Division of Forestry and Wildlife was initiated per requirements of the federal Endangered Species Act of 1973 (16 U.S.C. 1531-1543) and State law. Copies of the correspondence are located in Appendix C.

“Endangered” species are those that are in danger of extinction throughout all or a significant part of their ranges. A “threatened” species is one which is likely to become an endangered species in the foreseeable future. “Candidate 1” species are those for which the Service has evidence of vulnerability, but there are not enough data to support formal proposal as an endangered or threatened species.

In a letter dated January 8, 1997, the Service stated that alternatives that use the K2 segment pass within 1.5 km (1 mile) of Puu o Kali. This puu supports one of the few remaining examples of dry land forest in the State, and may contain three federally endangered plants

(*Abutilon menziesii*, *Hibiscus brackenridgei* spp. *brackenridgei*, and *Bonamia menziesii*) and rare plant species (*Acacia koaia*, *Achyranthes splendens* var. *splendens*, *Canavalia pubescens*, and *Nesoluma polynesianum*). The Service also reported that the alternatives that use the U2-A,-B segment pass near a reservoir which may be used by migratory or endangered waterbirds. The federally listed endangered Hawaiian coot (*Fulica americana alai*) was seen in this reservoir in 1986.

### **3.9 GEOLOGY, PHYSIOGRAPHY, SITE CONTAMINATION AND NATURAL HAZARDS**

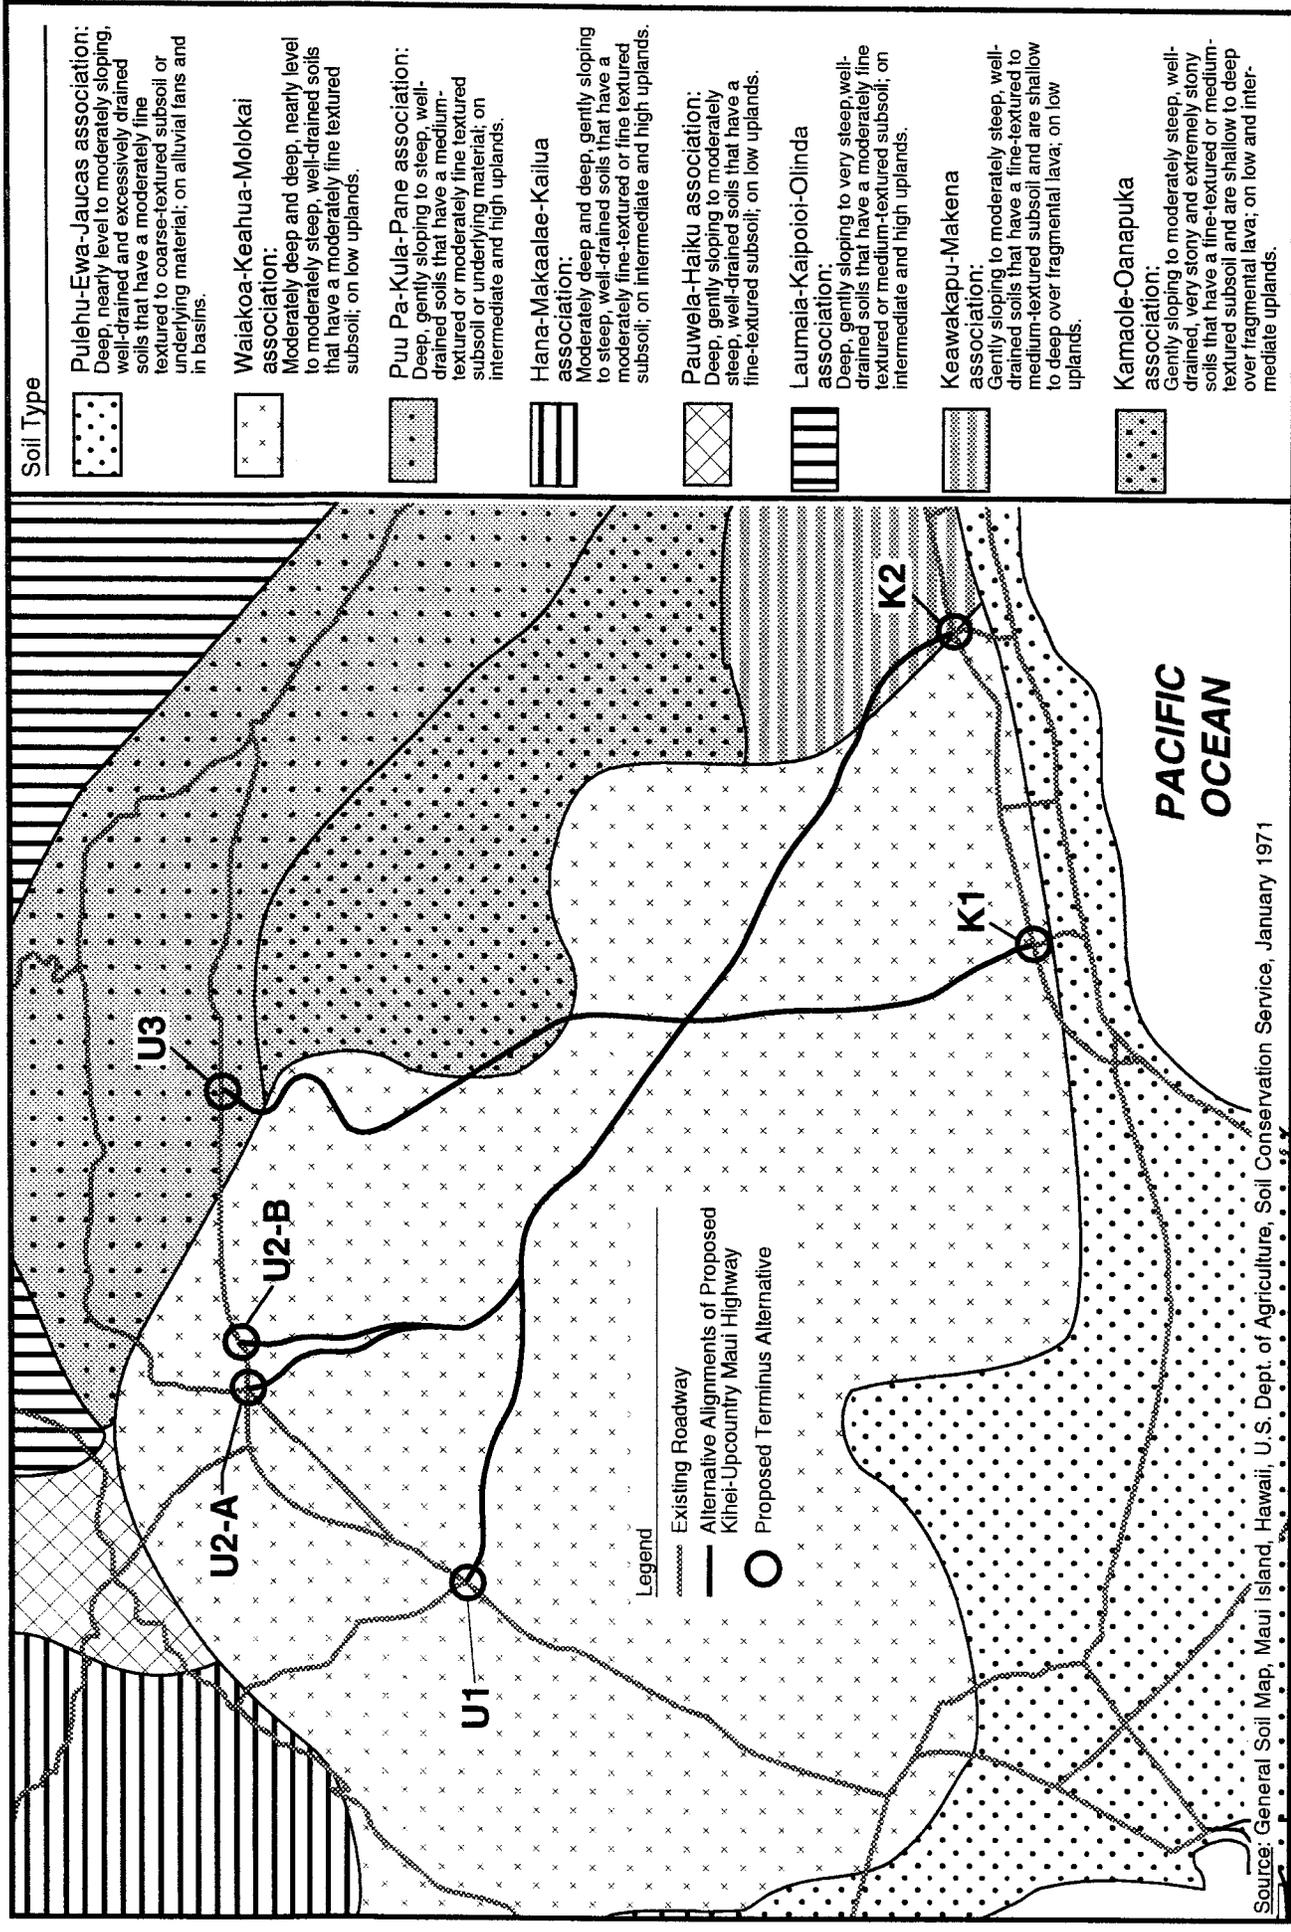

#### **3.9.1 PHYSIOGRAPHY AND GEOLOGICAL SETTING**

Maui consists of two major volcanoes, the West Maui Mountains and Haleakala. The older volcano, the West Maui Mountains, may be extinct. It consists of steep valleys and peaks carved by numerous streams. The younger volcano is Haleakala. Unlike the West Maui Mountains, Haleakala is a classic rounded dome typical of a shield volcano. Kihei-Upcountry Maui Highway would be located on Haleakala's western flank. The broad gently sloping plain connecting the two volcanoes, the Maui Isthmus, was formed when lava from Haleakala banked against the already existing West Maui volcano. Haleakala last erupted almost two centuries ago and is considered dormant. The potential for future eruptions exists.

Figure 3-13 displays the soil types in the project area. The alignments mostly traverse the Waiakoa-Keahua-Molokai association. This soil is characterized as nearly level to moderately steep, well-drained, and moderately fine textured. Portions of Segment U3 traverse the Puu Pa-Kula-Pane and Kamaole-Oanapuka associations.

#### **3.9.2 HAZARDOUS WASTE SITES**

Although the project area is largely undeveloped, a database search was conducted to investigate the potential occurrence of hazardous material sites along the proposed alignments (see Appendix K). The database search included federal and State environmental

**Soil Types in Project Area**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
 FIGURE 3-13

databases, in accordance with the American Society for Testing and Materials (ASTM) standards for environmental site assessments (E1527-93). No hazardous materials sites were identified in the database search that would be likely to pose a threat to public safety.

### **3.9.3 NATURAL HAZARDS**

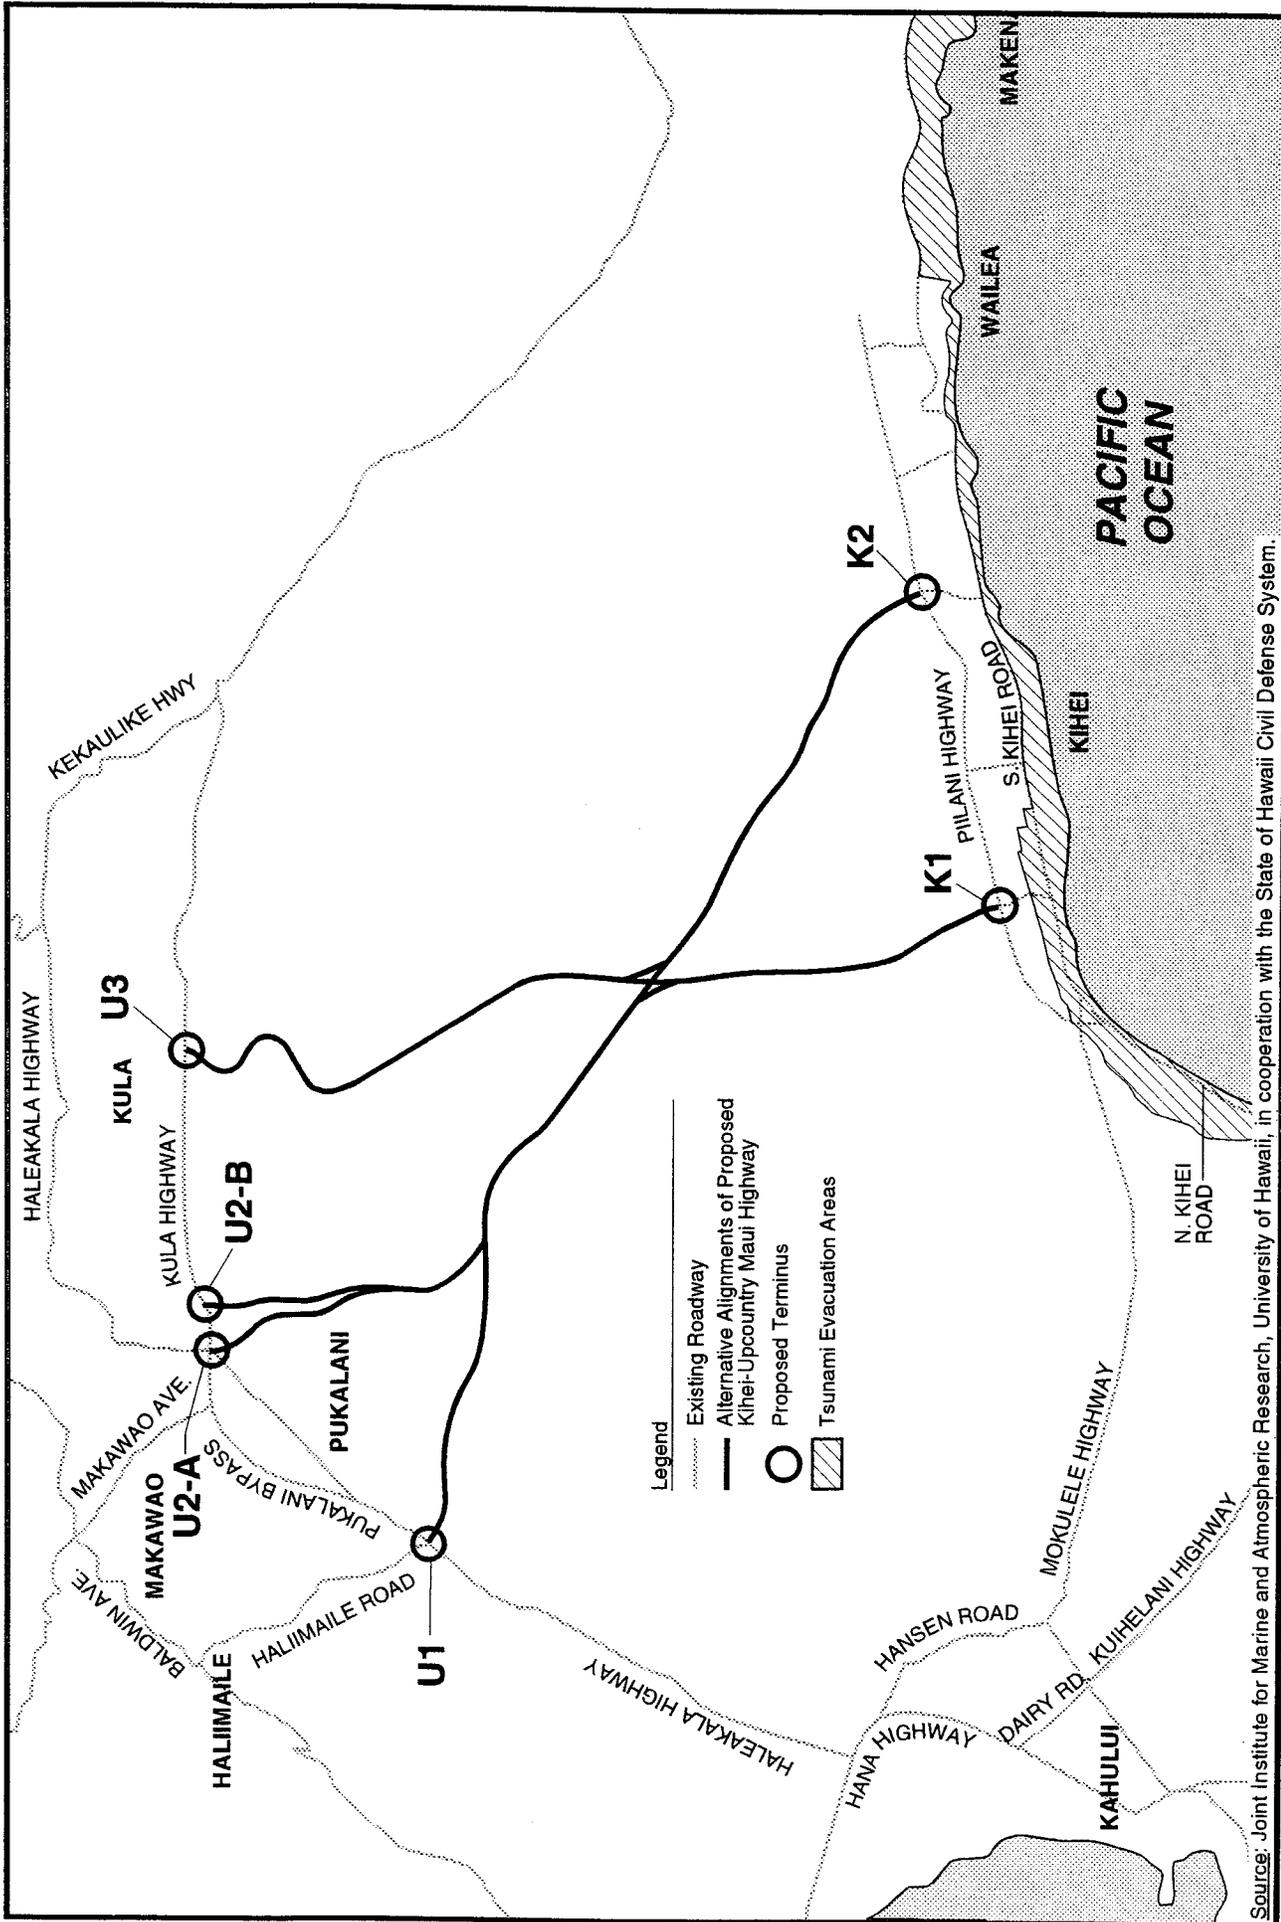

Maui's last major earthquake occurred in 1938, damaging roads and buildings on Maui and Molokai and causing minor damage in Honolulu. Its epicenter was about 40 km (25 miles) north of Puawela Point on the north coast of Maui. Most major earthquakes in Hawaii occur on the island of Hawaii, where earthquake epicenters are concentrated in the southern half of the island.

Tsunamis are usually generated when the ocean floor is deformed abruptly during an earthquake. Tsunami reaching Hawaii are generated by earthquakes occurring in such places as Chile, Japan, the Aleutian Islands, Alaska and Hawaii. Based on historical records, the areas most vulnerable to tsunamis are Hilo and the North shores of all the islands. Although the project area is not susceptible to tsunami, much of Kihei-Makena is within a tsunami evacuation area (see Figure 3-14).

Hawaii's heaviest rains are brought by winter storms from October to April. These storms can bring three or more inches of rain in a single hour. Lowland leeward areas, such as Kihei-Makena, obtain their rainfall chiefly from a few winter storms, and therefore, their rainfall is strongly seasonal. Hurricanes can also bring heavy rain and wind and cause damage. However hurricanes on Maui are infrequent.

## **3.10 HISTORIC, ARCHAEOLOGICAL AND CULTURAL RESOURCES**

This section documents activities to identify and evaluate historic and archaeological resources, and traditional cultural properties or practices (TCP) in the project area in accordance with the requirements of the Code of Federal Regulations (CFR) pertaining to the Protection of Historic Properties (36 CFR 800).

 FIGURE 3-14

### **3.10.1 EARLY AGENCY COORDINATION**

Coordination with the DLNR, State Historic Preservation Division (SHPD) was initiated during project scoping to achieve consensus on meeting the requirements of 36 CFR 800.4, Identifying Historic Properties. SHPD suggested that a reconnaissance-level survey be conducted on alignments considered in the Draft EIS because of the high cost of conducting an inventory-level survey of multiple alignments up to 17.5 km (10.9 miles) in length. This suggestion was followed as described below. SHPD also suggested that an inventory-level survey be conducted on the preferred alternative, which would be identified after public distribution of and comment on the Draft EIS. This suggestion was also followed as described below.

### **3.10.2 RECONNAISSANCE SURVEY**

#### **3.10.2.1 Methodology**

Cultural Surveys Hawaii (CSH) performed an archaeological reconnaissance from February 18 through March 6, 1997 along six alternative alignments (U1,K1; U1,K2; U2,K1; U2,K2; U3,K1; and U3,K2; see Section 2.2.1.4). The reconnaissance survey extended 60 m (200 ft) from the alignment center line (120 m (400 ft) total width). In total, 36 930 linear meters (121,160 ft of roadway centerline) or 450.3 ha (1113 acres) were surveyed. The reconnaissance survey report (Cultural Surveys Hawaii, December 9, 1997) included a field survey to assess archaeological sites, archival research of historical documents and maps, and a review of previous archaeological research by others.

Following the reconnaissance survey, two new alternatives were developed to replace the eastern (mauka) portion of Segment U2 because the U2 alignment would cross a future Kamehameha School campus, and would potentially affect archaeological sites likely to be important for preservation (see Section 2.2.2, and below). A reconnaissance survey was conducted of the U2-A (two versions; see below) (Cultural Surveys Hawaii, November 14, 1997 and July 1998) and U2-B alignments (Cultural Surveys Hawaii, November 14, 1997).

Cultural Surveys Hawaii prepared a single report that includes the results of all four reconnaissance surveys (see Appendix I).

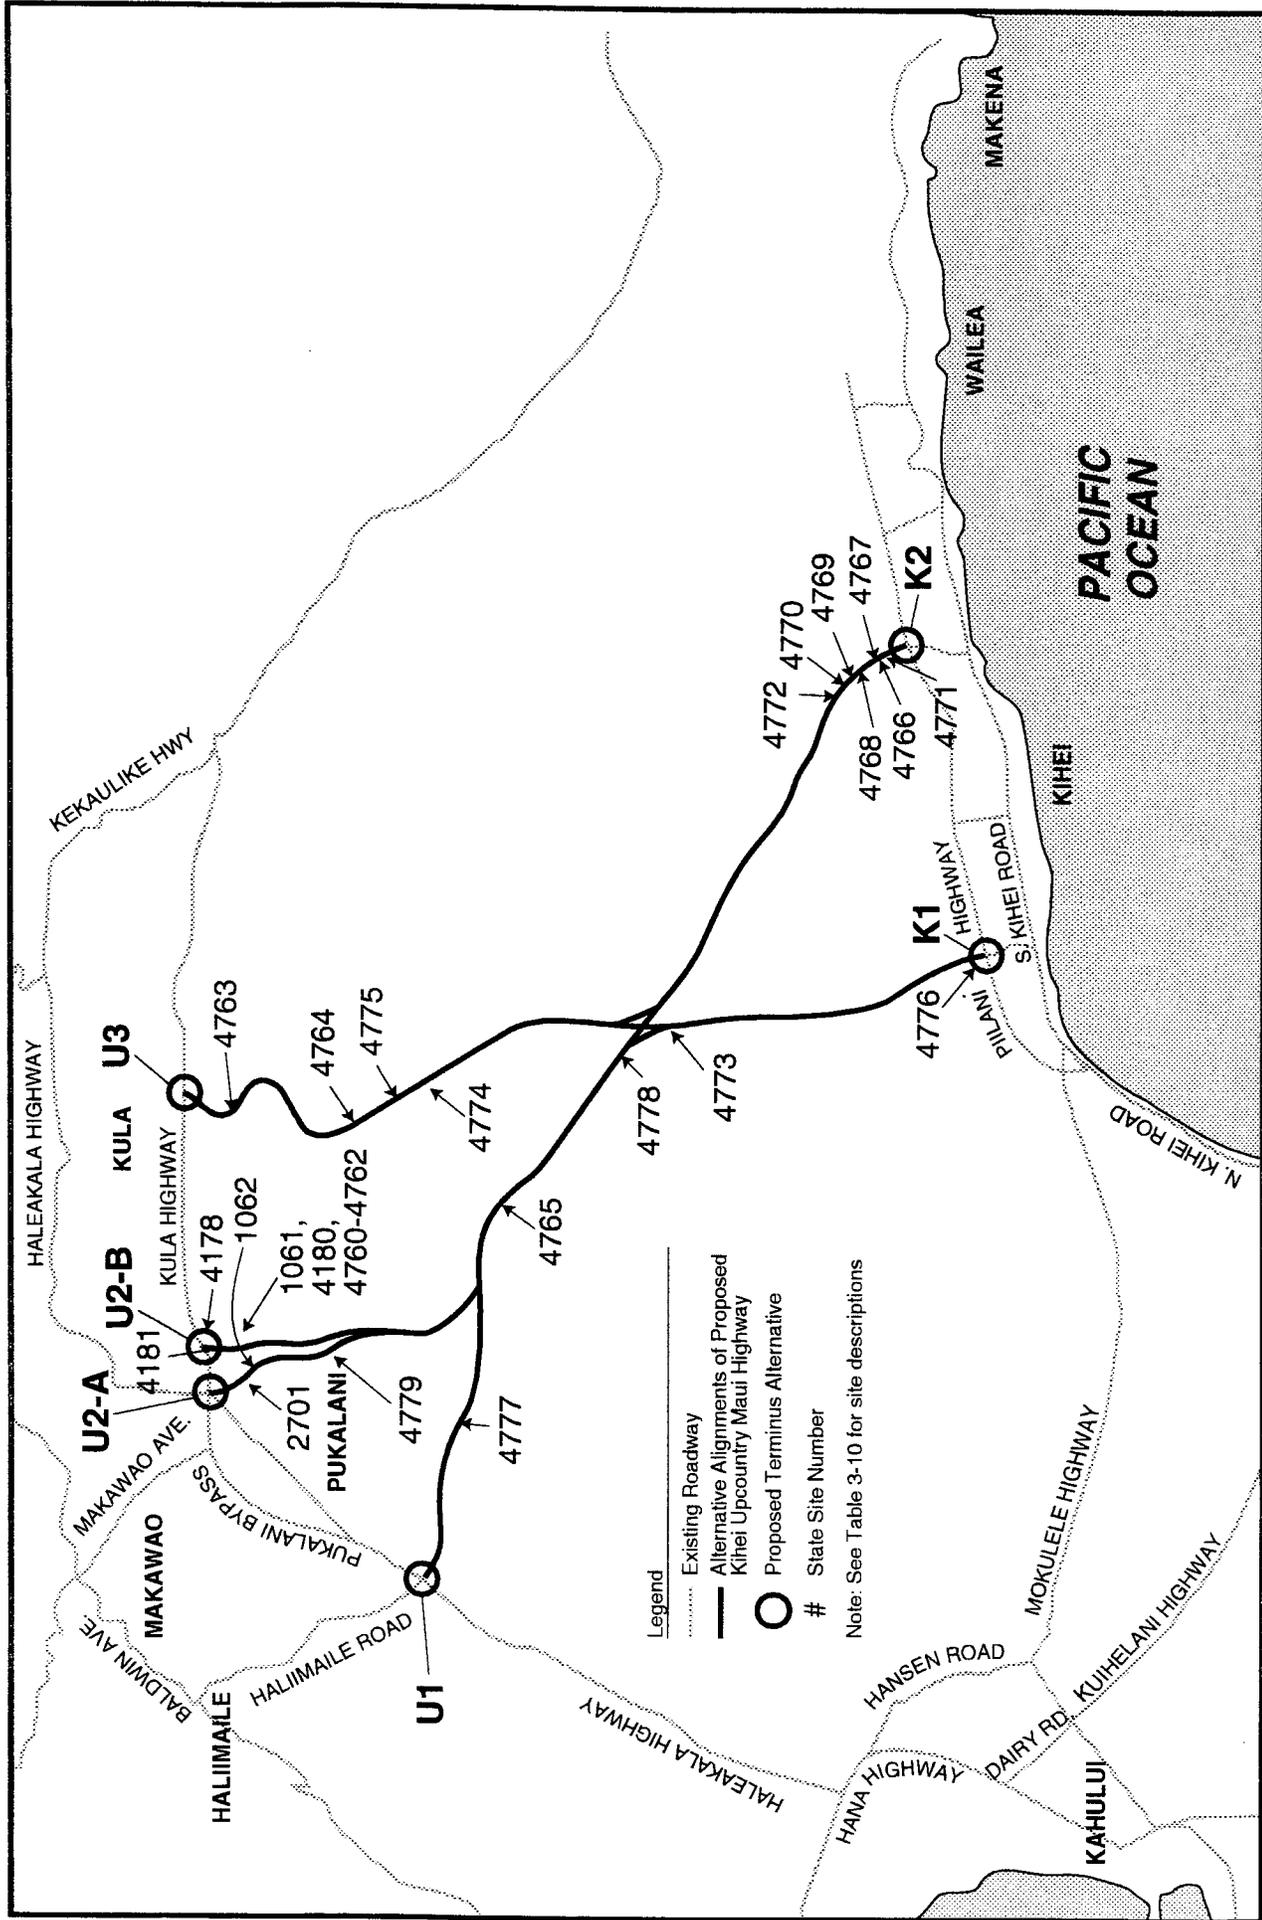

### **3.10.2.2 Survey Results**

A total of twenty-five sites were identified within the 120 m (400 ft) study corridor (see Figure 3-15 and Table 3-10). Twenty of these sites are newly discovered, and five sites were previously recorded from other surveys. As indicated in Section 3.10.5, the sites listed on Table 3-10 are eligible for the National Register of Historic Places.

The sites listed on Table 3-10 fall into two general categories: (1) prehistoric (or possibly early post-contact); and (2) post contact archaeological remains. The presumed prehistoric archaeological remains include simple shelter structures and petroglyphs. The post-contact sites include wall sections, various water control features, and clearing mounds associated with sugarcane irrigation and cattle ranching. Military features in the form of enclosures were also observed. The "barren" zone between the more environmentally favorable inland (mauka) and coastal (makai) habitation and agricultural zones contained very few sites, which is consistent with previous archaeological studies and the archival research on human settlement patterns for this area.

The first reconnaissance survey (U1, U2, U3, K1 and K2) identified three sites that would likely require preservation, State Sites 50-50-10-1061, 4178 and 4764 (see Section 3.10.5). The U2 alignment was modified to the U2-A and U2-B alignments, in part because of its potential affect on Sites 1061 and 4178. In addition, the U3 alignment was shifted northeast to avoid impacts to Site 4764. It is undetermined whether this U3 shift would adversely affect other archaeological sites. However, this information would be developed for U3 should it have been identified as the preferred alternative, because an inventory survey was conducted on the Preferred Alternative (see Section 3.10.3).

Reconnaissance surveys of the original U2-A alignment (see Section 2.2.2) identified two sites, one site in Kaluapulani Gulch (Site 1062) and the other in Kalialinui Gulch (Site 4779), within the alignment (see Figure 3-15 and Table 3-10). The sites appear to be significant (see Section 3.10.5), and would require preservation. These discoveries resulted in further

Source: Cultural Surveys Hawaii, Archaeological Reconnaissance Survey of the Proposed Kihei to Kula Road Corridors, Kailua to Kama'ole *Ahupua'a* (TMK 2:2 and 2:3), Makawao and Wailuku Districts, Island of Maui, June 1999

refinement of the U2-A alignment to avoid the sites. The second version of U2-A would avoid Site 1062 by shifting the original alignment north at Kaluapulani Gulch. It would avoid Site 4779 by shifting the original alignment south at Kalialinui Gulch.

A reconnaissance survey of the second version of U2-A found that it would indirectly affect a heiau (State Site 50-50-10-2701). This heiau appears to be significant under Criteria D and E (see Section 3.10.5). The alignment would pass on the south (makai) side of the heiau. It would obstruct the view plane from the heiau (see Figure 3-15 and Table 3-10), even though Site 2701 is not within the 120 m (400 ft) study area. CSH noted that an alignment on the north (mauka) side of the heiau, such as the original U2-A, would not present such an effect. Potential impacts to the heiau resulted in another redefinition of the U2-A alignment, as a combination of the original and second version of U2-A. This third version of U2-A avoids Sites 1062 and 4779 (second version of U2-A), and shifts the alignment south (mauka) of the heiau (original U2-A), avoiding visual affects. Since the third version of U2-A embodies the

alignments of both the original and second version of U2-A, an additional reconnaissance survey was not necessary.

The reconnaissance survey of U2-B was prepared using an existing archaeological reconnaissance survey report (Archaeological Inventory Survey, 44-Acre Pukalani Terrace Subdivision III, Land of Aapueo, Makawao District, Island of Maui, 1996) prepared for the area surrounding the eastern (mauka) portion of U2-B. Field work was conducted on the western (makai) end of U2-B (Kalialinui Gulch to Omaopio). The Pukalani Inventory Survey identified State Site 50-50-10-4181 within the U2-B alignment. However, the site was excavated for the information that attributed significance to the site, and is no longer considered significant as an historic property. The field work found no other sites.

### **3.10.3 INVENTORY SURVEY**

Following the identification of the preferred alternative (U1,K1), an archaeological inventory survey with limited subsurface testing was conducted on this alignment (Cultural Surveys Hawaii, Archaeological Inventory Survey of the Proposed Kihei to Kula Road Corridor, Kailua to Ka'ono'ulu Ahupua'a (TMK 2-05-001: por. 001, 002, 003, 009 2-05-002: por. 001, 002, 005, 015, 016, and 3-09-001: por. 016), Makawao and Wailuku Districts, Island of Maui, December 2000).

#### **3.10.3.1 Methodology**

CSH performed an archaeological inventory survey of the U1,K1 alignment from August 28, 2000 to October 3, 2000. Like the reconnaissance survey, the inventory survey area extended 60 m (200 ft) on both sides of the centerline, a total width of 120 m (400 ft). However, different methods were utilized during the course of the survey. Along those sections in active sugar cane fields, the surveying was conducted by two archaeologists in a vehicle. The active cane fields were not surveyed by foot. Along those sections in active pineapple fields, the surveying was conducted by four archaeologists on foot following existing pineapple roads. All clearing mounds in the pineapple fields within the survey area were inspected. All other sections, including gulches, valleys and ravines even within active agricultural areas, were surveyed by four archaeologists spaced 1 m (3 ft) to 15 m (50 ft)

apart. Generally, the four archaeologists were spaced 1 m (3 ft) to 3 m (10 ft) apart when surveying within gulches, valleys and ravines because petroglyphs are known to exist in these types of places in the study area. The archaeologists were spaced 5 m (16 ft) to 15 (50 ft) apart when surveying open savannah with scattered kiawe.

### **3.10.3.2 Survey Results**

A total of 126 structural and nonstructural features were identified along the 120 m (400 ft) wide study corridor of the U1,K1 alignment. These features are organized into 17 distinct sites that are associated with a variety of functions, including traditional Hawaiian temporary habitation, agricultural, symbolic (petroglyph sites), animal husbandry, a marker and historic military training activities. Table 3-11 provides a listing of the sites identified along the U1,K1 alignment, and the locations of these sites are shown on Figure 3-16.

#### Hawaiian Temporary Habitation Sites

The seven temporary habitation sites (State Sites 3742, 3743, 3745, 5032, 5033, 5034 and 5035) identified along the U1,K1 alignment are grouped at the lower portion of the alignment, roughly between the elevations of 14 m (45 ft) and 140 m (460 ft) (see Figure 3-16). Sites 3742, 3743 and 3745 were identified in a previous survey and cultural materials from these sites were collected at that time. Therefore, these sites were not re-evaluated.

Site 5032 consists of a series of boulder alignments and was determined to be a temporary habitation site based on the presence of cultural material observed on the surface that included a basalt net sinker stone, a basalt adz preform or core, and a single piece of marine shell midden. These items are typically associated with pre-contact Hawaiian culture. The construction style of the Site 5032 is similar to military sites found along the project corridor rather than the other temporary habitation sites. The size of the site is unique in that it is considerably longer.

Site 5033 is a rectangular enclosure that appears to be a traditional Hawaiian temporary habitation site that was later modified either by the military or by hunters. No cultural materials were observed on the surface, but 29.8 g (1.02 oz) of marine shell midden was encountered during excavation of the site.

**Table 3-11  
Summary of Inventory Survey of the U1,K1 Alignment**

<u>State Site #</u>	<u>Site Type</u>	<u>Function</u>	<u>Distance / Orientation from Center Line</u>	<u>Age</u>

<u>5035</u>	<u>C-Shape Enclosure</u>	<u>Temporary Habitation</u>	<u>15 m (50 ft) / North</u>	<u>Intermediate</u>

Notes: <sup>1</sup> All numbers preceded by "50-50-10-."  
<sup>2</sup> Site identified from previous research.  
 See Figure 3-16 for the locations of the sites.

Source: Cultural Surveys Hawaii, Archaeological Inventory Survey of the Proposed Kihei to Kula Road Corridor, Kailua to Ka'ono'ulu Ahupua'a (TMK 2-05-001: por. 001, 002, 003, 009 2-05-002: por. 001, 002, 005, 015, 016, and 3-09-001: por. 016), Makawao and Wailuku Districts, Island of Maui, December 2000, June 1999

Site 5034 is a square enclosure that appears to have been bulldozed, damaging the west and north walls of the enclosure. A sparse amount of marine shell midden was encountered during excavation of the site.

Site 5035 is a C-shaped enclosure. No cultural materials were observed on the surface or during excavation. However, a darker stained layer similar to the cultural layers found at Sites 5033 and 5034 was encountered, which suggests that the site contains cultural material.

#### Petroglyph Sites

Two petroglyph sites were found in Kalialinui (Site 5029) and Waiakoa (Site 5031) Gulches. Site 5029 consists of a panel of three historic petroglyphs pecked into the northern cliff face. Site 5031 consists of at least three traditional petroglyphs of anthropomorphic figures located on the southern side of the gulch. Both petroglyph sites are located about 60 m (200 ft) from the alignment center line. Site 5031 was originally only 15 m (50 ft) from the center line, but the alignment was adjusted 45 m (150 ft) to the east to avoid the site. Therefore, both petroglyph sites are outside of the project's Area of Potential Effect (APE) because they are 60 m (200 ft) from the centerline and because both gulches will be crossed by bridge.

#### Agriculture and Marker Sites

Three sites consisting of stone piles and cairns (Sites 3727, 3728 and 3729), which were identified in a previous study, are functionally associated with agriculture and a marker. All three sites were completely excavated during the previous study.

#### Military Sites

Site 4773 is large historic military site consisting of 102 features that include enclosures of various shapes. The U1,K1 alignment passes directly through the site at an elevation between 150 m (500 ft) and 225 m (740 ft) (see Figure 3-16). No cultural material was observed on the surface, and none of the test probes or excavations encountered cultural material.

Site 4776 is a small oval and isolated enclosure. The site was interpreted as a military site based on its construction style, size, location and lack of traditional cultural materials. There may have been more sites or features surrounding Site 4776 because there is evidence of considerable bulldozing in the area.

Site 4778 is a small L-shaped enclosure, and is similar to Site 4776 in that it is isolated with no observable cultural materials. The site was interpreted as a military site based on its construction style, size, location and lack of traditional cultural materials.

#### Historic Sugar Cane Agricultural Site

Site 4765 consists of remnants of historic sugar cane cultivation infrastructure in the section of the corridor between Pulehu and Omaopio Roads. The U1,K1 alignment passes directly through this site. Recorded features include clearing mounds associated with historic sugar cane cultivation and five inactive earthen irrigation ditches with each having two to three small bridges constructed of concrete and lumber. The bridges are in poor condition.

#### Cattle Wall Site

Site 5030 consists of sections of cattle walls along the north side of Waiakoa Gulch. The walls were used to prevent cattle from entering or exiting the gulch.

### **3.10.4 TRADITIONAL CULTURAL PROPERTIES / PRACTICES**

According to draft Procedures for Ethnographic Surveys (SHPO, 1999), a Traditional Cultural Property (TCP) is defined as:

"Any historic property associated with the traditional practices and beliefs of an ethnic community or members of that community for more than fifty years. These traditions (are) founded in a community's history and contribute to maintaining the community's cultural identity. (They) demonstrate a continuity of practice or belief until present or documented in historical source materials, or both. These properties include, but are not limited to, some types of archaeological sites." (italics added)

According to the National Register Bulletin 38, Guidelines for Evaluating and Documenting Traditional Cultural Properties (1994), a TCP is defined generally as a resource that is eligible for the NRHP because of its association with the cultural practices or beliefs of a living community that are rooted in that community's history, and are important in maintaining the continuing cultural identity of the community.

TCPs differ from archaeological or historic sites in that they are sites or resources that are currently in use by a particular ethnic group. Examples of TCPs that may be in the study area include ancient fishing *ko`a*, coastal zones providing edible shell fish and seaweed, land areas harvested for culturally significant plants, and structures associated with ceremonies conducted for graduates of *hula halau*.

#### **3.10.4.1 Methodology**

Scientific Consultant Services (SCS) conducted archival research and oral history interviews with long-time local residents of the Kihei-Upcountry region to determine whether there may be cultural resources in the project area. The oral interviews attempted to identify cultural properties in the study area, as well as defining their characteristics and associated cultural activities. These resources were evaluated in terms of their physical relationship with the alternatives. The SCS report is included as Appendix I to this FEIS.

More than 50 people were contacted and interviewed. They included several people associated ranching activities and those previously living in plantation camps. In addition, a descendant of a Land Commission Award recipient whose family had remained in the area was also interviewed.

#### **3.10.4.2 Results of Study**

No TCPs, based on definitions contained in draft Procedures for Ethnographic Surveys and National Register Bulletin 38, were identified in the project area. However, numerous culturally-significant sites and features in the general vicinity of the project area were identified through the oral histories, such as religious sites, ancient trails, petroglyphs, fishponds, and burial caves. Topographic anomalies associated with pre-contact events, individuals, or recorded in legends and stories were also noted. In addition, the reconnaissance and inventory surveys (see Sections 3.10.2 and 3.10.3) identified culturally-important archaeological sites (i.e., Criterion E for significance; see Section 3.10.5).

The following culturally-significant sites or resources in and surrounding the project area were identified through oral histories:

- Puu Pane, located outside the project area on the crest of a hill east of Haleakala Highway, which was declared sacred by the paramount chief Kihapi'ilani (c., A.D. 1500-1600s) and was used as a *heiau* for the high chiefs of Maui from ancient times to Kihapi'ilani;
- several old trails, including a trail near Puu o Kali, the ancient *alanui* coastal trail, and Waiakoa Trail, of which only portions remain or are visible;
- petroglyphs in the vicinity of Puu o Kali;
- fishponds, such as Kalepolepo, along the coast outside the project area; and
- *heiau* (site 2701; see Section 3.10.2) and *makahiki* sites near the U2-A alignment.

With the possible exception of the two *heiau*, one of the above potentially culturally-significant sites or resources are presently being used in a manner that would make them a TCP. The current uses of site 2701 and Puu Pane, if any, are unknown.

### **3.10.5 SIGNIFICANCE EVALUATION**

CSH conducted significance evaluations of the sites identified during the reconnaissance surveys and the 17 sites found during the inventory survey of the preferred alternative. The evaluations were based on criteria established for the National and Hawaii Registers of Historic Places.

A resource may be considered eligible for the National Register if it has "integrity of location, design, setting, materials workmanship, feeling, and association," and meets any one of the following criteria:

- A: associated with events that have made a significant contribution to the broad patterns of our history;
- B: associated with the lives of persons significant in our past;
- C: embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction;  
or
- D: yielded, or may likely yield, information important in prehistory or history.

The Hawaii Register includes another criterion:

- E: site that has cultural significance, such as religious structures (shrines, *heiau*), or human burial locations.

The purpose of conducting a significance evaluation is to determine whether a site is a "historic property," which is defined as being on or eligible for the National Register. Federal actions that affect "historic properties" are required to comply with Section 106 of the National Historic Preservation Act.

State Sites 50-50-10-1061, 1062, 4178 and 4764 appear to be significant under Criteria C, D and E. These findings led to the modifications of Alternatives U2-A and U3 to avoid these sites. These sites are likely to yield information important to history and prehistory, are considered excellent for their site types, and are culturally significant.

Sites 4762, 4779, 5029 and 5031 appear to be significant under Criteria C and D because they are excellent examples of their type, and may yield varying types of scientific data. After refinement of the alignments, none of these sites is within the path of any alternative, including Sites 5029 and 5031, which were identified during inventory survey.

Site 2701 appears to be significant under Criteria D and E because of its information content and its cultural significance as a traditional Hawaiian religious structure.

All the other sites, including the 15 sites identified during the inventory survey within the project's APE, were evaluated by CSH as significant under Criterion D. CSH did not believe the value of these sites warranted modifications or realignments of any of the alternatives. CSH found that data recovery at each of the sites affected by the project would be appropriate. Data recovery of many of the sites, such as Sites 4181, 3727, 3728, 3729, 3742, 3743 and 3745, was completed by others. Similarly, CSH recommended that no further work is needed for Sites 4765, 4773, 4776, 4778, 5030 and 5034 because the inventory survey documented their locations, types, age and functions sufficiently that no further research on these sites appears warranted. However, CSH did recommend that data recovery be conducted on sites 5032, 5033 and 5035.

In a letter dated June 21, 1999, the Deputy State Historic Preservation Officer (SHPO) concurred that the sites identified in the reconnaissance surveys are eligible for the National Register of Historic Places (see Appendix C). Following completion of the inventory survey and cultural impact reports, they were distributed to organizations recommended by the SHPD for consultation. In a letter dated May 10, 2001, the SHPD communicated agreement with the mitigation proposals contained in the inventory survey report, but asked that significance evaluations of Sites 5029 and 5031 be changed from "D" only to "C" and "D" (see Appendix C). The survey report was revised as recommended by SHPD (see Appendix I).

### **3.11 PARKS AND RECREATION**

Parks and recreational resources in the project area are shown on Figure 3-17.

The Kihei-Makena region contains three major beach parks (Kalama, Kamaole I, II and III and Mai Poina Oe Lau), and other smaller beach parks along the Kihei to Makena coastline. This region also features the recently completed Kihei Aquatic and Community Center, Silversword Golf Course, and two private golf courses in Wailea. The Kihei District Regional Park is being planned for the area east (mauka) of Piilani Highway, near its intersection with Ke Alii Alanui Street. According to the County of Maui Department of Parks and Recreation, development of the park has been delayed partly because of the recent completion of the Kihei Aquatic and Community Center. The master plan for the regional park includes football, baseball, softball and soccer fields, basketball courts, nature trails and an amphitheater.

Parks and recreation facilities in Upcountry Maui include the Makawao Park/Mayor Eddie Tam Memorial Center in Makawao; the Upcountry Youth Center, Pukalani Park and Community Center, Pukalani Country Club Golf Course in Pukalani; Kula Botanical Garden, Harold F. Rice Park, Keokea Par, and a new park in Kulamalu.

At the summit of Haleakala is Haleakala National Park. The National Park extends from the higher elevations on the western flank of the volcano across the crater, to the eastern coastline at Kipahulu. According to a Park official, approximately a million people visit the summit and about one half million visit the Kipahulu side of the Park annually (telephone conversation,

December 8, 1997). In a one-year period between 1999 and 2000, about two millions people visited the national park ("Haleakala Park Visits Reach Record-High", Honolulu Advertiser, February 25, 2001). Based on Maui Visitor Bureau estimates, a little more than half the number of park visitors went to the summit, which is consistent with the park official estimate. Approximately a third of the summit visitors watch Haleakala's famous sunrise. The summit is also used as a starting point for bike tours down the volcano (see Section 3.4.3). It was estimated that about 86,000 people bike down from the summit in 2000, up from 74,000 the year before (Honolulu Advertiser, February 25, 2001)

### **3.12 VISUAL AND AESTHETIC RESOURCES**

Identifying viewsheds is an important step to assess a project's potential visual affects. A viewshed can be described as all surface areas visible from an observer's viewpoint. The following are general viewsheds of the study area:

#### Ocean and Shoreline Views

The ocean and shoreline views, including views of Kahoolawe, Lanai, and Molokini Islands, are spectacular scenic viewsheds from both Upcountry and Kihei.

#### Haleakala

The dry vegetated slopes of Haleakala are a backdrop to the dominant eastern (mauka) viewshed from Kihei.

#### West Maui Mountains

The West Maui Mountains, a rugged and majestic physical landmark, can be seen from both Upcountry and Kihei.

#### Central Maui.

From Upcountry looking down hill, the Central Maui area is primarily open agricultural land.

These viewsheds have visual quality according to FHWA's guidance document on visual impacts (Visual Impact Assessment For Highway Projects Publication No. FHWA-HI-88-054) because they have a high level of vividness (memorability of landscape), some intactness

(extent to which the landscape is free from visual encroachment) and some unity (the degree to which the landscape joins together to form a coherent, harmonious visual pattern).

The viewsheds from Upcountry have visual quality because of the panoramic views of Central Maui, the West Maui Mountains, and the ocean. However, Kihei, Kahului and Wailuku degrade the intactness and unity of the Upcountry viewsheds.

The makai viewshed from Kihei offers near sea level views of the ocean and coastline. However, since this viewshed has visual obstructions because of Kihei's low elevation, its visual quality is not as high as the same viewshed from Upcountry. Kihei's uphill views of Haleakala and distant vistas of the West Maui Mountains have high visual quality because they have few visual disruptions.

## **CHAPTER FOUR**

### **Environmental Consequences**

## **CHAPTER 4 ENVIRONMENTAL CONSEQUENCES**

This chapter describes the potential environmental and social impacts of the proposed Kihei-Upcountry Maui Highway. The No Build alternative is used as the basis against which to evaluate the potential impacts of the preferred alternative (U1,K1) and the other build alternatives. Mitigation measures are also presented in this chapter. Many of the impacts and mitigation measures are attributed to a particular alternative, group of alternatives (e.g. the U3 alternatives), segment (e.g., Segment U1) or terminus (e.g., Terminus K2). In these instances, the particular section of the alternative is identified. When a particular impact or mitigation measure is attributable to the project regardless of the alternative selected, "Kihei-Upcountry Maui Highway" is often used.

### **4.1 LAND USE**

#### **4.1.1 LAND USE IMPACTS**

Construction of the Kihei-Upcountry Maui Highway will introduce a roadway into areas presently used for agriculture and ranching. Therefore, Kihei-Upcountry Maui Highway will cause an irrevocable loss of agricultural- and pasture-related open space (see Section 4.8.1). These areas contain few manmade structures, other than those related to agricultural / ranching activities and infrastructure.

Highway projects can remove impediments to development by enhancing access to vacant land or increasing transportation capacity. To evaluate the potential land use impacts of a highway project, one compares the proposed transportation project to the planned growth within the project area. The potential growth impacts of the proposed roadway is based on an assessment of whether the transportation infrastructure will facilitate planned growth, or induce unplanned growth. The pattern of planned growth is described in the Kihei-Makena Community Plan (1998) and the Makawao-Pukalani-Kula Community Plan (July 1996) (see Section 3.1.4.2d).

All the alternatives will support planned growth because they will improve transportation between Kihei and Upcountry by reducing travel time (see Section 1.2.1). Furthermore, the proposed project is intended to meet existing and future travel demand resulting from implementation of the study area's land use plans. The issue of whether Kihei-Upcountry Maui Highway would induce unplanned growth is addressed below.

#### **4.1.1.1 Kihei-Makena**

Development in Kihei-Makena has historically correlated with the health of Maui's visitor industry. Support of growth would be beneficial in Kihei-Makena where there is ample room between Piilani Highway and South Kihei Road. Additional development would conform to Kihei's visitor-based urban environment. Factors, such as future hotel and resort development and the pace of development of Maui's "high-technology" industry (see Section 1.2.2) are expected to determine the speed and extent of growth in Kihei more than the Kihei-Upcountry Maui Highway.

As indicated in the Kihei-Makena Community Plan, only limited commercial and business development would be allowed east (mauka) of Piilani Highway, most of which consists primarily of the continued development of the Maui Research and Technology (R&T) Park. State and county zoning east (mauka) of Piilani Highway will remain in agriculture. Therefore, neither K1 or K2 segments will facilitate development in areas east (mauka) of Piilani Highway. If Kihei-Upcountry Maui Highway facilitates in-fill development between Piilani Highway and South Kihei Road, this would be considered a positive impact consistent with the Kihei-Makena Community Plan.

#### **4.1.1.2 Upcountry**

The Makawao-Pukalani-Kula Community Plan (July 1996) describes preservation of low densities, open space, and agricultural activities in Upcountry's rural communities. Because of the strong concern about potential impacts of the proposed project on the "quality of life" in Upcountry, stated repeatedly during project scoping activities (see Chapter 5), a Community Impact Assessment report was prepared for this project (see Appendix H). The findings of this report are summarized below and elsewhere in Chapter 4.

In scoping activities and interviews conducted for this EIS, many "key informants" stated a broad concern about the proposed highway facilitating urban development and increasing traffic volumes in Upcountry, elements that are inconsistent with the vision articulated for the area in the Makawao-Pukalani-Kula Community Plan. However, it is appropriate to look beyond these concerns to other factors that could affect land use trends in Upcountry, and to the relative differences among the alignment alternatives.

The project could facilitate planned residential and commercial developments in Upcountry because it will provide a transportation link between the Kihei-Makena employment center and the popular Upcountry Maui residential area. However, regardless of whether areas are available to be developed (i.e., have appropriate zoning or are identified for growth in official County land use plans), the greatest obstacle to further development in Upcountry is water availability, which has historically constrained urban growth. According to the Maui Board of Water Supply (BWS), there is currently barely enough capacity to serve current Upcountry customers. Under drought conditions, customers are required to reduce water use, and the reservoirs quickly empty.

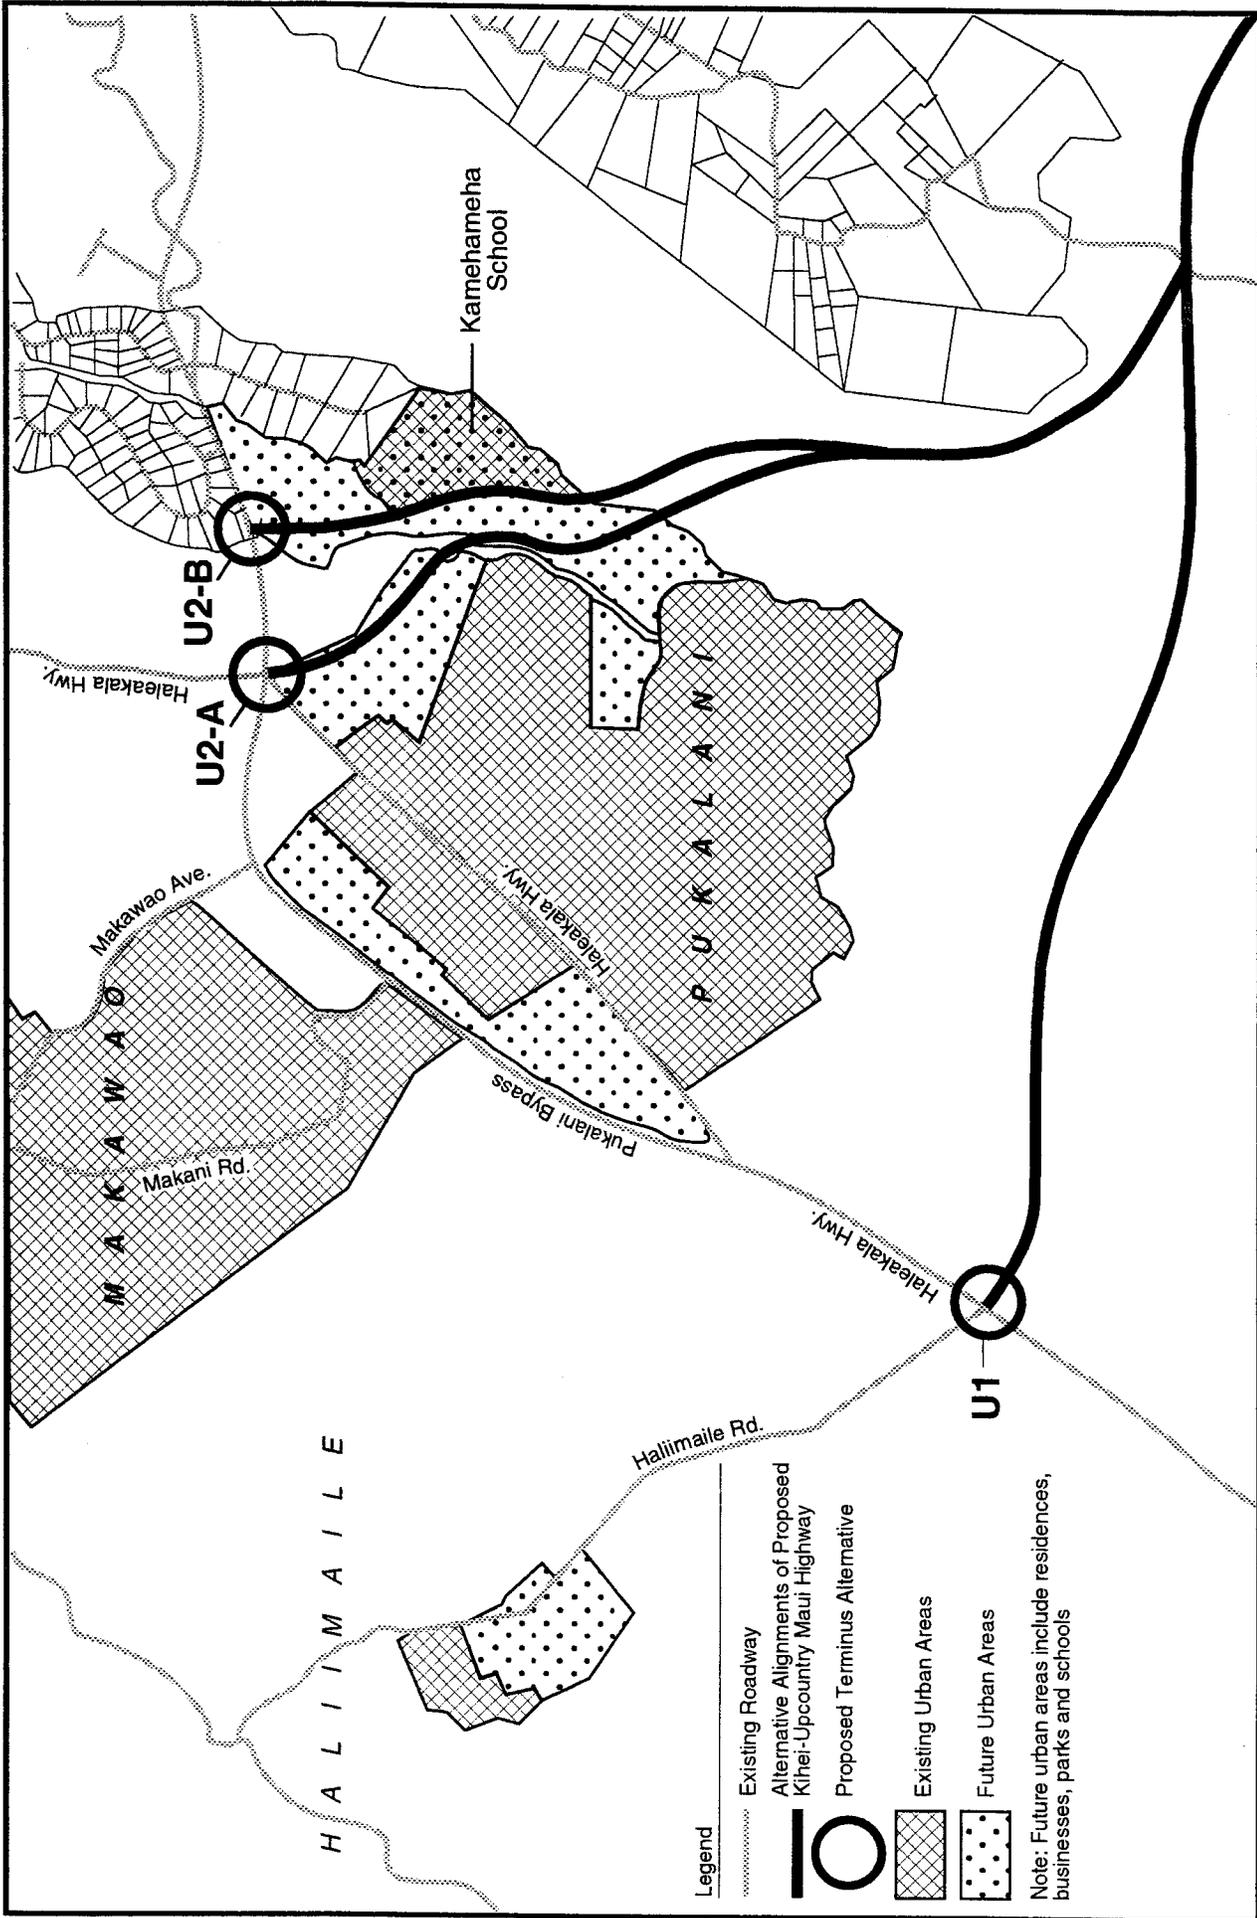

The Maui BWS uses the Community Plans in planning new water systems and/or increasing the capacity of existing systems. As described in Section 3.4.3, the Maui BWS is planning improvements to the Makawao system in response to the Makawao-Pukalani-Kula Community Plan (see Section 3.1.4.2d), and has allowed the private drilling of a well in Haiku to free water in the Makawao system for the Kulamalu development (see Section 3.1.3). These projects in the Upper and Lower Kula systems (see Section 3.4.3) are intended to improve service to current customers. With these improvements, the Maui BWS should not have to implement water use restrictions as frequently as in the past during drought conditions (telephone conversation with Maui BWS, May 5, 1998).

Providing the additional amount of water to the Kula systems that would be sufficient to support unplanned development in Upcountry, particularly Kula, is unlikely, mainly because the system relies on surface water. Surface water resources are vulnerable to drought conditions, whereas groundwater resources are a more stable source even during a year or two of limited rainfall. According to the Maui BWS, the high cost and substantial risk of developing alternative sources of water (i.e., wells) has stopped and constrained many

development proposals in Upcountry. The Kulamalu developer was able to assume the high cost and risk of drilling a well in Haiku only because of the large size and scale of the development, which is not expected to be typical for Upcountry because of land use controls (telephone conversation with Maui BWS, May 5, 1998). Therefore, water supply limitation is likely to constrain development in Upcountry in the future, despite the efforts of the Maui BWS to improve the Upcountry systems, and despite the construction of the Kihei-Upcountry Maui Highway.

Since the Maui BWS is planning to accommodate development in Pukalani, which is part of the Makawao system, the U1 alternatives could facilitate Pukalani's growth westward (makai) toward the proposed highway. This growth inducement will be partially consistent with the Makawao-Pukalani-Kula Community Plan because there are parcels on the west (makai) side of Pukalani designated for residential growth (see Figure 4-1). The U1 alternatives, including the preferred alternative, could facilitate development beyond Pukalani's urban growth boundary if the landowner, Alexander and Baldwin (A&B), chooses to develop its land north (makai) of Pukalani and Makawao. Similarly, the U1 alternatives may induce development in Haliimaile beyond what is designated in the Makawao-Pukalani-Kula Community Plan (see Figure 4-1).

The U2-A and U2-B alignments may have very little influence in the area south (mauka) of Pukalani. As described in Section 3.1.3, the area south (mauka) of Pukalani is planned for development to create Kulamalu, and its developer will be making substantial improvements to the water supply infrastructure (see Section 3.4.3). Since parcels for this project already have State urban classification, the County has approved zoning and Community Plan amendments supporting the project (Maui News, December 2, 1997). With water availability not being a constraint, Kulamalu will be developed with or without Kihei-Upcountry Maui Highway. However, the U2-A and U2-B alternatives would support this development to a greater degree than the U1 or U3 alternatives by providing additional transportation infrastructure directly to the site (i.e., Kulamalu residents would not have to use Haleakala or Kula Highways to travel to Kihei). The U2-B alignment came from the Kulamalu Master Plan, and therefore, is the alignment most consistent with this development.

**Existing and Future Urban Areas in Pukalani-Makawao**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Final Environmental Impact Statement  
**FIGURE 4-1**

The U2-A and U2-B alignments may facilitate in-fill development along Pukalani's southern (mauka) side. According to the Community Plan, some of Pukalani's growth is directed toward this area (see Figure 4-1).

Segment U3 is located approximately 5 km (3 miles) south (mauka) of Upcountry's "urban" areas of Pukalani and Makawao, in an area where the Community Plan designates very little additional growth. The developments that are planned include small scale commercial land uses in Waiakoa and rural residences. These uses, particularly the residences, are not dependent on the highway because of Kula's attractiveness as a residential area. However, these developments will have to receive other governmental approvals (e.g., zoning, subdivision, etc.) and obtain water meters. The latter could be difficult (see above discussion on U1, U2-A and U2-B). In summary, U3 would facilitate planned growth, but not induce unplanned growth.

#### **4.1.2 RELATIONSHIP OF THE PROPOSED ACTION TO GOVERNMENTAL PLANS, POLICIES, AND CONTROLS**

##### **4.1.2.1 Hawaii State Plans and Controls**

###### **4.1.2.1a Hawaii State Plan**

The No Build alternative does not support the objectives and policies of the Hawaii State Plan (June 1991) that seek to enhance the public welfare and economic development by providing needed infrastructure. Although the No Build alternative does not support these State Plan objectives and policies, it is not necessarily inconsistent with the State Plan.

The Kihei-Upcountry Maui Highway will support those objectives and policies of the Hawaii State Plan dealing with economic, physical and natural environment, and transportation objectives and policies.

In accordance with the Plan's economic objectives and policies, Kihei-Upcountry Maui Highway will facilitate commerce through an improved transportation network. It will contribute to the economy of Maui County and the State by providing largely federally funded

construction jobs. The State and federal government will spend roughly \$80 million to construct Kihei-Upcountry Maui Highway.

The proposed highway will support both the State's established visitor industry and its growing high technology industry by providing a transportation link between Haleakala / Science City and Kihei-Makena / West Maui. Kihei is also home to the growing Maui Research and Technology (R&T) Park. Because of its 3050 m (10,000 ft) elevation, the Haleakala summit is used for science and defense-related research located in Science City.

The Plan has objectives and policies promoting the viability of sugar, pineapple and diversified agriculture. The proposed highway will serve all three of these agricultural activities (see Section 4.2.1). Although certain proposed roadway segments will cross agricultural fields, mitigation measures will be implemented to minimize adverse impacts on these fields (see Section 4.2.4). No small privately-owned farm will be directly affected by any alternative.

In accordance with the objectives and policies for the physical and natural environment, the proposed Kihei-Upcountry Maui Highway will minimize impacts to the existing environment, and where unacceptable environmental impacts might occur, mitigation measures will be implemented. Since the proposed work will be located east (mauka) of Piilani Highway, it will not adversely affect the shoreline area. The proposed highway will also not affect the spectacular panoramic views from Upcountry of the West Maui Mountains, Central Maui and the ocean. Impacts on the physical and natural environment are discussed in more detail in other sections of this chapter.

Kihei-Upcountry Maui Highway will accommodate the transportation needs of both residents and visitors. For visitors, the highway will improve transportation between Maui's hotels and resorts along the coasts, and tourist-related activities in high elevation areas of Upcountry and Haleakala. The proposed highway will contribute to residents' quality of life by improving transportation between popular residential areas in Upcountry, and employment centers and recreational attractions in Kihei-Makena and West Maui. Since the improvement in transportation will result in substantial travel time savings, the highway will provide up to 50 percent savings in vehicle fuel consumption for certain alignment alternatives and/or trips.

#### **4.1.2.1b Coastal Zone Management (CZM)**

The following describes the Kihei-Upcountry Maui Highway's consistency with the objectives and policies of the State's Coastal Zone Management (CZM) Program. This assessment was reviewed by the Department of Business, Economic Development and Tourism (DBEDT), the agency administering the State's CZM program. DBEDT deferred its consistency determination pending completion of the Final EIS so that further information can be obtained about potential impacts to scenic and open space resources, public participation and historic resources (see letter dated March 30, 2001 in Appendix C).

##### Recreation Resources

Kihei-Upcountry Maui Highway will not adversely affect any park or recreational resource in the project area. The K2 alternatives (with the Kihei terminus at the Ke Alii Alanui Street/Piilani Highway intersection) would facilitate access to the future Kihei Regional Park for Upcountry residents.

##### Historic Resources

Compliance with Section 106 of the National Historic Preservation Act and Section 6E of the Hawaii Revised Statutes (the State's historic resources law) is required for this project. Archaeological reconnaissance surveys of the alternatives identified 25 sites potentially eligible for the National and State Registers of Historic Places. The archaeological inventory survey of the preferred alternative identified 17 significant sites, an increase from five sites identified during the reconnaissance survey of this alignment. As described in Section 4.10, only three of these sites will be adversely affected by the preferred alternative because the other sites have either been avoided, or the sites have been recorded with sufficient documentation so that no further archival work is needed.

Impacts sites eligible for the National and Hawaii Registers of Historic Places, and recommended for preservation-in-place, were avoided by modifying the alignment of the appropriate alternative. These sites include petroglyphs located in the gulches crossed by some of the alternative alignments, and one heiau in the vicinity of the U2-A alignment. Alignments were not adjusted to avoid affected sites not recommended for preservation, such

as temporary habitation sites, agricultural sites and military sites (see Section 4.10 for further details).

#### Scenic And Open Space Resources

Panoramic vistas of Central Maui, the West Maui Mountains, and the ocean can be seen from Upcountry Maui. Vistas from Kihei consist of near sea level views of the ocean and coastline, uphill views of Haleakala, and distant views of the West Maui Mountains. Kihei-Upcountry Maui Highway will not disrupt views from Upcountry because the terrain drops away towards Central Maui and the ocean. The proposed highway will, however, change the eastern (mauka) view of Haleakala from Kihei by introducing a paved roadway into the present visual backdrop of agriculture and pasture land.

#### Coastal Ecosystems

Since Kihei-Upcountry Maui Highway will not be within the Shoreline Setback Area or Special Management Area, the alternatives will not directly affect coastal habitats, wetlands or ecosystems. Roadway drainage and runoff from construction areas will also not affect coastal areas because of natural conditions and measures to minimize off-site discharges and sedimentation.

#### Economic Uses

The proposed highway will support both the State's established visitor industry and its growing high technology industry by improving transportation between Kihei-Makena (and West Maui) and Upcountry Maui, including Haleakala and Science City. Kihei-Makena is Maui's second largest visitor accommodation region, the third largest employment center and home to the growing Maui R&T Park. Upcountry Maui is a popular residential area, with some tourist activities including Haleakala National Park. Science City at the Haleakala summit is the site of science and defense-related research.

Depending on the alternative, Upcountry's sugarcane and pineapple cropland will be adversely affected to varying degrees (see Section 4.2).

### Coastal Hazards

Kihei-Upcountry Maui Highway will facilitate evacuation from Kihei-Makena in the event of coastal emergency, such as a tsunami. The K2 alternatives, with a more southern Kihei terminus, would facilitate evacuation better than the K1 alternatives, with a terminus in north Kihei close to the existing exit from South Maui. A more southern Kihei terminus would provide a more geographic separation between the exits from South Maui, allowing for a more orderly evacuation if needed.

### Managing Development

The proposed roadway will require State and County permits. The permitting processes include provisions for public participation important for the protection of coastal resources.

### Public Participation

The project included numerous scoping and coordination meetings with government agencies, elected officials, and the general public, as described in detail in Chapter 5. In addition, three public hearings were held during the public comment period on the Draft EIS. Over 400 oral and written statements about the project were received during this period.

### Beach Protection

Kihei-Upcountry Maui Highway will not affect the shoreline setback area nor have an impact on coastal erosion because it will not be adjacent to or abutting the shoreline.

### Marine Resources

Kihei-Upcountry Maui Highway will not directly affect marine and coastal resources. Kihei-Upcountry Maui Highway will improve access to coastal areas, especially from the Upcountry region.

Some indirect impacts are possible, such as erosion during construction, and roadway runoff during extreme storm events. However, a NPDES permit will be obtained, which will specify Best Management Practices (BMPs) to minimize erosion. As described in Section 4.7, Kihei-Upcountry Maui Highway will lead to a reduction of pollutant loading of coastal waters when compared to the future no-build condition.

#### **4.1.2.1c Island of Maui Long Range Land Transportation Plan**

The No Build alternative assumes the construction of the transportation system that is recommended in the Maui Long Range Land Transportation Plan (February 1996), except for the Kihei-Upcountry Maui Highway. Therefore, the No Build alternative is consistent with the Long Range Plan, with the exception of providing the Kihei-Upcountry highway link.

Kihei-Upcountry Maui Highway will be consistent with the Long Range Plan because it is an element of the Long Range Plan.

#### **4.1.2.2 County of Maui Plans and Controls**

##### **4.1.2.2a Maui County General Plan**

The No Build alternative would be consistent with the General Plan because of roadway improvements described in Section 2.1.1, provided that these improvements are implemented in a manner sensitive to Maui's environmental and social conditions.

Kihei-Upcountry Maui Highway will be consistent with the County of Maui's General Plan 1990 dealing with economic, environmental, and transportation objectives and policies. First, the proposed highway will support both Maui's visitor and high technology industries. The highway will improve Maui's highway network by shortening the length and duration of certain trips made by visitors, visitor industry employees and those traveling between the Maui R&T Park and Science City. Second, the project will minimize impacts to the existing environment, and will not affect vistas from Upcountry. Third, Kihei-Upcountry Maui Highway will provide a piece of transportation infrastructure that will enable people and goods to move safely, efficiently and economically between Kihei and Upcountry. In addition, the highway will be supportive of desired urban development objectives of the County of Maui (see Section 4.1.1), and therefore, will be responsive to planned growth.

The General Plan advocates land use planning that will promote a transportation system less reliant on the automobile as the primary transportation mode (see Section 3.1.2.2a). Kihei-Upcountry Maui Highway will not help achieve this objective without new transportation options becoming available. Furthermore, land use planning is not within the authority of the SDOT.

#### **4.1.2.2b Maui County Special Management Area**

There are projects under the No Build alternative that would occur in the County's Special Management Area (SMA). Construction of each of those individual projects in the SMA would require an SMA use permit.

Since no portion of Kihei-Upcountry Maui Highway will be within the SMA, the project will not require an SMA permit from Maui County.

#### **4.1.2.2c Community Plans**

Consistency of the project with the Kihei-Makena Community Plan (1998) and the Makawao-Pukalani-Kula Community Plan (July 1996) land use objectives are discussed in Section 4.1.1, Land Use Impacts. As described in Sections 3.1.2.2c, Kihei-Upcountry Maui Highway is consistent with the Kihei-Makena Community Plan because it includes a roadway between Kihei and Upcountry. However, Kihei-Upcountry Maui Highway is not consistent with the Makawao-Pukalani-Kula Community Plan because it does not include a roadway.

### **4.1.3 RELOCATION IMPACTS**

Depending on the alternative, Kihei-Upcountry Maui Highway will require right-of-way from the land owners listed below. The existing uses on these lands are also provided:

- Alexander & Baldwin (Hawaiian Commercial and Sugar Company (HC&S)): sugarcane cultivation (U1, U2-A and U2-B alternatives);
- County of Maui (Kula Agricultural Park): leased diversified agriculture (U3 alternatives);
- Dowling Company: Kamehameha Schools campus, mostly inactive, but with planned future housing and commercial development (U2-A and U2-B alternatives);
- Haleakala Ranch: pasture land and pineapple cultivation (all alternatives);
- Kaonoulou Ranch: pasture land (K1 and K2 alternatives)
- Malama Mohala Corp.: inactive, but future urban uses (U2-A alternatives)
- Maui Land & Pineapple Company: pineapple cultivation (U2-A, U2-B and U3 alternatives)
- Von Tempsky Trust: pasture land (U3 alternatives);

- Others (see Table 2-1 for a list of land owners): inactive with some planned future urban uses (U2-A alternatives); and existing pasture (U3 alternatives)

None of these land owners or uses will need to be relocated. All of the enterprises listed above could continue operation at their present locations after acquisition of roadway right-of-way. Mitigation measures to lessen the adverse impact on agricultural and ranching activities will be provided (see Section 4.2.4).

No alternative will require the displacement of any residence.

#### **4.1.4 MITIGATION MEASURES**

##### **4.1.4.1 Land Use**

Mitigation for potential land use impacts is not necessary because Kihei-Upcountry Maui Highway is intended to meet existing and projected traffic demand derived from existing land use planning objectives. The roadway is not anticipated to induce unplanned land use development in the study area. As described in Section 4.1.1, the health of the visitor industry determines the size, rate and location of development in Kihei-Makena. In Upcountry, water supply restrictions, and other factors such as State and County land use controls, determine the size, rate and location of development.

##### **4.1.4.2 Relocation**

Since no residence, tenant or business will be displaced by Kihei-Upcountry Maui Highway, relocation assistance will not be necessary. However, land owners affected by right-of-way acquisition will be compensated in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended. In addition, farmers (owners and leaseholders) will be compensated for crop damage and lease losses, if necessary (see Section 4.17.6).

## **4.2 FARMLAND**

### **4.2.1 CROPLAND IMPACTS**

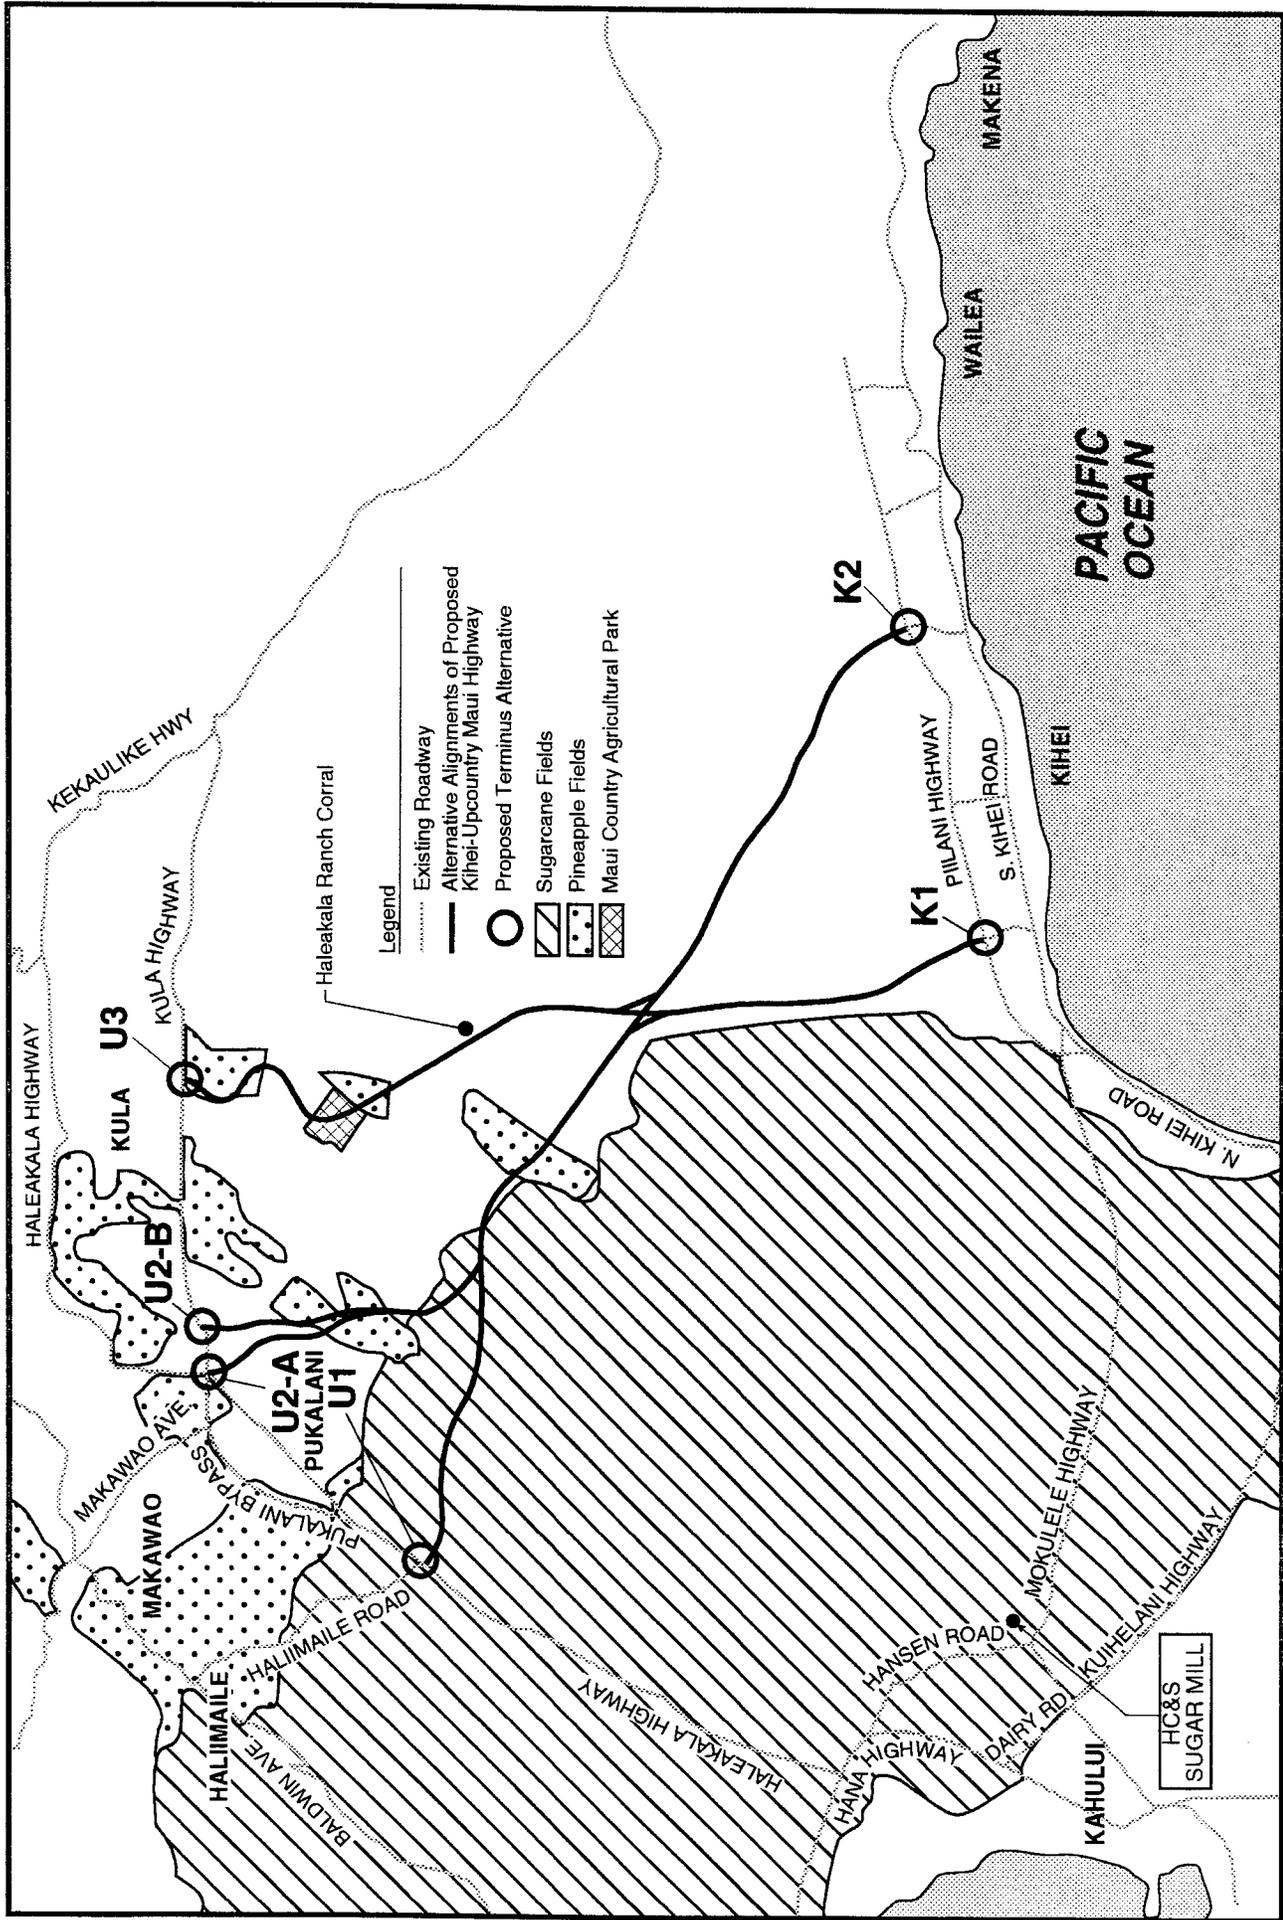

Kihei-Upcountry Maui Highway will cross agricultural land and convert the roadway right-of-way to transportation use (see Figure 4-2). Most of the agricultural impacts will occur on existing sugarcane and pineapple fields (see below). As indicated on Table 4-1, the degree of impact will depend on the alignment selected. The U1 alternatives, including the preferred alternative, would displace the greatest amount of active farmland (approximately 48 ha (120 acres). Table 4-1 also shows the estimated amount of agriculturally-productive soil that will be permanently displaced by Kihei-Upcountry Maui Highway.

**Table 4-1**  
**Estimated Displacement of Farmlands**

<b>Alternative</b>	<b>Est. Displacement</b>	<b>Land Owner</b>
<u>U1,K1</u>	<u>48.3 ha (119.4 acres)</u>	<u>Alexander &amp; Baldwin; Haleakala Ranch</u>
<u>U1,K2</u>	<u>48.3 ha (119.4 acres)</u>	<u>Alexander &amp; Baldwin; Haleakala Ranch</u>

Kihei-Upcountry Maui Highway will not directly affect any privately-owned Kula small-scale farm, although leased fields located in the Kula Agricultural Park owned by Maui County would be affected by the U3 alternatives (see below). Also, some of the alternatives could

GRAPHIC SCALE:

modify travel patterns in a way that may adversely affect certain Kula farms. This issue is discussed in Section 4.4.1.1, "Traffic Patterns."

All alternatives will adversely affect agricultural operations, such as planting, aerial spraying, irrigation, drainage and harvesting, for several reasons. For example, the highway will cross agricultural infrastructure, such as existing service roads and irrigation and drainage systems. In addition, the roadway could isolate portions of fields, making them inaccessible and unworkable for cultivation. However, in most cases, this project will not create unworkable remnant parcels because mitigation measures to maintain the productivity and workability of the affected fields will be implemented (see Section 4.2.4).

The impacts of alternative alignments are described below:

- Segment U1 crosses sugarcane fields owned by Hawaiian Commercial and Sugar Company (HC&S) west (makai) of Pukalani (see Figure 4-2). The alignment will separate approximately 400 ha (1000 acres) of sugarcane land from larger fields, and cross existing cane haul roads and irrigation and drainage systems. The isolated parcel will remain productive because mitigation measures, as described in Section 4.2.4, will be implemented if a U1 alternative were constructed.
- Segment U1/U2-A crosses a Maui Land and Pineapple Company (ML&P) pineapple field along Pulehu Road, affecting internal roadways, water conveyance infrastructure and drainage patterns (see Figure 4-2). The two newly created parcels will remain productive because mitigation measures, as described in Section 4.2.4, will be implemented if either a U1 or U2-A alternative were constructed.
- Segments U2-A and U2-B separate approximately 25 ha (60 acres) of HC&S sugarcane land from a larger field (see Figure 4-2). It will also cross two major water ditches, the Hamakua Ditch and the Reservoir 40 ditch. The U2-A alignment also crosses a ML&P pineapple field south (mauka) of Pukalani, separating two parcels from a larger field. These affected fields would remain productive because mitigation measures, as described in Section 4.2.4, would be implemented if a U2-A or U2-B alternative were constructed.

- The re-aligned Haleakala Highway, under the U2-A alternatives, crosses a ML&P pineapple field on the southeast (mauka) side of Pukalani. The field would remain productive because mitigation measures, as described in Section 4.2.4, would be implemented if a U2-A alternative were constructed.
- Segment U3 crosses two ML&P fields along Pulehu Road (see Figure 4-2). The western (makai) field would be divided into two field. However, both fields would remain productive because mitigation measures, as described in Section 4.2.4, would be implemented if a U3 alternative is constructed. Unworkable remnant parcels would be created at the eastern (mauka) field because of the small size of the isolated field. The U3 alignment would also cross the Kula Agricultural Park owned by Maui County (see Figure 4-2). The Agricultural Park leases low-rent parcels to small-scale farmers. Some of the parcels would be converted to the roadway. The remaining parcels and parcels modified by the roadway alignment would remain productive because mitigation measures, as described in Section 4.2.4, would be implemented if a U3 alternative were constructed.

Segments K1 and would not affect existing cropland.

#### **4.2.2 RANCHING IMPACTS**

Kihei-Upcountry Maui Highway crosses land used for cattle ranching and grazing. All proposed alternatives traverse cattle ranching and pasture land located toward the southern portion of the study area, south of the sugarcane fields and west (makai) of the small Kula farms. While reducing the acreage of pasture lands, Kihei-Upcountry Maui Highway increases accessibility to such land.

The U3 alignment would be approximately 90 m (300 ft) from a working corral and water system (tank and troughs) (see Figure 4-2). The owner of the corral, Haleakala Ranch, has indicated a preference that the highway not be within visual distance of the corral to prevent highway users from interfering with cattle operations. The U3 alignment would therefore interfere with corral operations.

Haleakala Ranch also stated that they will have to herd cattle across the K1 alignment several times a year. Herds may reach 1,500 cows, and take about 10 to 15 minutes for the animals to cross the highway. However, impacts are not anticipated because mitigation measures will be provided as described in Section 4.2.4.

### **4.2.3 FARMLAND PROTECTION POLICY ACT**

Under the Farmland Protection Policy Act (FPPA), federal agencies must identify and consider the adverse effects of their programs on the preservation of farmland; consider alternative actions that could lessen adverse effects; and ensure that their programs, to the extent practicable, are compatible with State, local government and private programs and policies to protect farmland. Agricultural areas that will be affected by Kihei-Upcountry Maui Highway (see Section 4.2.1) are considered prime, unique, statewide or locally important according to the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS). Therefore, the proposed project is subject to FPPA.

Per 7 CFR 658.4(a), a Form AD-1006, "Farmland Conversion Impact Rating," was submitted to the NRCS for a "relative value of farmland to be converted" score for each alternative alignment. The Federal Highway Administration (FHWA) completed the Form AD-1006 by providing site assessment scores per 7 CFR 658.5. Combined Land Evaluation and Site Assessment scores are shown on Table 4-2. The completed Form AD-1006 is provided in Appendix C.

If an alternative receives a total score equal to or greater than 160 points, alternatives that avoid farmland impacts must be evaluated. However, as indicated on Table 4-2, none of the alternatives has a score equal to or greater than 160 points.

### **4.2.4 MITIGATION MEASURES**

Affected agricultural areas will require mitigation measures to maintain their productivity. These measures will include haul road crossings (U1 includes two undercrossings; see Figure 2-3), and the modification and reconstruction of existing irrigation and drainage systems. Access provisions for farm equipment to reach isolated fields will be made. If U2-A or U2-B

were selected, Hamakua and Reservoir 40 Ditches would be protected and remain operative during and following construction. If U3 were selected, SDOT would purchase any unworkable remnant ML&P land based on guidelines of the Uniform Relocation Assistance and Real Property Acquisition Policies Act; and would work with Maui County to modify the Kula Agricultural Park. The details of the above mitigation measures will be specified in a "Maintenance of Agricultural and Ranching Activities Plan," which will be prepared during the design phase.

**Table 4-2  
Land Evaluation and Site Assessment Scores from Form AD-1006**

Alternative	Score		
	Part V <sup>1</sup>	Part VI <sup>2</sup>	Total <sup>3</sup>
U1,K1	66	85	151
U1,K2	63	85	148
U2-A,K1	61	80	141
U2-A,K2	62	80	142
U2-B,K1	59	80	139
U2-B,K2	59	80	139
U3,K1	60	80	140
U3,K2	57	80	137

**Notes:** <sup>1</sup> Part V of AD-1006: "Relative value of farmland to be converted." Score calculated by NRCS.  
<sup>2</sup> Part VI of Form AD-1006: "Total site assessment points." Calculated by FHWA.  
<sup>3</sup> Land evaluation and site assessment score calculated by combining Parts V and VI of Form AD-1006

**Source:** Form AD-1006, completed by U.S. Department of Agriculture, Natural Resources Conservation Service and the U.S. Department of Transportation, Federal Highway Administration, October 1997

To minimize impacts to ranching activities, stock-proof fencing will be erected along both sides of the highway where there is cattle grazing. The details of this fencing (type and location) will be determined during the design phase. Existing stock-proof fencing in the project area consists of hog wire with barb wire along the top and bottom of the fence. Also, provisions will be made at various bridge crossings and other locations as appropriate so that

cattle may be herded between pastures without disrupting traffic. Cattle will be herded underneath the bridges at certain gulches. If U3 were selected, SDOT would work with Haleakala Ranch to find a suitable location to relocate the cattle corral based on guidelines of the Uniform Relocation Assistance and Real Property Acquisition Policies Act. The locations of the cattle crossing areas, and the relocated corral (if a U3 alternative were constructed) will be determined during the design phase.

### **4.3 SOCIOECONOMIC**

A detailed discussion of the socioeconomic impacts of the proposed project is found in Appendix H, Kihei-Upcountry Maui Highway, Community Impact Assessment (October 1998). Most of the following information is based on that report.

#### **4.3.1 NEIGHBORHOODS**

Figure 3-1 identifies the neighborhoods and communities in the study area. None of the alternatives will split any existing neighborhood or isolate parts of neighborhoods from the greater community. Therefore, Kihei-Upcountry Maui Highway will not adversely affect community cohesion. The No Build alternative would also not affect community cohesion.

Although Kihei-Upcountry Maui Highway will not in itself change land use patterns in Upcountry in a manner different from the future development described in the community plan (see Section 4.1.1), implementation of the community plan may affect the rural country lifestyle of Upcountry by increasing the population and density, increasing traffic and associated roadway noise, and encroaching on agricultural land.

Some of the alignment alternatives have the potential to change existing travel patterns in a way that could adversely affect certain existing neighborhoods. These potential impacts are discussed in Section 4.4.1.

### **4.3.2 ECONOMIC ACTIVITIES**

The No Build alternative would not affect property values or property tax revenues collected by Maui County. Its impact on existing agricultural activities in Upcountry would be less than any build alternative. However, the No Build alternative would not support Maui's visitor and high technology industries to the degree of any build alternative.

Property values could increase over the long term for lands adjacent to the proposed highway, particularly at the termini. Increased values would result in increased property tax revenues for Maui County. None of the alignment alternatives would decrease property values on adjacent parcels because the market value of these properties (see Table 2-1) are based on other factors unrelated to the proposed highway, such as market demand for housing and agricultural produce.

Because of the conversion of private taxable real estate into a public right-of-way, Maui County's property tax collections would decrease by an estimated \$13,000 to \$17,000 per year (1997 dollars) under the U1 or U3 alternatives. Property tax revenues would decrease by approximately \$44,000 to \$46,000 per year (1997 dollars) under the U2-A or U2-B alternatives. This higher impact for the U2 alternatives is attributable to the conversion of urban-designated land into roadway right-of-way. The U1 and U3 alternatives will convert almost exclusively lands designated agricultural, which have much lower property values.

The proposed project will infuse federal funds into the local economy, which will increase short-term employment and the purchase of local goods and services. However, Kihei-Upcountry Maui Highway will have little influence on long-term employment opportunities because there will be little difference in future employment-producing development (e.g. commercial) between the No Build and build conditions (see Section 4.1.1). For example, the Kulamalu development (see Section 3.1.3) includes business development that will occur with or without the project (see Section 4.1.1). However, a U2-A or U2-B alternative will better support the Kulamalu development as a business district because of improved accessibility. The U2-B alignment was derived from the Kulamalu master plan.

Existing commercial districts in Upcountry are in Pukalani and Makawao (see Section 3.3.4). Kihei also supports commercial districts along South Kihei Road and at a parcel in North Kihei, west (mauka) of Piilani Highway. Regardless of the alternative chosen, the Kihei-Upcountry Maui Highway is generally not expected to adversely affect these districts because the roadway will not function as a commercial district bypass, except for Kahului. However, a Kulamalu shopping center is planned adjacent to the U2-B alignment. Depending on the tenants at the shopping center, a U2-B alternative would shift a portion of visitor spending to this shopping center, away from the visitor-oriented shops in Makawao. This shift may occur to lesser extent with a U2-A or U3 alternative. This effect would also occur with residents commuting between Upcountry and Kihei or West Maui.

Although Kihei-Upcountry Maui Highway will enable many motorists to bypass Kahului, economic impacts to Kahului businesses are not expected because residents will continue to travel to Kahului regardless of the proposed project because of Kahului's attractiveness as the island's principal commercial center, featuring Kaahumanu Shopping Center, K-Mart, and Costco, among others.

All the build alternatives will enhance access to tourist destinations in Upcountry and Haleakala National Park, and therefore will have a positive effect on the visitor industry. However, the proposed project is not expected to facilitate visitor-related economic activities in Kihei or Upcountry (see Section 4.1.1).

Impacts on agricultural activities are discussed in Section 4.2.

The proposed project will support Maui's efforts to develop high technology industry (see Section 3.1.3). The roadway will provide increased synergism between Science City on the summit of Haleakala Crater and the R&T Park in Kihei.

### **4.3.3 PUBLIC FACILITIES AND SERVICES**

None of the alternatives will directly affect (through right-of-way impacts) existing public facilities described in Section 3.3.5. However, access to these facilities and services will be

enhanced by any of the build alternatives because of the decreased travel time between Kihei and Upcountry.

Many people who commented on the Draft EIS expressed concerns about the safety of students driving or walking to King Kekaulike High School and the new Kamehameha Schools campus, especially with regards to the U2 alternatives (A and B) because these alignments would be near or adjacent to these schools. King Kekaulike High School is on Kula Highway near the Five Trees intersection (the U2-A terminus) and the Kamehameha Schools campus is next to the U2-B alignment within Kulamalu (see Figure 3-8).

The amount of traffic passing the school on Kula and Haleakala Highway would be the same under the No Build, U1 or U2-A alternative, disregarding the effects of Omaopio and Pulehu Roads in diverting traffic. These alternatives would not change the routes of travel markets so that those routes that do not presently pass the school would not pass the school in the future. On the other hand, a U2-B or U3 alternative would increase traffic volumes passing by the high school. These alternatives would change the routes of some of the major travel markets, such as the Makawao-Pukalani / Kihei-Makena and the drive to/from the summit, to routes that pass by the high school. However, the highways (Kula and Haleakala) fronting the school are subject to lower speed limits during school hours.

The installation of signalized crosswalks and sidewalks can prevent students walking to and from the schools being placed in danger from vehicles using the highways (see Section 4.4.4). For example, under the U2-A alternative, the Pukalani leg of Haleakala Highway would be converted to a pedestrian walkway and sidewalks would be installed along Kula Highway near the high school. Under the U2-B alternative, an urban design that includes sidewalks would be used in the section of the highway adjacent to the Kamehameha Schools campus.

Scoping activities and interviews conducted for this Final EIS indicated a strong belief among some Upcountry residents that Kihei-Upcountry Maui Highway will increase the crime rate in Upcountry because criminals based in Kihei will have more convenient access to Upcountry. The Makawao and Kula community police officers (see Appendix H) could not speculate on whether the highway will increase the crime rate in Upcountry, although both officers were in

agreement that the proposed highway will facilitate better police response through additional highway infrastructure.

#### **4.3.4 ENVIRONMENTAL JUSTICE (EXECUTIVE ORDER 12898)**

Executive Order (EO) 12898, signed on February 11, 1994, requires federal agencies to take appropriate and necessary steps to identify and avoid disproportionately high and adverse effects of federal projects on the health and environment of minority and low-income populations. Because of the expected federal participation in the construction funding for this project, the project must comply with EO 12898. This section has been prepared in accordance with FHWA Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (December 2, 1998).

Figure 3-1 identifies the residential areas in the study area. The Upcountry communities are clustered along Haleakala and Kula Highways. As described in Section 3.1, Pukalani, Makawao and Haliimaile are mostly suburban. The Kula communities are of lower density, and many are typical of a rural setting (i.e., small truck farms). The Kihei-Makena communities are mostly located west (makai) of Piilani Highway. The area midway between Upcountry and Kihei, or the area that will be used for the proposed highway, is owned by a few large land owners, such as Alexander & Baldwin and Haleakala Ranch, and are used for large-scale agricultural activities. Near Haleakala, Kula and Piilani highways, where the residential communities are clustered, the alternatives have the following physical relationships with these residential areas:

- Segment U1 is located approximately 1200 to 1400 m (4000 - 4500 ft) west to northwest (makai) of Pukalani.
- At its closest point, Segment U2-A is located approximately 150 m (500 ft) south of Pukalani and approximately 300 m (1000 ft) north of a few Omaopio homesteads.
- Segment U2-B is located approximately 275 m (900 ft) south of Pukalani and approximately 240 m (800 ft) north of the Omaopio homesteads. The lower part of a

- residential subdivision, Kula 200, is directly east (mauka) of the U2-B/Kula Highway intersection. However, this subdivision is upslope from the terminus.
- Segment U3 is located approximately 240 to 700 m (800 to 2300 ft) north of residences along Pulehu Road. U3's intersection with Kula Highway is approximately 500 m (1600 ft) southwest of the Kula Kai Subdivision, which is located east (mauka) of Lower Kula Road. However, the U3 alignment would displace portions of Kula Agricultural Park (see Section 5.2.1), which is used by minority farmers, but not as residences. Although impacts would be mitigated if a U3 alignment were selected as the preferred alternative, minority farmers would be at least temporarily be affected by the project.
- Segment K1 is located approximately 500 m (1600 ft) south of a residential subdivision located east (mauka) of Piilani Highway. Kaonoulu Estate is the nearest residential subdivision, located west (makai) of the K1/Piilani Highway intersection.
- The nearest residential area to Segment K2 is approximately 500 m (1600 ft) north of the K2/Piilani Highway intersection, across Piilani Highway.

Based on the information above, no alternative will cut through a neighborhood (see Section 4.3.1) or displace any residence or business (see Section 4.1.3). In addition, proximity impacts to these communities, such as high noise levels or degraded air quality, are not anticipated. Therefore, other than minority farmers using the Kula Agricultural Park who would be temporarily affected by the U3 alternative, there are no minority or low-income populations that will be adversely affected by the proposed project, which is the finding required by EO 12898 regarding Environmental Justice.

#### **4.3.5 MITIGATION MEASURES**

Potential adverse social impacts could occur through travel pattern impacts and the location of Kihei-Upcountry Maui Highway near existing schools. Mitigation measures to minimize this impact are discussed in Section 4.4.4.

## **4.4 INFRASTRUCTURE**

### **4.4.1 TRANSPORTATION**

#### **4.4.1.1 Traffic Patterns**

Table 4-3 summarizes the discussion in this section.

Under the future No Build condition, major traffic pattern changes are not anticipated because no new major roadway, other than Kihei-Upcountry Maui Highway, is planned for the project area. No Build transportation improvements, as described in Section 2.1.1, consist of capacity enhancements of existing roadways. Therefore, although capacity enhancements would improve the operations of the roadways identified in Section 2.1.1, changes in traffic patterns would not occur.

Kihei-Upcountry Maui Highway, on the other hand, will cause major changes to existing traffic patterns in the project area. The proposed project will divert most trips between Kihei-Makena and Upcountry onto the new highway and off of Haleakala Highway, Hana Highway, Dairy or Hansen Roads, Puunene Avenue and Mokulele Highway, the Kihei and Upcountry, and the route that would persist under the No Build alternative. If a K1 alternative were selected, some of the travel demand between Upcountry and West Maui will also be diverted onto the new highway. Kihei-Upcountry trip lengths could be cut by half, depending on the alternative, trip origin and trip destination. Therefore, Kihei-Upcountry Maui Highway will substantially reduce total regional vehicle-miles-traveled (VMT), fuel consumption, air pollutant emissions and travel time for a large number of trips in comparison to the No Build condition. Under the No Build alternative, regional VMT would increase as population and subsequent travel demand increase on Maui. However, overall travel time may be slightly reduced under the No Build alternative in comparison to the present condition because of better roadway operations from capacity enhancements.

The diversion of trips by the proposed highway will reduce traffic volumes on the existing Kihei to Upcountry route, and therefore improve operations along this route for the remaining traffic in comparison to the No Build alternative. However, the K1 alternatives will increase

**Table 4-3  
Comparison of Traffic Pattern Impacts by Alternative**

Alternative	Relief of Upcountry to Kihei Traffic Congestion	Relief of Upcountry to West Maui Traffic Congestion	Enhance Contra-Flow of Morning Peak Directional Traffic in Upcountry	Adverse Effect on Omaopio and Pulehu Roads	Adverse Effect on Local Roads Between Kula and Haleakala and Highway Highways

U1,K1	Yes	Yes	No	Yes	No
U1,K2	Yes	Some	No	Yes	No
U2-A,K1	Yes	Yes	Yes	Yes	No
U2-A,K2	Yes	Some	Yes	Yes	No
U2-B,K1	Yes	Yes	Yes	Yes	No
U2-B,K2	Yes	Some	Yes	Yes	No
U3,K1	Yes	Yes	Yes	No	Yes
U3,K2	Yes	Some	Yes	No	Yes

Note:  Indicates an adverse impact

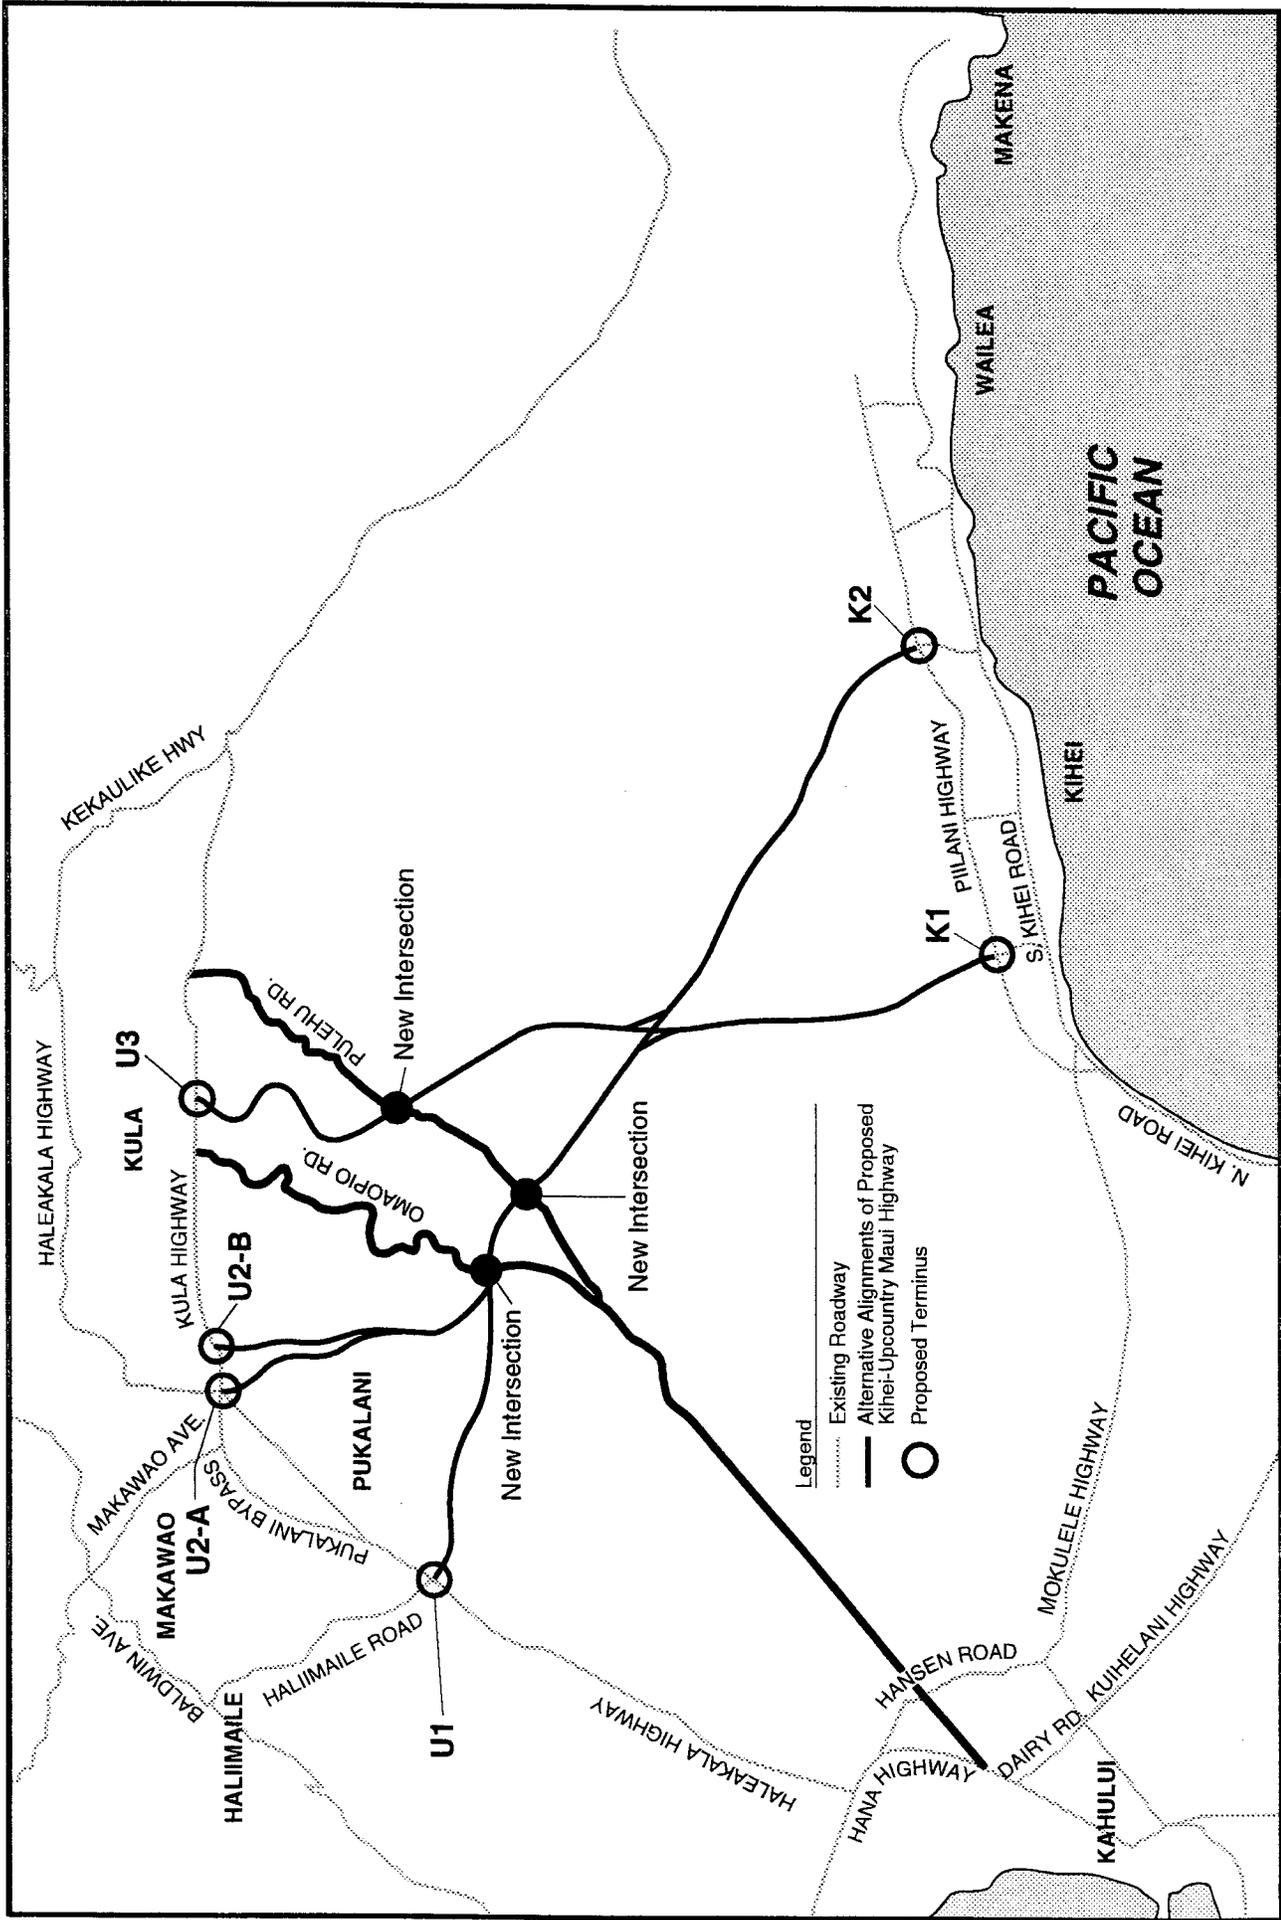

Source: Parsons Brinckerhoff Quade & Douglas, Inc., October 1997

traffic volumes on Piilani Highway, north of the K1 terminus, and North Kihei Road, as traffic is diverted off the above roadways and Kuihelani Highway (Upcountry-West Maui trips). The traffic diversion impacts on Piilani Highway and North Kihei Road will not be substantial under the K2 alternatives (see above).

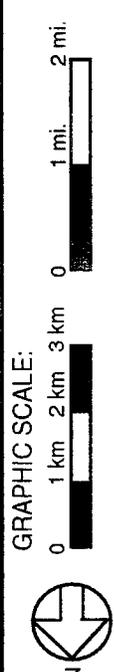

The U2-A, U2-B and U3 alternatives would create a redistribution of morning peak directional traffic on Haleakala Highway, Pukalani Bypass and Kula Highway. As described in Section 3.4.1, the middle south (mauka) bound lane on Pukalani Bypass and Haleakala Highway is presently contra-flowed to the northwest (makai) bound direction in the morning peak period because most home-based work trips originating in Upcountry use these roadways to travel to Maui's major employment centers at Kahului-Wailuku, Kihei-Makena and West Maui. This redistribution would consist of Makawao and Pukalani commuters, and Kula commuters under the U3 alternatives, traveling southeast / south (mauka) bound against peak directional traffic to access either the U2-A, U2-B or U3 alignments. With the K1 terminus option, many of these commuters would include those traveling to West Maui. By contrast, under the U1 alternatives, Upcountry morning commuters would continue to travel in the north / northwest (makai) bound direction on Kula Highway, Pukalani Bypass and Haleakala Highway, as they currently do, until the U1 terminus at Halliimaile Road. At that point, many of the commuters would turn onto the proposed roadway.

The U1, U2-A and U2-B alternatives intersect both Omaopio and Pulehu Roads (see Figure 4-3), which would cause an increase in through traffic on these agricultural roads (see Section 3.4.1). The traffic on these roads will be higher under the preferred alternative, as well as the U1,K2 alternative because the U1 terminus is farther from Kula than the U2-A and U2-B termini. By increasing the use of Omaopio and Pulehu Roads as through routes, impacts from the inappropriate use of these roads is expected (see Sections 3.4.1.1 and 3.4.1.2). These impacts include interference with farm equipment movements, increased traffic noise and lower traffic safety through excessive speeds on inappropriate roadways. However, the County is planning to improve Omaopio and Pulehu Roads, which should improve safety.

In addition, the U1/U2-A,B crossings will have a slight adverse effect on farm product transportation from Kula to Kahului because delivery trucks will cross the new highway. However, the highway will enhance product transportation to Kihei-Makena. Safety at the at-

**Possible Intersections with Omaopio and Pulehu Roads**

 Final Environmental Impact Statement  
 FIGURE 4-3

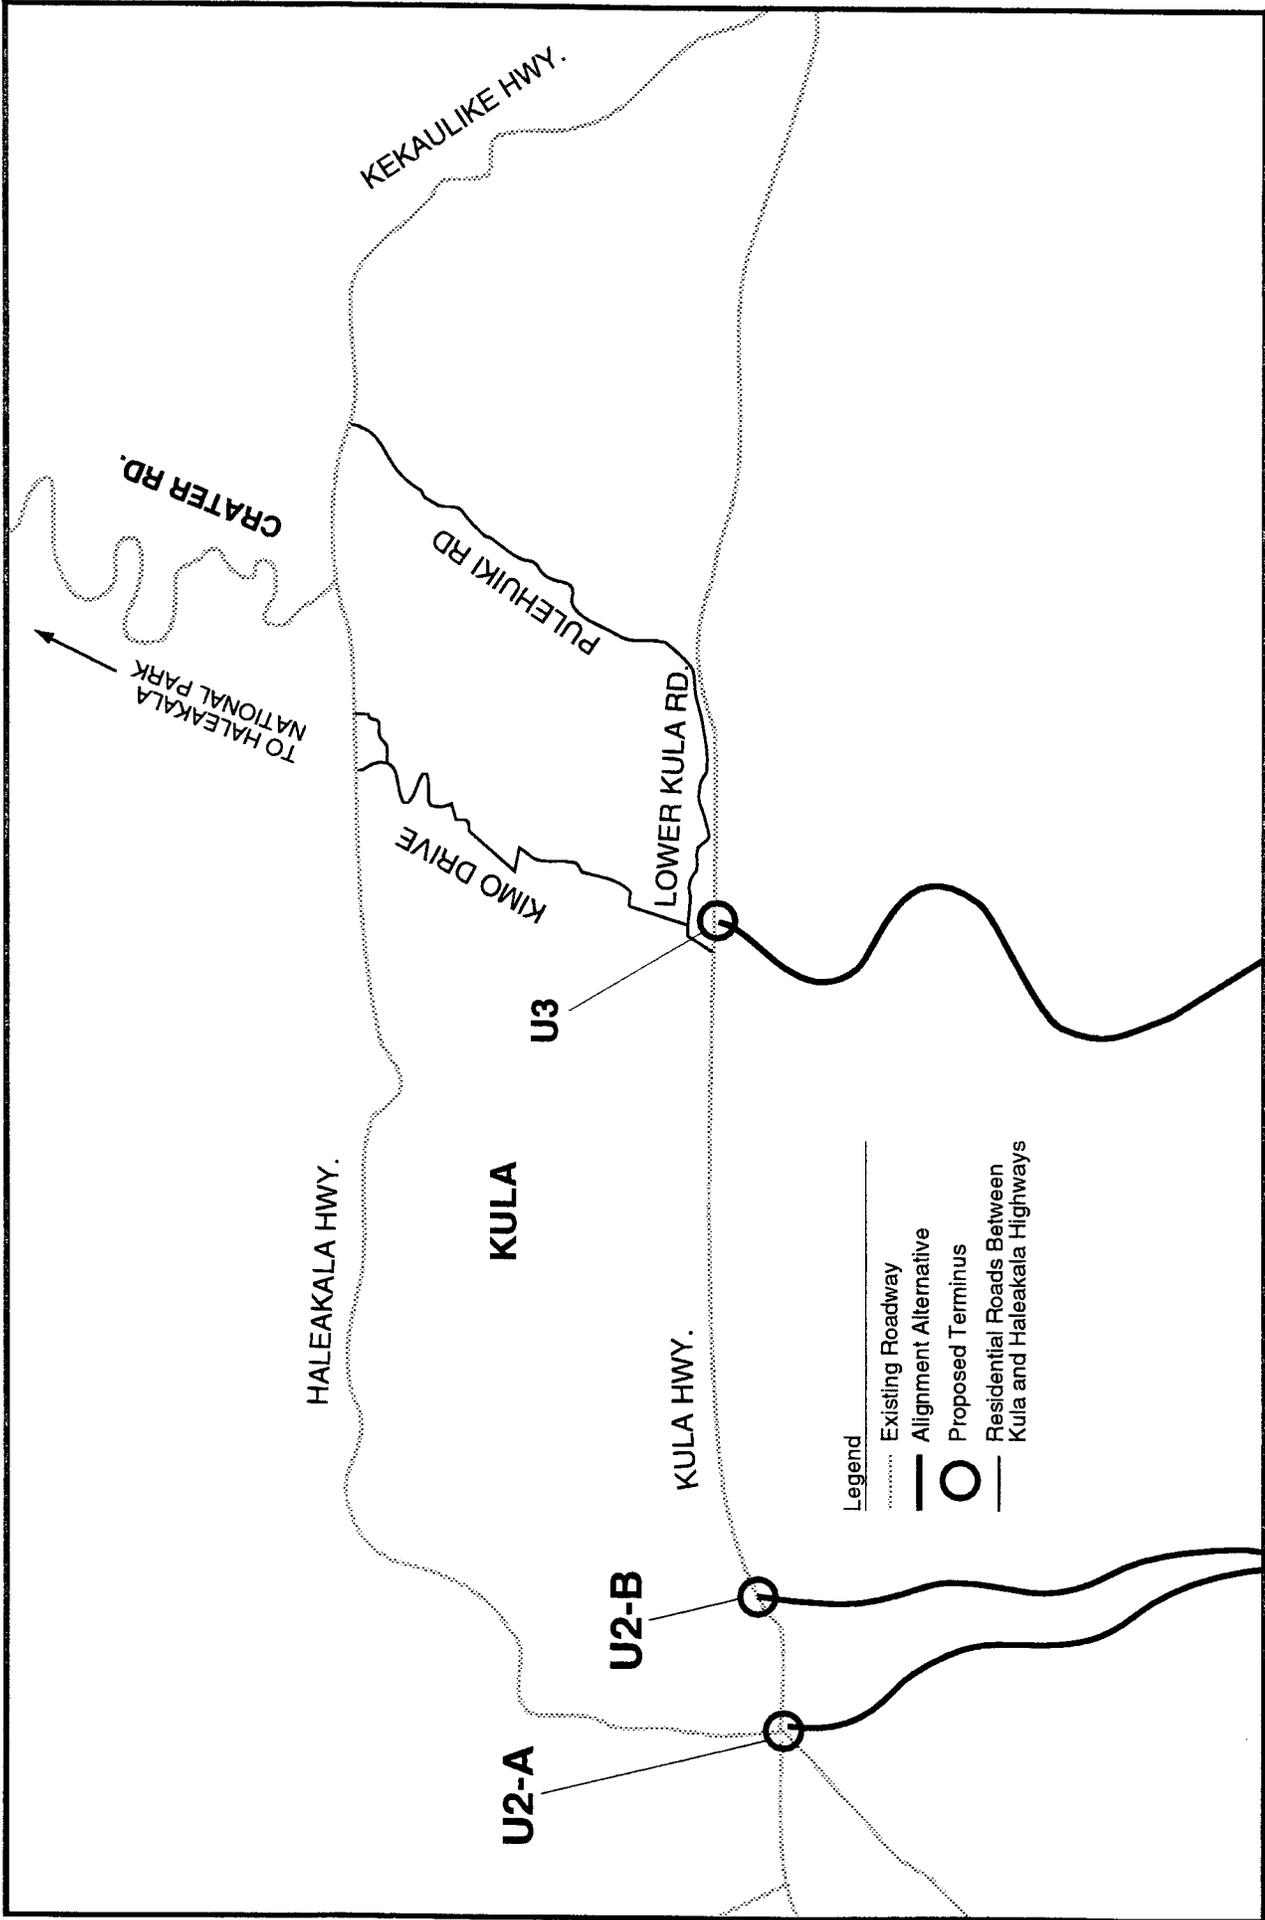

grade crossing of the new highway with Omaopio and Pulehu Roads will be maintained through mitigation measures (see Section 4.4.4). Farm vehicles will use the new highway.

The U3 alternatives intersect Pulehu Road (see Figure 4-3). Since the U3 terminus is a short distance away from the Pulehu Road/Kula Highway intersection, traffic diversion similar to the impacts described above on Pulehu Road would not be expected. However, U3 alternatives may encourage travelers to and from the Haleakala summit to use local residential roads between Kula Highway and Haleakala Highway because it would appear to a visitor reading a map that this is a shorter route to the summit (see Figure 4-4). The preferred route for this trip is for motorists to stay on Kula and Haleakala Highways. Increasing traffic volumes on local residential roads that are not designed for through traffic would adversely affect the adjacent neighborhoods through increased traffic noise (including travel to the summit early in the morning to watch the sunrise), and the increased potential for accidents on roadways not designed for heavy volumes. The potential use of local roads between Kula and Haleakala Highways would be mitigated as described in Section 4.4.4 if a U3 alternative were selected as the preferred alternative.

#### **4.4.1.2 Future Traffic Operations**

Year 2020 traffic volume projections were analyzed using methods described in the 1994 Highway Capacity Manual (HCM) to determine levels of service (LOS) for each alternative during the morning and afternoon peak hours. Levels of service are classified on an “A” through “F” scale, representing best to worst conditions. The LOS is based on user delays, a measure of driver discomfort, frustration, fuel consumption, and lost travel time.

Depending on the alternative, between 7,000 to 13,000 vehicles per day are predicted to use the highway. The K2 alternatives will produce lower volumes. Tables 4-4 and 4-5 provide projected levels of service for the build alternatives. For the U1, U2-A and U2-B alternatives, three roadway segments were analyzed: Haleakala Highway or the “Five Trees” intersection to Omaopio Road; Omaopio Road to Pulehu Road; and Pulehu Road to Piilani Highway. For the U3 alternatives, two roadway segments were analyzed: Kula Highway to Pulehu Road; and Pulehu Road to Piilani Highway.

As indicated on Tables 4-4 and 4-5, most segments will operate acceptably, at LOS C or D during the a.m. and p.m. peak hours. However, there will be segments that are projected to operate at LOS E for alternatives U1,K1, U2-A,K1 and U2-B,K1. This condition will occur during the p.m. peak hour when volumes will be heaviest in the upgrade direction.

#### **4.4.1.3 Bicycle and Pedestrian Movements**

Kihei-Upcountry Maui Highway will have no adverse effects on any existing and future bikeway. When completed, some bicycle tour companies may use the roadway, modifying their Haleakala bike tours. Although Kihei-Upcountry Maui Highway was not identified in Bike Plan Hawaii (April 1994) as a potential bikeway, the Kihei-Makena region will be a natural area to end some of the Haleakala bike tours if the highway were constructed. The proposed roadway will have sufficient room for bicyclists riding single file because bike lanes will be provided along urban roadway sections and adequate shoulders will be provided along rural roadway sections (see Figure 2-2). If a U2-A or U2-B alternative were selected, bike tours may interact with traffic surrounding King Kekaulike High School. If a U3 alternative were selected, bike tour operators utilizing this route would probably use Kula residential roads between Haleakala and Kula Highways. Bicycle tours moving through these neighborhoods may disturb residents and disrupt local traffic. Bike tour operators will be less likely to modify their routes if a U1 alternative were selected because of the distance between the "Five Trees" intersection and the U1 terminus.

No alternative will adversely affect an existing pedestrian facility. In some cases, some of the alternatives will improve or install walkways, sidewalks and crosswalks along existing roads (see Section 4.4.4). Kihei-Upcountry Maui Highway will include sidewalks in conformance with the Americans with Disabilities Act (ADA) where the highway is constructed in an urban area. In rural areas, pedestrian facilities will not be provided.

#### **4.4.2 WATER SUPPLY SYSTEM**

Kihei-Upcountry Maui Highway will not affect existing water supply systems or future Maui BWS plans, which are described in Section 3.4.3.

#### **4.4.3 DRAINAGE**

Kihei-Upcountry Maui Highway will not affect existing drainage systems in the project area.

#### **4.4.4 MITIGATION MEASURES**

Under a U1, U2-A or U2-B alternative, traffic conditions at the intersections of the proposed highway with Omaopio and Pulehu Roads will be monitored after completion of the project to determine whether these intersections meet traffic signal warrants specified in the Manual on Uniform Traffic Control Devices, published by FHWA.

If a U2-A alternative were selected, the modified Five Trees intersection would include crosswalks and sidewalks to the high school. In addition, the Pukalani leg of Haleakala Highway would be converted to a pedestrian walkway.

If a U2-B alternative were selected, an urban design (see Section 2.1.2) would be used next to the Kamehameha Schools campus in Kulamalu. This design includes sidewalks.

If a U3 alternative were selected, signage will be provided to direct motorists to the proper route to the Haleakala summit.

### **4.5 AIR QUALITY**

A detailed discussion of the microscale air quality impacts of the proposed project is found in Appendix F, Air Quality Study for the Proposed Kihei-Upcountry Maui Highway (September 1998). The following information is based on that report.

#### **4.5.1 POLLUTANTS FOR ANALYSIS**

The pollutants relevant to evaluating the air quality impacts of a roadway project are those contained in motor vehicle emissions. These pollutants include carbon monoxide (CO), hydrocarbons (HC), nitrogen oxide (NO<sub>x</sub>), ozone (O<sub>3</sub>), and lead. Vehicles account for a very small percentage of regional emissions of sulfur dioxide (SO<sub>2</sub>) and particulate matter (PM<sub>10</sub>), and therefore detailed analyses of these contaminants are typically not warranted for a proposed roadway.

Motor vehicles have historically constituted a major source of lead emissions to the atmosphere. However, lead levels have decreased substantially and will continue to do so due to the mandated decrease and elimination of lead in gasoline. Therefore, a detailed analysis of the impact of lead emissions is also not warranted.

HC and NO<sub>x</sub> emissions from automotive sources are of concern primarily because of their roles as precursors in the formation of O<sub>3</sub> in the lower atmosphere. Ozone, a major greenhouse gas, is formed through a series of reactions that take place in the atmosphere in the presence of sunlight. Since the reactions are slow and occur as the pollutants diffuse downwind, elevated ozone levels are often found many miles from sources of the precursor pollutants. HC and NO<sub>x</sub> emissions are therefore examined on a regional or “mesoscale” basis.

CO impacts are localized. Even under the worst meteorological conditions and most congested traffic conditions, high concentrations are limited to a relatively short distance (91 to 183 m (300 to 600 ft)) from heavily traveled roadways. Consequently, it is appropriate to predict concentrations of CO on a localized or “microscale” basis.

## **4.5.2 METHODOLOGY**

### **4.5.2.1 Microscale Analysis**

To estimate future CO levels by year 2020, microscale air quality modeling was performed using the most recent version of the Environmental Protection Agency (EPA) mobile source emission factor model (MOBILE 5A) and the CAL3QHC version 2 air quality dispersion model. Appendix F contains a more detailed description of the methodology used to predict CO concentrations.

Adverse air quality effects of a roadway project are caused by increased vehicular activity in a particular area, such as an intersection. Impacts at these local areas, typically intersections, are often referred to as “hot spots.” According to the EPA Conformity Guidelines, a hot spot analysis should be prepared if:

- the project worsens an intersection's LOS if it was previously a C or D; and

- the intersection LOS is D or worse and the project substantially increases intersection delay.

According to Section 4.4.1, the LOS at the alternative termini (U1, U2-A, U2-B, U3, K1 and K2) are predicted to remain the same as present or be no worse than LOS C, except for one terminus. Because of this predicted traffic condition, only the following two sites received detailed CO analysis because they represent the termini with the worst predicted traffic conditions:

- Site #1: Haliimaile Road / Haleakala Highway / Kihei-Upcountry Maui Highway intersection - Alternatives U1,K1 and U1,K2; and
- Site #2: Kaonoulu Street / Piilani Highway / Kihei-Upcountry Maui Highway intersection - Alternative U1,K1

A localized (microscale) analysis of mobile sources applies mathematical models that simulate physical conditions to predict CO concentrations at specific receptor locations. Mobile source dispersion models are the basic analytical tools used to estimate CO concentrations expected under given conditions of traffic, roadway geometry and meteorology. The mathematical expressions and formulations that comprise the various models attempt to describe extremely complex physical phenomena. However, because all models contain simplifications and approximations of actual conditions, most have been designed to be conservative.

#### **4.5.2.2 Mesoscale Analysis**

The effects of a proposed project on regional hydrocarbon and nitrogen oxide emissions are an indication of the project's overall affect on areawide ozone levels. A regional emission burden (or mesoscale) analysis is often conducted to estimate these effects. This analysis utilizes vehicle miles of travel (VMT) and vehicle hours or travel (VHT) within the region (together with appropriate mobile source emission factors) to estimate changes in pollutant burden levels with and without the proposed project. The results of this analysis are then used to determine if the area will be in compliance with regulations set forth in the Final Conformity Rule.

### **4.5.3 POTENTIAL IMPACTS**

#### **4.5.3.1 Microscale Analysis**

Maximum 1-hour and 8-hour carbon monoxide levels were predicted at two analysis sites for Alternatives U1,K1 and U1,K2. The results of this analysis are provided in Tables 4-7 and 4-8. An analysis of other sites and alternatives, including the No Build alternative, is unnecessary because the CO levels at Sites #1 and #2, under the U1 alternatives, would be the “worst-case” among all of the other termini and alternatives. Therefore, the predicted CO levels at these two analysis sites would be the highest due to microscale effects from the project. As indicated on Tables 4-7 and 4-8, no violations of State Ambient Air Quality Standards (SAAQS) for one- or eight-hour CO standards are predicted, even at these “worst-case” locations (the SAAQS are more stringent than the Federal Ambient Air Quality Standards).

Since the project is not predicted to cause a violation of the applicable air quality standards, it conforms to the goals set forth in the Clean Air Act Amendments.

**Table 4-7  
Predicted Worst-Case 1-Hour Carbon Monoxide Concentrations (ppm)\***

Site	Description	Alter.	State Std.	Build (Year 2020)	
				AM	PM
1	Haliimaile Road / Haleakala Highway intersection	U1,K1	9	0.81	0.71
1	Haliimaile Road / Haleakala Highway intersection	U1,K2	9	0.91	0.61
2	Kaonoulu Street / Piilani Highway intersection	U1,K1	9	0.81	0.81

Note: \* 1-hour CO Background = .012 ppm

Source: Parsons Brinckerhoff Quade & Douglas, Inc., September 1998

**Table 4-8  
Predicted Worst-Case 8-Hour Carbon Monoxide Concentrations (ppm)\***

<b>Site</b>	<b>Description</b>	<b>Alternative</b>	<b>State Standard</b>	<b>Build (Year 2020)</b>
1	Haliimaile Road / Haleakala Highway intersection	U1,K1	4.5	0.07
1	Haliimaile Road / Haleakala Highway intersection	U1,K2	4.5	0.08
2	Kaonoulu Street / Piilani Highway intersection	U1,K1	4.5	0.07

Note: \* 8-hour CO Background = .012 ppm

Source: Parsons Brinckerhoff Quade & Douglas, Inc., September 1998

#### **4.5.3.2 Mesoscale Analysis**

On a regional air quality basis, any of the build alternatives will produce an improvement over the No Build alternative because of the reduction of travel distance between Upcountry and Kihei-Makena or West Maui, which will result in decreased fuel consumption. The Kihei-Upcountry Maui Highway is included in the current State of Hawaii Statewide Transportation Improvement Program (STIP), 1997, for Fiscal Years 1998-2000. The regional effects of this project are incorporated into and satisfy the requirements of the conforming Statewide Implementation Plan (SIP). Therefore, a regional or mesoscale analysis is not necessary.

#### **4.5.4 MITIGATION MEASURES**

Mitigation measures for the air quality impacts of Kihei-Upcountry Maui Highway after its construction will not be necessary. Construction-phase air quality impacts and mitigation measures are addressed in Section 4.17.2.

## **4.6 NOISE**

A detailed discussion of the noise impacts of the proposed project is found in Appendix G, Noise Technical Report for Kihei-Upcountry Maui Highway (January, 1998). The following information is based on that report.

The noise impact analysis for Kihei-Upcountry Maui Highway was prepared using SDOT's FHWA-approved Noise Analysis and Abatement Policy (October 1996) (hereinafter referred to as Noise Policy). This Final EIS considers two types of future traffic noise impacts:

- the traffic noise levels along Kihei-Upcountry Maui Highway under each alignment alternative; and
- the change in traffic noise levels on other roadways within the project study area due to traffic diversion caused by Kihei-Upcountry Maui Highway.

### **4.6.1 PREDICTION METHODOLOGY**

Future noise levels with and without the project were predicted using FHWA's highway traffic noise prediction model, STAMINA 2.0 Highway Traffic Noise Modeling Program (FHWA, 1982). Input variables to the model include traffic volumes, speeds and vehicle fleet mix (auto, medium truck, and heavy truck percentages). The analysis assumes that existing and future traffic conditions have the same vehicle mix and speeds.

The noise analysis considered the following traffic scenarios:

- two-lane facility (proposed project) - sunrise hours (5:00 a.m. to 6:00 a.m.);
- two-lane facility (proposed project) - peak hour; and
- two-lane facility (proposed project) - roadway operating at level of service (LOS) C.

Roadway "level of service" (LOS) is measured on a scale from A to F (see Section 4.4.1). LOS C is a traffic condition, where vehicular volume is at the capacity of the roadway, yet vehicles operate at the allowable speed limit. This is considered to be the noisiest of the six levels of service (A through F).

## **4.6.2 POTENTIAL IMPACTS**

Noise abatement must be considered when there is a noise impact. According to the Noise Policy, a noise impact occurs when:

- predicted traffic noise levels approach or exceed the FHWA Noise Abatement Criteria (NAC); or
- predicted traffic noise levels substantially exceed the existing noise levels.

Noise is measured by the one-hour  $L_{eq}(h)$  parameter. "Approach" means to attain a noise level 1 dBA less than the NAC and "substantially exceed the existing noise levels" means to increase the one-hour  $L_{eq}(h)$  by at least 15 dBA.

Computer modeling results for the Year 2020 are presented in Table 4-9.

Under the No Build alternative, predicted future traffic noise levels are expected to be no more than 1 dBA over the existing noise levels. The NAC of  $L_{eq}(h)$  67 dBA is expected to be approached at Site 7 (see Table 4-9). All other sites are predicted to remain below the NAC.

The predicted sunrise noise levels presented in Table 4-9 represent traffic using the proposed highway and other roadways during the early morning hours to model the condition of tourists traveling to the Haleakala summit for sunrise. However, these predicted noise levels do not include the cumulative effects of ambient early morning noise from other activities except at Site 1, which includes the effects of ambient early morning noise because measurements at this site were taken at 5:00 a.m. (see Section 3.6.3). The results in Table 4-9 indicate that the effects of early morning traffic will not cause future noise levels at the receptor sites to approach or exceed the NAC, including the K1 alternatives' traffic noise effects on Site 1. Site 1's sunrise noise levels are predicted to increase by 3 dBA over the existing ambient level, which is considerably less than the "substantial increase" threshold in the Noise Policy. A 3 dBA increase is barely perceptible to the human ear. Predicted noise levels at Site 1 included the effect of tour buses accelerating uphill.

Table 4-9  
Predicted Year 2020 Noise Levels

Site	Location	Segment	Noise Levels (L <sub>10</sub> (h) (dBA))					
			NAC	Existing	No-Build	Sunrise	Peak Hour	LOS C 2 Lanes
1	Ohukai community (Ohukai St.)	K1	67	39	40	42	46	48
2	Kamalu Elementary School	K2	67	58	59	46	60	61
3	Omaopio Homesteads	U2-A	67	53	54	52	59	63
		U2-B	67	53	54	52	59	63
4	Haleakala Hwy. / Hallimalile Rd. Intersection	U1	---	68	69	49	69*	69*
5	Pukalani community (Alani St.)	U2-A	67	57	58	48	56	59
		U2-B	67	57	58	45	58	60
6	Kula 200 community	U2-B	67	51	52	48	55	59
7	Kula residence along Kula Hwy.	U3	67	66	67	33	67*	67*
8	Pulehu community (Holopuni Rd.)	U3	67	47	48	50	56	57
9	Future Kamhehameha School	U2-B	67	53	54	42	54	56
10	Piilani Hwy. / Kaonoulu St. Intersection	K1	67	60	61	52	62	63
11	Future Kihei Regional Park	K2	67	45	46	55	63	70
		U2-A	67	49	50	40	51	53
12	King Kekaulike High School	U2-B	67	49	50	38	50	52
13	Unnamed Road off of Haleakala Hwy. near Five Trees Intersection	U2-A	67	50	46	56	60	63
		U2-B	67	49	50	44	52	58

Notes: (XX)- Values that are underlined approach or exceed the applicable Noise Abatement Criteria.

\* The predicted future traffic at Sites 4 and 7 results in noise levels that are lower than the predicted future No-Build noise levels. Therefore, future noise levels at these sites are assumed to be the same as the future No-Build levels.

Source: Parsons Brinckerhoff Quade & Douglas, Inc., June 1997 and September 1998

Peak hour and LOS C traffic noise levels at 12 of the 13 receptor sites are predicted to increase from 1 dBA to 11 dBA over existing ambient noise levels (see Table 4-9). Site 11 is located at the future County Park in South Kihei. Under the K2 alternatives, Site 11's peak hour and LOS C noise levels are predicted to increase by 18 dBA and 25 dBA over its existing ambient level, respectively. Both increases are considered "substantial," and the LOS C condition would exceed the NAC. Therefore, a noise impact is predicted at Site 11 with the K2 alternatives, even though the site of the future park is currently being used for pasture.

Site 7, an off-site receptor, is predicted to have peak hour noise levels of  $L_{eq}(h)$  67 dBA under the U3 alternatives and the No Build alternative. Its predicted  $L_{eq}(h)$  under the U3 alternatives would be slightly lower than the predicted  $L_{eq}(h)$  under the No Build alternative (or under a U1 or U2-A alternative). Nevertheless, a noise impact is predicted at Site 7 because future conditions under the U3 alternatives would "approach" the NAC, as defined in the Noise Policy.

### **4.6.3 MITIGATION MEASURES**

Noise abatement measures must be considered as part of the project if traffic noise impacts are identified. The Noise Policy is used to help determine whether noise abatement measures shall be implemented, depending on whether the measures are reasonable and feasible based on the following criteria:

- Measure would provide a minimum noise reduction of 5 dBA.
- Cost of noise abatement would not exceed \$35,000 per residence benefited. The number of residences protected includes all dwelling units - owner occupied houses, rental units, mobile homes, etc. All units benefited by a 5 dBA or more noise reduction will be counted regardless of whether or not they were identified as impacted.
- Views from impacted residences are a major consideration in the reasonableness of noise abatement measures.

- Greater consideration of implementation of abatement measures is given to residential areas where high absolute traffic noise levels are expected to occur, e.g., greater than 70 dBA, or where large increases over existing noise levels are anticipated.
- Greater consideration of implementing abatement measures is given to residential areas along highways in a new location, residential areas constructed before an existing highway, and residential areas in place along an existing highway for an extended period of time.
- Consideration of adverse environmental effects and beneficial reduction of construction noise.

Noise abatement would only be considered at existing residential or planned development sites where building permit approvals have been obtained, and would only apply to outdoor ground level areas.

As stated in Section 4.6.2, a noise impact is predicted at Site 7 under the U3 alternatives, and Site 11 under the K2 alternatives.

At Site 7, a noise barrier that would provide at least a 5 dBA reduction in  $L_{eq}(h)$  at the Site 7 residence was considered, but was found not to be reasonable and feasible because the barrier would block the residence's egress/ingress on Kula Highway, block viewplanes from the residence and not be appropriate in a rural, country setting.

At Site 11, abatement measures that are reasonable and feasible include buffer zones between the roadway right-of-way and noise-sensitive areas within the park, and berms that deflect noise from the highway. If a K2 alternative had been selected as the preferred alternative, the SDOT would work with the County of Maui Department of Parks and Recreation to determine which combination of these two measures would be preferred. For example, according to the latest master plan for the park, an amphitheater would be located at the southwest corner of the park adjacent to the K2 alignment. The grade at this location would allow the highway to be constructed at a lower elevation than the amphitheater, and therefore the highway would be separated from the park by berms. At other locations along the southern perimeter of the park, activities that are not noise sensitive (e.g., ball fields) could act as buffer zones for activities that are noise sensitive (e.g., camping grounds).

## **4.7 WATER RESOURCES**

### **4.7.1 SURFACE WATER**

Impacts to the intermittent streams (gulches) crossed by the Kihei-Upcountry Maui Highway will be associated in part with the bridges or embankments that will cross the gulches. After construction, the bridges will have no or very minimal impacts on the intermittent streams because current flow capacities of the gulches will be maintained. Storm water will be confined within the gulch, preventing flooding of adjacent areas. Information about the size and location of the bridges is provided in Section 2.1.2, and typical bridge profiles are shown on Figure 2-4.

Decisions on whether to use a bridge or embankment for gulch crossings partially depend on the storm water flow in the affected gulches. Many of the affected gulches have small storm water flows (under 100 m<sup>3</sup>/sec (3,500 cfs) for the 100-year design storm), which culverts will be able to accommodate. Therefore, the embankment crossings (containing culverts) will not create upstream impoundments, and there will be no hydraulic impacts except perhaps during conditions exceeding the 100-year design storm.

In rural areas, the roadway will cause run-off to drain into areas previously free of automobile-related pollutants. However, these areas have already been exposed to agricultural and ranching-related pollutants, such as fertilizers, pesticides and livestock waste. Under most cases, the roadway runoff will drain into gulches and thereupon percolate into the ground. Roadway run-off could enter coastal waters during a heavy rain. However, roadway pollutant levels are related to VMT, and by reducing total regional VMT (see Sections 4.4.1 and 4.13), Kihei-Upcountry Maui Highway's impact to total pollutant loading will be to decrease pollutant emissions in comparison to the No Build alternative. Under the No Build alternative, a larger amount of pollutants would be generated because of the greater VMT compared to the build alternatives.

The U.S. Army Corps of Engineers (USACE), has stated that construction of bridges and embankments in Haleakala's gulches will require a U.S. Department of Army Nationwide permit under Section 404 of the Clean Water Act (see Appendices B and C). The Corps is

therefore a cooperating agency in the preparation of this document. A Section 401 Water Quality Certification from the State of Hawaii Department of Health (SDOH) may also be required.

#### **4.7.2 GROUNDWATER**

Kihei-Upcountry Maui Highway will overlie dike-confined groundwater sources deep below the surface. The amount of roadway run-off percolating into the ground will not be sufficient to reach the deep aquifers. In addition, according to the Maui Board of Water Supply, these sources are not utilized for potable water because of the high cost of drilling and the risk of not reaching water.

As an arterial roadway, Kihei-Upcountry Maui Highway will be used by vehicles transporting fuel and other chemicals. In the event of an inadvertent spill, fuels or chemicals could be released. Should there be an inadvertent release, State regulations require immediate containment and clean-up, and the County Department of Fire Control already has response procedures in place. The depth from the surface to the groundwater will help protect the aquifer under these conditions.

As described in Section 3.7.2, there is no U.S. Environmental Protection Agency designated principal or sole-source aquifer in the project area. Therefore, the requirements pertaining to potential impacts to such a resource under Section 1424(e) of the Safe Drinking Water Act do not apply to the proposed project.

With the No Build Alternative, roadway pollutants also would be generated and the risk of spills would exist. The location of the discharges would be different, however.

#### **4.7.3 WETLANDS**

Wetlands at Kealia Pond and along the Kihei-Makena coastline will be unaffected by Kihei-Upcountry Maui Highway. Although the U.S. Fish and Wildlife Service National Wetlands Inventory Map identifies wetlands within two of the gulches that will be crossed by some of the alternatives (Waipuilani and Waiakoa), botanical surveys conducted for this project found no

vegetational, soil or hydrological evidence that wetlands exist in any gulch to be crossed by the proposed highway. Therefore, wetlands do not exist within the path of any alternative.

#### **4.7.4 FLOODPLAINS**

As described in Section 3.7.4, the project area is not considered a floodplain because of its Zone C classification on the Flood Insurance Rate Maps. The hydrological impacts of the proposed bridges and culverts on the intermittent stream flow in the gulches are discussed in Section 4.7.1.

#### **4.7.5 MITIGATION MEASURES**

According to existing State regulations, hazardous spills require immediate containment and clean-up. Effective incident response procedures will minimize impacts to water sources. Measures to mitigate or prevent adverse impacts to the quality of State waters during construction are described in Section 4.17.4.

### **4.8 ECOSYSTEMS**

#### **4.8.1 FLORA**

The No Build alternative consists of widening several existing roadways. The floral impact of the No-Build alternative would be removal of the vegetation in the construction zone of these widening projects.

Construction of Kihei-Upcountry Maui Highway will also remove vegetational communities. Some of these communities are commercial croplands, and cropland impacts are discussed in Section 4.2.

None of the alternatives (No-Build and Build) are expected to have an adverse impact on the region's botanical resources. The vegetational communities that will be directly affected by the proposed highway are regionally abundant (see Section 3.8.1). From a botanical

perspective, there is no alternative that is preferable because of the extensive involvement of existing agricultural areas along all alignment alternatives. However, for comparative purposes, the area of vegetational clearance for each alternative (including cropland) is shown on Table 4-10. Alternative U3,K1 requires the least clearance of vegetation.

The indirect effects of the highway include increased risk of fire and the potential introduction of alien species. Kihei-Upcountry Highway may increase the potential of brush fires in the region by enhancing public access to areas that are near dry land forests. The kiawe/buffelgrass association is especially fire-prone during the dry summer months. According to the National Park Service (letter dated October 25, 1994; see Appendix A), wildland fires are generally caused by humans.

The introduction of alien plant species to areas free of such species is also a concern. This concern was raised explicitly by the U.S. Department of Interior (see letter commenting on the Draft EIS, dated September 30, 1999 in Volume Two: Draft EIS Comments and Response).

One way that alien species could be introduced is through materials of construction and equipment that would be used to build the roadway. Since Maui already has all the equipment and vehicles needed to construct the road, there is little chance that off-island alien species would be introduced to the project area through equipment. In addition, much of the construction materials, such as base course and aggregate, would be obtained on Maui. Imported materials needed for the project include asphalt, cement, and rebar, but such materials are unlikely to contain alien species. Mulch may be imported for roadside landscaping, but in accordance with SDOT specifications, this material would be certified to be free of alien seed before being used.

Another way that alien species could be introduced would be through the conduit created by the roadway. This mechanism would be a greater concern if the roadway crossed areas of native vegetation. However, the agricultural areas that would be traversed by the roadway are already highly disturbed, and the increased risk of introduction of alien species is considered minimal.

In summary, Kihei-Upcountry Maui Highway will not change the current floral conditions of the project area. The area surrounding the highway will continue to be dominated by agriculture and kiawe trees/buffelgrass. The highway does not cross areas of native vegetation, and so would not increase the risk of introducing alien species into areas presently supporting native vegetation.

#### **4.8.2 FAUNA**

The impact of the No Build alternative on faunal resources would be associated with the habitat disturbance caused by the roadway widening projects contained in this alternative. This impact would not affect regional faunal conditions.

As with the No-Build alternative, the Build alternatives will convert faunal habitats into roadway and embankment. Table 4-10 shows the acreage of habitat converted for each alternative. Alternative U3,K1 would convert the smallest amount of acreage. However, regardless of the alternative, Kihei-Upcountry Maui Highway will not have a regional impact on faunal communities because they are common and widespread. As discussed in Section 3.8.2, the mammal and bird species in the project area are common throughout the Hawaiian Islands.

**Table 4-10  
Size of Vegetational Displacement**

<b>Alternative</b>	<b>Approximate Vegetational Displacement</b>
U1,K1	97.6 ha (241.2 acres)
U1,K2	112.2 ha (277.3 acres)
U2-A,K1	98.5 ha (243.3 acres)
U2-A,K2	113.1 ha (279.4 acres)
U2-B,K1	99.4 ha (245.6 acres)
U2-B,K2	114 ha (281.7 acres)
U3,K1	89 ha (219.3 acres)
U3,K2	102.4 ha (252.5 acres)

Source: Warren S. Unemori Engineering, Inc., October 1997

Several commentors to the Draft EIS (see Volume Two: Draft EIS Comments and Responses) stated that Kihei-Upcountry Maui would increase the number of vehicle collisions with axis deer. The number of deer is increasing, their range is expanding, and the build alternatives cross areas where the deer have been observed (see Section 3.8.2). While the risk of vehicle-cattle collisions can generally be minimized by well-maintained stock-proof fencing (see Section 4.8.4), preventing vehicle-deer collisions is more difficult because deer can jump stock fencing. The population of axis deer in the study area is denser in Ulupalakua and less dense in Puunene. Therefore, of all the build alternatives, the U1,K1 alignment (the preferred alternative), has the least involvement with the axis deer population. The U3,K2 alignment would have the most involvement with concentrations of axis deer.

### **4.8.3 ENDANGERED, THREATENED AND MIGRATORY SPECIES**

Consultation with the U.S. Fish and Wildlife Service (Service) (Parsons Brinckerhoff letter November 25, 1996 (see Appendix C)) and the State of Hawaii Department of Land and Natural Resources (DLNR), Division of Forestry and Wildlife (see Section 5.1.1) has occurred. The Service was consulted because of its jurisdiction under Section 7 of the Endangered Species Act of 1973 to impose requirements upon federal agencies regarding endangered or threatened species and critical habitat. The Service noted that Puu o Kali supports a rare dry land forest which may contain endangered and rare plant species. The Service also noted a reservoir that may be used by migratory or endangered waterbirds (see Section 3.8.3).

Botanical surveys which covered all alignment alternatives did not identify any listed, proposed or candidate threatened or endangered plant species, or any plant species of concern (see Section 3.8.1 and Appendix J). None of the species identified in the Service's January 8, 1997 letter were observed.

Concern about potential impacts to endangered or migratory waterbirds resulted in additional consultations with Service staff (telephone conversations on April 2 and May 9, 1997). Service staff clarified that the January 8, 1997 letter did not request faunal surveys of the alignments and the reservoir. Additional consultation with the Maui Nature Conservancy (telephone conversation on April 2, 1997) supported the Service's position that endangered or

threatened faunal species were unlikely to be found along the alignments. However, Service staff recommended that the EIS acknowledge that the reservoir could attract migratory or endangered waterbirds. At its nearest approach, the edge of the U2-A,B alignment right-of-way would be approximately 70 m (230 ft) from the reservoir (horizontal distance), with an elevational difference between the road and the reservoir of approximately 20 vertical meters (60 ft). None of the U2-A or U2-B alternatives would modify the reservoir or its functions during or after construction.

Based on the information above, FHWA determined that Kihei-Upcountry Maui Highway will have no effect on the plant species identified in the Service's January 8, 1997 letter or other listed, proposed or candidate threatened or endangered plant species known at the time the botanical surveys were conducted. FHWA also determined that the proposed project will have no effect on migratory or endangered waterbirds that use the reservoir near the U2-A,B alignment. A letter was sent to the Service on December 1, 1997 requesting concurrence with the above conclusions under Section 7. In a letter dated December 24, 1997, the Service concurred with the FHWA determinations (see Appendix C).

#### **4.8.4 MITIGATION MEASURES**

Losses of floral communities will be partially mitigated by the implementation of a landscaping plan, which is discussed further in Section 4.13.2. Mitigation for losses of cropland is discussed in Sections 4.1.4 and 4.2.4.

Signage will be provided to encourage motorists to prevent brush fires. In addition, SDOT will conduct regular maintenance to control weed growth along highway shoulders. During the design phase, sources of water near the highway will be inventoried, and procedures to use these sources during a brush fire will be established.

Well-maintained stock-proof fencing will be provided at cattle grazing areas (see Section 4.2.4) to prevent cattle from wandering onto the highway. However, since such fencing will not prevent deer from getting onto the highway, frequent signage will be provided warning motorists of the danger of deer crossing the highway. Also, reduced speeds could help prevent and reduce the severity of vehicle-deer collisions. Although the highway is planned for

a 90 km/h (55 mph) posted speed limit in rural sections, this limit will be re-evaluated during the design phase, and the risk of vehicle-deer collisions will be considered further in this assessment. As noted in one of the Draft EIS comment letters, the reflection of automobile headlights off of the raised pavement markers used on many of the highways on Maui mimic the headlight reflection off of axis deer eyes, which make it difficult for drivers to see the deer. Therefore, alternative pavement markers would be studied during the design phase.

Existing SDOT specifications on the use of mulch for landscaping will be followed to prevent alien plant species from invading the project area. In addition, existing SDOT specifications requiring construction vehicles and equipment to be washed after use will help prevent the spread of alien species among construction sites on Maui.

## **4.9 GEOLOGY, PHYSIOGRAPHY, SITE CONTAMINATION AND NATURAL HAZARDS**

### **4.9.1 GEOLOGIC AND PHYSIOGRAPHIC SETTING**

None of alternatives will affect the geologic conditions of the study area.

Kihei-Upcountry Maui Highway will alter the physiography of the study area by introducing a roadway where there is presently open space used for agriculture and ranching. The project will require cuts and fills, resulting in localized changes in topography. Table 4-11 displays the estimated amount of earthwork for each alternative. Alternative U3,K1 will require the least amount of earthwork. Regardless of the alternative, total cuts and fills will be balanced during the design phase so material will not need to be disposed of or imported from outside the project site.

### **4.9.2 HAZARDOUS MATERIALS**

A search of federal and State environmental databases did not identify hazardous materials sites along any of the alignments. Prior land use history indicates agricultural and ranching

use. Therefore, hazardous materials are not expected to be encountered during project construction.

**Table 4-11  
Comparison of Earthwork<sup>A</sup> (General Site Work) Among Alternatives**

<b>Alternative</b>	<b>Excavation</b>	<b>Embankment</b>	<b>Total</b>
U1,K1 <sup>B</sup>	656 900 m <sup>3</sup>	516 300 m <sup>3</sup>	1 173 200 m <sup>3</sup>
U1,K2 <sup>B</sup>	792 800 m <sup>3</sup>	625 100 m <sup>3</sup>	1 417 900 m <sup>3</sup>
U2-A,K1 <sup>C</sup>	922 700 m <sup>3</sup>	739 400 m <sup>3</sup>	1 662 100 m <sup>3</sup>
U2-A,K2 <sup>C</sup>	1 058 800 m <sup>3</sup>	848 200 m <sup>3</sup>	1 907 000 m <sup>3</sup>
U2-B,K1	770 900 m <sup>3</sup>	616 700 m <sup>3</sup>	1 387 600 m <sup>3</sup>
U2-B,K2	906 800 m <sup>3</sup>	725 500 m <sup>3</sup>	1 632 300 m <sup>3</sup>
U3,K1	489 600 m <sup>3</sup>	391 800 m <sup>3</sup>	881 400 m <sup>3</sup>
U3,K2	604 600 m <sup>3</sup>	483 700 m <sup>3</sup>	1 088 300 m <sup>3</sup>

**Notes:** <sup>A</sup> Earthwork for a two-lane highway in rural areas and a four-lane highway in urban areas, and excess excavation material to be used to fill major gulches (where bridges will not be used) for a four-lane roadway  
<sup>B</sup> Includes earthwork to construct two undercrossings where the road crosses cane haul roads.  
<sup>C</sup> Includes earthwork to re-align Haleakala Highway in Pukalani.

Source: Warren S. Unemori Engineering, Inc., December 1997 and July 1998

### **4.9.3 NATURAL HAZARDS**

Kihei-Upcountry Maui Highway will not produce any additional exposure of communities to geologic hazards, tsunami or other natural hazards, such as tropical storms and hurricanes. The No Build alternative would also not result in additional exposure to natural hazards.

Kihei-Upcountry Maui Highway will enhance roadway evacuation capacity from Kihei-Makena in the event of a coastal emergency. In comparing the alternatives for their evacuation effectiveness, the K2 alternatives, with their more southerly terminus, would facilitate a coastal evacuation better than the K1 alternatives. With the K1 alternatives, including the preferred alternative, traffic flows will collect in North Kihei because the K1 terminus is approximately 1 km (0.6 mile) from the Piilani Highway/Mokulele Highway intersection.

## **4.10 HISTORIC, ARCHAEOLOGICAL AND CULTURAL RESOURCES**

The purpose of this section is to summarize potential project impacts on historic and archaeological resources and traditional cultural properties (TCP), and to document compliance with Section 106 of the National Historic Preservation Act and Chapter 6E of the Hawaii Revised Statutes.

In coordination with the State Historic Preservation Division (SHPD), reconnaissance level surveys were conducted on all the alternatives considered in the EIS, and an inventory-level survey was conducted on the preferred alternative. More information about the project's historic and archaeological research activities is provided in Section 3.10.

### **4.10.1 SECTION 106 AND CHAPTER 6E**

Section 106 of the National Historic Preservation Act of 1966 requires that federal agencies consider the effect of their projects on any resource listed on or eligible for the National Register of Historic Places, in coordination with the State Historic Preservation Officer (SHPO). The Advisory Council on Historic Preservation (ACHP) is given an opportunity to review project impacts if appropriate. Chapter 6E places similar responsibilities on State agencies to evaluate their projects. The processes of Section 106 (as described in 36 CFR 800) and Chapter 6E are very similar, with both containing two basic steps: (1) identify historic properties (sites on or eligible for the National and Hawaii Registers); and (2) assess effects, and if necessary, mitigate adverse impacts.

Section 3.10 documents the activities performed to comply with Step 1.

In assessing the effects of a project on a historic property (Step 2), there can be only one of the following three possible findings under the Section 106:

- no historic properties affected;
- no adverse effect; and
- adverse effect.

“No historic properties affected” means that either there are no historic properties present or there are historic properties present but the undertaking will have no effect upon them of any kind (that is, neither harmful nor beneficial). An “effect” means alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register.

“No adverse effect” means that there could be an effect, but the effect would not be harmful to those characteristics that qualify the property for inclusion in the National Register. In other words, it would not diminish or adversely affect the integrity of the property’s location, design, setting, materials, workmanship, feeling, or association.

An “adverse effect” means an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property’s location, design, setting, materials, workmanship, feeling, or association. Consideration is given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property’s eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative.

If a project has an “adverse effect”, a Memorandum of Agreement (MOA) that is signed, at minimum, by the federal sponsoring agency and the SHPO, is required. The ACHP may sign the MOA when the federal agency and the SHPO are in disagreement. Other entities may sign the MOA as concurring parties, such as the State sponsoring agency (SDOT), and agencies and organizations with an interest in the historic property(ies) affected.

Effect determinations, in accordance with Section 106 and Chapter 6E, are provided in Section 4.10.2.

Section 106 also requires consultation with those who may have knowledge about historic properties in the project area. A group of organizations and individuals recommended by the SHPD, which included the State of Hawaii Office of Hawaiian Affairs and the State Department of Hawaiian Home Lands, were contacted and asked to participate in consultation at various times throughout the project. They were sent copies of the reconnaissance survey reports, the inventory survey report, and the cultural impact study, and were also asked if they had

knowledge of other historic properties not identified in these reports (see Appendix C). One of the consulted parties provided information about other historic properties near the U2-A alignment during the Draft EIS review period (see letter from Charles Maxwell in Volume Two).

## **4.10.2 POTENTIAL IMPACTS**

### **4.10.2.1 Historic and Archaeological Resources**

None of the build alternatives completely avoid significant historic and archaeological sites. Table 4-12 lists the historic properties (sites eligible for the National Register) that would be adversely affected ("adverse effect") depending on the alternative. Since an inventory survey was only conducted on the U1,K1 alignment, the preferred alternative, the level of information obtained for this alternative is superior to the information obtained for the other alternatives. If inventory surveys were conducted on the other alternatives, additional significant sites could be identified. In addition, FHWA rendered official Section 106 effect determinations only for the U1,K1 alignment (see Appendix C). Section 3.10 contains information about these sites, including significance evaluations that indicate that they all are significant only under Criterion D. Criterion D sites yield, or may likely yield, information important in prehistory or history.

Although the number of historic properties that would be adversely affected differs by alternative, the overall impacts among the alternatives were judged to be equal because none of the affected historic properties are culturally significant (i.e., eligible for listing based on Significance Criteria E), or require preservation. Both the FHWA and SHPO agreed that none of these sites warrant modifications or realignments of any of the alternatives, and that data recovery would be an appropriate mitigation measure at each of the sites affected by the project.

The FHWA determined that the U1,K1 alignment, the preferred alternative, will have an "adverse effect" on three historic properties, State Sites 5032, 5033 and 5035. Sites 5032 and 5033 are about 57 m (190 ft) and 45 m (150) from the U1,K1 center line, respectively, which is barely within the alignment's Area of Potential Effect (APE). Nevertheless, FHWA rendered adverse effect determinations even though construction of Kihei-Upcountry Maui Highway may not affect these sites. As described in Section 3.10.2, Sites 5032, 5033 and 5035 functioned

as temporary habitation as evidenced by the discovery of cultural materials. Although these sites do not require preservation, additional data recovery is needed if detailed design activities to be conducted in the next phase of project engineering confirm that these sites are displaced by the project.

**Table 4-12  
Historic Properties to be Adversely Affected by Alternative**

<b>Alternative</b>	<b>Historic Properties Adversely Affected<sup>1</sup></b>
U1,K1 (Preferred Alternative)	<u>5032, 5033 and 5035</u>
U1,K2	4766, 4767, 4768, 4769, 4770, 4771 and 4772,
U2-A,K1	<u>5032, 5033 and 5035</u>
U2-A,K2	4766, 4767, 4768, 4769, 4770, 4771 and 4772,
U2-B,K1	<u>5032, 5033 and 5035</u>
U2-B,K2	4766, 4767, 4768, 4769, 4770, 4771 and 4772
U3,K1	4763, 4774, 4775, <u>5032, 5033 and 5035</u>
U3,K2	4763, 4766, 4767, 4768, 4769, 4770, 4771, 4772, 4774, 4775

Note: <sup>1</sup> Site numbers preceded by "50-50-10-." The impacts of the U1,K1 Alternative reflect information from the inventory survey. The impacts of other U1 and K1 alternatives partially reflect information from the inventory survey. Section 106 effect determinations were made only for the U1,K1 alternative.

Source: Cultural Surveys Hawaii, November 1997, December 1997, July 1998 and December 2000 Federal Highway Administration, June 18, 2001 (see Appendix C).

The FHWA rendered "no adverse effect" determinations on State Sites 3727, 3728, 3729, 3742, 3743, 3745 4765, 4773, 4776, 4778, 5030, and 5034. None of these sites warrant preservation and sufficient documentation on these sites was compiled during the inventory survey or in previous studies. The SHPD agreed in a May 10, 2001 letter (see Appendix C) that no further work is needed on these sites.

The two petroglyph sites (State sites 5029 and 5031) are located approximately 60 m (200 ft) from the alignment centerline in Kalialinui and Waiakoa Gulches. Because of this distance, and since Kihei-Upcountry Maui Highway will cross both gulches via two-lane bridge, both

petroglyph sites are outside the APE. Nevertheless, mitigation measures will be implemented during construction to prevent accidental damage to the sites (see Section 4.17.7.2).

As described in Section 3.10.2, the U2-A alignment avoids State Sites 1062 and 4779 (petroglyph sites). With proper mitigation (see Sections 4.10.3 and 4.15.7.2), proximity impacts can also be avoided.

At its nearest point, the U2-A alignment's edge of pavement would be approximately 50 m (150 ft) from State Site 2701 (a heiau; see Section 3.10.2). Adverse effects on this site would not be expected because the alignment runs along the heiau's south (mauka) side, which would not affect the heiau's downslope (north and west) view plane (see Figure 4-5). Measures to mitigate proximity impacts to State Site 2701 would be implemented if a U2-A alternative were selected as the preferred alternative (see Sections 4.10.3 and 4.15.7.2).

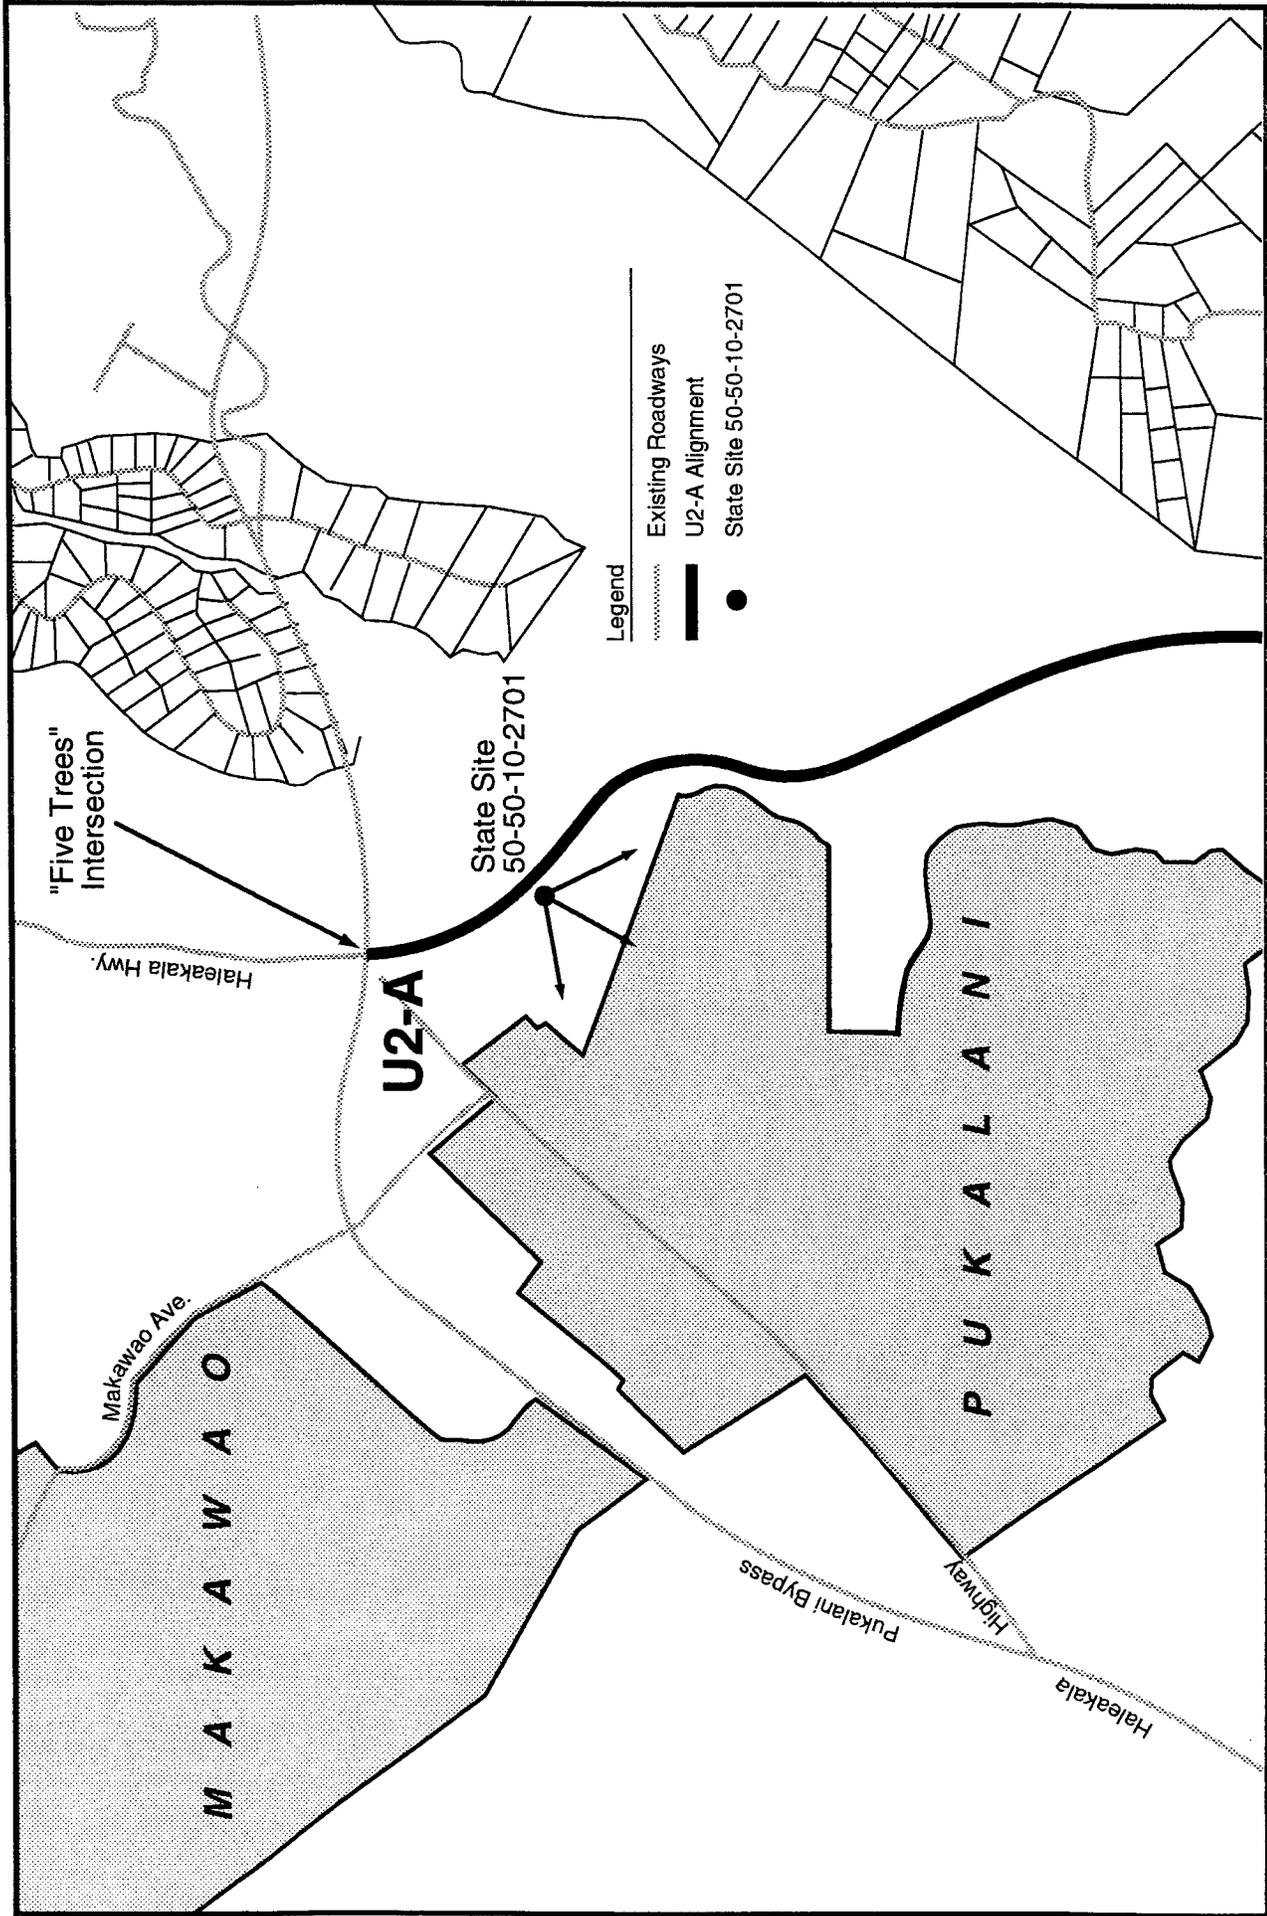

State Site 4181 may be within the U2-B alignment's APE. However, this site is no longer considered a historic property (see Section 3.10.2).

The U3 alignment was shifted to avoid Site 4764 (see Section 3.10.2). Measures to mitigate proximity impacts to Site 4764 would be implemented if a U3 alternative were selected as the preferred alternative (see Sections 4.10.3 and 4.15.7.2).

#### **4.10.2.2 Traditional Cultural Properties / Practices**

As described in Section 3.10.4, Scientific Consultant Services, Inc. (SCS) prepared a report on the potential cultural resource impacts of the proposed project (Identification and Assessment of Potential Traditional Cultural Impacts Within the Kihei-Upcountry Maui Highway Project Area, Maui, Hawai'i [TMK: 2-2 and 2-3], October 2000). The SCS report is provided in Appendix I.

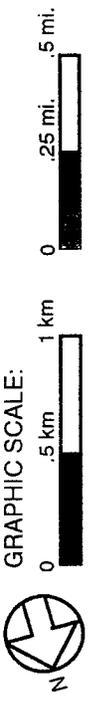

According to the SCS study, the project area contains no TCPs, although there are culturally-significant sites near the project area, such as the petroglyphs (Sites 5029 and 5031) and heiau (Site 2701). None of the culturally-significant sites will be affected by Kihei-Upcountry Maui Highway (see Section 4.10.2.1). The SCS study was reviewed by the SHPD, the State

Office of Hawaiian Affairs and others who were consulted regarding the historic impacts of the project (see Appendix C).

### **4.10.3 MITIGATION MEASURES**

In accordance with Section 106 regulations, a MOA was prepared and signed by the FHWA and SHPO because of the "adverse effects" that the project could have on three historic properties along the U1,K1 alignment (see Appendix C). The MOA specifies that a data recovery plan be prepared and implemented in coordination with the SHPD. The plan will be prepared during the design phase and will specify:

- the research questions to be addressed through the data recovery, with an explanation of their relevance and importance;
- the methods to be used, with an explanation of their relevance to the research questions;
- contents of the archaeological data recovery report;
- the report review procedures;
- a report completion date;
- proposed distribution of the results; and
- proposed methods by which native Hawaiian groups will be notified when the work is beginning and be provided a summary of the report findings.

Should a previously unidentified historic or archaeological site be discovered during construction, all work will stop and the SHPD will be informed and consulted on the appropriate treatment measures.

### **4.11 PARKLANDS**

In general, the proposed Kihei-Upcountry Maui Highway will enhance access to Haleakala National Park, the new Kihei Aquatic and Community Center and the future Kihei Regional Park. No alternative, including the No Build, will adversely affect access to or use land from any existing or future park or recreational facility described in Section 3.11.

Kihei-Upcountry Maui Highway is not anticipated to increase the approximately one million visitors traveling to the summit annually. The health of Maui's visitor industry is the fundamental factor affecting the number of visitors to Haleakala. Roadway capacity does not act as a constraint on the number of visitors.

Kihei-Upcountry Maui Highway, regardless of the build alternative, will improve access to the future Kihei Regional Park. However, the K2 alternatives would enhance access to the Regional Park to a greater degree than the K1 alternatives. However, if a K2 alternative were selected as the preferred alternative, the SDOT would work with the County of Maui Department of Parks and Recreation to determine appropriate noise mitigation measures, such as buffer zones and berms (see Section 4.6.3).

## **4.12 SECTION 4(F)**

Section 4(f) of the Department of Transportation Act, 49 U.S.C. 303 and 23 U.S.C. 138 (referred to hereafter as "Section 4(f)"), permits the use of land for a transportation project from a significant publicly-owned public park, recreation area, wildlife and waterfowl refuge, or a historic site only when the FHWA has determined that:

- there is no feasible and prudent alternative to such use; and
- the project includes all possible planning to minimize harm to the property resulting from such use.

The purpose of Section 4(f) is to preserve significant parkland, recreation areas, refuges, and historic/archaeological sites by limiting the circumstances under which such land can be used for transportation projects. The word "use" in this case means:

- land is permanently incorporated into a transportation facility;
- there is a temporary occupancy of land that is adverse in terms of preservation of the resource; or
- the project's proximity to the site substantially impairs those functions that qualify the site as a Section 4(f) resource even though no land is permanently or temporarily acquired. This type of use is called "constructive use."

None of the alternatives will use lands from publicly-owned public parks or recreational facilities, or wildlife and waterfowl refuges, because there are no such resources within the path of the alignments. The Section 4(f) resource nearest to any alternative is the future Kihei Regional Park, which would be adjacent to the K2 alternatives. As described in Section 4.6.2, these alternatives are predicted to have a noise impact at the future park because there would be a "substantial" increase of noise from its present level (the area is presently vacant and is used for pasture). However, a constructive use of the park would not occur because the SDOT would work with the County to ensure that noise impacts are mitigated by buffer zones or berms (see Section 4.6.3).

An archaeological site falls within the protection afforded by Section 4(f) only if it is on or eligible for the National Register of Historic Places and the site has been determined, after consultation with the SHPO and the ACHP, to be important for preservation-in-place. Since none of the historic and archaeological sites that may be affected by the project meet these two criteria (see Section 3.10.2), the project would not involve any historic properties under the jurisdiction of Section 4(f).

## **4.13 VISUAL AND AESTHETIC RESOURCES**

### **4.13.1 POTENTIAL IMPACTS**

The No Build alternative, which consists of widening existing roadways, would not affect the viewsheds described in Section 3.12. Views of roadside trees and landscaping could be affected by the removal of vegetation associated with the widening.

Regardless of the build alternative selected, views from Upcountry will not change because the terrain drops away towards Central Maui and the ocean. The visual quality of the ocean, West Maui Mountains and Central Maui from Upcountry will not be affected. In fact, the Kihei-Upcountry Maui Highway will provide additional viewpoints of these vistas for motorists. The possibility of providing a scenic overlook will be studied further in the design phase of the project.

The intactness (extent to which the landscape is free from visual encroachment) of the eastern (mauka) view of Haleakala from Kihei will be affected by a paved roadway and associated embankments climbing the slope.

Highway lights will be provided at the terminus intersections, and they will be visible from several vantage points during the evenings. Highway lights will not be provided along the entire length of Kihei-Upcountry Maui Highway.

The visual quality of the ocean, coastline and the West Maui Mountains from Kihei will be unaffected.

#### **4.13.2 MITIGATION MEASURES**

Although the proposed project's visual impact is expected to be minor, landscaping will be provided to improve the appearance of the roadway. Native trees and shrubs will be used. These plants are already adapted to local growing conditions and will require less water and soil amendments. Some of these native species include:

- wiliwili--these occur naturally in some of the larger gulches in the study area;
- naio (*Myoporum sandwicense*)--a glossy, dark green shrub with fragrant white flowers;
- nehe--a member of the daisy family;
- ilima (*Sida fallax*)--a small shrub with bright orange flowers that is used in landscaping;  
and
- akia (*Wikstroemia uva-ursi*)--a low, mat-forming shrub and excellent ground cover which is used in landscaping.

The Maui Native Plant society and the DLNR will be contacted for additional suggestions for planting and planting material. A project "Landscaping Plan" will be developed and completed during the project's design phase.

Scenic overlooks will be established if appropriate location(s) are found. This will be explored during the design phase.

## **4.14 ENERGY**

The No Build alternative would have higher regional VMT and vehicle fuel consumption when compared to any of the build alternatives because travelers would experience increased traffic delay along the existing circuitous route between Upcountry and Kihei-Makena or West Maui.

In contrast, any build alternative for the Kihei-Upcountry Maui Highway will produce lower regional VMT and vehicle fuel consumption when compared to the No Build alternative because any build alternative will provide a shorter, more direct route between Upcountry and Kihei or West Maui. As an example, Table 4-13 provides the travel distances from the "Five Trees" intersection (a point representing a centralized location in Upcountry) and the Lipoa Street/Piilani Highway intersection (a point representing a centralized location in Kihei) for the No Build and build alternatives. Trip lengths between these centroids will decrease from 50 percent to 26 percent, depending on the alternative. Alternative U2-A,K1 would decrease the length of this trip by half, and subsequently reduce vehicle fuel consumption by roughly this amount.

Electricity will be needed for roadway lighting at the termini and signalization.

## **4.15 CUMULATIVE IMPACTS**

A cumulative impact, according to 40 CFR 1508.7, is defined as:

. . . . an impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

**Table 4-13  
Trip Distance Between Five Trees and the  
Lipoa Street by Alternative**

Alternative	Approx. Distance Between Centroids (km)	Trip Reduction	
		Length (km)	Percentage
No Build	36	n/a	n/a
U1,K1	23	13	36%
U1,K2	25	11	31%
U2-A,K1	18	18	50%
U2-A,K2	21	15	42%
U2-B,K1	19	17	47%
U2-B,K2	22	14	39%
U3,K1	22	14	39%
U3,K2	24	12	33%

Source: Warren S. Unemori Engineering, Inc., October 1997

Sections 2.1.1, 3.1.3, and 3.1.4.2d describe proposed roadway improvements, the major land use developments in the project area, and the characteristics of the built environment in accordance with the County's Community Plans, respectively. The cumulative impacts of the proposed project and the transportation and land use projects described in these sections have the potential to be serious, if not mitigated. Under the No Build alternative, there would be a smaller level of cumulative impacts because the proposed Kihei-Upcountry Maui Highway would not be included in the mix. A discussion of the expected cumulative impacts as they relate to major environmental resources is provided below.

Land Use

Planned land use development projects, such as the Waena Generating Station, Kulamalu, DHHL homesteads and the expansion of the Maui R&T Park, would immediately and irrevocably change the land use of these areas from agriculture, open space and pasture to industrial, urban, suburban and rural uses. Roadway projects are capable of inducing regional development because they often remove

one of the impediments to growth—transportation access. Since some of the planned roadway projects, including the proposed project, are intended to improve circulation in existing urban areas, a certain amount of development can be expected from transportation and other infrastructure projects. Development in existing urban areas, such as in Kihei, would be consistent with County land use plans. Highway-induced growth in areas not approved for development, such as existing agricultural lands in Upcountry, is not expected because of land use controls (e.g., zoning) and other constraints, such as water availability. However, the major planned residential developments in Upcountry, such as the Kulamalu and DHHL projects, would substantially increase population in the region, which may encourage commercial development. For example, plans for Kulamalu include a commercial shopping center.

#### Farmland

The agricultural activities of the project area include large scale sugarcane and pineapple operations, and small-scale Kula farms that cultivate vegetables and flowers (see Section 3.2). The No Build alternative, comprised of several roadway widening projects, would affect sugarcane operations through the conversion of active fields to roadway infrastructure. Since these projects entail the widening of existing highways (Mokulele, Kuihelani, Hana and Haleakala), sugarcane operations would not be severely affected. In contrast, some of the build alternatives would cause more severe effects because they would bisect active fields. In addition, the planned Waena Generating Station would displace 66 acres of sugarcane fields. Although the residential projects in Upcountry would not directly affect agricultural land, they would substantially increase population in the region, which may exacerbate many of the concerns expressed by both the large and small scale farmers: urban encroachment, competition for water, increasing land values, and complaints from neighbors about farming activities (e.g., pesticide spraying, cane burning, etc.).

#### Socioeconomic Characteristics

Regardless of the alternative, planned projects would provide short-term construction employment. In addition, the expansion of the Maui R&T Park, the Waena Generating

Station and Kulamalu commercial development would provide long-term employment. The expansion of the Maui R&T Park would benefit and diversify the local economy. None of the planned roadway projects are anticipated to cause adverse social or economic impacts to any community in the study area. The Upcountry residential projects would substantially increase population in Upcountry, which may change the "country" ambiance of the region by potentially affecting the factors that create this ambiance: farming (see above), open space, low population density, and rural lifestyle. Population growth in existing urban areas, such as Kihei or even Pukalani, would have less of a social impact because these two areas are physically and culturally already urban and suburban.

#### Transportation

Without adequate transportation improvements, planned land use developments, such as expansion of Pukalani, Kulamalu, DHHL Homesteads and Maui R&T Park, can overburden the existing roadway infrastructure. However, the planned roadway projects, including the proposed project, would alleviate the traffic impacts of these developments, and help improve regional and local circulation.

#### Air Quality

Other than particulate matter emissions from sugarcane burning activities, the project area has excellent ambient air quality conditions (see Section 3.5). The planned projects or developments are not anticipated to substantially change these conditions. However, some of the roadway projects may change "hot spot" or microscale conditions at certain locations. The planned Waena Generating Station would also be a major point source of Nitrogen Dioxide, Sulfur Dioxide and PM<sub>10</sub> (particulate matter of less than 10 microns in diameter). However, it is not anticipated that this project would cause the SAAQS and NAAQS to be exceeded.

#### Noise

None of the planned land developments are anticipated to substantially affect ambient noise levels, including the Waena Generating Station. This power station would be located in a relatively isolated area surrounded by sugarcane fields. Some of the

roadway improvements, especially those near noise sensitive land uses, may cause noise impacts. These projects include the North-South Collector and Road C in Kihei, Piilani Highway widening, Kuihelani Highway widening, Haleakala Highway widening and Kula Highway widening.

#### Water Resources

Surface waters in the project area consist of gulches that contain intermittent streams, coastal ocean waters, and Kealia Pond (see Section 3.7.1). Groundwater in the project area is largely unexploited (see Section 3.7.2). Wetlands in the project area are at Kealia Pond and along the coastline of Kihei-Makena (Section 3.7.3). Construction that clears vegetation can cause erosion, which could increase sediment loading of surface waters during heavy rains. However, under the National Pollutant Discharge Elimination System permit process, large projects are required to incorporate Best Management Practices to minimize erosion. Once completed, many of the projects would contribute to the amount of runoff containing automobile-related (petroleum, oil, rubber) and domestic (waste water, pesticides, etc.) pollutants that could percolate into the ground or drain to surface and coastal waters. The EPA, in accordance with Section 303(d) of the Clean Water Act, has identified several surface water bodies in the project area as impaired by point and non-point pollution sources. Among these include the Kihei coastal waters.

None of the planned projects would be constructed in a wetland or floodplain, except the Mokulele Highway widening, which would be partially constructed in a floodplain at its terminus in Kihei. Wastewater from new development can pose a pollution threat to groundwater resources if sewer and treatment systems are not used. For example, the DHHL homesteads would probably utilize septic systems or seepage pits or fields for wastewater disposal.

#### Biological

The vegetation of the project area consists of cultivated lands (see above discussion on farmland), and uncultivated lands of various non-native and weedy species, but dominated by kiawe trees and buffelgrass. Although the projects described in Sections 2.1.1, 3.1.3 and 3.1.4.2b would clear vegetation on uncultivated lands, an

adverse impact on the botanical resources of the project area is not expected because the type of vegetation found on uncultivated lands would still be regionally abundant. Likewise, faunal habitat would remain unaffected because of the large size of the project area.

As described in Section 3.8.3, federally-protected plant species may be found in a dry land forest at Puu o Kali on the south side of the project area. Since this forest is within the DHHL property that would be used for homesteads, the DHHL project may be adversely affect the forest and the endangered species contained within it (see Section 3.8.3). There are no known federally-protected faunal species in the project area other than migratory or endangered waterbirds that may use the agricultural reservoirs.

#### Historic and Archaeological

Most of the planned projects are not expected to affect historic or archaeological sites because of the relative paucity of sites in the project area. However, archaeological reconnaissance and inventory surveys conducted for the proposed project found petroglyph sites and a heiau. These sites are considered to be significant and important for preservation. Since development is planned around some of these sites, they could be adversely affected. However, under State law private land owners are required to inform the SHPD before any construction work that would affect a historic property. The SHPD could permit the land owner to proceed if he or she demonstrates that mitigation would be implemented to protect the historic property or the necessary data recovery occurs prior to construction.

#### Parklands

None of the planned projects are anticipated to adversely affect any park or recreational resource. However, the Upcountry residential projects would substantially increase population in the region, which would place additional burdens on existing park resources. Additional parks, such as the Kihei Regional Park and Kulamalu Park, are planned to accommodate expected growth.

Visual and Aesthetic

Major visual resources of the project area are views of Haleakala and the West Maui Mountains from low-lying areas, views from Upcountry, and views of the coastline from various locations (see Section 3.12). Some of the planned projects, especially those on the slopes of Haleakala, would affect the visual quality of the Haleakala view plane.

Infrastructure and Utilities

Roadway projects would enhance Maui's transportation infrastructure, and would help improve response time for police and emergency personnel. The planned residential developments could place substantial burdens on the existing infrastructure and public services. For example, residential development in Upcountry may worsen the overburdened water supply condition of the region. As described in Section 3.4.3, Upcountry residents and farmers are presently required to reduce water use during drought conditions because surface waters are the source. The Kulamalu development has drilled a well in Haiku to free existing water capacity for the development.

In summary, cumulative impacts are tempered by the large size of the project area. For example, the loss of uncultivated lands from some of the projects would not affect the biological diversity of the region because the plant species affected are abundant, and mostly non-native. Moreover, these plant species are not federally-protected with the exception of those found at Puu o Kali. Although the impacts to uncultivated lands are not a major concern, the cumulative impacts to agricultural land, in particular HC&S sugarcane fields, are a concern. Although the cumulative take would be marginal compared to the total size of HC&S's sugarcane land holdings (14 000 ha (35,000 acres)), throughout the century HC&S has sustained substantial losses of productive croplands due to urban encroachment. Although foreseeable cumulative impacts are not likely to shut down HC&S's operations, continuing urban encroachment, if not controlled, may adversely affect the sugarcane-growing industry on Maui.

Planned development in Upcountry would also be a cumulative impact concern because it would substantially increase the population of a region that is largely rural and agriculturally

based. The developments may place substantial new demands on public infrastructure and services, such as water supply systems, schools, and roadways. Farming activities in Upcountry may be affected because of increasing land values, worsening traffic conditions and complaints about agricultural activities. These impacts may contribute to the change in the “country” ambience of Upcountry.

The notable difference in cumulative impacts between the build and No Build conditions would be on agricultural resources. The U1 and U2 alternatives cross sugarcane and pineapple fields, thereby adversely affecting these operations. In addition, the U1 and U2 alternatives cross Omaopio and Pulehu Roads (the U3 alternatives would only cross Pulehu Road), which will affect the existing truck transport system for produce between the Kula farms and Kahului. In other environmental resource areas, there will be little difference between the cumulative impacts of the build and No Build conditions.

#### **4.16 SECONDARY IMPACTS**

According to 40 CFR 1508.8, secondary impacts are impacts that have the potential to occur “later in time or farther removed in distance but are still reasonably foreseeable.” They can be viewed as actions of others that are taken because of the presence of the proposed project. For example, the presence of a U2-A alternative may influence some bicycle tour companies to modify their Haleakala bike tours so they take advantage of the new highway to end the tours in Kihei. Secondary impacts from highway projects often occur because they can induce development. These secondary impacts can include affects to open space, air quality, water quality, natural vegetation, historic sites, social environment and demands on infrastructure systems.

Secondary impacts are not anticipated because the build alternatives will have little influence on those who could propose development. Other factors, such as water supply, appear to be controlling development to a greater degree than limited roadway capacity. Further, proposed actions, such as housing, commercial, research, light industrial and institutional developments (see Sections 3.1.3 and 3.1.4.2d), would be completed regardless of whether Kihei-Upcountry Maui Highway is approved. For example, the Department of Hawaiian Home

Lands (DHHL) homesteads in Keokea (see Section 3.1.3) would be completed regardless of the proposed project. Similarly, Kulamalu (see Section 3.1.3) would be completed despite lack of implementation of a build alternative, although the U2-A and U2-B alternatives would support this development. Therefore, for most of the build alternatives (see below), secondary impacts are not anticipated.

As described in Section 4.1.1.2, the U1 alignments may facilitate a westward (makai) expansion of Pukalani and additional growth in Haliimaile. Therefore, the U1 alternatives may cause secondary impacts, as opposed to the No Build and other build alternatives. This potential land use development would be beyond what is designated in the Makawao-Pukalani-Kula Community Plan (July 1996). The secondary impacts from land development on the northwest (makai) side of Pukalani would include the potential for erosion due to site development, loss of agricultural lands, and increased population, which can lead to more traffic, and higher demand for utility and other public services.

## **4.17 CONSTRUCTION**

### **4.17.1 MAINTENANCE OF TRAFFIC**

Almost all construction will take place on agricultural and pasture lands. Therefore, during construction, only slight delays to existing traffic flows, if any, are expected. Traffic impacts could occur at construction site ingress and egress areas, and when work is being conducted at the highway termini (e.g., at the intersections with existing roadways). These impacts may include lane closures and/or detours. A "Maintenance of Traffic Plan" will be prepared during the design phase to minimize impacts on traffic flows during construction.

### **4.17.2 AIR QUALITY**

#### **4.17.2.1 Potential Impacts**

Air quality impacts during roadway construction generally consist of fugitive dust and mobile source emissions from construction equipment.

### Fugitive Dust Emissions

Fugitive dust is airborne particulate matter and is usually relatively large in particle size. Construction vehicles operating around the construction sites and material blown from uncovered haul trucks, stockpiles, and exposed areas will generate fugitive dust.

The dispersion of fugitive dust depends on particle size, emission height, and wind speed. Small particles (30 to 100 micron range) can travel several meters before settling to the ground, depending on wind speed. Most fugitive dust, however, is made up of relatively large particles (i.e., particles greater than 100 microns in diameter). Given their relatively large size, these particles tend to settle within 6 to 9 m (20 to 30 ft) of their source. Therefore, because most of the construction will occur where there are no existing homes or commercial areas, fugitive dust impacts will be minimal.

### Mobile Source Emissions

Construction vehicles will emit engine exhaust while in operation. However, this is expected to cause minimal impacts because carbon monoxide (CO), the principal pollutant of construction vehicles, is most serious under localized (microscale) conditions. Most of the construction activities will occur away from sensitive receptors, such as residences.

#### **4.17.2.2 Mitigation**

The following particulate control measures related to construction activities will be followed:

1. Site Preparation
  - minimize land disturbance;
  - use watering trucks to minimize dust;
  - cover trucks when hauling dirt;
  - stabilize the surface of dirt piles if not removed immediately;
  - use windbreaks effectively;
  - limit vehicular paths and stabilize temporary roads; and
  - to the maximum degree possible, pave all unpaved construction roads and parking areas to road grade for a length no less than 15 m (50 ft) from where such roads

and parking areas exit the construction site, to prevent dirt from washing onto paved roadways.

2. Construction:

- cover trucks when transferring materials;
- use dust suppressants on traveled paths that are not paved;
- minimize unnecessary vehicular and machinery activities; and
- minimize dirt track-out by paving site exit road just before entering the public road.

3. Post-Construction:

- restore to original conditions any disturbed land not used;
- remove unused material and dirt piles; and
- restore to original condition all vehicular paths created during construction and prevent future off-road vehicular activities.

### **4.17.3 NOISE AND VIBRATION**

#### **4.17.3.1 Potential Impacts**

Construction will involve the use of heavy machinery that may cause temporary noise impacts to adjacent noise sensitive land uses. Table 4-14 presents maximum noise levels ( $L_{max}$ ) produced by heavy mobile construction equipment and compressors measured at a distance of 15 m (50 ft). These noise levels are estimates based on minimal site-specific data. Therefore, because of the preliminary nature of this analysis, specific impacts cannot be accurately determined without a detailed construction plan. However, because construction will normally occur during daylight hours when occasional loud noises are more tolerable, and the construction site will be in relatively isolated areas away from noise sensitive land uses, extended noise disruptions to normal activities are not anticipated.

With rubber-tired vehicles, ground borne vibration is generally low. There may be some vibration with the passing of heavy duty trucks, but this movement is usually not perceptible except within the immediate right-of-way. Construction activities will not generate

unacceptable vibration impacts at nearby land uses because no unusual activities that would generate substantial vibration are anticipated.

**Table 4-14  
Construction Equipment Noise Levels**

<b>Source</b>	<b>L<sub>max</sub>(dBA) at 15 m (50 ft)</b>	<b>Model Tested</b>
Backhoe	85	John Deere 609A
Front Loader	84	Caterpillar 980
Dozer	84	Caterpillar D7e
Grader	91	Caterpillar 16
Scraper	92	Caterpillar 660
Compressor	80-89	Various Tested
Pile Driver	95-100	Various Tested

Source: Federal Highway Administration, Highway Construction Noise: Measurement, Prediction, and Mitigation, 1976

#### **4.17.3.2 Mitigation Measures**

Specifications for allowable noise levels will be formulated and implemented to minimize adverse impacts on surrounding communities. Since the State Department of Health (SDOH) maintains community noise control standards (HAR Section 11-46) that apply to construction noise, these specifications will be submitted to SDOH for their review. The project will not deliberately exceed the stipulated noise limits unless a permit is granted by SDOH.

To minimize noise impacts from construction, the following mitigation measures will be followed:

- Design Considerations. During the early stages of construction plan development, natural and artificial barriers, such as ground elevation changes, will be considered for use as shielding against construction noise. Strategic placement of stationary equipment, such as compressors and generators, could reduce impacts at sensitive receptors.

- Source Control. Each internal combustion engine used for any purpose on the job or related to the job will be equipped with a muffler of a type recommended by the manufacturer.
- Time and Activity Constraints. Noisier activities will be limited to daytime hours when most people normally impacted are either not present or engaged in less noise sensitive activities.

These mitigation measures will be incorporated into the construction plan, and the contractor will comply with SDOH standard or permit specifications.

#### **4.17.4 WATER RESOURCES**

##### **4.17.4.1 Potential Impacts**

The primary potential for construction-phase water resource impacts will be associated with erosion and sedimentation associated with the project's clearing and earthmoving activities and alteration of existing drainage patterns.

##### **4.17.4.2 Mitigation Measures**

Stormwater runoff and erosion during project construction and landscaping will be mitigated through the use of Best Management Practices (BMPs) established before construction begins. Generally accepted BMPs applicable to this project include:

- use of silt curtains and silt fences;
- minimizing areas of disturbance;
- covering stockpiles;
- immediate planting of vegetation and/or mulching on highly erodible or critical areas, such as the upper elevation portions of Kihei-Upcountry Maui Highway where the climate is generally wetter and the topography steeper; and
- construction of dikes or diversions to avoid runoff across erodible areas.

The specific erosion control measures to be implemented will be approved by the SDOH when they issue the National Pollutant Discharge Elimination System (NPDES) Stormwater

Discharge Permit for this project and the County of Maui will also require specific measures when they issue the Grading, Grubbing, Stockpiling and Excavation Permit.

## **4.17.5 SOLID WASTE MANAGEMENT AND HAZARDOUS WASTE**

### **4.17.5.1 Potential Impacts**

Project construction will require excavation, filling and grading activity. As discussed in Section 4.9.2, the excavated materials are expected to be free of contamination and will be used elsewhere on the project for fill. As described in Section 2.1.2 the amount of cuts and fills will be balanced so that no fill material will need to be disposed outside the construction area, nor will fill material be imported from other areas.

The construction crew will generate solid waste. The materials or substances listed below may be present on site during construction:

- detergents;
- paints;
- metal;
- tar;
- petroleum-based products; and
- cleaning solvents.

### **4.17.5.2 Mitigation Measures**

During construction, all waste materials will be collected and stored in a securely lidded metal dumpster. The dumpster will meet all State and County solid waste management regulations. All trash and construction debris from the site will be deposited in the dumpster. The dumpster will be emptied as needed. No construction waste materials will be buried on site. The Contractor will be responsible for implementing the correct procedures for waste disposal. Notices stating these practices will be posted in the office trailer; the Contractor will be responsible for ensuring that procedures are followed.

All sanitary waste generated during the construction phase will be collected from portable units as required.

The following material management practices addressing good housekeeping and hazardous products will be used to reduce the risk of spills or other accidental exposure of materials and substances to the environment. In addition, a Spill Prevention Plan will be proposed and followed by the contractor.

1. Good Housekeeping

- an effort will be made to store on-site only enough product required to complete the job;
- all materials stored on site will be stored in a neat, orderly manner in their appropriate containers and, if possible, under a roof or other enclosure;
- products will be kept in their original containers with the original manufacturers' labels affixed;
- substances will not be mixed with one another unless recommended by the manufacturer;
- whenever possible, all of a product will be consumed before disposing of the container;
- manufacturer's recommendations for proper use and disposal will be strictly followed; and
- a daily inspection will be conducted by the contractor to ensure proper use and disposal of materials on site.

2. Hazardous Products

- products will be kept in original containers unless they are not resealable;
- original labels and materials safety data will be retained; and
- if disposing of surplus product, manufacturer's or local and State-recommended methods for proper disposal will be followed.

3. Petroleum Products

All on-site vehicles and other machinery will be monitored for leaks and receive regular preventive maintenance to reduce the chance of leakage. Petroleum products will be

stored in tightly sealed, clearly labeled containers. Any asphalt substances used on site will be applied according to the manufacturer's recommendations. Vehicle servicing and maintenance activities shall not pollute the environment.

4. Paints

All containers will be tightly sealed and stored when in use. There will be the proper disposal of excess paint according to manufacturer's instructions or State and local regulations.

5. Spill-Control Practices

In addition to the good housekeeping and material management practices discussed previously, the following practices will be implemented for spill prevention and clean up:

- manufacturer's recommended methods for spill clean up will be clearly posted, and site personnel will be informed of the procedures and the location of the information and clean up supplies;
- materials and equipment necessary for spill clean up will be kept in the material storage area on site;
- all spills will be cleaned up immediately after discovery;
- the spill area will be kept well ventilated, and personnel will wear appropriate protective clothing to prevent injury from coming in contact with hazardous substances;
- regardless of their size, spills of toxic or hazardous materials will be reported to the appropriate State or local government agency;
- should they occur, the spill prevention plan will be adjusted to include measures to prevent spills from re-occurring and clean-up procedures for spills. A description of the spill, its cause, and the clean-up measures will be included; and
- the Contractor will coordinate spill prevention and clean-up efforts. In addition, the Contractor will designate at least three site personnel to receive spill prevention and clean-up training; these individuals will each be responsible for a specific

phase of prevention and clean-up. The names of responsible spill personnel will be posted in the material storage area and in the office trailer on site.

Although hazardous materials sites are unlikely to be encountered during construction, the contractor will report to SDOT and SDOH any undiscovered undocumented storage sites, hazardous materials releases or potential signs of contamination when soil is excavated. If any contaminants are encountered during construction, they will be handled according to applicable SDOH requirements.

#### **4.17.6 AGRICULTURAL ACTIVITIES**

##### **4.17.6.1 Potential Impacts**

Construction activities in agricultural areas will damage crops and remove grazing land from agricultural use. Pineapple, sugarcane and ranching activities will be adversely affected.

##### **4.17.6.2 Mitigation Measures**

A "Maintenance of Cropland and Ranching Activities Plan" will be prepared. The details of the Plan will be developed during design in coordination with affected agricultural operators, such as HC&S, ML&P, Haleakala Ranch and Kaonoulu Ranch. Some of the measures to be addressed in the Plan include the following:

- provision of temporary road crossings (existing roads will be maintained where feasible);
- provision of irrigation and drainage systems (existing systems will be maintained as much as possible);
- appropriate fencing of construction site so that agricultural and ranching workers will be kept a safe distance away from construction activities;
- provision of stock-proof fencing around construction sites to safeguard and secure livestock; and
- provision of cattle crossings where appropriate.

## **4.17.7 HISTORIC AND ARCHAEOLOGICAL RESOURCES**

### **4.17.7.1 Potential Impacts**

Construction has the potential to damage archaeological and historic sites, as described in Section 4.10. It also has the potential to damage sites that have not been identified.

### **4.17.7.2 Mitigation Measures**

This Final EIS includes an MOA (see Appendix C) stipulating mitigation measures for historic and archaeological resources. The measures stipulated in the MOA will be implemented prior construction. In addition, marked buffer zones will be placed around known archaeological preservation features at and near the construction sites. For example, buffer zones will be established around Sites 5029 and 5031, demarcated with bright colored markers, so that they will not be damaged during the construction of the bridges over Kalialinui and Waiakoa Gulches. SDOT will consult with the SHPD to determine adequate buffer zones.

If additional historic or archaeological sites are uncovered during construction, work will stop immediately, and the SHPD will be notified without delay. Construction will resume only upon approval of the appropriate authorities.

## **4.18 PERMITS AND APPROVALS**

The following permits or approvals will be required prior to the construction of the highway.

### Federal

- USACE - Section 404 permit (Nationwide)

### State

- SDOH - National Pollutant Discharge Elimination System (NPDES) permit (storm water from construction site)
- SDOH - Noise permit (if noise levels are expected to exceed allowable levels as stated in HAR 11-46-6(a), which will be known during the design phase)
- SDOH - Water Quality Certification

County

- Department of Public Works (DPW)- Grading, Grubbing, Stockpiling and Excavation permit
- DPW - Permit for Excavation of Highway

#### **4.19 RELATIONSHIP BETWEEN SHORT-TERM USES VERSUS LONG-TERM PRODUCTIVITY**

Implementation of Kihei-Upcountry Maui Highway will involve trade-offs between short-term environmental and economic losses, and long-term transportation and economic gains. Depending on the alternative, the long-term productivity of the build alternative will offset the short-term losses to varying degrees.

Adverse short-term construction-phase impacts from the construction of Kihei-Upcountry Maui Highway will disappear soon after construction is completed.

Long-term conditions include:

- reduced traffic congestion on Haleakala Highway, Hana Highway, Dairy Road and Mokulele Highway;
- reduced travel times between Upcountry and Kihei-Makena or West Maui regions; and
- improved regional State Highway System.

Considering the long-term productive uses listed above, and the fact that adverse impacts from Kihei-Upcountry Maui Highway will be minimized, the project appears beneficial to the community and to the present and future land uses in the vicinity.

#### **4.20 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES**

Implementing the Kihei-Upcountry Maui Highway project will require an irreversible commitment of natural, physical, human, and fiscal resources, as follows:

- agricultural lands will be permanently lost by construction of the project (see Section 4.2.1);
- archaeological resources will be damaged, destroyed, or lost in constructing the project (see Section 4.10.3);
- considerable amounts of fossil fuels; labor required for construction, planning, engineering design, landscaping, purchasing, and services; and construction materials will be committed;
- construction will also require a substantial one-time expenditure of government funds that will not be retrievable (see Section 2.1.2). The commitment of these resources will be appropriate because the benefits from the completed Kihei-Upcountry Maui Highway include the following:
  - convenience and substantial savings in time and vehicle fuel consumption for residents, businesses, researchers and scientists, and visitors through an improved transportation system; and
  - improved accessibility and safety.

These benefits are anticipated to outweigh the commitment of resources.

## **CHAPTER FIVE**

### **Comments and Coordination**

## **CHAPTER 5 COMMENTS AND COORDINATION**

This chapter presents a record of the public and agency consultation and coordination activities conducted for the project, beginning with project scoping activities. It also summarizes the comments received on the project's Environmental Assessment (EA), Environmental Impact Statement Preparation Notice (EISPN), Notice of Intent (NOI) to prepare an EIS (see Appendix B), and the Draft EIS, which was distributed in August 1999, as well as other written and oral comments received throughout the EIS process.

### **5.1 PROJECT SCOPING PROCESS**

#### **5.1.1 AGENCY SCOPING AND COORDINATION**

The project's scoping process was initiated on September 1, 1994 through the issuance of letters to the agencies, organizations and individuals shown in Table 5-1. These letters requested comments on the proposed project. (The project initiation letter is provided in Appendix A). Responses from agencies and organizations (see Table 5-1) identified the following key concerns:

- alignment selection;
- directness between the Maui R&T Park and Science City;
- proposed termini;
- land use and transportation impacts;
- existing travel demand and traffic congestion;
- improved commuter and tourist accessibility;
- socio-economic impacts on existing communities;
- disruption to agricultural lands and farming activities;
- endangered species; and
- archaeological features.

A scoping meeting with government agencies was held on October 26, 1994. The agencies that were in attendance are shown in Table 5-1, and the meeting minutes can be found in Appendix A. Concerns raised at the scoping meeting included:

- congestion at the Maui R&T Park/Piilani Highway intersection;
- access to Hawaiian Home Lands;
- farmland impacts; and
- criteria to be used to select the alternatives that would receive detailed analysis in the Draft and Final EIS.

Coordination with various State and federal agencies continued throughout EIS preparation (see Appendix C), such as:

- State Historic Preservation Division (SHPD) and Officer (SHPO):
  - meeting on January 31, 1996 to discuss their comments on the EISPN;
  - letter from the Federal Highway Administration (FHWA) to the SHPO, dated February 16, 1999, requesting concurrence on the results of archaeological reconnaissance surveys, and “effect” and “adverse effect” evaluations;
  - letter from the SHPO to the FHWA, dated June 21, 1999, concurring with FHWA’s determination on the eligibility of sites identified along the alternative alignments;
  - Letter from the State of Hawaii Department of Transportation (SDOT) to the SHPD, dated February 8, 2001, requesting review of the archaeological inventory survey and cultural impacts study;
  - Letter from the SHPD to the Cultural Surveys Hawaii, dated May 10, 2001, providing comments on the archaeological inventory survey report;
  - Letter from the FHWA to the SHPO, dated June 18, 2001, requesting concurrence on effect determinations and submission of draft Memorandum of Agreement (MOA); and
  - Letter from the SHPO to the FHWA, dated September 28, 2001, approving the MOA.
- State Department of Business, Economic Development and Tourism, Office of Planning (OP):
  - Submission of the Hawaii Coastal Zone Management (CZM) program consistency evaluation from the FHWA to the OP on January 29, 2001; and
  - Letter from the OP to the FHWA, dated March 30, 2001, stating that the CZM consistency determination would be deferred until after the Final EIS.
- U.S. Army Corps of Engineers (USACE):
  - letter from the USACE, dated April 1, 1998, accepting cooperating agency status;

- meeting on February 9, 1999 to discuss applicable Department of the Army permit; and
- letter from the USACE, dated February 26, 1999, providing information on the applicable Department of the Army permit.
- U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS):
  - NRCS on two occasions provided “relative value of farmland to be converted” scores for the alternatives (Form AD-1006).
- U.S Fish & Wildlife Service (Service):
  - letter from Parsons Brinckerhoff, dated November 25, 1996, requesting information on endangered and threatened species in the vicinity of the project;
  - letter from the Service, dated January 8, 1997, with information on possible endangered and threatened species in the project area;
  - letter from the FHWA, dated December 1, 1997, requesting concurrence on effect evaluations on endangered and threatened species; and
  - letter from the Service, dated December 24, 1997, concurring with the FHWA effect evaluations.

### **5.1.2 COORDINATION WITH ELECTED OFFICIALS**

Following the agency scoping meeting and distribution of the EA (see below), project briefings were held for the Mayor of Maui County and other County officials on October 17, 1995, and members of the Maui County Council on October 18, 1995.

### **5.1.3 ENVIRONMENTAL ASSESSMENT**

#### **5.1.3.1 Issuance of the EISPN and NOI**

An “Environmental Impact Statement Preparation Notice” (EISPN) was published in the September 23, 1995 edition of The Environmental Notice, published by the Office of Environmental Quality Control (see Appendix B). A “Notice of Intent” (NOI) to prepare an EIS was published in the November 9, 1995 edition of the Federal Register (see Appendix B). At the same time, the project’s EA was completed and distributed (the distribution list is provided in Appendix B; the EA is provided in Appendix D).

With the EISPN and NOI duly published, the public had the opportunity to provide comments on the EA. Under State EIS law, an EA, when prepared in the context that an EIS will be

prepared later, is viewed as a public and agency scoping document and a vehicle for the agency (in this case the State of Hawaii Department of Transportation (SDOT)) or applicant to establish contact with the public and agencies.

The Kihei-Upcountry Maui Highway EA was distributed a couple of weeks before the first round of public information meetings (see Section 5.2) with the intent that it would provide background information to those attending the public information meetings.

In brief, the EA:

- presented 10 alternative roadway alignments;
- summarized potential project impacts that could be significant, pending further study;
- summarized potential project impacts that did not appear to be major, pending further study;
- presented candidate alignment screening criteria for review and comment; and
- stated that an EIS would be prepared.

The public review period closed on November 10, 1995, several weeks after the first round of public information meetings (see Section 5.2).

### **5.1.3.2 Responses Received During the EISPN Comment Period**

The following agencies, organizations and individuals submitted written comments to the SDOT during the EISPN public comment period on the EA (September 23, 1995 through November 10, 1995). No comments were received during the NOI public comment period (November 9, 1995 through December 8, 1995). All names appearing below were included in the project mailing list to ensure notification of all subsequent EIS-related activities to interested parties.

#### FEDERAL AGENCIES

- U.S. Department of the Army, U.S. Army Engineer District
- U.S. Department of the Interior, National Park Service, Haleakala National Park
- U.S. Department of Transportation, Federal Aviation Administration

STATE AGENCIES

- Department of Accounting and General Services
- Department of Land and Natural Resources, Historic Preservation Division
- Office of Environmental Quality Control
- Office of State Planning (currently Department of Business, Economic Development and Tourism, Office of Planning)

OTHER ORGANIZATIONS AND INDIVIDUALS

- Robert M. Butterfield
- Ann F. Crowe
- Dowling Company, Inc. (Don Fujimoto)
- Jamie Fonseca
- Hawaiian Classic Perfumes (Dennis Edward Bell)
- Hawaiian Commercial & Sugar Company (Richard F. Cameron)
- Hawaiian Estates Realty Ltd. (Suzanne Lee Freitas)
- Sam S. Hironaka
- The Incense Works (David J. Baar)
- International Longshoremen's and Warehousemen's Union, Local 142 (William Kennison)
- Kevin Johnston
- Buck Joiner
- James Judge
- Hale D. Judson III
- Nancy Kanady
- Kizmet Brokerage (Sunny Crowley)
- Kula Community Association (Steve Sutrov)
- Elizabeth Marciel
- Maui Land & Pineapple Company, Inc. (Warren A. Suzuki)
- Maui Pineapple Company, Ltd. (L.D. MacCluer)
- Lenda McGehee-Simon
- William W. Monahan

- Edwin S. Murai
- O Cole
- Christopher Perreira
- Fred Peterson
- Sally Raisbeck
- Hans Riecke
- Fredrick W. Rohlfing
- Dennis Smith
- Gordon Stellway
- Edward S. Syrjala
- Leah Wesson
- Frank W. White

These written EISP comments were reviewed and their contents are summarized below:

- Five letters (almost 12 percent) offered no comment on the Draft EA.
- Nearly 45 percent of those responding stated that they supported at least one of the ten alternative alignments proposed in the EA for the Kihei-Upcountry Highway. The alignments garnering the most support were Alternatives 1, 4B and 6A or 6B.
- Conversely, 26 percent of the letters opposed the project for reasons including:
  - disturbance of archaeological resources;
  - increased traffic in areas where no problem currently exists;
  - project cost;
  - safety concerns;
  - loss of quality of life in Upcountry;
  - increased crime in Upcountry;
  - increased subdivision development;
  - increased tourism;
  - need to improve existing roadways;
  - loss of agricultural lands and related jobs;
  - lack of national defense justification;
  - lack of mass tourism and tourist-related jobs;
  - lack of water Upcountry; and
  - limited need to travel to Kihei because of increased jobs in the Upcountry area.
- The most frequently made comments involved:
  - project cost;

- secondary growth or lifestyle changes in Kula;
  - traffic concerns;
  - need to improve existing highways;
  - desire to maintain agricultural land; and
  - lack of defense-related justification.
- Other comments requested clarification of information presented in the EA or studies and analyses beyond the scope of the Draft EIS document.

Some of the comments were useful in preparing this Draft EIS, while others were useful in the Screening Analysis Report, which is summarized in Chapter 2.0. The letters are reproduced in Appendix B accompanied by response letters from the SDOT.

## **5.2 PUBLIC INFORMATION MEETINGS**

Two rounds of public information meetings (four meetings total) were conducted as part of the project's public involvement efforts. Each round consisted of a meeting in Upcountry and a meeting in Kihei. The first set of meetings was scheduled in coordination with the issuance of the project's EA (see Section 5.1.3). Comments were accepted for several weeks after the meetings for those choosing to comment based on the meetings. The Upcountry meeting was held in the evening of October 17, 1995, at the Upcountry Community Center in Pukalani; the Kihei meeting was held in the evening of October 18, 1995, at Kihei Elementary School. Nearly 80 participants attended the Upcountry meeting, and 35 participants attended the meeting in Kihei. Sign-in sheets and meeting minutes are provided in Appendix A. Meeting attendees were added to the project mailing list.

The Upcountry meeting produced the following comments and concerns:

- the desire to improve linkage between the Maui R&T Park and Science City is not important or could be addressed through other means;
- the project has the potential for cost overruns;
- the project should include access to Hawaiian Home Lands parcels;
- the "no build" is the preferred alternative;
- an alternative consisting of widening existing roadways should be considered; and

- the project should assess potential impacts in the following areas:
  - tourists using the roadway;
  - Upcountry's rural lifestyle and social environment;
  - crime in Upcountry;
  - access to the proposed highway by emergency medical service vehicles;
  - agricultural activities, including small truck farms in Kula; and
  - secondary land use impacts in Upcountry.

The Kihei meeting produced the following comments and concerns:

- the link between the Maui R&T Park and Science City is important;
- the proposed highway would provide relief to many Upcountry residents who presently have to commute long distances to their jobs in Kihei, Lahaina, and Wailea; and
- the commuting link between Upcountry and Kihei will be more crucial in the future as developers construct housing in Upcountry.

The second set of public information meetings was conducted in the evenings of May 15, 1996 at the Upcountry Community Center in Pukalani and May 16, 1996 at Kihei Elementary School. Fifty-five participants attended the May 15 meeting and 25 participants attended the May 16 meeting. Sign-in sheets and meeting minutes are provided in Appendix A. Meeting attendees were added to the project mailing list.

The following comments and concerns expressed at the second Upcountry meeting augment the comments received at the first Upcountry meeting:

- agricultural impacts (to sugar cane fields) are not that crucial because this industry is not important to the future of the island;
- the Kihei terminus should be as far south as possible because the Mokulele/Piilani Highway intersection would be a choke-point if an evacuation from Kihei is needed;
- certain alternatives may cause unanticipated traffic problems on existing sub-standard roads; and
- certain alternatives may have potential impacts on the new high school in Pukalani.

The following comments and concerns expressed at the second Kihei meeting augment the comments received at the first Kihei meeting:

- the Kihei terminus should be placed as far south as possible to accommodate projected growth in the Makena area and provide a second evacuation route from Kihei;
- some of the alternatives will produce unacceptable noise levels in existing neighborhoods;
- two Kihei termini should be considered;
- the road should not cross the Maui R&T Park;
- some of the alternatives would cause traffic problems on existing sub-standard roads;
- a spur to Hawaiian Home Lands parcels should be provided; and
- the EIS should address visual and secondary land use impacts.

Public and small group meetings have continued since the second round of public information meetings. For example, meetings have been held with:

- Hawaiian Commercial & Sugar Company on January 9, 1996 and April 10, 1997;
- Maui Land and Pineapple Company on April 25, 1997; and
- Kula Community Association on February 19, 1998.

### **5.3 WRITTEN COMMENTS RECEIVED FOLLOWING PUBLIC INFORMATION MEETINGS**

Following the May 1996 information meetings, the organizations and individuals listed below provided written comments (reproduction of these letters and responses from the SDOT are located in Appendix A). All names appearing below were added to the project mailing list to ensure notification of all EIS-related activities to interested parties.

- The Amaral Company (Zandra Souza Amaral)
- Keith Dinsmoor
- Isabel Gerhard-Kalahau
- Ed and Stephanie Hackenbruch
- Hawaiian Commercial & Sugar Company (Richard F. Cameron)
- Ikua Purdy Road Committee (Sam S. Hironaka)

- John Janinski
- Maui Research and Technology Park (Brett M. Klyver)
- George Schubert
- Frank W. White
- Don Williams & Company (Don Williams)

Generally, the comments focused on the need for the project and suggested alternatives or alignments. Some were valuable in the selection of the alternatives studied in the Draft and Final EIS (see Chapter 2.0). Others requested that the EIS study the following issues:

- secondary land use impacts;
- evacuation from Kihei;
- impacts to agriculture; and
- noise impacts to existing neighborhoods.

Following the selection of the alternatives to be studied in detail in the Draft EIS (see Section 2.2), the SDOT mailed notices on May 6, 1997 (see Appendix A) to interested individuals, businesses and organizations informing them of this selection. This notice also appeared in the May 7, 1997 editions of the Honolulu Advertiser and the Maui News.

Following this notice and a meeting with the Kula Community Association (see Section 5.2), the organizations and individuals listed below provided written comments (reproductions of these letters and corresponding responses from the SDOT are in Appendix A). Names appearing below were added to the project mailing list, if they were not already on the list.

- Robert M. Butterfield
- Kimo Galbraith
- Hawaiian Commercial & Sugar Company
- Kula Community Association
- Barbara L. Luke
- Kula Community Association;
- RSK Enterprise LLC;
- Azeo Park

- Heinz Rominger and Diane Clarke

Generally, the comments focused on the need for the project, suggested alternatives or alignments, provided information on potential project impacts, and presented community views of the project.

## **5.4 DRAFT ENVIRONMENTAL IMPACT STATEMENT**

### **5.4.1 AVAILABILITY OF DRAFT ENVIRONMENTAL IMPACT STATEMENT**

The project's Draft EIS was announced in the August 8, 1999 edition of The Environmental Notice, and the August 20, 1999 edition of the Federal Register (see Appendix B). These announcements formally initiated the public comment period on the Draft EIS. In accordance with the stipulated review periods in State and federal law, the comment period on the Draft EIS officially ended on October 14, 1999. However, comments received after this date were considered official comments under the environmental review process.

Copies of the Draft EIS were mailed to federal, State and County agencies and elected officials who may have an interest in the project. Copies were also sent to five public libraries on Maui (Wailuku Regional, Kihei, Lahaina, Makawao and Kahului). In addition, copies of the Draft EIS were mailed to affected landowners, community organizations, and individuals who previously commented on the project or who requested copies. All organizations and individuals to whom SDOT sent copies of the Draft EIS were asked to provide comments. Appendix B lists all the parties who received copies of the Draft EIS.

### **5.4.2 PUBLIC HEARINGS**

Three formal public hearings were held during the formal review period for the Draft EIS. These hearings were held during the evening, as follows:

- September 29, 1999 at the Kihei Aquatics and Community Center;

- September 30, 1999 at the Mayor Hannibal Tavares Community Center in Pukalani; and
- October 13, 1999, at Kahului School.

All three hearings were advertised in the "Hawaii State & County Public Notices", a weekly publication of Statewide distribution. The hearings were also advertised in the Maui News, the only daily newspaper serving Maui County. Also, more than 200 government agencies, individuals, community and civic organizations, and businesses on the project mailing list received notice of the public hearing by mail.

Initially, only the Kihei and Upcountry public hearings were scheduled. The third public hearing was added in response to community concerns that the second hearing conflicted with the County Fair. The decision to hold the third public hearing was made before the first two hearings were held. Therefore, a sign was placed at the first two hearings informing participants of the third public hearing at Kahului School.

A record of all hearing attendees was maintained, and a handout that included project information was distributed at the sign-in table (see Appendix B).

The format of the first two public hearings was an "open house". In an open house format, no formal presentation is made, but "science fair" types of displays provide information about the project, and experts are available to answer questions. The objective of an "open house" public hearing is to create a non-threatening, relaxed environment in which participants can easily learn about the project, and then make informed comments. An open house hearing is also more convenient to the public as they may attend the hearing at any time while the hearing is occurring, and receive the same information. In comparison, at a traditional hearing, the public must arrive at the hearing by a certain time to hear the formal presentation, and those wishing to comment on the project "testify" in front of an audience. In general, most attendees tend to comment at an "open house" style hearing in comparison to a "traditional" hearing.

The “open house” format of the first two hearings was previewed by the SDOT Administrator at a Kula Community Association meeting prior to the hearings. Later, the Maui News published an article about the project and the “open house” format of the public hearings.

During the open house, the room was set up to establish the following flow through the room:

- Sign-in;
- Watch project video;
- Visit “science fair” display section and talk with experts; and
- Provide written or oral comments.

The rooms used for the hearings were large enough to accommodate this flow.

Upon entering the hearing, participants were asked to sign-in so they would be included in the project’s mailing list. They were then handed a project informational packet including instructions on how to obtain project information and participate in the public hearing. They were then asked to watch a 12-minute video about the project. Many chairs were provided, and the video was set to play continuously for the full duration of the public hearing. The project video provided basic information about the project so participants would be better oriented before visiting the display section. The video provided information on the study area, purpose and need of the project, the planning process, the alternatives being considered, potential environmental impacts, and next steps.

After watching the video, the participants visited the display section where they spent most of their time. Displays were organized into the following six stations, with a member of the project planning staff positioned at each station to exchange information:

- Purpose and need: why the project is proposed, and what transportation problems the project is intended to address;
- Alternatives screening: how the planning process arrived at the alternatives addressed in detail in the Draft EIS;
- Project description: detailed information (schedule, cost estimates, roadway sections) on the alternatives under consideration;

- Transportation impacts: comparison of the alternatives' transportation performance and effectiveness;
- Environmental impacts: comparison of the alternatives' environmental impacts; and
- Historic and archaeological impacts: information on the historic and archeological resources found in the project area and how they would be affected by the alternatives.

Each station was staffed by a person knowledgeable about the subject addressed by the station (e.g., the historic and archaeology station was staffed by the principal of Cultural Surveys Hawaii, Inc., the subconsultant who conducted this work). Station attendants wore name tags affiliating them with their station (i.e., "Ask Me About Environmental Impacts"), and engaged public hearing attendees in dialogue about the project.

After visiting the display section, participants were encouraged to provide comments. The comment area was physically separated from the other areas so that participants would not be distracted by the video or discussions taking place in the display area. Participants had several means of providing comments:

- Use a form that was provided (the form asked only for a name and address, and the commenter could write whatever they wish,);
- Provide oral comments directly to a court reporter; or
- Take forms with them for later completion and submission, or distribution to those not attending the hearings.

A drop box for completed forms was provided in the comment area. Two court reporters were also present who transcribed oral comments.

The third public hearing was held because of concerns that the second public hearing conflicted with the County Fair, which would detract from attendance. Also, some complained that the first two public hearings did not provide the public with the opportunity to hear others in the community state their opinions about the project due to the format of those public hearings. Therefore, the third public hearing was a "hybrid" of "open house" and "traditional" formats. The video, station displays and court reporter were available during the first part of

the hearing. During the second part of the hearing, a panel of SDOT and FHWA officials and project consultants sat in the front of the room and took testimony in front of an audience. The testimony was transcribed by the court reporter.

The first public hearing at the Kihei Community Complex drew 67 people; the second hearing at the Mayor Hannibal Tavares Community Center drew 129 people; and the third hearing at Kahului School drew 48 people. Total attendance was therefore 244, but some people attended more than one hearing.

Of the 244 who attended the three public hearings, a total of 163 provided comments. The most frequent mode of comment delivery was oral, with 93 persons providing oral comments to the court reporters. Written comments were the second most common mode of comment delivery, with 70 persons writing comments on the comment forms and turning them in during the hearings. The public hearings were successful in obtaining comments from 67 percent of those who attended the hearings. This high "comment productivity ratio" is attributed to the open house format of the public hearings.

Volume Two of this Final EIS, Draft EIS Comments and Responses, contains the complete transcripts of the oral comments made at the three public hearings, as well as copies of the written comments received at these hearings.

### **5.4.3 COMMENTS**

This section provides a summary of all comments received during the Draft EIS comment period, including the comments received at the project's public hearings. Four hundred and thirteen (413) written and oral statements were received during the Draft EIS public comment period. Table 5-2 summarizes the methods in which these comments were provided, and the number of statements received through each method.

The comment letters, including completed forms, and their associated responses, are provided in Volume Two: Draft EIS Comments and Responses. They are arranged in the following order:

- Federal agencies;

- State agencies;
- County agencies; and
- Individuals and organizations

**Table 5-2  
Summary of How Draft EIS Comments Were Provided**

<b>Method of Comment Delivery</b>	<b>Number of Statements</b>
<u>Comment Forms</u>	
<u>During public hearings</u>	<u>70</u>
<u>Mailed In-Between or After the Public Hearings</u>	<u>131</u>
<u>Total Number of Comment Forms</u>	<u>201</u>
<u>Oral Statements at Public Hearings</u>	
<u>Kihei Aquatic and Community Center</u>	<u>19</u>
<u>Mayor Hannibal Tavares Community Center</u>	<u>52</u>
<u>Kahului School</u>	<u>22</u>
<u>Total Number of Oral Statements</u>	<u>93</u>
<u>Written Statements Mailed to SDOT or FHWA</u>	
<u>Governmental Agencies</u>	<u>17</u>
<u>Others</u>	<u>102</u>
<u>Total Written Statements</u>	<u>119</u>
<b>Total</b>	<b>413</b>

Source: State of Hawaii Department of Transportation, November 1999.

Written comments (letters of forms) requiring responses were numbered in the left margin. The oral comments that require responses are paraphrased in the response letter from the SDOT. The paraphrasing of oral statements was done for the purpose of brevity, with no intention of modifying or obscuring the content of any comment received.

Some of the comments received led to changes in the EIS, such as clarifying information and analyses, and inserting new information that was brought to the attention of the project sponsors. The letters responding to the comments were sent in December 2001 and January 2002 (see Volume Two: Draft EIS Comments and Responses). Because of the controversial nature and high profile of this project, nearly every facet of the EIS triggered comments. However, most comments dealt with the alternative preference of the commenter.

Concern about traffic impacts also generated many comments, such as the fear that the U2 alternatives (A or B) would jeopardize the safety of King Kekaulike High School students by

increasing traffic volumes near the school. Other comments on traffic impacts predicted that the U2 alternatives would cause increased congestion in Makawao, and that they would lead to increased through traffic in Pukalani (the latter comment based on mistaken information that the U2 alternatives include a direct access to and from Pukalani). In addition, many commentors agreed with the findings in the EIS that some of the alternatives would cause an increase in through traffic on some of the local agricultural and residential roads, such as Omaopio and Pulehu Roads.

The comments on environmental impacts ranged from concern that the Kihei-Upcountry Maui Highway would result in excess development in Upcountry, to exacerbating alien species invasion. Other environmental issues raised by the commentors included disagreement that the loss of productive agricultural land is worth the transportation benefits provided by the highway, and that the highway would generate automobile-related pollutants that could threaten previously unaffected areas. Some of the comments related to environmental concerns about particular alternatives, such as opinions that the U2-A alternatives would adversely affect a *heiau* (State Site 2701) and unknown burial caves, and that a U3 alternative would increase through traffic on local Kula residential roads. Other comments provided information about the population density of axis deer. This information became very useful in comparing the alternatives in terms of chances of vehicle-deer collisions. All of the comments were used in the preparation of the Final EIS.

# **CHAPTER SIX**

## **List of Preparers**

## **CHAPTER 6 LIST OF PREPARERS**

Below is a listing of persons who were primarily responsible for preparing the Final Environmental Impact Statement (EIS), their titles, years of experience and educational background.

### **DOCUMENT PREPARATION**

#### State of Hawaii Department of Transportation

Kenneth Au, P.E., Advance Planning Engineer  
34 years experience in highway engineering and planning  
B.S., Civil Engineering, University of Hawaii at Manoa

Stephen Chang, P.E., Project Manager  
15 years experience in highway engineering and planning  
B.S., Electrical Engineering, University of Hawaii at Manoa

Wayne Kawahara, P.E., Project Manager  
13 years experience in highway engineering and planning  
B.S., Civil Engineering, University of Hawaii at Manoa

#### Warren S. Unemori Engineering, Inc. (Engineering Prime Consultant)

Warren S. Unemori, P.E., Project Manager  
35 years experience in highway engineering  
B.S., Civil Engineering, University of Hawaii at Manoa

Reed Ariyoshi, P.E., L.S., Engineer  
19 years experience in engineering and land surveying  
B.S., Civil Engineering, University of Hawaii at Manoa

Clifford Mukai, P.E., Engineer  
15 years experience in engineering and CAD system development and administration  
B.S., Civil Engineering, Oregon State University

Darren Unemori, P.E., Engineer  
12 years experience in hydrology and highway engineering  
M.S., Transportation Engineering, University of California at Berkeley  
B.S., Civil Engineering, University of California at Berkeley

Parsons Brinckerhoff Quade & Douglas, Inc. (Environmental Subconsultant)

David Atkin, Ph.D., Project Manager

20 years experience in environmental planning

Ph.D., Biology (Ecology), Princeton University

B.S., Biology (Marine), Stanford University

Jason Yazawa, AICP, Environmental Task Leader

8 years experience in environmental planning

M.U.R.P., Urban and Regional Planning, University of Hawaii at Manoa

B.A., Economics, University of Hawaii at Manoa

Jan Reichelderfer, CPG, Environmental Planner

12 years experience in geology and environmental planning

Professional Certificate, Urban and Regional Planning, University of Hawaii at Manoa

M.S., Geology, University of Illinois, Urbana

B.S., Geology, University of Delaware, Newark 1982

Nami Ohtomo, Environmental Planner

6 years experience in environmental planning

M.P.P., Public Policy, University of Michigan, Ann Arbor

M.S., Natural Resources and Environment, University of Michigan, Ann Arbor

A.B., East Asian Languages and Civilizations, Harvard-Radcliffe Colleges

Wayne Yoshioka, P.E., Transportation Task Leader

21 years experience in transportation engineering and planning

B.S., Civil Engineering, University of Hawaii at Manoa

Mike Miyamoto, P.E. (pending), Transportation Engineer

14 years experience in transportation engineering

Graduate Courses, University of Lowell

B.S., Civil Engineering, University of Lowell, 1980

Deneitra M.G. Hutchinson, Environmental Planner

10 years experience in environmental and transportation planning

M.S., Community and Regional Planning, University of Texas at Austin

B.F.A., University of Texas at Austin

Lisa Santiago, Air Quality Specialist

6 years experience in conducting air quality assessments

B.S., Mathematics, New York State University

Steven Wolf, Lead Noise and Vibration Specialist

25 years experience in conducting noise analyses

Graduate Work in Applied Mechanics, Polytechnic Institute of Brooklyn

B.S., Mathematics, Long Island University, 1973

Kevin Keller, Noise and Vibration Specialist  
8 years experience in environmental planning and noise analyses  
B.A., Geography, California State University Fullerton

Edie Sagarang, Graphic Designer  
10 years experience in graphic design  
B.A., Fine Arts, University of Hawaii at Manoa

Environmental Subconsultants

Winona Char, Botanist, Char & Associates  
22 years experience in conducting botanical studies  
M.S., Botanical Sciences, University of Hawaii at Manoa  
B.S., Botanical Sciences, University of Hawaii at Manoa

Hallett H. Hammatt, Ph.D., Archaeologist, Cultural Surveys Hawaii  
35 years experience in conducting archaeological studies  
Ph.D., Archaeology, Washington State University  
M.A., Prehistoric Archaeology, University of Edinburgh  
B.A., History, University of Pennsylvania

Robert L. Spear, Ph.D., Anthropologist, Scientific Consultant Services, Inc.  
26 years experience in conducting anthropological studies  
Ph.D., Anthropology, University of Oregon  
M.A., Anthropology, Western Washington University  
B.A., Anthropology, Western Washington University

**REVIEWER**

U.S. Department of Transportation, Federal Highway Administration, Honolulu

Domingo Galicinao, Structural Engineer  
22 years experience in highway engineering and planning  
B.S., Civil Engineering, University of Hawaii at Manoa

Pat V. Phung, Transportation Engineer  
9 years experience in highway engineering and planning  
B.S., Civil Engineering, University of Washington

# **CHAPTER SEVEN**

## **Final EIS Recipients**

## **CHAPTER 7 FINAL EIS RECIPIENTS**

Listed below are agencies and organizations to whom copies of this Final EIS are being sent.

### **Federal Agencies**

U.S. Department of Agriculture

U.S. Department of Defense  
Army Corps of Engineers

U.S. Department of Interior  
Biological Resources Division  
Office of Environmental Project Review  
U.S. Geological Survey, Water Resource Division

Environmental Protection Agency  
Office of Federal Activities  
Region IX

### **U.S. Legislators**

The Honorable Daniel K. Inouye

The Honorable Daniel K. Akaka

The Honorable Patsy Mink

### **State of Hawaii Agencies**

Department of Business, Economic Development and Tourism (DBEDT)  
Office of Planning  
Library

Department of Defense

Department of Health

Department of Land & Natural Resources  
Division of Forestry and Wildlife

Office of Environmental Quality Control

Office of Hawaiian Affairs

University of Hawaii  
Environmental Center

### **State Senators**

The Honorable Robert Bunda, Senate President

The Honorable Cal Kawamoto, Chair Transportation, Military Affairs and Governmental Operations Committee

The Honorable Jan Buen, District 4

The Honorable J. Kalani English, District 5

### **State Representatives**

The Honorable Calvin Say, Speaker of the House

The Honorable Joseph M. Souki, Chair House Transportation Committee

The Honorable Ron Davis, District 7

The Honorable Bob Nakasone, District 9

The Honorable Kika Bukoski, District 10

The Honorable Chris Halford, District 11

### **County of Maui**

The Honorable James "Kimo" Akana, Mayor

Department of Parks and Recreation

Maui Police Department

### **Libraries**

Kihei Public Library

Lahaina Public Library

Makawao Public Library

Wailuku Regional Library

Hawaii Kai Regional Library

Hilo Regional Library

Kaimuki Regional Library

Kaneohe Regional Library

Lihue Regional Library

Pearl City Regional Library  
Hawaii State Library  
Legislative Reference Bureau  
University of Hawaii at Manoa  
Hamilton Library  
Maui Community College Library

**Media**

The Maui News  
South Maui Times  
Honolulu Advertiser  
Honolulu Star Bulletin

**Major Land Owners Affected by the Preferred Alternative**

Alexander & Baldwin  
Haleakala Ranch  
Kaonoulu Ranch

In addition to the above agencies and organizations who will receive a copy of this Final EIS, individuals and organizations who provided substantive comments (see Volume Two: Draft EIS Comments and Responses) will receive this Final EIS in CD-ROM. However, they will be provided with the option of receiving a hard copy of the Final EIS, or refusing the Final EIS in either format.

## **CHAPTER EIGHT**

### **Bibliography**

## **CHAPTER 8 BIBLIOGRAPHY**

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

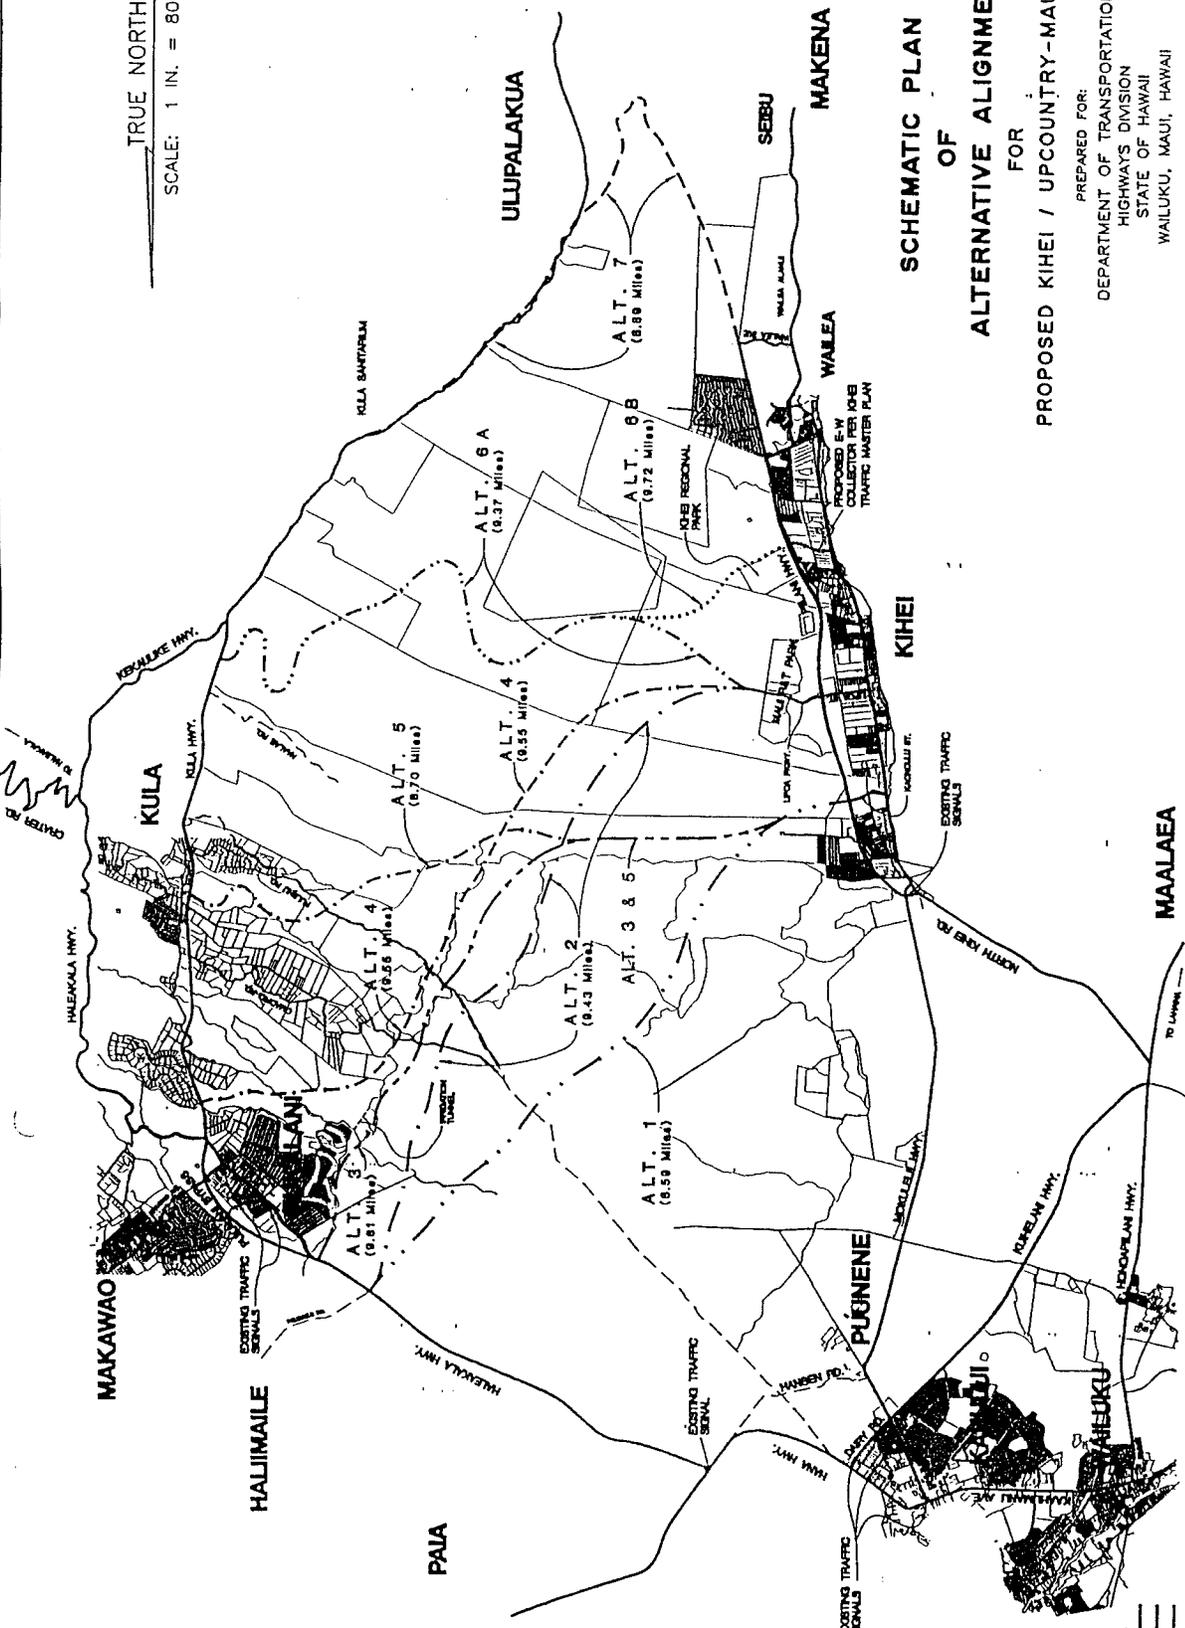

We are undertaking planning studies for the proposed  
Kihei-Upcountry Maui Highway Project and have engaged the  
consultant services of Warren S. Unemori Engineering, Inc. The  
project proposes to construct a new roadway connecting the Kihei  
area with Upcountry Maui.

The objective of the planning study is to select an alignment for  
design and construction through our public  
involvement/environmental process. The process will consist of  
the following major activities:

- o Scoping
- o Environmental Assessment and Environmental Impact  
Statement (EIS) Preparation Notice
- o Public Informational Meetings
- o Issuance of the Draft EIS
- o Public Hearing
- o Issuance of the Final EIS

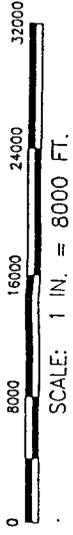

I have enclosed a map (dated August 19, 1994) of the project area  
showing preliminary alternative alignments which are being  
investigated by our consultant. As part of our early scoping  
efforts, we would appreciate any comments, concerns, or  
information which your organization may have regarding these  
alignments.

U.S. ARMY ENGINEER DISTRICT, HONOLULU  
FORT SHAFTER, HAWAII 96859-5440

September 12, 1994

REPORT TO  
ATTENTION OF

Planning Division

Mr. Rex D. Johnson, Director  
Department of Transportation  
State of Hawaii  
869 Punchbowl Street  
Honolulu, Hawaii 96813-5097

Dear Mr. Johnson:

Thank you for the opportunity to review and comment on the Kihel-Upcountry Maui Highway Project (Project No. HDP5-9203-1). The information provided in your letter dated September 1, 1994 was not sufficient to provide an evaluation at this time. Once detailed plans have been developed, the Corps will need to review the project to determine Department of the Army permit requirements and evaluate flood hazard designations as applicable under the Federal Emergency Management Agency's National Flood Insurance Program.

Sincerely,

*James J. Jyo*

NATIONAL PARK SERVICE

Haleakala National Park  
P.O. Box 369  
Maunaloa, Maui, Hawaii 96768

October 25, 1994

Rex Johnson, Director of Transportation  
State of Hawaii  
869 Punchbowl Street  
Honolulu, HI 96813-5097

Dear Mr. Johnson:

Thank you for the invitation to the October 26, 1994 scoping session for the proposed Kihel-Upcountry Maui Highway. Due to the temporary absence of Haleakala National Park Superintendent Don Reaser and several other key staff, we are unable to attend this session. However, we hope to be involved as consultants as the proposed development evolves. Please accept the following comments in lieu of our attendance at tomorrow's meeting.

Alternative 6 and 6A, pass through or very near what is generally recognized by biologists as one of the most intact and diverse lowland dry forests remaining in the Hawaiian Islands that contains a number of listed or proposed endangered plant species recognized by the US Fish and Wildlife Service, i.e., the Pu'u-o-kali lava flower. The other alternative to the west appear to pass through areas of relatively little known biological value and hence may be more acceptable from that perspective versus the alternatives to the east.

Direct displacement of dryland forests in this area by highway easements are not the only threats posed by the proposed development; however. Non-native plants and animals and the effects of wildland fire are other severe causes of loss. It is well known in Hawaii that the preponderance of wildland fires are human-caused. In general the native shrublands that persist in this region are nearly invariably found in areas of rough 'a'a lava. However, the fire history of the past 60 years has shown that even in these discontinuous fuels, fire fed by surrounding or intermixed flash fuels (principally alien grasses and kiawe) burns aggressively in spite of barriers more than 60 feet wide, e.g., Honopulihi Highway. Increased public access to areas that are peripheral to dryland forests may affect them by increasing fire frequencies in the region -- a severe perturbation.

Our assessment that the more western alternative routes may be "generally more acceptable" from a biological perspective is somewhat subjective, because these are private ranchlands without easy legal access. The private lands are largely unexplored and relicta populations of endangered species may be found among any of the proposed routes. Hence these areas largely lack the basis of biological survey which would allow approval or disapproval of particular routes on that basis. Scientists of the National Park Service and the National Biological Survey have a strong interest in assisting exploration of the proposed alternatives so that values at risk can be identified and appropriate mitigation efforts made in the planning and route selection process.

Road planners recognize that without stringent limited-access rules road development is the purveyor of a sequence of growth. We recommend considering the proposed roadway carefully as to centralize development, thereby providing some protection to Maui's rural and wild areas.

Sincerely,  
*Karen Ardoin*

Dear Mr. Johnson:

This is in response to your September 1, 1994 letter regarding the proposed Kihei-Upcountry Maui Highway Project. The FAA has no facilities in the proposed project area; however, we would appreciate being kept informed during the environmental process particularly as the highway project relates to improved access to Kahului Airport.

We appreciate the opportunity to comment on this project.

Dear Mr. Johnson:

Subject: Early Scoping Efforts  
Kihei-Upcountry Maui Highway  
Project No. HDPS-9203 (1)

We have reviewed the preliminary alternative alignments being investigated for the subject highway and have no comment as to which is preferred. However, we believe consideration should be given to the amount of traffic generated which may affect Kihei Elementary School on Lipoa Street and Kihei II Elementary School on Pailani Highway near the intersection of Alternate 6B. The new King Kekaulike High School near the mauka intersection of Alternate 4 would also be affected.

Should there be any questions, please call the Facilities Branch at 733-4862.

Dear Mr. Johnson:

RE: HWY-PA 2.2552  
Kihei-Upcountry Maui Highway  
Project No. HDPS-9203 (1)

My staff has reviewed the subject matter. From the limited information provided, Alternative 1 appears to be the more acceptable site. The highway would be constructed for most of its length in areas that have had high vegetative disturbance, and would be impacted the least biologically when compared to the other alternatives. Alternative 1 would provide the best service to the upcountry residents by hooking up to Hall'imale Road. Of course, a more thorough biological survey will be needed and we will be able to provide substantial comments at that time.

Very truly yours,

869 Punchbowl Street  
Honolulu, HI 96813-5097

Dear Mr. Johnson:

RE: HWY-PA 2.2552  
Kihei-Upcountry Maui Highway  
Project No. HDPS-9203 (1)

My staff has reviewed the subject matter. From the limited information provided, Alternative 1 appears to be the more acceptable site. The highway would be constructed for most of its length in areas that have had high vegetative disturbance, and would be impacted the least biologically when compared to the other alternatives. Alternative 1 would provide the best service to the upcountry residents by hooking up to Hall'imale Road. Of course, a more thorough biological survey will be needed and we will be able to provide substantial comments at that time.

Very truly yours,

*Keith W. Ahue*

Honolulu, Hawaii 96813-5097

Dear Mr. Johnson:

Pre-Planning Consultation  
Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

The referenced document describes potential road alignments for the proposed Kihei-Upcountry Maui Highway Project. The document provided six alternate routes for the proposed project.

This review was conducted with the assistance of Richard Mayer, Maui Community College/Geography; and Chris Welch, Environmental Center.

Our reviewers found the proposed route alignments interesting, yet could discern no basis for the selection of these particular routes. Were the routes picked on the basis of topography only or were there other factors involved (such as land use consideration)? In order to fairly evaluate whether the seven choices given are indeed the "best seven choices", the criteria for ranking the particular alignments need to be defined.

In weighing the seven alternatives, our reviewers found four critical parameters necessary for evaluation: visitor trips, recreational usage by residents, transits to and from work, and travel between Kihei Industrial Park and the Haleakala Summit. The pertinent points in optimizing the location of the road would be for gas and time savings during the above mentioned operations.

Of course, other considerations come into play when deciding the best route. Alignments six and seven obviously do not optimize for travel time or gas savings except to a very select population. Further, these routes potentially have a substantial impact on the rural atmosphere present in the Kula area. The limitations of such alignments, in terms of time, fuel, and social impact need to be clearly spelled out in the Environmental Impact Statement.

Mr. Rex D. Johnson  
page 2

disturbed by modern farming or ranching. Historic period ranching features over 50 years in age will also be present.

A number of historic sites are known to exist in the major Gulches of Kula, to the west of Kula Highway. Sites such as Hawaiian Petroglyphs, burial caves, and habitation shelters occur in Kāwepūlani, Kāliālinui, Pūlehu, Hapapa, Waiākea, and Alae Gulches. Known heiau sites occur on ridges to the west of Kula Highway in Oma'opio, Waiākea, Keokea, Waiohuli, Kaonouli, and Kamaole. The known heiau occur at elevations ranging from 1600 to 2800 AMSL. Upper portions of ALT. 4, 5 and 6 are in this general area of Kula.

Systematic surveys have occurred in Waiohuli and Keokea (ALT. 6A) where numerous historic sites associated with permanent habitation, agriculture, and ceremonial activities have been identified. Archaeological surveys conducted within relatively confined areas in Kamaole and Kanahana (ALT. 7) have confirmed the presence of permanent habitation and intensive agriculture in these areas as well.

A more detailed map of the proposed alternate routes will be needed in order to determine where specific routes are located in relation to the known historic sites. This level of work would be included in the scope of an archaeological overview, which would be part of the Environmental Impact Statement. Aerial reconnaissance and on-ground pedestrian survey work will also be needed, as the alternate route selection proceeds.

The location of known sites with preservation value in relation to proposed routes should be done in early planning stages so that these sites can be safely avoided. Likewise, it is preferable to identify areas with high site densities and/or significant cultural resources in early stages of planning.

Please contact Ms. Theresa K. Donham at 243-5169 if you have any questions.

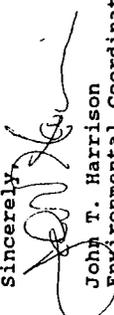

KD:jen

Mr. Rex D. Johnson  
October 8, 1994  
Page 2

Our reviewers suggest that another heretofore undescribed alternative would be the construction of several feeder roads to the main road going up from Kihei. Currently, the Lipoa Street intersection is very heavily used. Compressing all of the traffic from upcountry through this junction is problematic. Since much of the traffic originates in Wailea, the alternative of providing a feeder to the Wailea resort should be considered. Thus, both Kihei and Wailea would be served and both would be impacted to a lesser extent (for example alternative 6B and the Lipoa Street connection would merge near Kihei). Consideration of a similar operation should be undertaken for the junctions near Hailemaile, Kula, Pukalani, and Makawao.

Thank you for the opportunity to comment.

Sincerely,

  
John T. Harrison  
Environmental Coordinator

Dear Mr. Johnson: *Rex,*

RE: Kihei-Upcountry Maui Highway Project No. HDPS-9203(1)

In your letter to me dated September 1, 1994, you identified the major activities which were to be accomplished in the planning study and asked for our comments and concerns. My Planning Director had responded earlier on September 19, 1994, identifying those items which were of particular interest to his Department. I thought, however, that I would stress some issues of more general impact or concern.

In the scoping portion of the project, I believe we need to ensure an understanding of the socioeconomic effects of the road. In particular:

- The ability to live and work in the Upcountry environment will be enhanced. The shorter commute to both Kihei and Lahaina will provide better access to markets and jobs for farmers, craftsmen and employees.
- The selected route should be one to benefit both the present residents, as well as future residents. The development of the Hawaiian Homelands which extend from Keokea to Kihei must be considered. We need to ensure that the route chosen either connects to the Keokea Homelands or provides for a relatively inexpensive access to these homelands.

Mr. Rex D. Johnson, Director  
October 19, 1994  
Page 2

The preservation of the lifestyle is also very important in selecting the route. A minimum of disruption to agricultural lands, especially cane lands is very important.

When considering the environmental impact of the project, we felt that the effects could be very large and wish that several issues be reviewed in detail.

This is a major interconnecting highway and will profoundly impact the character and timing of development at both ends of the highway. The statement must adequately address the change in the direction of community growth implied by construction of this highway.

The road will allow people to transit easily between the Upcountry rural home environment and the coastal urban work environment. The environmental statement should address the long-term effects of such a transportation system and identify or implement measures to improve energy efficiency and reduce environmental effects. We feel that bikeways and Park & Ride facilities need to be addressed.

I appreciate the work of your staff in this process, and I am hopeful that we can continue to progress on this very important project.

Please call me if you would like to discuss my comments in more detail.

Sincerely,

  
LINDA CROCKETT LINGLE  
Mayor, County of Maui

Dear Mr. Johnson,

Re: Comments on upcoming planning studies for the Proposed Kihai-Upcountry Maui Highway Project

Thank you for your request for information and our comments on the upcoming planning studies for the proposed Kihai-Upcountry Highway Project. We are aware of the areas of concern which affect water and deserve inclusion in the analysis for this project such as the following:

1. Water Transmission:

Water concentrates in and on the north slopes of Maui, while the majority of the new land-use approvals occur on the south shores, in the central valley and high on the western valley slope. Therefore, land-use approvals in those areas require and generate water transmission lines which crisscross the isthmus from the north to the south. Requirements to pump more water up to waterless areas also grow. The proposed highway would directly require no new transmission lines. However, the road would be a likely alignment for the future lines which are required to serve land-use approvals. New transmission lines which run to newly-approved projects can have side effects on land-use pressures and growth under certain conditions. These effects are best reviewed by the Planning Department. We would be willing to assist with technical support in any masterplanning efforts which are needed to anticipate the side-effects of land-use approvals and our subsequent facilities. Please be advised that there may be a cost effect also. If a new road or other factors, including existing ones, induce growth at elevations above the existing water sources, the Board may be required to pass the unique, high cost of pumping onto high-elevation consumers. We are researching elevation-related cost and pricing issues now.

"By Water All Things Find Life"

November 21, 1994  
 Mr. Rex D. Johnson, Director, Department of Transportation  
 Proposed Kihei-Upcountry Maui Highway Project, page 2

2. Aquifer Protection:

Also, we suggest that aquifer protection be studied and included as part of the analysis of the highway project. The possible actions and results of petrol-based contamination, especially large container spills should be considered.

3. Water Conservation:

With the involvement of state funds and pursuant to state Act 73, erosion-control and revegetation plantings would be native Hawaiian species. We suggest species which are climate-adapted to the isthmus' arid coastal vegetation zone. Such plantings can prevent the overuse of the EPA-standard drinking water of the area's Central water system. Examples are as follows:

- trees -
  - Wiliwili (Erythrina sandwicensis, 20'ht.)
  - Hao (Rauvolfia sandwicensis, 20'ht.)
  - 'Ohe makai (Reynoldsia sandwicensis, 20'ht.)
- shrubs -
  - (Morinda citrifolia, 20'ht., polynesian intro.)
  - (Canthium odoratum, 12'ht.)
  - (Diospyros sandwicensis, 12'ht.)
  - (Nypoporum sandwicensis, 10'ht.)
  - (Nototrichium sandwicense, 8'ht.)
  - Kulu'i (Hibiscus brackenridgei, 8'ht., endangered)
  - Ma'o hau heia (Scaevola sericea, 6'ht.)
  - Naupaka kahakai (Dodonaea viscosa, 6'ht.)
  - 'A'ali'i (Scaevola tomentosa, 5'ht.)
  - Ma'o
- Groundcovers -
  - 'Ulei (Osteomeles anthyllifolia, 4'ht.)
  - Pohinahina (Vitex rotundifolia, 3'ht.)
  - Nehe (Lipochaeta lavatum, 3'ht.)
  - Nehe (Lipochaeta rockii, 2'ht.)
  - Nehe (Lipochaeta suchlantha, 3'ht.)
  - 'Akoko (Chamaesyce olonahuana, 2'ht.)
  - 'Akia (Solanium nelsoni, 3'ht.)
  - 'Akia (Miktoemia uva-ursi and M. species, 2'ht.)
  - 'Ohai (Sesbania tomentosa, 1'ht., endangered)
  - Kalamāliō (Chamaesyce spp., 1'ht.)
  - 'Akoko (Scaevola coriacea, 1'ht., endangered)
  - Naupaka (Bidens mauiensis, 1'ht.)
  - Ko'oko'olau (Portulaca villosa, .5'-1'ht.)
  - 'Ihi (Sida fallax, .5'ht.)
  - 'Iiima papa (Jacquemontia ovalifolia, subsp. sandwicensis, .5'ht.)
  - pū'ūhī'iaka (Fimbristylis cymosa, .5'ht.)
  - Mau'u 'aki'aki

November 21, 1994  
 Mr. Rex D. Johnson, Director, Department of Transportation  
 Proposed Kihei-Upcountry Maui Highway Project, page 3

3. Water Conservation (concluded)

Planting with these or similar species, as site conditions and commercial-availability permit, saves drinking water. The plants survive on the sites' rainfall, supplemented with low amounts of irrigation during the first year(s) and summers.

Further guidance in water conservation in landscaping may be found in the attached document or in the Maui County Planting Plan.

4. Water Availability and System Requirements:

The water supply for an irrigation system would require hook-up to the Central Maui water system. The system pulls water from Iao Aquifer. The aquifer is closing in on its maximum safe yield as set by the state Commission On Water Resource Management. Attempts to provide other water to the system have been delayed.

Water meters for this project may not be available until new water meters for the system is developed. No guarantee of water is granted or implied as a result of these comments or the approval of land-use permits, because the Board determines precise water availability only at the time of meter application. The developer may be delayed in receiving water and a meter for the project, even if land-use permits are approved.

Once again, thank you for providing us with the opportunity and the materials to comment on the upcoming studies. If you would like to request further information or comments, please contact us at (808)243-7835.

Sincerely,

David R. Craddock, Director

Honolulu, Hawaii 96813-5097

Dear Mr. Johnson:

Re: Kihel-Upcountry Maui Highway, Project No. HDPS-2403 (A)  
(HWY-PA 2.2552)

This is in response to your letter of September 1, 1994, regarding the above subject. We have the following comments:

1. The EIS must have a goal and needs assessment which states why this project is necessary and who or what function it will serve. Analysis should show the benefits the county would realize from this road and the criteria used for route selection. Would there be energy savings, a reduction of congestion, get people to jobs in a more efficient manner, how many people commute from which areas of "upcountry" to which areas of Kihel-Makena? What is the cost/benefit per route? Which route would carry the most number of people? Would it be more efficient for travelers from the airport to take this route than Mokulele Highway? Would people from Lahaina travel this route to get to "upcountry"? The EIS should also address the "growth inducement" potential along the alignment and at the terminus. Related to growth inducement would be the potential loss of some family farms because of increased demands to live upcountry and impacts on agriculture.
2. The route selected should connect existing population centers. Alternatives 6A, 6B, and 7 would result in little or no savings of mileage/time between Kihel and existing population centers "upcountry" over existing routes. Alternative 6 is likely to encounter a significant number of archaeological sites; mitigation would prove expensive, avoidance/preservation is preferable to mitigation.
3. Alternative Route 4 provides advantages of convenience to the R&T Park and connecting central Kihel to Kula, Pukalani, and Makawao, however, increased traffic on Lipoa Street would need to be considered, and Lipoa Street, its intersections, and entries/exits from Piihoni Highway upgraded accordingly.

SEP 21 1994  
HIGHWAY PLANNING DIVISION

4. The proposed Makawao-Pukalani-Kula Community Plan, Part II, Policy Recommendations on transportation objectives and policies #2 states: "Support the planning of the proposed Upcountry-Kihel connector highway with the least negative impact to the Upcountry lifestyle and character by locating the upcountry terminus in the vicinity of the intersection at Haliimaile Road and Haleakala Highway." Alternatives 3 and 4 terminus in the "upcountry" area, with access from the bypass will allow the major population centers of Makawao, Haliimaile, Pukalani and parts of Kokomo-Haiku easier access to the proposed Upcountry-Kihel road.

5. The proposed Kihel-Makena Community Plan (K-M CP), Part III, Policy Recommendations on transportation policies and objectives states: "Support a new bypass highway mauka of Piihoni Highway, coordinated with a Maalaea-Kaalia Pond bypass and an Upcountry-Kihel connector road, to be constructed as growth in the region warrants."

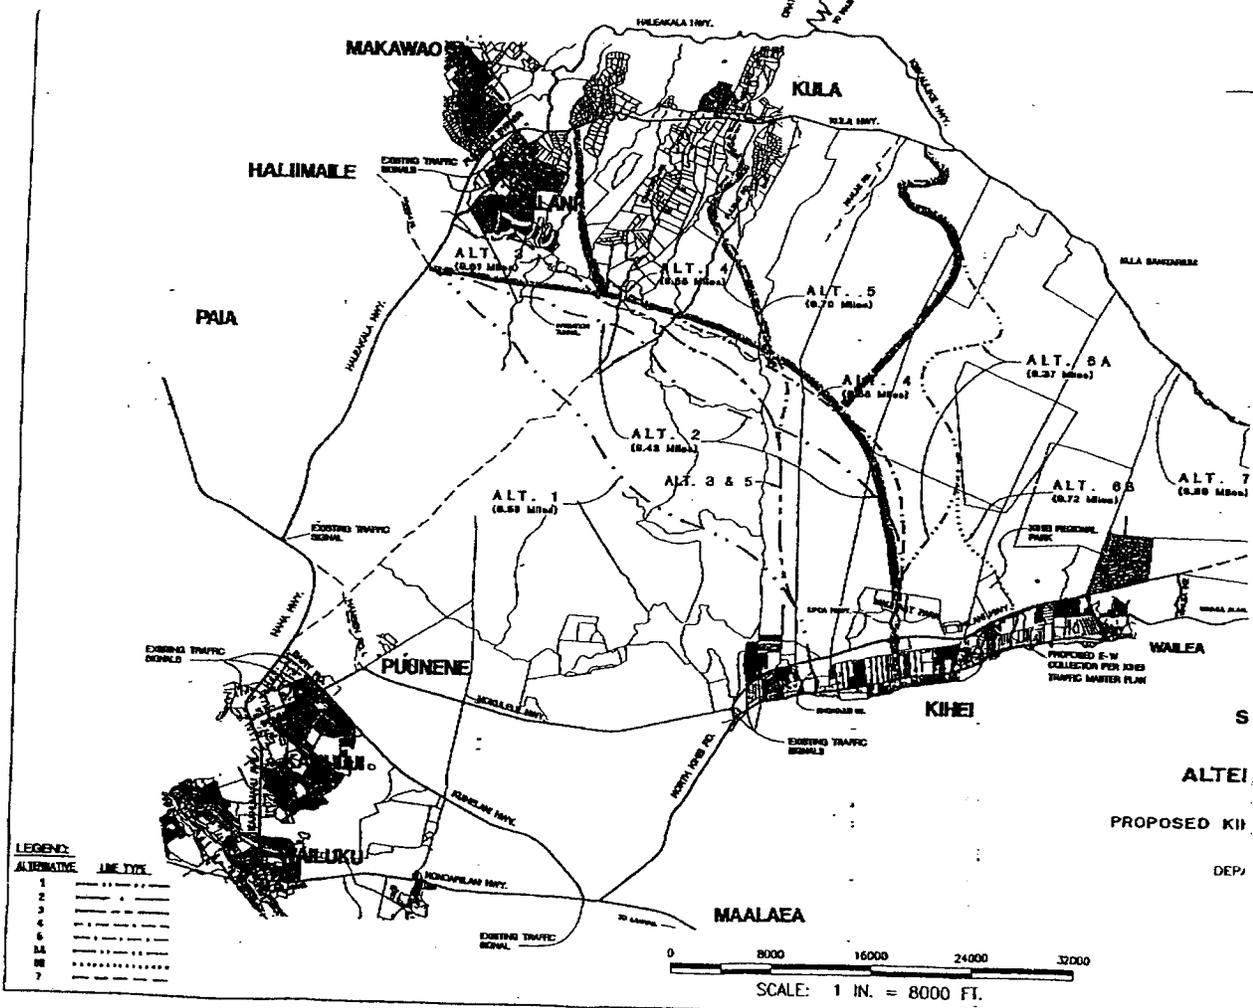

The K-M CP also seems to be consistent with Alignment alternative 2 and 4 which terminates in Kihel at Lipoa Street and Piihoni Highway intersection which is the future intersection of Road "C". The K-M CP under goals, objectives, and policies, on "Land Use" states: "A central business and commercial center for Kihel clustered around the South Kihel Road/Road "C" intersection" would seem a logical point to terminate the upcountry road.

6. One route that is not examined on the alternative alignments is the old county ROW which still shows in the tax map key books. The route may be more cost effective because it would be a shorter route, avoid larger gulches, one overpass may resolve the agricultural traffic conflict, and since the makai terminus is near the intersection of Mokulele and North Kihel road, it would be more easily service people going to or coming from either Kihel or Lahaina.

If you have any further questions, please call myself or Julie Higa at 243-7735.

Very truly yours,

 Mr. Rex Johnson  
 Department of Transportation  
 889 Punchbowl St.  
 Honolulu, HI 96813-5097

Dear Mr. Johnson:

I am very interested in the planning process for this proposed road. To me it seems that the best thing would be to have several routes down from upcountry not just one connecting in to lower Pukalani, see attached. To have just one connection to upcountry seems shortsighted. By having just one connection you are just adding to the bottle neck that already exists below Pukalani.

I would like to be kept informed of any public meetings. Will you be able to add me to your mailing list for this project? Thank you.

Sincerely,  
 Robert M. Butterfield

Dear Mr. Johnson:

Re: Kihel-Upcountry Maui Highway Project No. HDPS-9203 (1)

Thank you for your letter dated September 1, 1994 informing Hawaiian Commercial & Sugar Company (HC&S) of the planning studies being done for the proposed Kihel-Upcountry Maui Highway Project and requesting our input on the preliminary alternative alignments.

My comments are based on the map that was provided with your letter of August 19, 1994. HC&S has specifically focused on the various alignment that have a detrimental effect on HC&S' viability.

Alternatives 1, 2, & 3

All three alternative routes traverse through HC&S' lands; lands that are currently in cultivation, therefore, severely disrupting field operations. The physical splitting of the plantation, intersecting canehauler road systems, drip irrigation systems, potential disruption of the major water distribution systems, and adverse effects on current agricultural practices will seriously affect HC&S' operating efficiency. This is a major threat to the future viability of HC&S and ultimately the island of Maui.

Along with the cost to the plantation, significant project costs can also be associated with these alternatives. Costs such as the purchase cost of land right-of-ways, relocating existing drip irrigation supply lines, realigning water transportation systems, canehaul roadways, and highway hauler crossings will significantly add to the cost of this project.

Re: KIHEL UPCOUNTRY ROAD

Dear Mr. Tsuzuki:

Haleakala Ranch Company prefers that the Mauka connection be somewhere near Kula 200 and the Makai connection through R & T to Lipoa/Piilani intersection.

Yours truly,

Peter D. Baldwin  
President

A DIVISION OF ASP-HAWAII, INC.

Mr. Rex Johnson  
September 28, 1994 - 10/10/94  
Page Two

Alternatives 4-7

All of these alternatives would be acceptable by HC&S since it does not increase our cost of operations. Alternative 4 appears to skirt HC&S' operations and, therefore, does not isolate any cane. Alternatives 5, 6, & 7, which are outside of lands owned by A&B-Hawaii, Inc. will not affect our operations. In our opinion, Alternative 6A appears to be the best route because it is the most direct, the shortest length, crosses the fewest gulches, intersects with pasture lands, and provides access to Hawaiian Homes lands.

As we have consistently stated throughout the State/County Joint Task Force for the Kihel-Upcountry Highway process, HC&S and its parent company A&B-Hawaii, Inc. (ABHI) supports a proposed Kihel-Upcountry highway, provided that the chosen alignment does not interfere with HC&S' operations. This statement is made with full awareness that there are several alternative alignments which do not traverse through the plantation and are considered to be equally, if not more, viable.

Thank you for this opportunity to provide input into the early scoping efforts. As the planning study progresses, we will be awaiting an opportunity to provide more input.

If you have any questions regarding these comments or are in need of additional information, please do not hesitate to contact me at 877-6902 (phone), or 871-2149 (fax).

Subject: Kihel-Upcountry Maui Highway  
Project # HDPS-9203 (1) HWY-PA 2.2552

Dear Mr. Johnson,

Thank you once again for inviting the public into this important process. Our Association appreciates the opportunity to further study this project along with the DOT and all those who might benefit. We know this plane will never fly without widespread community acceptance. To achieve this acceptance it must be shown to benefit the many residents who travel down to work daily in a safe, efficient direction. Military purposes, visitor traffic, and definitely Hawaiian Home Lands are all important concerns, but loosing our small farms, awakening our rural communities of Omaopio, Keokes, and Waiakoa with the screams of development and transient traffic flows will be unacceptable to a few who live on this mountainside.

CONDITIONS OF OUR SUPPORT

We stand ready to support a final alignment only if:

1. The highway benefits the main upcountry resident commuter population base ( Pukalani, Makawao, Haiku )
2. Impacts to the future Socio-Economic environment of Kula is minimal
3. The route is safe and efficient (overpasses and underpasses, where needed)
4. Small farms and residents will not be displaced or disadvantaged
5. The route connects directly with Halealaka Highway ( to eliminate the potential use of many narrow, steep, neighborhood roads as shortcuts.
6. The Kihel termini should be located to aid Westside commuters and a future spur road access to the Hawaiian Homes Development if possible.

RECEIVED

OF TRANSPORTATION  
OCT 17 2 27 PM '94  
HIGHWAYS DIVISION  
PLANNING BRANCH

General Comments, Concerns, and Information On Schematic Plan of Alternative Alignments (W. Unemori Map Revised Aug. 19, 94)

ALT 1, 2, & 3

These routes would satisfy most of our conditions if all interections were made to be safe. The Kula C.A. would favor them in numerical order.

Alt. 1. only intersects Pulehu Rd. and intersects directly into Halliimaile Rd, routing traffic from Makawao and Haiku

straight to Kihel.

Alt. 2. crosses both Pulehu and Omaopio but intersects with Halliimaile Rd.

Alt. 3. this route would not benefit as many lacking the efficiency of 1 & 2, crossing both Pulehu and Omaopio, also not connecting with Halliimaile Rd, but meeting most of our conditions

Alt 4, 5, 6, 7

These suggested alignments would fail to meet most or all of the Kula C.A.'s conditions of support for the Kihel / Upcountry Highway

With much thought and debate, the Kula C.A. concurs with the:

Distinguished members of the Makawao / Pukalani / Kula Citizens Advisory Committee (Re:Kihel / Upcountry Highway)

And

The Maui County Planning Department's recommendations of the revisions of the M.P.K. Community Plan Update (Re:Kihel / Upcountry Highway.

That :

Kihel-Upcountry Highway: The proposed highway between Kihel and the Upcountry region is significant in terms of its land use and transportation impacts. The CAC recognized that the selection of an alignment must consider the growth inducing impacts to the region's agriculture, rural character and open spaces. The need to maintain the unique Upcountry ambience is an essential parameter in analyzing alternative routing schemes. Recognizing that the evaluation of alternatives should weigh transportation costs and benefits as well as community and land use impacts, the CAC recommends that the Upcountry terminus intersect Haleskala Highway in the vicinity of Halli'imaile Road. The CAC further recommends that a spur off of the proposed Kihel-Upcountry Highway be provided to facilitate access to the Department of Hawaiian Home Lands development area.

The Kula C.A. also agrees with both the Upcountry CAC and the Maui Planning Dept. that the Makana-Ulupalakua Connector road be dropped as a capital improvement project thus, all planning, design, and funding be suspended. ( ALT 7 )

We also believe this route ( ALT 7 ) would benefit very few, worsen traffic safety, disrupt quiet communities, and only benefit visitor traffic and private landowners.

Some citizens in our association do believe the losses outweigh the gains connecting these mauka and makai communities, and funds should be used to improve existing roads and highways to aid the traffic flow between Upcountry and the South / West Side. The Kula C.A. also believes this is a realistic alternative and should be studied.

The Kula Community Association has followed the Upcountry Highway discussions through the Toll Road concept of former Mayor Tavares (Dec. 1990) and the hard work of the Upcountry / Kihel Highway Task Force. We are full aware of the importance of choosing a workable alignment versus one plagued with problems or weighted by special interests.

Thanks again for listening, and could you please forward the origin / destination studies and any reports filed to you on this project to help us stay current.

Much Aloha  
Sincerely,

Steve Sutrov  
President,  
Kula Community Association

Kihei-Upcountry Maui Highway Project  
Planning Study

Rex D. Johnson, Director  
Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813-5097

Dear Director Johnson,

Mayor Lingle, County of Maui, has kindly distributed copies of your letter of September 1, 1994, regarding the above subject, to members of the Kihei-Upcountry Task Force. I hope it is appropriate for me, as a Task Force member, to respond directly to your request for comments relative to "early scoping".

Your letter states that the objective of the planning study is to "select an alignment" or as I believe it might also be described -- perform a route-location study. In light of this objective, my experience leads me to question the consultant's intent to include 6A, 6B, and particularly 7 among the "alternatives".

These "alternatives" would seem better described as additional potential highway routes. They appear to serve travel desires largely different from those served by a "Pukalani to Kihei" route as shown on the DOT "Island-Wide Long Range Highway Plan". "Alt 7" is, in fact, shown on the Island-Wide Plan as a distinct, separate route described as the combined extensions of Kula and Piihiani Highways.

"Alternative 6A/B", not yet included in the Island-Wide Plan, might provide another useful additional route but because of the 1500' climb and longer travel distance, probably would be used by very few of the drivers traveling between Haiku-Makawao-Pukalani and Kihei-Wailea -- the high-volume traffic corridor.

Retaining these alternatives in this study would be mixing three steps in the planning process which should be discrete, sequential steps -- island-wide system determination, priority setting, and route-location. Priority, rather than route-location, study should weigh the relative importance of: -serving the heavy travel demand corridor, -serving the future needs of yet undeveloped homelands, -providing an interesting scenic/tourist connection via Ulupalakua.

Of course when the travel benefit/cost comparisons are made "Alternatives" 7 and 6A/B should drop out of serious contention, but why muddy the waters in the first place?

Sincerely,

John W. McDonald  
RR 2, Box 230C Kula Highway  
Kula, Hawaii 96790

Mr. Rex D. Johnson, Director  
Department of Transportation  
State of Hawaii  
869 Punchbowl Street  
Honolulu, HI 96813-5097

Attention: Mr. Ronald Tsuzuki

Dear Mr. Johnson:

Subject: Kihai-Upcountry Maui Highway  
Project No. HDPS 9203 (1)

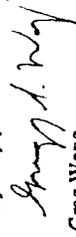

We are taking this opportunity to respond to your letter dated September 1, 1994, with regards to the planning studies for the proposed Kihai-Upcountry Highway on the island of Maui.

Our review of the proposed alternative alignments, in particular alternatives 3 and 4, leads us to believe that these routes may impact two parcels owned by Shinwa International, Inc. Perhaps, the Schematic Plan of Alternative Alignments prepared by Warren S. Umemori Engineering, Inc., revised August 19, 1994, can be supplemented with a map identifying the parcels affected by these proposed alignments.

Due to the proximity of these proposed alignments, we would appreciate your consideration to be included in any subsequent review processes.

Thank you for this opportunity to comment. Should you have any questions, please do not hesitate to contact us.

Very truly yours,

Greg Wong  
Vice President

Memorandum

TO: FILE  
FROM: DENEITRA M. GREEN *[Signature]*  
DATE: NOVEMBER 2, 1994  
RE: KIHAI-UPCOUNTRY MAUI HIGHWAY PROJECT  
SCOPING MEETING  
OCTOBER 26, 1994, 1:30 P.M.  
PB MAKAI CONFERENCE ROOM

**IN ATTENDANCE:**  
DEPT. HAWAIIAN HOME LANDS - LINDA CHINN  
MAUI COUNTY PUBLIC WORKS - GEORGE KAYA  
MAUI COUNTY PLANNING - JULIE HIGA  
DOH, CLEAN WATER BRANCH - DENENDER NAKALA  
SDOT - RON TSUZUKI  
SDOT - KENNETH AU  
SDOT - OWEN LIU  
WSU - WARREN UNEMORI  
PB - DAVID ATKIN  
PB - DENEITRA M. GREEN  
PB - CRYSTAL JOHNSON

**MEETING SUMMARY**

The meeting was held to consult with appropriate agencies about the proposed Kihai-Upcountry Maui Highway Project prior to the preparation of the environmental assessment (EA).

SDOT described the meeting's purpose and introduced the project team.

WSU defined the project location and points of significance, including the Maui R&T Park in Kihai and Science City at Haleakala. The project's history of more than 20 years was described. At least four different studies have been conducted, including the 1970 study conducted by Maui County, the Maui County Toll Road Study, the Maui Long-Range Highway Planning Study, and the State/County Task Force Final Report. Eight Build alternatives were presented in terms of their termini, zoning designations, and current land uses.

WSU described the highway's design criteria. The proposed highway would be a rural arterial with limited access. The highway would have a maximum design grade of 7.0 percent. The typical section would require a 160-foot minimum right-of-way consisting of four 12-foot lanes, paved shoulders on either side, and a 30-foot median. The project's design year is 2022.

PB described the environmental process and the major milestones of the project.

PB explained that a coordination and consultation letter was mailed on September 1, 1994 to various agencies and interested parties, requesting data and comments. To date, SDOT has

Over a Century of  
Engineering Excellence

Subject: Environmental Scoping Meeting  
Kihai-Upcountry Maui Highway  
Project No. HDPS-9203(1)

We will be conducting an environmental scoping meeting with the environmental agencies and other interested parties that are expected to participate in the consultation and coordination of the Kihai-Upcountry Maui Highway Environmental Impact Statement (EIS). The purpose of the scoping meeting is to provide a forum to discuss the scope of the environmental studies and EIS that will be prepared for the project.

The meeting will be held on Wednesday, October 26, 1994, at 1:30 p.m. in the office of Parsons Brinckerhoff Quade and Douglas, Inc., Pacific Tower Suite 3000 at 1001 Bishop Street.

If you have any questions, please call Mr. Ronald Tsuzuki, our Head Highway Planning Engineer, at (808) 587-1830.

Sincerely,

*[Signature]*

Rex D. Johnson  
Director of Transportation

Enclosure

received some responses to the initiation letter. Subsequent letters were then sent to invite appropriate agencies to this meeting.

The EA is expected to be issued in December 1994. Concurrent with its publication, an Environmental Impact Statement Preparation Notice (EISPN) will be published in the Office of Environmental Quality Control (OEQC) Bulletin and a Notice of Intent (NOI) will be published in the Federal Register. This will trigger both the National Environmental Protection Act (NEPA) and Chapter 343, Hawaii Revised Statutes (HRS) processes.

The EA is expected to include the eight Build alternatives previously described, the No-Build alternative, a public transit/TSM alternative, and an alternative which explores the widening of existing roadways. It will identify those areas where impacts could be significant or where the level of impact is unknown. The EA is expected to recommend the preparation of an EIS. Two public information meetings, one in Kihei and one in the Upcountry area, are expected to follow the completion of the EA.

Screening criteria are presently being developed and input on the criteria was requested. Following the completion of the EA, the criteria will be applied to the alternatives to narrow them to three.

After completing the screening analysis, the draft EIS will be prepared. The following topics, among others, will be emphasized:

- farmland conversion;
- archaeology;
- endangered and threatened species;
- traffic impact;
- cost/benefit analysis; and
- social impacts.

The draft EIS is expected to be completed in January 1996. The draft EIS:

- will disclose the results of the screening analysis;
- will analyze the No-Build alternative;
- will analyze the three Build alternatives in detail; and
- will not disclose the preferred alternative.

Public hearings will follow the issuance of the draft EIS. After publication in the OEQC Bulletin and the Federal Register, a 45-day comment period will ensue.

The final EIS will disclose the preferred alternative and respond to the comments received on the draft EIS. The Record of Decision will be approved after allowance of a minimum 30-day review period from the publication date of the final EIS (in the Federal Register).

Parties on the mailing list will receive notices of meetings and the draft and final EISs. Today's meeting attendees are automatically included on the list. Suggestions of additional names for inclusion on the list should be made in writing to the Chief (SDOT) or by phone to Ron Tsuzuki (SDOT).

A comment sheet provided an avenue for the participants to express relevant concerns.

Finally, the scoping meeting concluded with general discussions, summarized below:

**Comment:** Since "directness to Haleakala" is one of the listed screening criteria, "access to the Maui R&T Park" should be included as a criteria.

**Question:** The State/County Task Force recommended that a spur be constructed to provide access to the Hawaiian Home Lands. Will this be included in the project?

**Response:** No. The spur does not satisfy the project's objectives.

**Question:** Does the Hawaiian Home Lands have plans for their area?

**Response:** Yes.

**Comment:** Alternative 6 would provide access to Hawaiian Home Lands from Upcountry.

**Comment:** Maui County Public Works Department has received calls concerning impacts to small family-owned farms.

**Response:** WSU explained that Alternative 4 would be the only alignment to traverse a small, family-owned farm parcel. Presently, the land is not being farmed but is being used for limited grazing.

**Comment:** The Kula Community Association wants the Upcountry terminus located below Pukalani.

**Response:** Engineering and traffic limitations may not make this alignment as feasible as others.

**Question:** When will the screening analysis be completed?

**Response:** The screening process will be completed in February or March, 1995.

**Question:** Will there be another public opinion survey, similar to the one that the Task Force administered?

**Response:** No. However, the public input process is ongoing. There will be opportunities for the public to comment, including the meetings to be held after issuance of the EA and the public hearings on the draft EIS.

**Comment:** A recommendation was made to change the Kihei terminus of Alternative 4 from the Maui R&T Park at Lipoa Street to Kaonoulu Street. This revision would better serve commuters from Lahaina.

**Response:** Comment to be considered.

**Memorandum**

Memorandum to file  
Page 2  
10/31/95

Commenter - Susan Ray, South Maui Chiropractic Group

Supports Alternative 5 because of its cost. Why is the cost of Alternative 5 so much less than the others?

Commenter - Kenny Barr

Proposed highway would benefit Upcountry residents commuting to Kihei, Lahaina, or Wailea. Therefore, supports Upcountry terminus near Pukalani Bypass and Kihei terminus at the Maui R&T Park or further north.

Commenter - Phil Christopher, Realty

Will costs associated with each alternative be modified to include land acquisition?

Commenter - Gene Thompson, Sun Maui Times

Questioned Hawaiian Home Lands opposition to constructing proposed highway. Thought it facilitated development of Hawaiian Homes parcel Upcountry.

**MEETING SUMMARY:**

The following summarizes oral comments presented during the public information meeting held at the Kihei School Cafetorium on October 18, 1995.

Commenter - Carla Flood, Kihei Community Association

Enthusiastic about the project and supports the link between the Maui R&T Park and Science City at Haleakala.

Commenter - Greg Vainowski

1. Estimated that about 1,500 Upcountry residents presently commute to work daily, traveling 42 miles one-way.
2. People would need the proposed highway as growth and expansion of the Upcountry area continues into year 2020. As homes are built Upcountry, residents will need to travel to Kihei for hotel/tourist-related jobs.
3. Favors Alternative 5.

MEETING SUMMARY:

The following summarizes oral testimony presented during the public information meeting conducted by the State Department of Transportation.

Commenter - Richard Cameron, Hawaiian Commercial & Sugar Co., Plantation Gen. Manager
Please see attached written comments.

Commenter - Charles Maxwell, Waihuli Community Association

- 1. Alternative 6 was never part of the task force report.
2. Preference for a route that would touch the bottom of the Hawaiian Home Land property without taking Hawaiian Homes land.
3. Considers the "No Build", with widening improvements to existing roadways, a viable and possibly less expensive alternative than the build alternatives.

Commenter - Dan Evert
1. Concerned about the No Build not passing the screening analysis.

KIHAI-UPCOUNTRY MAUI HIGHWAY PROJECT
PUBLIC INFORMATION MEETING
OCTOBER 18, 1995 • 7:00 P.M.
KIHAI SCHOOL CAFETORIUM

PLEASE PRINT

Table with 5 columns: #, NAME, ORGANIZATION, ADDRESS, PHONE #. Contains handwritten entries for attendees like JAMES AARON, SHAWN YUEN, etc.

2. Suggested using telecommunications and high-tech communication improvements to reduce the need to travel between Maui R&T Park and Science City.
3. An update to the Makawao-Pukalani-Kula Community Plan has just recommended maintaining the rural characteristics of the Upcountry area. The roadway would disrupt this way of life.

Commenter - Mary Evanson, Maui Conservation Council

Requested better maps in the draft EIS than were provided in the EA.

Commenter - Dick Mayer, Upcountry Citizens Advisory Committee (CAC), Vice-Chair

1. The presentation did not reference the alignment alternative for the roadway which is contained in the recently released CAC version of the update to the Makawao-Pukalani-Kula Community Plan. The CAC recommended an alignment similar to Alternative 2, with its Upcountry terminus near Haliimaile Road and the Kihai terminus near the Maui R&T Park.
2. Strongly supported the No Build alternative and wanted it considered a viable alternative throughout the development of the EIS.
3. Would like the project to consider the possibility of relocating defense operations from the Maui R&T Park to a site closer to Science City, or use telecommunications to reduce need for travel.
4. Is this an official scoping meeting? If not, you must have an official scoping meeting in case of a legal challenge.
5. Need to update 1991 and 1992 numbers used in the EA to reflect 1995 figures.
6. Clarify whether project is a four-lane or two-lane highway, and whether the construction costs being provided correspond to the four-lane or two-lane concept. The EIS will need to address cost of the four-lane highway. The cost estimate needs to include right-of-way costs and looks low.
7. The real reason for the road is tourist travel. Hopes that the EIS addresses impact of tourist travel through rural area.
8. Concerned about increased accessibility that the roadway will bring to the area. Crime is three to four times higher in Kihai than Upcountry and therefore road will increase crime rate Upcountry.

Commenter - Nancy Gillingham

1. On a scale of 1-10, what is the likelihood of the roadway being built?
2. If the project is not built within the next four years, will the project disappear?

3. How many residents live Upcountry and work in Kihai? Is there a need for the project? How many people travel between the Maui R&T Park and Science City? What are the future travel projections? Have there been travel studies? Will the State calculate the cost per commuter or scientist?

Commenter - Richard Pohle

1. Disagrees that there is a linkage need between Maui R&T Park and Science City.
2. Thinks that the true reason for the proposed roadway is to get Upcountry residents into Kihai.
3. While he supports the project, he believes that voters should determine whether the project should proceed via referendum.

Commenter - Sally Ralsbeck

1. Believes that there is not enough traffic between Science City and Maui R&T Park to justify building a highway. The EIS should be very specific about the levels of the Maui R&T Park and Science City traffic; the number of people who would use the roadway; and time savings as compared to the No Build alternative. Sensed that there would be only a small travel time savings that would benefit only a few people.
2. Thought it might be less expensive to shuttle people between the two locations via helicopter.
3. Future expansion of the Upcountry area is limited because of Haleakala National Park.

Commenter - Calvin Nemoto, Pukalani Community Association

Questioned whether federal funds would be contributed if the No Build alternative were selected, and whether payment would be an 80% (federal)/20% (State) split.

Commenter - John McDonald, Kula Community Association

Requested greater analysis of the benefit/cost ratio. Wanted benefit/cost analysis included in the future studies. Recommends that the selected alternative be the most cost effective.

Commenter - Sidney James

Is it true that if Kihai-Upcountry Highway is built, Puunene Bypass will not be built?

Commenter - Phil Mulligan

1. Challenged survey that showed only 3 percent of population opposing the road. In general, Kula residents don't want the roadway. Therefore, the percentage of residents opposing the project must be greater than 3 percent.
2. Objects to roadway because of resultant adverse impacts.

Commenter - Steve Sutrov, Kula Community Association

1. Which highway improvements will be included in the No Build alternative?
2. Is Alternative 7 part of the No Build alternative?
3. The Kula Community Association voted in favor of building a new roadway two years ago. At that time, they favored an alignment with an Upcountry terminus near Halimaile Road, similar to either Alternative 1 or 2. Now a roadway might be favored that has its lower terminus facilitating travel to Lahaina. However, since new members now sit on the board, they will need to re-vote on whether they favor the road or the No Build alternative.

Commenter - Masami Hironaka

1. Project could resemble H-3 project on Oahu and experience cost overruns. Link between Maui R&T Park and Science City is not the true justification for constructing the road since very few commuters would actually use the road, just as the defense-related reason was not the true reason for building the H-3 project. The real reason for the proposed highway is to help get tourists and residents around.
2. Senator Inouye has secured federal funds. If Maui residents don't want the road now, federal funding may be lost, and the island may not get a new roadway later when it is really needed.

Commenter - Laura Patesa, registered nurse

Quite concerned about access and response time for emergency medical service vehicles reaching accidents that might occur along the alignment.

Commenter - unknown

1. What is the actual cost of each alternative as a four-lane highway?
2. The project does not have to be constructed simply because funding is available. The Senator will not support a project the community does not support.
3. Level of social impact on Kula would be severe for the residents who live there. An urban environment would be introduced into an existing rural one.
4. The Omaopio area, in particular, would be most severely impacted. Since there could be an intersection between Omaopio Road and Kihei-Upcountry Highway, Omaopio Road

would have to handle increased traffic if the proposed highway is constructed, and since Omaopio Road is only 14 feet wide, there are safety concerns with respect to increased traffic volumes.

5. How much use would the proposed highway actually get?
6. How much travel time would the proposed highway save?

Commenter - Kenneth Okamura

1. Concerned about the impacts to agricultural activity Upcountry, the State's premier area for flowers and vegetables.
2. Disputes statement in EA, Section 3.1, which states that the project "might enhance farming." Sees proposed road as having only adverse impacts on farming. Predicts that the road would increase housing supply and water demand; accelerate the loss of agricultural lands; cause more tourists to become nuisances to farmers; disturb rural lifestyles; adversely affect access to the harbor for trucks carrying agricultural products from Upcountry via Omaopio Road; and create safety concerns at the intersection of Omaopio Road and Kihei-Upcountry Highway.

Commenter - Steve Burgeon, Casanova, Inc.

1. As a restaurateur, supports the proposed highway and notes that tourism benefits the entire Upcountry community, either directly or indirectly. For example, he stocks his restaurant with produce and flowers from several local vendors. Increased tourism would expand the Kula economy.
2. Is concerned about the pace of the project. Wants the road to open before he retires.
3. Kula is already a bedroom community, and Kula residents already need to commute to non-farm related employment centers. The opportunity for Kula residents to take non-farm related employment would grow with the proposed roadway because Kula residents would have increased access to employment opportunities and roadway congestion would be less.

Commenter - unknown

Would like to see an additional alignment (Alternative 11) that presents improvements to existing roadways that go beyond the proposed No Build roadway improvements and are not included in the Maui Long-Range Highway Plan.

**NOTICE**  
**KIHEI-UPCOUNTRY HIGHWAY**  
**PUBLIC INFORMATION MEETINGS**

The Department of Transportation (DOT), Highways Division announces that it will hold two public information meetings on the proposed Kihei-Upcountry Highway project. The first will be conducted on May 15, 1996, at 7:00 p.m. at the Upcountry Community Center in Pukalani. A second meeting will be held the following night, May 16, 1996, at 7:00 p.m. in the Kihei School Cafeteria, (250 Lipoa Street). The meetings follow-up the October 1995 meetings which presented the conclusions of the Environmental Assessment and ten alternative alignments for the proposed roadway. The purpose of the May meetings is to inform the public of the screening analysis that has been conducted since October, and to present the three alternative alignments proposed for detailed study in the draft Environmental Impact Statement.

The proposed Kihei-Upcountry Highway would be a 15.4 kilometer (9.6-mile) highway that would link the coastal area of Kihei (Pillani Highway) to Upcountry Maui at either Haleakala Highway or Kula Highway. The highway would be generally aligned in an east-west (mauka-makai) direction.

For additional information, please contact Ron Tsuzuki of DOT at 808-587-1830.

Kazu Hayashida, Director  
Department of Transportation

## Kihei-Upcountry Highway Project Maui, Hawaii

State of Hawaii • Department of Transportation • Highways Division  
U.S. Department of Transportation • Federal Highway Administration

### Project Description

The Hawaii Department of Transportation and the Federal Highway Administration (FHWA) are sponsoring the construction of a rural, limited access arterial roadway that would connect the coastal area of Kihei to the Upcountry area of Maui. The proposed highway would range between 14.1 kilometers (8.8 miles) and 16.9 kilometers (10.5 miles). It would link the coastal area of Kihei (Piilani Highway) to Upcountry Maui at either Haleakala Highway or Kula Highway.

### Tier One Screening

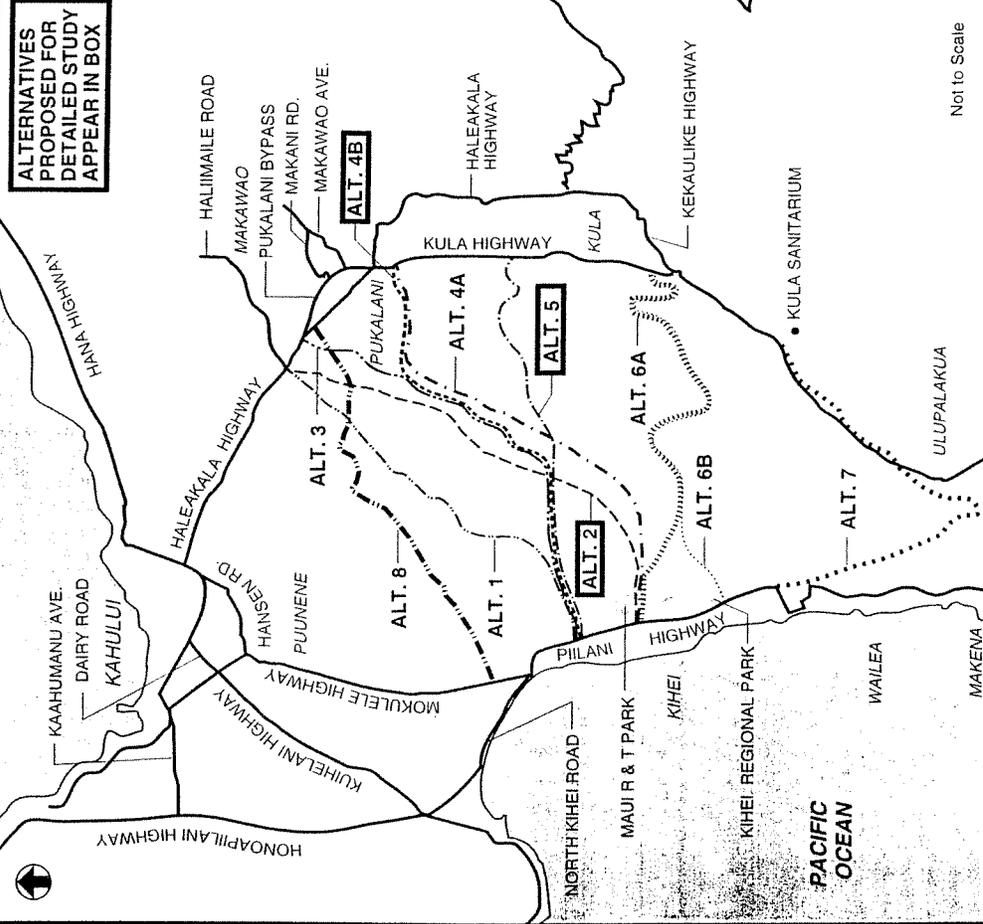

Criterion	Alt 1	Alt 2	Alt 3	Alt 4A	Alt 4B	Alt 5	Alt 6A	Alt 6B	Alt 7	Alt 8
Design Feasibility	Y	Y	Y	Y	Y	Y	Y	Y	Y	N
Benefit-Cost (ratio)	0.98	1.00	1.12	0.95	1.41	1.58	0.41	0.26	-0.04	1.14

### Tier Two Screening

Criterion	Alt 1	Alt 2	Alt 3	Alt 4A	Alt 4B	Alt 5
Agricultural Impact (cane and pineapple field encroachment in hectares)	56.2	28	32.6	16.4	21.6	5.9
Operations	B	B	W	B	B	B
Cost (\$ million)	3	52	2	73	47	37

## Memorandum

**DRAFT**

**TO:** FILE

**FROM:** DENEITRA M.G. HUTCHINSON

**DATE:** JUNE 10, 1996

**SUBJECT:** KIHEI-UPCOUNTRY HIGHWAY  
PUBLIC INFORMATIONAL MEETING

**DATE & TIME:** WEDNESDAY, MAY 15, 1996

**LOCATION:** PUKALANI UPCOUNTRY COMMUNITY CENTER

**IN ATTENDANCE:** SDOT: BOB SIAROT  
SDOT: RON TSUZUKI  
WSU: WARREN S. UNEMORI  
WSU: DARREN UNEMORI  
WSU: CLIFFORD MUKAI  
PBQD: DENEITRA M.G. HUTCHINSON  
PBQD: DAVID ATKIN  
PUBLIC: SEE ATTACHED SIGN-IN SHEET

### MEETING SUMMARY

SDOT conducted a public informational meeting on the status of the proposed Kihei-Upcountry Highway project. This meeting was a follow-up to the October 1995 meeting in which ten alternatives were introduced to the public. Approximately 57 individuals were in attendance.

Bob Siarot presided over the meeting that began with introductions of the project team members. Next, Warren Unemori summarized the project's progress and findings to date. David Atkin described the screening analysis and how ten alternatives were screened down to three recommended for study in the draft Environmental Impact Statement (EIS).

### COMMENT SESSIONS

A brief intermission followed the presentation to allow the participants to view the exhibit boards. After 15 minutes, the meeting was opened for comments. Whenever possible, the commentator is identified in parentheses preceding the question or comment.

#### (Gage Schubert, Kula Glen)

C: Where is the growth in population density projected to occur. Concerned about how the through traffic along Alternative 5 will affect the Kula Glen area.

Draft Memorandum to file  
June 10, 1996  
Page 2

#### (Peter Sisco)

C: What is the purpose of the proposed road? Who will it serve?

#### (Brett M. Klyver, Maui Research & Technology Park)

C: Read written testimony (see attached).

#### (Richard Kellom)

C: Suggested that Alternative 1 be reconsidered since agricultural impact may not be that important to the future of the island. Considering the cost, Alternative 1 is only \$2 million more costly than Alternative 2. But, Alternative 1 would intersect only one existing roadway (Pulehu Road), while Alternative 2 would intersect two roadways (Pulehu Road and Omaopio Road).

#### (Steve Sutrov)

C: Ultimately favored the No Build Alternative. However, also felt that Alternative 1 needed to be reconsidered since agricultural impacts should not be so heavily considered. Compared Alternative 1 to Alternative 2 which would intersect two existing roads, to the one road that Alternative 1 would affect.

#### (Unidentified)

C: Agreed with screening conclusion that Alternative 1 should not be considered. Favors Alternatives 2 and 4B. These two alignments would provide commuters a choice of routes.

#### (Buck Joiner, Kihei Community Association)

C: Prefers Kihei terminus as far south as possible since existing access to Kihei is via North Kihei only. The Mokulele/Piilani Highway intersection is presently a choke-point. The proposed Kihei terminus could be a second evacuation route. In the Upcountry area, a preference was made for a terminus above Pukalani, not Halimalle Junction, which is presently too congested.

#### (Sam Clark, President of Haiku Community Association)

C: Concerned about future traffic volumes on Kaipakalua Road. This is an older sub-standard road that would not be able to handle additional traffic if Alternative 2 is selected.

#### (Nancy Hoefken)

C: Favors Alternative 5 because lots of congestion currently exists in Pukalani. Is especially concerned because of the new high school in Pukalani near the mauka terminus of 4B and the students having accidents because they are not experienced drivers.

#### (Sam Hironaka)

C: Favored Alternative 7 because of low cost, donation of ranch land for roadway, no gulches to cross, the extension of existing Piilani Highway (which has been long-

planned), tourist benefits, far south Kihei terminus, minimal 4.5 miles of highway, and secondary escape route for Kihei.

PBQD: DAVID ATKIN  
PUBLIC: SEE ATTACHED SIGN-IN SHEET

### MEETING SUMMARY

SDOT conducted a public informational meeting on the status of the proposed Kihei-Upcountry Highway project. This meeting was a follow-up to the October 1995 meeting in which ten alternatives were introduced to the public. Approximately 24 people were in attendance.

Bob Siarot presided over the meeting that began with introductions of the project team members. Next, Warren Unemori summarized the project's progress and findings to date. David Atkin described the screening analysis and how ten alternatives were screened down to three recommended for study in the draft Environmental Impact Statement (EIS).

### COMMENT SESSION

As David concluded his portion of the presentation, participants began asking questions. Since this portion of the meeting was unstructured, most comments have not been attributed to individual speakers, but whenever possible, a name is provided.

C: Why is the cost benefit for Alternative 5 so high?

Draft Memorandum to file  
June 10, 1996  
Page 2

- C: The Kihei terminus be should be placed as far south as possible because of projected growth in the Makena area (similar to Alternative 6B). An alignment near the regional park is preferred.
- C: The increased noise levels created by the highway would affect the subdivision mauka and north of Kaonolu Street. Favors Alternatives 6A, 6B, and 7 because noise impacts on this subdivision would be farther away.
- C: Two Kihei connections should be considered, one north and the other south. Perhaps alignment should extend in the direction of Wailea.

### (Brett M. Klyver, Maui Research & Technology Park)

C: Questioned the State legislative appropriation to study Alternative 7.

### (Buck Joiner, Kihei Community Association)

- C: Appreciates that Alternative 5 is the least expensive, but is concerned about constructing Alternative 5 because it would deposit large volumes of traffic onto Kimo Drive in the Upcountry area. Believes that Kimo Drive is unable to handle large volumes of traffic.
- C: Also opposes alignment that would intersect at Halimaille Road because this already congested intersection would worsen.
- C: Would like to see Kihei terminus as far south as possible.

C: Supports Alternative 4B as a way to encourage the counter flow of traffic. Is aware that some oppose because of potential impact to high school, but believes that issues with high school would only occur at the open and close of the school day.

### (Gene Thompson, Maui Sun Times)

- C: Agrees that an alternative which terminates at the Maui R&T Park is not a good idea. Supports Alternative 5.
- C: Concerned about cost differential of Alternative 4A vs. Alternative 4B. Does not think the cost is reasonable.
- C: Kihei terminus should be a far south as possible to provide a back door out of Kihei in the event of disaster (i.e., fire). The road is currently unpassable or closed during bad storms.
- C: Supports alignment that would use Lipooa Street.
- C: Requested spur to Hawaiian Home Lands.

C: Because of the many commuters between Haiku and Makawao, there needs to be a way to reduce travel time. Favors a hybrid Alternative 1/Alternative 2, but not at the expense of traversing the Maui R&T Park.

**(William Spence, Maui Planning Department)**

C: Planning Department offered the latest versions of community plans for analysis. Upcountry community favors alternative in the vicinity of Halimaile Road.

C: Recognized A&B planned development along Omaopio Road.

C: EIS should address visual and secondary impacts since the highway would be more than a connector. It would open up growth in the corridor.

C: Supports Alternative 4B because it would provide an escape route from Kihei.

C: Recommended hybrid of Alternatives 3 and 8 (mauka portion of Alternative 8 and makai portion of Alternative 3). It would reduce agricultural impacts.

C: If the road is moved too far south, would contradict legislative mandate of connecting to the Maui R & T Park.

RE: Alternate 2 for the proposed Kihei-Upcountry Highway above Ohukai Road.

Dear Mr. Hayashida:

The above mentioned route for the Kihei-Upcountry Highway, is strongly opposed by the Ohukai residents. I, Zandra Souza Amara appeared on behalf of some of our community members to make clear our objections to this intended route. Our concerns are, but not limited to:

- A. The noise impact on our community.
- B. The history of speeding cars endangering the safety of our children.
- C. The overall safety of our community and our children.

As I stated at the public hearing on May 16, 1996, noise from above the ranch is amplified and is heard clearly in our residential community. At this time the noise is limited to cows and shots from hunters. However, if **OUR** State goes through with their plans of placing the Kihei-Upcountry route using **Alternate 2** (behind the water tank) it would cause severe noise impacts on our community caused by cars racing up and down the highway at all hours of the day and night. Not to mention us having to deal with tour buses shuttling tourist at 4:00 or 5:00 in the morning up to Haleakala to view the sun rise. I doubt sincerely that anyone in **OUR** state government would appreciate being awoken by traffic noise at 4:00 in the morning and we certainly would not appreciate it either.

As a residential community we feel that placing such a highway on Alt. 2 would cause undue hardship and strain as well as cause a problem with safety, on our already strained community. We have had problems with speeding traffic in the past. We felt we alleviated this problem by us successfully working with the Department of Public Works. With the support of our community and Our County's Public Works Committee we were successful in putting "Speed Humps" in place on June 2, 1992.

Again in 1993, we were faced with unsafe conditions. Our homes were burglarized because of security and safety problems being cause by loitering parked cars at the mauka end of Ohukai Road which did not have adequate lighting and street signs. On September 14, 1992 our County Department of Public Works installed two "No Parking Anytime" signs along with a street light." Our community firmly believes that: **WORKING TOGETHER WITH OUR GOVERNMENT, WE CAN MAKE A DIFFERENCE.**

We as a community need to ask, why does OUR state need to place a highway in an area that would affect existing residential communities when they have more viable solutions? Such as routing the highway further into the Makena/Wailea area. Placing the route in the Makena/Wailea areas would have much less impact on existing residential communities. It would also fulfill the goal of our Federal Government in connecting the Haleakala Observatory with the Technical Park. And foremost it would eliminate potential law suites against our state in the event of endangerment and the **USE or LACK OF USE** of prudence in planning by our state, thereby **costing all of us a lot more money in the long run.** Let us not plan for today with no regard for the future, we've done it in the past and we all paid very dearly for those mistakes.

We ask that The Department of Transportation work with us and not use "Alternate 2" for the proposed Kihei-Upcountry Highway. Should you have any questions, please don't hesitate to contact me at 879-7445.

We look forward to your expedient response in assisting us in maximizing harmony and security in our communities.

Sincerely,

Zandra Souza Amara

Dear Ms. Amaral:

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

Thank you for your input in our planning process. The comments expressed in your May 21, 1996 letter made us aware of the concerns of yourself and your neighbors on the Kihei-Upcountry Maui Highway project and its proposed alternatives. The purpose of an informational meeting is to inform the public of our progress/direction and to solicit opinions that have not made themselves evident or that we were not aware of. Your concerns and recommendations will be considered in the development of this project.

Very truly yours,

*Glenn M. Okimoto*

RE: KIHEI-UPCOUNTRY HIGHWAY, MAUI  
DEAR MR. HAYASHIDA:

AS AN OWNER OF A VACATION RENTAL BEACH RESORT IN KIHEI, MY GUESTS FREQUENTLY CONSIDER DRIVING AROUND THE SOUTH SIDE OF THE ISLAND ON THEIR WAY BACK FROM DAY TRIPS TO HAWAII, MOST OF THEM RETURN THE SAME WAY THEY CAME BECAUSE:

- 1) OF THE ROAD CONDITIONS IN THE KAUPU AREA, AND
- 2) THERE IS NO DIRECT ROUTE BACK TO THE KIHEI-WAILUA AREA FROM UPCOUNTRY, TO BETTER SERVE OUR THOUSANDS OF VISITORS, I AM IN FAVOR OF THE MOST SOUTHERLY ROUTE #7 FROM MAUNA TO WAILUA, IF THE UPCOUNTRY TERMINUS WAS AS FAR SOUTH AS POSSIBLE THE FAST MAJORITY OF TRAVELERS WOULD RETURN TO THE COAST FROM HAWAII WITHOUT IMPACTING THE RESIDENTS OF KULA AND WAILUA. AT ONE UPON A TIME, THIS ROAD WENT THROUGH, AND I WOULD THINK IT WOULD BE THE CHEAPEST ALTERNATIVE TO CONSTRUCT.

IF THE MAIN PURPOSE OF THE UPCOUNTRY HIGHWAY IS TO SERVE THE COMMUTERS FROM MAUI + PUKAANI TO KIHEI + WAILUA THEN PERHAPS A MORE NORTHERN ROUTE IS PREFERABLE, HOWEVER, THE TOURISTS WILL STILL FOREVER BE ASKING WHY THERE ISN'T A ROAD FROM WAILUA TO MAUI.

VERY TRULY YOURS,

Dear Mr. Hayashida,

I live in Kihei and want a  
Kihei-Upcountry Highway very  
much as I travel frequently to  
Kaunoi and Kipahulu.

I read the South Maui Times  
(May 24 + May 31) about the meeting  
on May 15 and 16. I would like to  
attend future meeting.

I am voting for Route 5 from  
Kaunoi to middle of Kula Highway.  
Thank you for giving us this  
new highway soon. Sincerely,

DEAR MR. HAYASHIDA,

WE RECENTLY ATTENDED THE MAY 15TH INFORMATIONAL MEETING AT PUKALANI. OF THE ROUTES DISCUSSED FOR THE NEW UPCOUNTRY HIGHWAY, WE FAVOR ALT. 2, WITH TWO MODIFICATIONS. WE WOULD LIKE TO SEE THE HIGHWAY WITH TWO TERMINUSES UPCOUNTRY. ONE AT HALLIMALE ROAD, AND ONE WHERE ALT. 4B ENDS. THIS WOULD GREATLY RELIEVE CONGESTION AT THE END OF THE HIGHWAY WHICH WE FEEL WILL BE A MAJOR PROBLEM IF THERE IS ONLY ONE EXIT/ENTRANCE TO THE ROADWAY.

Dear Ms. Gerhard-Kalalau:

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

Thank you for your interest and support of the proposed highway.

Our consultants are currently working on the draft Environmental Impact Statement (EIS) for the project. A public hearing will be held after the draft EIS is completed and circulated. We will inform you either by mail or by means of the news media when a meeting or hearing is scheduled.

Very truly yours,

*Kazu Hayashida*  
KAZU HAYASHIDA  
Director of Transportation

cc: Warren S. Unemori Engineering, Inc.

ON THE KIHEI END, WE WOULD LIKE TO SEE THE TERMINUS AS FAR SOUTH AS POSSIBLE. INSTEAD OF COMING THROUGH THE MIDDLE OF THE MAUI R&T PARK, MOVE IT TO CONNECT BY THE KIHEI REGIONAL PARK WHERE ALT. 6B WAS PROPOSED.

WE HAVE HEARD AT VARIOUS TIMES THAT THIS ROAD WILL BE ONLY 2 - OR POSSIBLY 3 - LANES WIDE. PLEASE, PLEASE, PLEASE!! MAKE THIS ROAD 4 LANES!! 2 OR 3 LANES WILL BE OBSOLETE THE DAY YOU OPEN THE HIGHWAY!! WE DO NOT WANT TO BE IN A MEETING 5-10 YEARS FROM NOW AND BE TOLD THAT TO WIDEN THE HIGHWAY TO 4 LANES IS GOING TO COST ANOTHER 50 TO 60 MILLION DOLLARS. EVEN THOUGH BUILDING 4 LANES NOW WILL COST MORE, IT WILL BE MUCH CHEAPER IN THE LONG RUN.

DO IT ONCE! DO IT RIGHT!

WE HOPE YOU WILL TAKE THESE SUGGESTIONS TO HEART, AND THAT WE END UP WITH A HIGHWAY WE CAN ALL VIEW WITH PRIDE AND NOT ONE THAT WE VIEW WITH SCORN AND SHAME.

THANK YOU.

Dear Ed and Stephanie Hackenbruch:

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

Thank you for your letter received on May 20, 1996, regarding the proposed alignments.

While having more lanes and fanning out into multiple termini may be desirable, additional considerations or cost constraints may affect the feasibility of these proposals. In addition, the alignment ultimately selected is expected to sufficiently handle the projected traffic demand between Upcountry Maui and South and West Maui through the year 2022. Although the projected traffic demand only warrants a two (2) lane highway to year 2022, adequate right-of-way will be acquired in conjunction with this project to accommodate a four (4) lane highway in the future.

Nonetheless, please be assured that your comments are appreciated and will be taken into consideration.

Very truly yours,

*Warren S. Unemori*

RE: Proposed Kihei-Upcountry Maui Highway Project  
Three Alternative Alignments

Thank you for this opportunity to provide comments on the three Alternative Alignments for the Kihei-Upcountry Maui Highway that were presented at the public meeting on May 15, 1996. Since HC&S cultivates 36,000 acres of sugarcane here in the central valley of Maui, the location of this project is very important to our farming operations.

Alternative 2, dissects several HC&S' fields, roadways, irrigation systems and drainage systems, in addition to taking cane land out of production, this will significantly disrupt our operations. This route would require HC&S to change its operational practices making it extremely costly and inefficient. Keeping HC&S "whole" will require far more extensive mitigating measures which go beyond the cost of acquiring the right-of-way itself. Due to the significant effect on agricultural operations associated with this route, HC&S cannot support this alternative.

With proper mitigation, HC&S could support Alternative 4B since it would affect our operations to a lesser degree isolating a much smaller section of the farm. Therefore, the cost of mitigative measures would be far less than Alternative 2.

HC&S supports Alternative 5 since it does not cross through any of our fields and therefore would have minimal effects on our operations.

We request that the potential impacts on HC&S' existing operations be addressed in the Environmental Impact Statement for this project and that HC&S be consulted and recognized in the preparation of the EIS. Mitigating measures

Mr. Kazu Hayashida, Director  
May 31, 1996  
Page two

should be identified in the EIS, as these will be bona fide costs of the respective alignments. Attachment 1 shows a summary of the impacts to HC&S of two of the identified alignments.

We look forward to future discussions with the DOT and its consultants on this proposed highway project. We believe that by working together, we can identify an appropriate roadway alignment which will benefit all parties -- farmers, residents and businesses on Maui. The over 1,000 farmers at HC&S have an important stake in the chosen alignment.

Thank you for this opportunity to provide comments.

Sincerely,

Richard F. Cameron  
Plantation General Manager

Attachment

## ATTACHMENT 1

### Kihei-Upcountry Maui Highway Three Alternative Alignments

The Public Meeting on May 15, 1996 showed three alternate roadway alignments for the proposed highway. Alternative 2 would have a serious effect on HC&S' operations.

Alternative 2 -- From Haleakaala Highway at Haliimaile Road to Maui R&T Park at Kihei.

- a. Land area for right-of-way is 78 acres; transverses 4 miles through HC&S property.
- b. This route crosses one primary (paved) hauler road and two secondary hauler roads.
- c. This route crosses three small ditches and numerous drip irrigation pipelines.
- d. This route isolates approximately 1,200 acres of cane land. HC&S would need underpasses or traffic lights to cross the new highway.
- e. Drainage -- This route will cross at least three major gulches, Waiakoa, Pulehu and Kaliainui Gulches, and several smaller ones which will require the State to build bridges to traverse these gulches adding additional cost to these projects.
- f. Endangered species -- This route crosses three gulches that contain the endangered plant species *Abutilon menziesii*. The largest concentration of these plants is at the Kaliainui Gulch.

Alternative 4B -- From Kula Highway, near Kula 200, to Piilani Highway at Kaonoulu Street.

- a. Land area for right-of-way is 19 acres; transverses 1 mile through HC&S property. This route isolates approximately 60 acres of cane land since it is near the top edge of the farm land.
- b. This alternative route crosses two major ditches, the Hamakua Ditch and the Reservoir 40 Ditch.
- c. Drainage -- This route will cross at least three major gulches, Waiakoa, Pulehu and Kaliainui Gulches, and several smaller ones which will require the State to build bridges to traverse these gulches adding additional cost to these projects.

HWY - PA  
2.0662

JUN 17 1996

d. Endangered species - This route crosses three gulches that contain the endangered plant species *Abutilon menziesii*, but this route is farther away from the endangered species than Alternative 2.

In the above mentioned alternatives, the disruption would require mitigative measures such as:

- Land for right of way - HC&S' lands needed for the highway would be "prime" agriculture land that will need to be purchased.
- Splitting of fields - Compensation for the increased cost of field operations due to the additional hauling time mileage, concrete crossings for haulers and tracked equipment. Field isolation and possible abandonment may also have to be compensated for.
- Cane hauler roads intersects - There will be a need for underpasses or traffic lights at these hauler roads to minimize hauling delays and provide a measure of traffic safety. Additional cane hauler roads that are parallel to the new road may be necessary.
- Proximity to highway - Compensation for the additional costs of operation to control dust and cane smoke and the potential to restrict the use of chemicals currently being used would reduce operating efficiencies.
- Irrigation system intersects - Several pipelines, ditches, supply lines and mainlines would need to be relocated and cross the new road.

May 28, 1996  
Page 2

Link to Ulupalakua.

Yes, many of us who have homes or farms in the Keokea-Ulupalakua-Kanaio-Kaupo-Kipahulu area will benefit. Please remember, though, that when the highway to Kapalua was built, the Cameron family benefited a great deal.

It is important to note that Waikiki has 5 roads leading in and out of the area. Waikiki also has the convenience of the City Bus. Kihei. THE FASTEST GROWING COMMUNITY ON MAUI, HAS ONLY ONE WAY IN AND OUT OF THE AREA.

The extension of Piilani makes a lot of common sense because the highway was designed and approved more than 20 years ago. There are no questions re the right of way, engineering and construction will be relatively reasonable.

The closing of the old road became an issue in the mid 1980s. The Kihei and Kula Community Associations, The Maui County Council including now Mayor Linda Lingle were 100% behind the reconstruction of the road. Unfortunately, tourists don't vote on Maui. And we don't have enough votes in our area to help our cause.

We would also appreciate your consideration and study of using the existing Kanaio-Kalana Park Road to the Hana Road. There are more than 18 homes and farms on this road. One of these farms is highly successful with an investment exceeding \$1 Million and more than 2,000 bearing avocado and citrus trees. Currently, there is no reasonable public access to the Kanaio-Kalana Park Road since the closure in 1984. Water is adequate.

Thank you for your consideration of your request.

Sincerely,

IKUA PURDY ROAD COMMITTEE

Mr. Kazu Hayashi, Director  
State of Hawaii, Department of Transportation  
869 Punchbowl Street  
Honolulu, HI. 96813

Dear Mr. Hayashida:

Re: Kihei to Upcountry Maui Highway  
On behalf of the Ikua Purdy Road Committee, we sincerely ask your assistance in building a new road to replace the 100 year old road which was closed in March 1984.

The decision on the selection of one of the 3 routes met with negative reaction at the hearings held on May 15 and 16.

PUBLIC OPINION IS SWINGING VERY STRONGLY IN FAVOR OF COMPLETING THE PIILANI HWY. FROM WAILEA TO ULUPALAKUA.

There are thousands of tourists who drive or ride to Hana, Lindburgh's grave in Kipahulu and stop at the Tedeschi Winery in Ulupalakua every week. These visitors feel frustrated when they see their hotels in Wailea just below the hill, but must drive another one and a half hours instead of just 5 minutes. We all know how important it is to stress visitor satisfaction and enjoyment during these times of budget constraints

Ironically, at the May 15 meeting, Buck Joiner, Chairman of the Maui Road Committee, did not endorse any of the 3 routes. But he strongly advocated a road out of Kihei as FAR SOUTH ON PIILANI as possible to PROVIDE AN ESCAPE ROUTE IN CASE OF DISASTER.

It is ironic because it was this same Mr. Joiner who torpedoed the road from Wailea to Ulupalakua in a letter to the Maui News on 9/23/93 because "the Highway was a Political Porker" (See attached copy). Mr. Joiner then proudly announced in another letter to the Maui News on 12/12/93 that the "Extension of Piilani Highway is DEAD". (See attached copy). It is sad indeed that one person (a relative newcomer) could halt a project, -- especially after our legislature appropriated \$7.4 Million for the extension. Your engineers and staff were already at work on the right of way and design when the project was halted. Mr. Joiner now wants the road which he killed. The road would have been completed by now were it not for a single man.

Certainly, we are all for a route which will benefit the largest number of residents in the Pukalani-Makawao area. But such a highway will be many years away.

In the meanwhile, please help our tourists get back to their hotels in Wailea and Kaanapali an hour and half sooner by completing the SHORT

Dear Mr Hayashida,

I'm a resident of upper Kula on Maui, and would like to offer some opinions on the proposed highway alignment between Kihei and Upcountry Maui.

First, I would choose the least expensive plan. Because of budgetary constraints in tight times, the 6.7 mile route from Kaonoulu, Kihei to Waikoa, Kula would take my vote.

Next, any option of where the road starts in Kihei should consider the congestion already resulting from the quick-paced construction of homes in Kihei district. I think the new road should intersect Kihei as far south as possible so as not to add to the troubles of gridlock now resulting in north Kihei. My choice again would be the Kaonoulu Street (or anywhere further south) alternative.

And last, where the alignment road joins Upcountry should again be as far away from present or potentially new overcrowded areas of our highways. I disagree with any elective below Pukalani because of traffic jams that already occur now during rush hour. How will this be in a few years when more homes are built in upcountry Maui? The best options then would be to send the upcountry commuter traffic away from these spots by diverting the flow of traffic away from where it's already overcrowded. People instead of going down the hill into a traffic mess would detour uphill shortly before heading to their business or beach in Kihei. Therefore, either intersections of the alignment road upcountry at King Kekaulike High School or anywhere south would be preferable. I suggest joining the road at the intersection of Hwy. 37 and Hwy. 377 near Rice Park. This would allow easiest access for tourist traffic to bypass the central Maui traffic mess and get to Haleakala National park in an expeditious way from the South Maui resorts.

Thank you for your time in considering my views.

Kihoa Kakou,

Mr. Kazu Hayashida, Director  
State of Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813

Dear Mr. Hayashida,

Last Wednesday and Thursday, I testified at the informational hearings held by the state to discuss the different alternatives for Maui's Upcountry-Kihei link. As the Maui Research & Technology Park developer and the representative for the park's owners, I spoke against having the Upcountry Road run through the park to the intersection at Lipoa and Pilihi Hwy. I repeat our position to you now that, while we are not opposed to the Upcountry-Kihei road, we do not want it running through the park.

During the early 1990's, with the park's first Master Plan, our initial thought was that an Upcountry road running through the park would be appropriate. This thinking continued because our initial development master plan was, in reality, a light industrial park similar to the Wailuku Milliyard. As the true nature and character of the park took shape and as the first buildings were occupied with specific user types, it became clear that the original master plan was too limited in scope and unable to take advantage of the many opportunities high technology represented. The result has been that we have now re-oriented our master plan to represent a true research park campus (see attached). As you can see, a major road such as is planned for the Upcountry-Kihei link would split our campus in half and drastically weaken the special appeal high technology users are seeking in their moves to Maui.

With the opening of the Maui High Performance Computing Center, one of the world's largest "supercomputers" as our anchor tenant and with other tenants moving into the park to take advantage of this facility and the park's telecommunication infrastructure, it is imperative to Hawaii's and Maui's future technology growth that the State take no action that would adversely impact the success of this project. An Upcountry road running through the park would be just such an action. As the new Master Plan clearly shows, the park is redesigned around a large roundabout or "Green" with key facilities such as the international teleconferencing center, three new premier office buildings, a support services core and an educational facilities, all lending to this new campus environment. Your proposed road would split the campus in two,

destroying the roundabout and representing a major obstacle for the interaction of many new elements in the park, including the pedestrian walkways and bike paths.

We, therefore, ask that you NOT include the alignment of the Upcountry Road through the park as an alternative for your consideration. It represents the most expensive and longest of all of the options. It has a direct and immediate negative impact on all further development in the park. It destroys the nature and character of the technology campus environment we are attempting to create. And it will cause a number of users, desiring to relocate to the park with valuable jobs and investment capital for our community, to re-think their commitment of bringing high-tech industries here.

The Maui Research & Technology Park's mission is to be the information center of the Pacific Rim nations and one of the state's most valuable economic assets. The Governor's State of the State address and his Economic Recovery Report both stressed the park's importance to Hawaii's future economic recovery. We would all hate to see the State's department of Transportation take actions that could destroy that mission.

Sincerely,  
**MAUI R & T PARTNERS**

Gentlemen:  
RE: Alternative Alignments Study  
Maui Highway: Kihei to Upcountry

As a resident of Kula, living in an agriculturally zoned subdivision that is directly connected to the Pulehu Rd./Omaopio Rd. corridor that connects "Up-Country" Maui to the district of Kahului and the airport, I am much concerned with the highway alignments being considered.

During my many years residency in northern California I took an active role in community planning and its interface with Caltrans. I have seen the havoc created by well-intentioned studies that failed to anticipate the rampant growth that seems to inevitably follow the introduction of new highways in to previously undeveloped lands.

The public response to the two meetings held during the last few days (in Pukalani and in Kihei) was remarkably small. As an "old hand" regarding such public-impact issues, I can only guess that the newspaper reports of the scheduled meetings were not read by a wide audience or that those that did learn of the meetings had too little time to rally their forces; of course the other possible explanation relates to public apathy!

Clear and concise data was presented to the public attending these meetings. I found it easy to understand and compliment the engineers on their patience and care during their presentation.

I was not surprised to learn that the criteria followed in determining the "best" alignments was motivated to a large extent by expense. It was daunting, however, to perceive so easily how much political power was clearly being applied vis-a-vis the interests of the big land owners.

Most of those attending the meetings saw clearly that an alignment that would begin at the south end of Piilani, near the Maui Meadows subdivision, and entrances to the Wailea project, and continue directly to a point northwest i.e. down hill of the Halemaile Road connection with Haleakala Highway would meet the needs of most of the electorate, with the least impact on "human needs".

Many of those who have studied the increasing traffic burden to pre-existing roadways through out Maui have reasoned that a rural, limited access roadway from Piilani Highway to Haleakala Highway is most important for many important reasons, chief among them, providing a secondary exit from the Kihei/Wailea area in the event of storm or catastrophe.

But the rallying cry of "No Growth" has been key to the recommendation.

NOT IN MY BACK YARD, (NIMBY) is the popular sentiment. If the Maui Planning Department and the State Department of Transportation could only agree to agree, the issues of criteria would focus on conformance with Community Plans, thereby supporting planned growth and the varied issues that are not motivated by the long range profit plans of a few large companies.

None of us have forgotten that the site of King Kaulaika High School was selected via profit and political issues. Traffic safety, nearness of the residences of students and the general impact of such a large institution at the intersection of such narrow, pre-existing roads were clearly not issues at all!

Though I live on Holoopuni Rd., less than a mile from the proposed terminus of ALT. 5 at Kula Highway, I am less focused on the likelihood of traffic roar, increased density of traffic, even that which will inevitably spill into my neighborhood from Pulehu Rd., for what concerns me greatly is the inevitability of new subdivisions and commercial development adding to traffic.

Kula is an agriculturally zoned or rurally zoned area. Residences like mine are mandated to grow crops to maintain pre-existent ag rules.

ALT. 5 and ALT. 4-B (as well as 4-A), raise the certainty of development that the county would be hard-pressed to curtail, and which would lead to broad residential development along this alignment, and particularly as it would abut the existing roads of Pulehu and Omaopio.

ALT. 4B would introduce traffic focused on access to Haleakala Highway, at an intersection that already has a very sensitive traffic issue building at this time, i.e. King Kaulaika School. As was pointed out by me at the Kihei School Meeting on May 16, there is a 25 Mile per hour speed zone for a city block or two stretching south from the intersection of the Pukalani By-Pass with Kula and Haleakala Highways.

Within two to three years a full compliment of several thousand students will be attending that high school. Parents will be driving their students to this school at seven am, commuters from much of southern Kula will be lined-up at the existing traffic light seeking an easy flow of traffic towards the Pukalani Bypass and down into Pukalani. Add to this already critically dense flow tourists in private car and bus and one begins to perceive the flaw in positioning the terminus of ALT. 4B in that location.

And that is just focused on current development at the 5-tree intersection. Already county approvals are in the works for development of the so-called Pukalani Triangle, a pineapple field bounded by Makawao Avenue on the west, Pukalani Bypass on the north and Old Haleakala Hwy on the south. And then there are the developments that Sports Shinko envisions for lands directly west of the high school.

All in all, this location promises far worse traffic snarls than ever ALT. 5!

Upcountry critics will probably not focus on the issue of low-income housing as it affects the employment of families living in Haiku and surrounding areas. There is little doubt however that many residents of northeastern edge of Upcountry as well as those communities that about Hana Highway have sought employment at the resorts in Wailea and Makena.

Aligning the new highway, so that its terminus with Haleakala Hwy, is near Hallimale Road will enable many residents of the area to avoid the near terminal traffic congestion that even now exists at the intersection of Dairy Road and Hana Hwy., without factoring in the impact of traffic as future Dairy Road development comes on-line.

A cursory glance at any map of the Hallimale, Makawao, Haiku districts yield the information that there are now many rural roads that connect these communities with one another. Though none of these roads would meet current federal standards, most of them carry traffic throughout the day for residents and visitors alike.

It is a logical and fair assumption that no one locale would be seriously impacted by a focused flow of traffic, excepting perhaps the small community of Hallimale, but since it already is a near totally company-oriented community I believe that this particular "company" would undertake cooperation with the County in order to widen Hallimale Rd., at least the financial impact would be foreseeable.

In conclusion, may I summarize my views:

Though cost will undoubtedly determine the future augmentation of this highway project, I urge the State D.O.T. to factor-in as much focus on the future impact of traffic and development as is possible to do.

Maui may be tilting away from agriculture, tourism-interests are ever more important for the future of the state, and jobs will be necessary to bring that about.

An increasing job market pre-supposes increased residential development, and that undoubtedly mandates more and better roadways.

Maui needs carefully planned roadways, perhaps not more roadways as such. Your Project Description says that the Federal Highway Administration is joining the State D.O.T. in sponsoring the construction of a rural, limited access arterial roadway.

If the arterial roadway goes indeed maintain its rural character and limited access, all would be perfect for Maui and its future interests.

But we all understand just how big an "if", that really is!

Thank you for considering my views.

Sincerely,

Dear Mr. Schubert:

RE: Proposed Kihei to Upcountry Highway

Thank you for your letters dated May 17 and 19, 1996, expressing your concerns and encouraging this Department's involvement with this project. We share many of your concerns and have been involved since the project's inception.

The State Department of Transportation (DOT) recently held two informational meetings, May 15 at the Pukalani Community Center, and May 16 at the Kihei School Cafeteria. A Planning Department representative attended both meetings with the purpose of monitoring project status and assessing public sentiment.

Your letters express a concern with the possibility of unwanted and uncontrolled growth along the project's right of way. In a letter written during the scoping phase of the EIS process, this Department pointed this out as a possible impact and asked that it be analyzed in the document. The letter brings out other issues as well. A copy is enclosed.

Again, thank you for expressing your opinions, and I assure you that this Department will continue to be involved in this project. If you need any additional information, please contact William Spence of my staff at 243-7735.

Very truly yours,

Re: Kihei-Upcountry Highway Project - Maui, Hawaii

Dear Mr. Hayashida:

Thank you for this opportunity to provide the following comments.

It appears by the comments made at the May 16, 1996 Kihei meeting that the Pihlani Highway terminus would be better located at one end or the other of the Maui R & T Park, not through the middle on Lipoa Street. Actually, I suggested two terminuses one north and south of the park but was informed that only one terminus is allowed within the funding guidelines. Perhaps the private sector could be induce somehow to add half of the two road intersection "Y" above the R & T Park.

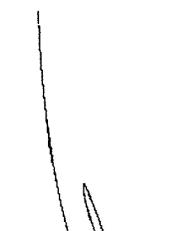

For the Upcountry terminus, perhaps convince Maui Land and Pine to sell, dedicate or otherwise transfer enough property in Pukalani to provide an acceptable buffer zone to existing residential sub-divisions. This would allow an Upcountry terminus in the Pukalani area without negative impacts to neighborhoods while providing positive economic impacts. This concept uses the most mauka portion of Alternative #8 (the portion above Alternative #2) and then continues down Alternative #2 and then to a terminus at Pihlani Highway near the sewer treatment plant and the Kihei regional park. The north portion of the "Y" theory mentioned above could then be completed by the private sector.

With the valid concerns on all sides of this issue, the above combination of alternatives may provide a balance of satisfaction to all concerned.

Thank you for your continuing dedication to resolving this very difficult situation.

You are welcome to contact me with your questions and comments.

## NOTICE

The latest information regarding the Kihei-Upcountry Maui Highway project follows below:

Due to comments received from our last public meetings, we have made adjustments to our then-recommended alignments No. 2A, 2B, 4B and 5. The new alignments are illustrated in the above map and are named by the U-(Upcountry) termini in combination with a K-(Kihei) termini.

- U1 - Haleakala Highway at Haliimaile Road intersection
- U2 - Kula Highway east of Pukalani Bypass Road
- U3 - Kula Highway south of Pulehu Gulch
- K1 - Piilani Highway at Kaonoulu Street intersection
- K2 - Piilani Highway at proposed Road "F" intersection (south of Kihei Regional Park)

These alignments are currently being investigated in the Draft Environmental Impact Statement (EIS) now being prepared.

We wish to thank you for your input into this environmental process and look forward to your continued support and interest as this project develops.

Please contact the Highways Division, Planning Branch, at (808) 587-1843 if additional information is desired.

Kihei, Maui

Dear Kazu Hayashida:

I am against all your proposed "up country" roads as they don't make sense! First, future growth will be towards Makena & past Wailea. Your main tourist areas in these areas all want to go to Haleakala and the "wind country".

Why put the road in Kihei where traffic is already congested and why to Pukalani? (Just to please the upcountry people?)

A road up at the end of Pukalani highway would be the shortest, easiest and most scenic. But all mountains were trash it has been many years. How did it get out 2 years ago but it's the best way! <sup>1982</sup>

The State can acquire the needed land without that much environmental problems.

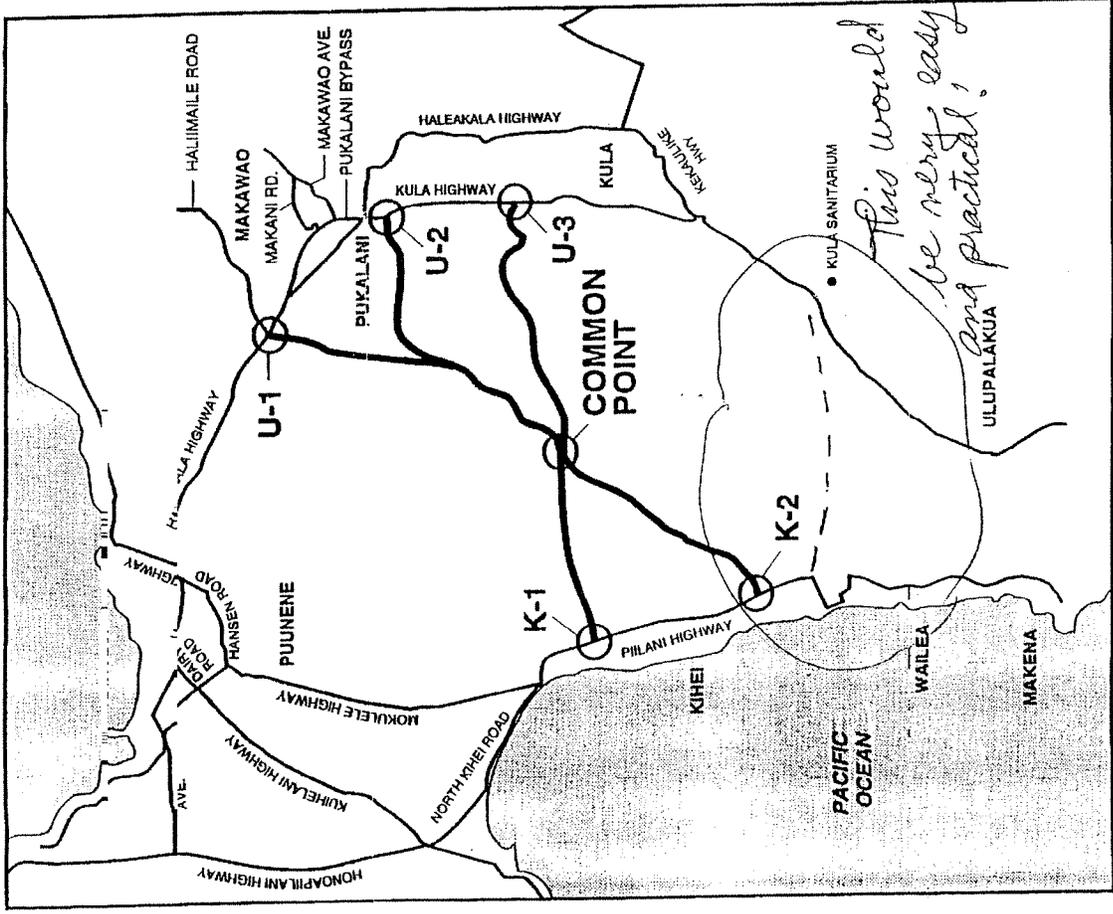

We need some action now on roads on this island as ours are the worse! It's way past time someone starting repairing and adding new roads to ease the traffic problems which are getting worse very fast. It's been way too long since roads have even been repaired and repaired.

Were the #1 island in the world to visit but can't even drive on decent roads! I can name dozens of main roads in and out of every city that are terrible to drive on and killing our cars! <sup>3</sup>

I don't even remember seeing a road repaired in the last 4 years unless it was a new sub-division. Please acquire and use all the funds possible to relieve this dangerous situation.

I've lived in Hawaii over 40 years and am watching every thing I love slowly disappear with "progress" but new roads are vital. It's been way too long so how about some action from there?

Kihei, Hawaii 96753

Dear Mr. Galbraith:

Subject: Kihei-Upcountry Maui Highway, Project No. HDPS-9203(1)

Thank you for your letter expressing your feelings on the proposed Kihei-Upcountry Maui Highway, Project No. HDPS-9203(1). We are always interested in the public's opinion to assist us in developing our project. However, "a road at the end of Piihiki", while one of the original alignments under consideration, was dropped due to its low economic feasibility. Your input in the planning process is a vital link in our project development.

Very truly yours,

KAZU HAYASHIDA  
Director of Transportation

RE: Proposed Kihei-Upcountry Maui Highway Project

Dear Mr. Hayashida:

In June 1997, as a result of comments received from public hearings held in 1996, we were informed of new alignments being proposed by DOT for the Kihei-Upcountry Highway project.

We are aware that these alignments will be included in the Draft Environmental Impact Statement for this project, which is currently being prepared. Accordingly, we would like to provide you with our preliminary comments for your consideration in the preparation of this document:

- 1) The points of origin in Kihei currently have no impact on HC&S' operations and therefore we have no concerns or preferences;
- 2) Haleakala Highway at Halimalie Road intersection (U1): As we have commented upon in the past, this routing alternative would bisect HC&S' property. As a result, this route would serve to isolate 1,000 acres of cane land under the cultivation and would require the installation of underpasses or traffic lights to enable HC&S to continue to cultivate these acres. This alignment also intersects canehaul roadways which are primary thoroughfares for our haulers and crosses essential irrigation ditches and pipelines. Our ability to move equipment and to irrigate our crop must be preserved. As a side note, this alignment would also require the construction of bridges to cross the several gulches, which will increase the cost of the highway. Unless satisfactory mitigative measures are implemented, HC&S strongly opposes this route.
- 3) Kula-Highway East of Pukalani Bypass Road (U2): This highway alternative also traverses through HC&S' property, although to a somewhat lesser degree than the above mentioned alignment (U1). This

Aug 8 10 25 AM '97

RECEIVED  
11 41 AM '97  
DEPT. OF TRANSPORTATION  
HIGHWAYS DIVISION

alignment, which runs along the top edge of our farm land, would isolate approximately 60 acres of cane land, and again, would require mitigative measures to maintain HC&S' access to these lands. The route also crosses two major water ditches, the Hamakua Ditch and the Reservoir 40 Ditch, which will need to be protected and remain operative, even during construction. This alignment also crosses at least three major gulches and several smaller gulches, which again will require bridges and will add to the cost of the projects. Again, unless satisfactory mitigative measures are implemented, HC&S strongly opposes this route.

- 4) Kula Highway South of Pulehu Gulch (U3): Of the three alternatives being presented, this alternative (U3) has the least impact to HC&S. The route does not cross through any of our fields and therefore would have minimal effects on our operations.

We have attached a map to help illustrate the impacts of the roadway alignments on the plantation.

The alternatives U1 and U2 will cause significant impacts to HC&S and, this will require significant mitigative measures, which have been previously outlined to the department, to ensure minimal disruption to HC&S' current operations. We trust that these impacts and mitigations will be addressed in the upcoming draft EIS. If you need further clarification of these measures, please feel free to call me for the information.

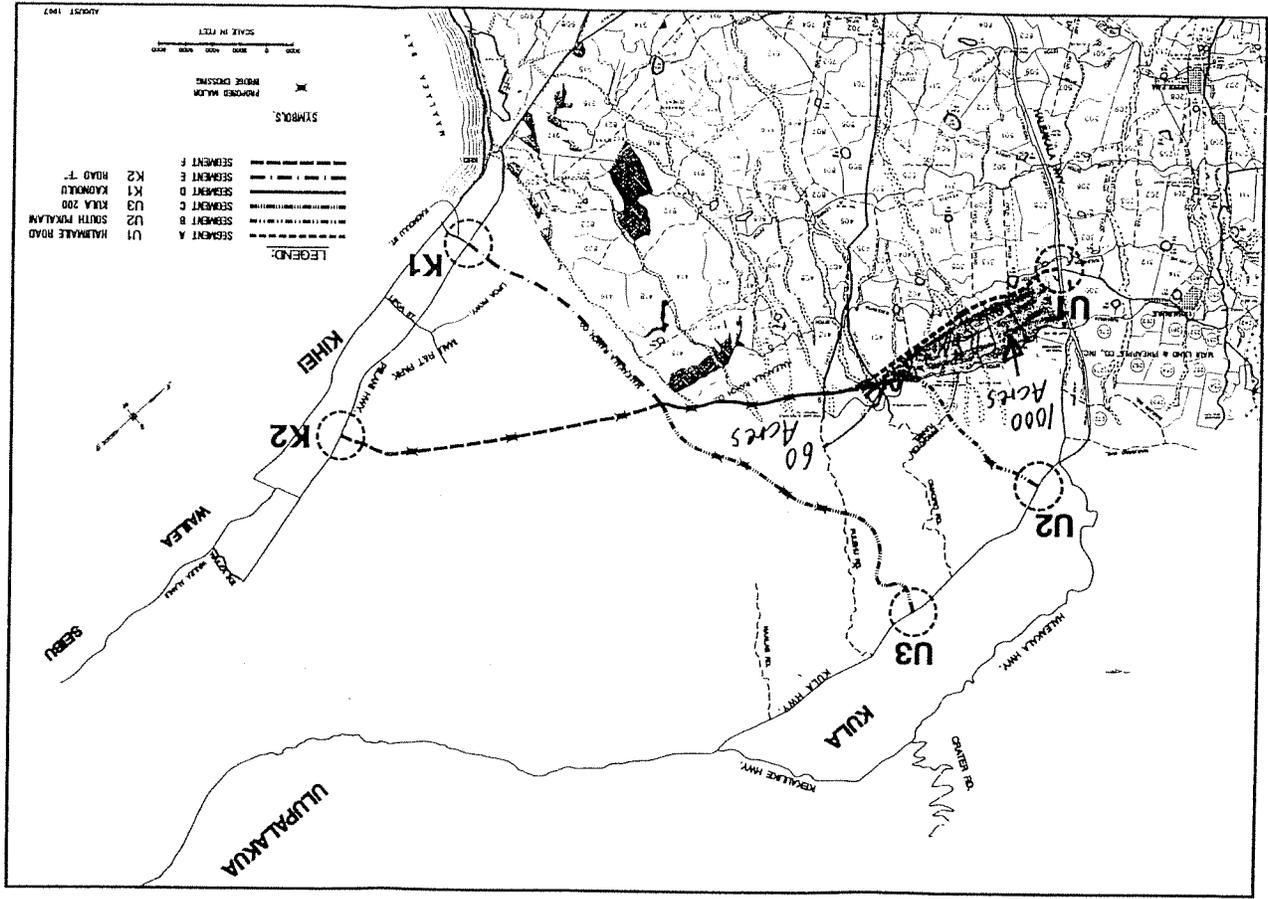

We continue to welcome open and early discussions with the DOT and its consultants on this highway project. Though our working together, early on in the process, we believe that an alignment which will benefit all parties--farmers, residents and businesses on Maui--can be identified. Over 1,000 employees at HC&S have a lot at stake on your choice of alignments.

Sincerely,

*Stephen Holaday*

Dear Mr. Holaday:

Subject: Kihei-Upcountry Maui Highway, Project No. HDPS-9203(1)

Thank you for your August 4, 1997 letter summarizing Hawaiian Commercial & Sugar Company's (HC&S) position on the proposed alternatives for the Kihei-Upcountry Maui Highway project.

We are confident that, through our previous meetings and correspondence, we have been made aware of HC&S' operations and position on the alternatives and will strongly consider them in our analysis of this project.

As stated previously, we will keep you informed of major developments in the project and look forward to any assistance you can provide.

Very truly yours,

Kula Community Association  
P.O. Box 417  
Kula, Maui, Hawaii 96790

"The specific purpose of this corporation is to improve the quality of life for the residents of Kula, to promote civic welfare and generally to benefit the community of Kula."

To: Maui County Council  
From: Alan Kaufman, KCA president  
Date: 2 May 1997

The Board of Directors of the Kula Community Association has asked that I inform you about results of a just completed community survey. The survey was mailed to every household in the Kula area. A total of 318 surveys were returned, for a response rate of 45%. 18% of 7/10/97

It has been the position of the KCA Board of Directors to support water rate increases provided that the proceeds are used to expeditiously initiate and complete needed system repairs. Of those responding, 81.2% agreed with this position, 8.9% disagreed, 6.7% were undecided, and 3.2% did not respond.

The community was also polled on the preferred location of the Upcountry terminus of the Kihei-Upcountry Road. Halimaile was favored by 30.8%, the "No Build" option by 27.2%, Pulehu/Omaopio area by 19%, Five Trees/Kula 200 by 15%. Undecided by 5.7%, and 2.3% did not respond to the question. The position of the KCA Board of Directors has been to favor the "No Build" option, or if the road is to be built, to put it at Halimaile. It appears this position accurately reflects the opinion of the Kula Community.

As these issues are addressed, the KCA Board of Directors hopes the opinions of our community will receive due consideration.

Sincerely,

Alan Kaufman

September 10, 1997

Mr. Kenneth Au  
DOT Highways Division  
869 Punchbowl St.  
Honolulu, Hawaii 96813

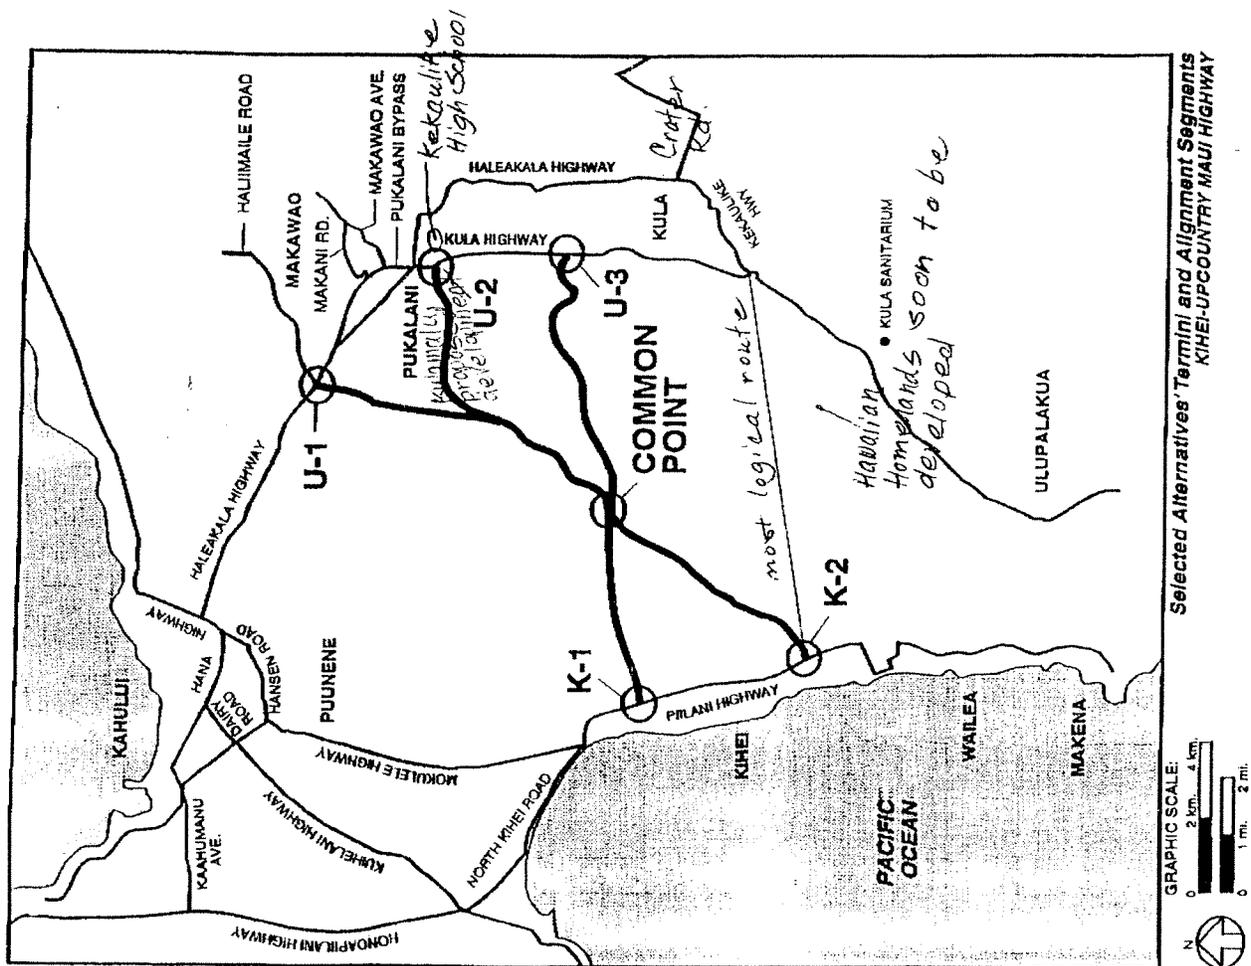

Re: Kihei-Upcountry Highway Project

Dear Mr. Au,

This letter is long overdue. I spoke with you by phone several months ago about the above project. I still, as I conveyed to you, feel that the best route for the highway is from K-2 to the upper end of Kekaulike Highway. This is the most direct way to the crater, which over 2,000,000 people a year visit. This is also the most direct route for those working in the crater. Four hundred lots will be subdivided in the Hawaiian Homelands area in upper Kula in the very near future. This will necessitate the improvement of the roads in this area. Since a number of these people may be employed or seek employment in the Wailea area the upper Kula connection makes a lot of sense.

Recently we were informed a developer in our neighborhood is planning a town with a twenty acre shopping center. It appears on his maps with what looks like the U-2 alternative on your map. Since we have a not yet completed high school, King Kekaulike, only a few hundred feet below this proposed development, I question why the State would support such a situation. This man and his fellow investors have rubbed elbows with several State and County people, leading many of us to think a back room deal was struck. Although only a few weeks ago in a meeting with residents he stated he would be building 324 homes, he jumped to 400 and is now at 450. I'm enclosing a master plan of his project obtained from the County Planning Department here on Maui.

I hope you will look it over and understand as I have that the scope of this project is detrimental to the safe environment the students in Kekaulike deserve. I did a traffic study Monday, Sept. 8, 1997 from 2:00pm to 4:00 pm. The numbers I came up with were astonishing. The vehicles going in numbered 188, going out

Selected Alternatives Termini and Alignment Segments  
KIHEI-UPCOUNTRY MAUI HIGHWAY

262. students walking alongside (there is no sidewalk) the Kula Highway numbered 41, vehicles going up or down, 1,720, and industrial vehicles, 22, for a total count of 2,194 vehicles during the two hour period. I intend to do more traffic studies as I realize one is not sufficient to be a true study of traffic. The developer of the above project I mentioned, did a traffic study, however it was done in 1996 when two classes attended Kekaulike High. Since then a number of those students have obtained a drivers license. The high school at present contains freshmen through juniors, with it becoming a four year high school for the 98/99 school year. In speaking with the principal I was told the school is full with each class that comes in. The freshmen class this year consists of 400 students. There are a total of 1,040 students in the school at present. Since the school is bordered by Haleakala Highway on one side and Kula Highway on the other I believe adding another highway in the same area would be like sentencing a few students every year to certain death. While observing the traffic, a tourist made a U-turn on the highway while another went in the school turning lane, and realizing he made a mistake, quickly cut out almost hitting a town-bound vehicle.

Some parents are upset and feel they can do nothing to stop this since this man seems to have everyone in his back pocket. They feel if anything happens to them or their children as a result of the tremendous amount of traffic coming into the neighborhood of the school, they will sue the developers of Kulamalu, the County of Maui and the State. I believe good planning is important and with good planning we can avoid the above.

Since the Kihai to Upcountry Highway is a plan for the future the U-2 and U-3 areas are the least efficient at allowing for traffic flow. The U-2 site would be a good recipe for traffic gridlock.

If you would like to go over the area in depth I would be happy to meet with you. We have had several accidents in the area since the school opened. The most recent resulted in a death. My home phone is 572-0729.

Sincerely,

*Barbara J. Luke*

Subject: Kihei-Upcountry Maui Highway Project,  
Project No. HDPS-9203(1)

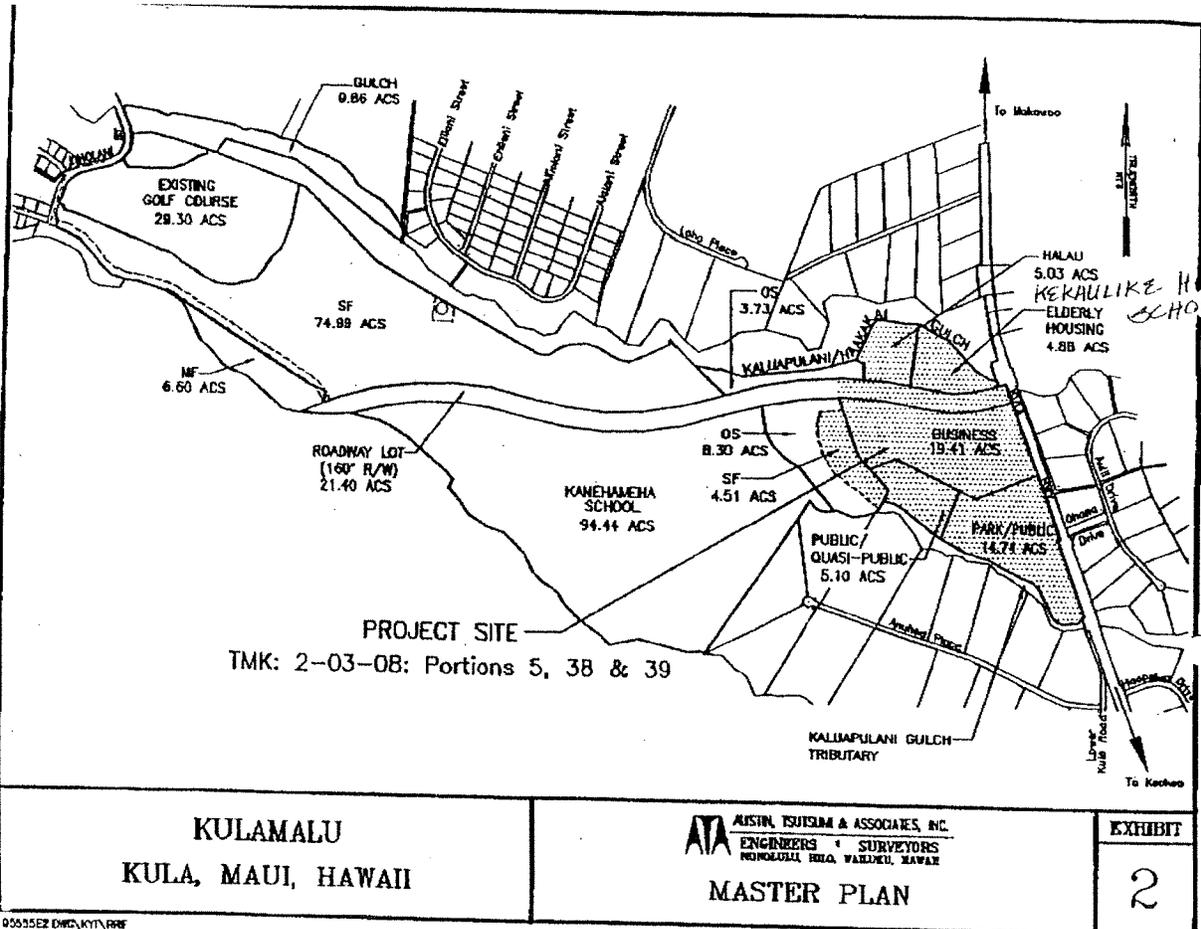

Thank you for your input on the Kihei-Upcountry Maui Highway Project. Through letters like yours, we hope to get an idea of the public's feelings during this environmental process.

In regards to the Kulamalu development, the Department does not favor one alignment over another at this time. A minimum of six alignment combinations are possible and viable. However, while an astute businessman will take advantage of areas opening up due to a new highway, the Department does not select an alignment specifically to encourage development.

Very truly yours,

"The specific purpose of this corporation is to improve the quality of life for the residents of Kula, to promote civic welfare and generally to benefit the community of Kula."  
"The vision of the Kula Community Association is to preserve open space, support agriculture, maintain a rural residential atmosphere, and to work together as a community..."

To: Maui County Council Members, Everett Dowling, Kazu Hayashida (State Department of Transportation), Bob Starot (Division of Highways), Mayor Lingle  
From: Alan Kaufman, DVM, Kula Community Association President  
Date: 8 November 1997

At the 6 November meeting of the Kula Community Association Board of Directors, I was directed to remind our elected representatives, and other interested parties, of the survey undertaken by our Association this year regarding the Kihei-Upcountry Highway. Survey results indicated that two thirds of our community either does not want this highway built, or if it is to be built, to have the upcountry terminus at Haliimaile. I am attaching a copy of the results of that survey for your review.

There is concern by the KCA Board that the Kulamalu development will encourage the placement of the terminus in Kulamalu, the approximate location identified as the 5 Trees area in the community survey. Because of this concern the Board has resolved:

*"... that approval of the Kulamalu project be conditional on the Upcountry terminus of the Kihei/Upcountry highway not being located in the Kulamalu development area."*

This resolution passed, 13 in favor, none opposed, with 2 abstentions.

At the meeting it was pointed out that the County may not have the authority to prevent the State from designating the preferred location of this highway. Regardless, the Board felt the Council should not grant approval of this development without the provision expressed above in place.

Thank you for your consideration.

Re: Kihei/Upcountry Highway

Dear Mr. Hayashida

As one of the General Partners of the Kulamalu Limited Partnership, I was dismayed to learn that your department has replaced alternative U2 (Kulamalu) with a new alternative, U2A. I feel that alternative U2 is a better route and should remain as the primary alternative for the following reasons:

1. Should alternative U2 be selected, the owners of the Kulamalu property have offered to dedicate the appropriate right-of-way land area and provide the design, to federal standards, for the section through the Kulamalu project area. Assuming a constant right-of-way width of 160 feet, we estimate that approximately 21.4 acres of land will be needed. Please note that in November of 1997 a 3 acre Kulamalu parcel was sold at a price of over \$200,000 per acre. As such the dedication of a 21.4 acres right-of-way required for an alternative U2 will result in a significant savings to both federal and state taxpayers.

2. We are aware that your department is concerned about the approximately 1100 lineal feet (2% of the entire highway length) of alternative U2 which has a 10% roadway grade. The Kulamalu property has been classified as "urban" by the State Land Use Commission since October of 1969. Based upon the design criteria of the AASHTO Green Book ("A Policy on Geometric Design of Highways and Streets, 1990"), it would be appropriate to characterize the area as mountainous urban and to utilize a design speed of 40 mph (posted 35 mph) and a maximum grade of 10% (Table VII-4, page 525). A more detailed explanation from Austin, Tsutsumi & Associates is attached for your review.

3. Kulamalu will be proceeding with construction of a two lane roadway from Kula highway to the Kamehameha School campus in early 1998 at a cost of approximately \$6,200,000. This substantial amount represents additional project savings should alternative U2 be selected.

4. Although alternative U2A provides for a more direct approach to Haleakala Highway, there are several major issues relating to this route.

RECEIVED

DEC 03 1997

Mr. Alan Kaufman, President  
Kula Community Association  
P. O. Box 417  
Kula, Hawaii 96790

Dear Mr. Kaufman:

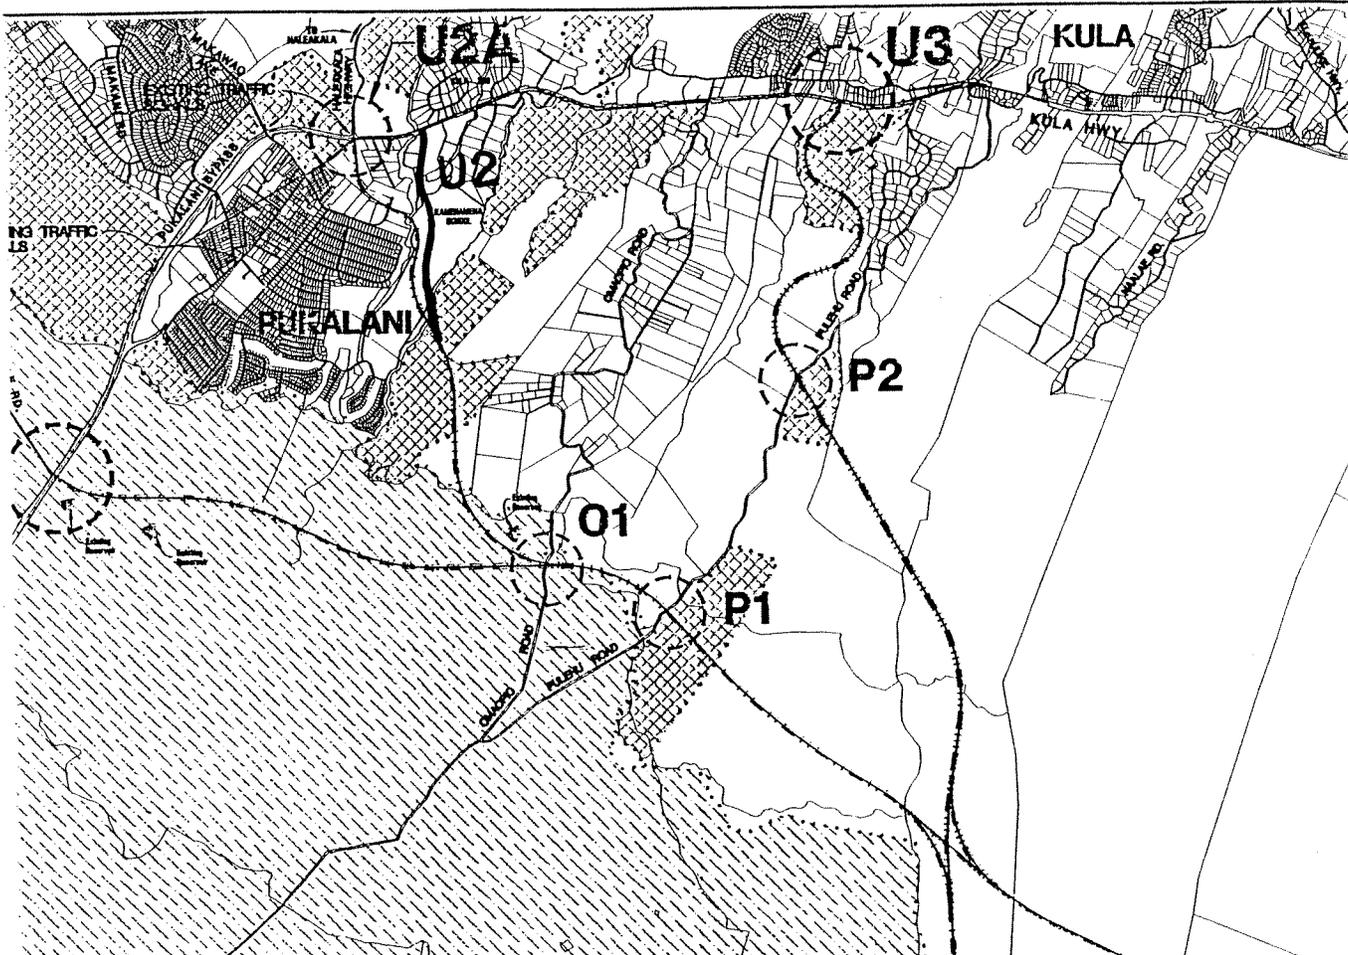

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

Thank you for your November 8, 1997 letter informing us of the results of the Kula Community Association's survey. We appreciate the input on your community's opposition to U-2 and U-3 and will consider it in our project evaluation.

Very truly yours,

KAZU HAYASHIDA  
Director of Transportation

/bc: Warren S. Unemori

Mr. Kazu Hayashida  
 January 6, 1998  
 Page 2

- A. Alternative U2A bisects an established residential community between Kaakakai Gulch and the terminus. This would require the condemnation of a number of parcels with various owners. Additionally, parallel roadways adjacent to the highway would need to be constructed to service the existing lots since the highway will be classified as a limited access highway.
- B. Alternative U2A requires an additional gulch crossing over Kaakakai Gulch, adding substantial cost to this route. Additionally Kaakakai gulch is known to be rich in Hawaiian cultural artifacts.
- C. Kulamalu has developed their masterplan accommodating alternative U2. Should alternative U2A be selected, the section of this alignment traversing the Kulamalu property results in several remnant parcels that would be unusable to the developer and therefore should be included in the right-of-way acquisition. Due to the additional project replanning and redesign efforts, as well as the overall impact to the master plan, Kulamalu will not dedicate the right-of-way land area and design funds for the U2A alternative. Furthermore, Kulamalu will expect to receive condemnation proceeds based upon the fair market value of this urbanized and fully zoned property.

We feel that alternative U2 provides the Federal Highways Administration and the Department of Transportation with a far more economical route than alternative U2A and respectfully request that you reconsider designated alternative U2 as the primary route in the final EIS for the Kihel/Upcountry Highway project. Based on the above reasons we feel that this alignment is the only viable route through this area.

In closing we want to make it clear that Kulamalu will not support alternative U2A, but on the other hand is willing to be supportive of U2 due to it's minimal impact to the development. Thank you for your time and consideration. Please feel free to contact me should you have any questions or if you or your staff wish to further discuss this matter.

Sincerely,  
 RSK Enterprise LLC

  
 Ronald Kobayashi,  
 Its Principal

**Grades**

The length and steepness of grades directly affect the operational characteristics of an arterial. Table VII-1 gives recommended maximum grades for rural arterials. When vertical curves for stopping sight distance are considered, there are seldom advantages to using the maximum grade values except when grades are long. Grades below the maximum are always desirable, the minimum grades being considered primarily to provide natural roadside drainage.

Type of Terrain	Design Speed (mph)			
	40	50	60	70
Level	5	4	3	3
Rolling	6	5	4	4
Mountainous	8	7	6	5

Table VII-1. Relation of maximum grades to design speed for rural arterials.

**Number of Lanes**

The number of lanes required is determined by volume, level of service, and capacity conditions. A divided arterial, as discussed in this chapter, refers to four or more lanes.

**Superelevation**

When the use of curves is required on a rural arterial alignment, a superelevation rate compatible with the design speed must be used. Superelevation rates should not exceed 0.12; however, where ice and snow conditions are a factor, the maximum superelevation rate should not exceed 0.08. Superelevation runoff denotes the length of roadway needed to accom-

plish the change in cross slope from a section with adverse crown remove a fully superelevated section and vice versa. Adjustments in design run lengths may be necessary for smooth riding, drainage, and appearance. Chapter III provides a detailed analysis and tables for superelevation for various design speeds.

**Pavement Crown**

Pavement crown is constructed to provide cross-slope drainage for a pavement. Two-lane rural pavements are normally designed with a center crown and cross slopes ranging from 1.5 to 2 percent with the higher value being most prevalent. Multilane pavements are crowned at the pavement centerline or sloped one way. When drainage is carried across adjacent lanes, cross slope may be increased from one lane to another.

**Vertical Clearances**

New or reconstructed structures should provide 16-ft clearance over entire roadway width. Existing structures that provide 14-ft, if allowed local statute may be retained. In highly urbanized areas, a minimum clearance of 14-ft may be provided if there is one route with 16-ft clearance. Structures should provide additional clearance for future resurfacing of the unpassing road.

**Structures**

The full width for the approach roadways should normally be provided across all new bridges. Long bridges, defined as bridges having an over length in excess of 200 feet may have a lesser width. On long bridges, off to parapet, rail or barrier shall be at least 4 feet measured from the edge of nearest travel lane on both the left and right. See Chapter X for more information on bridge widths.

Bridges to remain in place should have adequate strength and at least width of the traveled way plus 2-ft clearance on each side, but should be considered for ultimate widening or replacement if they do not provide at least 3-ft clearance on each side or are not capable of HS-20 loadings. As interim measure, narrow bridges should be considered for special narrow bridge treatments such as signing and pavement marking.

Kulamalu Limited Partnership  
 P.O. Box 758  
 Wailuku, Hawaii 96793  
 Attention: Mr. Don Fujimoto  
 Gentlemen:  
**Subject: Justification for Variance From Route Design Criteria, Kulamalu Road**

The design criteria utilized for designing new roadways is based upon the character of the terrain and adjacent land uses of the areas in which the roadway is located.  
 The new Upcountry-Kihel Road from Kihel to Kula is being planned and designed as a rural highway in mountainous terrain, since that is the general character of the route. Under that route description, the State Department of Transportation, Highways Division, has apparently selected a design speed of 50 miles per hour (posted 45 mph) and the maximum grade is 7 percent, as determined by Table VII-1, Relation of maximum grades to design speed for rural arterials, page 486, of the AASHTO Green Book (A Policy on Geometric Design of Highways and Streets, 1990).

The mauka terminus of the new road is through the planned Kulamalu development. Through the development, the adjacent land uses will consist of a school and businesses, as well as subdivision roads connecting to the Upcountry-Kihel Road. Under these conditions, it would be appropriate to characterize the adjacent land use as mountainous urban and to use a lower design speed for the highway. Therefore, the design criteria could be adjusted to utilize a design speed of 40 mph (posted 35 mph) and maximum grade of 10 percent, as shown in Table VII-4, Maximum grades for urban arterials, page 525. Further, since the Kulamalu development is the upcountry terminus of the new road, it is desirable to reduce the highway speed limit approaching Kula Highway to provide the transition from the open highway to the Stop condition at Kula Highway.

Any variance from the general design criteria for the new roadway must be requested to and concurred by the State Department of Transportation, Highways Division. Attached for your information are copies of the tables cited above. If you have any questions, please feel free to call me.

Sincerely,  
 AUSTIN, TSUTSUMI & ASSOCIATES, INC.

Dear Mr. Kobayashi:

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

Thank you for your comments and recommendations for the Upcountry termini of the Kihei-Upcountry Maui Highway project. We have been in constant contact with your representative, Don Fujimoto of Kulamalu Limited Partnership, and have kept him abreast of all developments. A copy of our February 3, 1998 letter to him is attached.

I would like to clarify a couple of points in your letter.

1. Alignment U2 has been redesignated U2B.
2. Alignment U2B has not been dropped. Investigations are still ongoing. A decision of which alignment will be selected for further study will be made after the circulation and comment period of the Draft Environmental Impact Statement for our subject project.

Very truly yours,

KAZU HAYASHIDA  
Director of Transportation

/bc: Warren S. Unemori Engineering, Inc.

### Design Speed

Design speed for urban arterials generally range from 40 to 60 mph, and occasionally may be as low as 30 mph. The lower (40 mph and below) speeds apply in the central business district and intermediate areas. The higher speeds are more applicable to the outlying business and developing areas.

### Design Traffic Volumes

The design of urban arterials should be based on traffic data developed for the design year, normally 20 years. The design hourly volume (DHV) is the most reliable method to determine design requirements. Sometimes, capacity is used as a design tool. The limitations and restrictions that are often encountered are recognized in capacity design, and a preselcted level of service for those conditions is provided. Refer to Chapter II for information on traffic and capacity.

### Levels of Service

For acceptable degrees of congestion, rural and suburban arterials and their auxiliary facilities, i.e., turning lanes, weaving sections, intersections, interchanges, and traffic control systems (traffic signals, etc.), should generally be designed for level-of-service C. Heavily developed sections of metropolitan areas may necessitate the use of level-of-service D. When level-of-service D is selected, it may be desirable to consider the use of one-way streets or alternative bypass routes to improve the level of service.

### Sight Distance

The provision of adequate sight distance is important in urban arterial design. Sight distance affects normal operational characteristics, particularly where roadways carry high traffic volumes. The sight distance values given in Table VII-3 are also applicable to urban arterial design.

### Cross Grades

The grades selected for an urban arterial may have a significant effect on its operational characteristics. Steep grades affect truck speeds and overall

capacity. On arterials having large numbers of trucks and operating near capacity flat grades should be considered to avoid undesirable reductions in speeds. Steep grades also result in operational problems at intersection, particularly during adverse weather conditions. For these reasons it is desirable to provide the flattest grades practicable while providing minimum gradients as required to ensure adequate longitudinal drainage in curbed sections. (See Table VII-4.)

Type of Terrain	Design Speed (mph)			
	30	40	50	60
Level	8	7	6	5
Rolling	9	8	7	6
Mountainous	11	10	9	8

Table VII-4. Maximum grades for urban arterials.

### Alignment

Alignment of the urban arterial is ideally developed strictly in accordance with the design speed selected particularly when a principal arterial is located on a new location and is not restricted by normal right-of-way requirements. There are many cases, however, where this is not possible and deflections must be made in intersections. It is desirable to use the highest alignment design possible because urban arterials are often not superelevated in the low-speed range.

### Cross Slope

Adequate cross slope for proper drainage is important on urban arterials. The normal problems related to splashing and hydroplaning are compounded in heavy traffic volume operations at intermediate to high speeds. Cross slopes should range from 1.5 to 3 percent, the lower values being in the center lanes with the cross slopes increasing about 1 percent for each additional lane over which water must drain until the maximum 3 percent is reached. Even

FEB - 3 1998

- 5. Our investigation of your alignment indicates that the Kaliainui Gulch crossing will require piers in excess of 100 feet and a bridge span of 650 to 700 feet. This is far higher and longer than other alignments under consideration.
- 6. While the design speed can be lowered, this is applied in the Central Business District and immediate areas and only for urban arterials.

Thank you for your interest in our project. We will be continuing our analysis of various alternatives as part of our draft environmental impact statement process.

Very truly yours,

KAZU HAYASHIDA  
Director of Transportation

Mr. Don S. Fujimoto  
Vice President  
Kulamalu Limited Partnership  
P. O. Box 1417  
Wailuku, Hawaii 96793

Dear Mr. Fujimoto:

Subject: Kihei-Upcountry Maui Highway, Project No. HDPS-9203(1)

We are still considering your proposed alignment for the U-2 terminus (Pukalani end) as part of our investigation into viable alternatives. However, as mentioned in our numerous meetings we still have several reservations. These include the following:

- 1. Safety. The problem of braking of vehicles especially a fully loaded truck on a downgrade of 10% and the proximity of an elementary school (Kamehameha feeder school) will create a potentially hazardous mix of pedestrians and motorists.
- 2. Your proposed alignment would be more acceptable with a curvilinear alignment to prevent excessive speeding on a downhill 10% grade.
- 3. If the right-of-way is limited to a 160' width exclusive of cut and fill for 4 lanes of through traffic plus turning and deceleration/acceleration lanes, costly retaining walls may be required.
- 4. The steep uphill grade will more than likely require a truck climbing lane.

Kazu Hayashida  
The State Director of Transportation  
757 Kinalau PL 1003  
Honolulu Hi  
96813-2638

Dear Mr. Hayashida,

I've written you to persuade you to reconsider building the roads U-1, U-2, U-3, K-1, K-2, from Kihei to the Upcountry area to prevent serious damage to the quality of life in Kula.

U-1 will cause more traffic in the Makawao and Pukalani areas. This will eventually force you to upgrade Makawao Avenue, which is now not ready to receive more traffic. If you haven't been in Makawao lately, you may not know it is also usually very crowded.

Ending Highway U-2 near the King Kamehameha High School is a bad idea. After school, this area is full of kids walking home, school busses and traffic. Students crossing the road may get hurt with the added traffic.

Tourists coming up Highway U-3 from the hotel and beach area will flood Kula. They will cause tourist stands to pop up every where and tourist bus stops. The result will be destroying one of the only areas with real rural life on the island.

Also, adding these roads will result in a population increase. This will directly affect our water supply. Sometimes, during the summer we receive notices to not use the water carelessly, and to not wash the cars until the semi-drought is over and even worse for the farmers not to water. More

houses means more people will need water. We do not have the water for another subdivision.

The traffic increase will cause a buildup in traffic which during school hours will be dangerous and unpleasant on the Lower Kula Highway #37. Traffic moves slowly on that road near schools. Two schools are located in Kula, and both are right next to Haleakala Highway where the posted speed limit is 25 MPH. Every morning my brother and I bike to school. We travel north along the Upper Kula Highway. I don't want to see the road crowded since there is no bike lane.

Going in the downhill direction, people traveling from the Upcountry area traveling down to Kihei will result in Kihei being even more crowded. Kihei is already so crowded; I once saw this Lady in her car trying to turn right from the beach, and it took her twenty minutes. So, I assure you that the traffic and the bad air from it is unnecessary from the point of view of many.

Some people want the road so they don't have to drive as much. This is not good reason to ruin a beautiful land.

In short, this is not the time to add a major new road into Upcountry. It would be good to put the time, money and resources into building up the upcountry so it can handle the highways in the future.

Please answer back with your input, Sincerely

Azeo Park

Dear Sir

On February 19, 1998 my wife and I attended a meeting of the Kula Community Association. One of the topics of discussion was the Kihai-Upcountry road.

We were informed that the Association has taken the following position:

1. There should be no road
2. If a road is to be built, it should be as far from Kula as possible.

There is a very vocal minority in favor of the 1<sup>st</sup> alternative, so much so that it really was not possible to voice a dissenting opinion. This is quite surprising in light of the fact that the Association itself undertook a survey of residents with the following result:

- 27% did not want a road at all
- 67% wanted a road, but were split between the different routes
- 6% had no opinion

While it is true that the single largest group did not want a road, one cannot help but be impressed by the overwhelming majority in favor of the project. However, this group was split among the various routes.

Having established that the vast majority of the respondents would like a road, it is probably wiser to leave the actual routing to the professionals working in and for the Department

The Kula Community Association is not speaking for us in this matter and we do not believe that the democratic process was helped by their stance. On our part we are going to speak to our friends and neighbors to make sure our views are also heard and to this end we would appreciate to be placed on the project mailing list.

Dear Mr. Rominger and Ms. Clark:

Subject: Kihai-Upcountry Maui Highway, Project HDPS-9203(1)

Thank you for your interest in our Kihai-Upcountry Maui highway project. We encourage public comments and recommendations regarding the alternative alignments. Your February 27, 1998 letter will help us better gauge the public's feeling on our proposals.

We are preparing a Draft Environmental Impact Statement (DEIS) that is scheduled for distribution later this year. Copies will be available for review at your local libraries. Public hearings will then be held in Kihai and Upcountry Maui where the public can again make known their comments on this project. Your names have been placed on our mailing list and you will be notified of the availability of the DEIS and the specific details of the public hearings.

If you have further questions you can write to me or contact Kenneth Au by calling Maui's toll free voice access number 984-2400 extension 71843.

Very truly yours,

April 1, 1998

Department of Transportation  
To Whom It May Concern:

I feel the new highway that you are considering of constructing from Kihei to Kula is needed, however, I hope you consider bringing it up from Kihei, Lipoa street area coming in at highway 37 where 377 comes in South of Pulehu Gulch near Kooloa Gulch. It would make a quick way up to Haleakala for Kihei & Wailea residents and tourists. At the same time those from up country commuting to Kihei/Wailea to work would be traveling south on Kula Highway (37) where the ones commuting to Kahului, Lahaina would be traveling in the opposite direction. It would ease up some of the congestion in the mornings.

Sincerely,

*Helga Folkes*

### (15) Central Maui Expansion of Sanitary Landfill Project

**District:** Wailuku  
**TMK:** 3-8-03.4  
**Applicant:** County of Maui, Department of Public Works & Waste Management  
200 South High Street  
Wailuku, Hawaii 96793  
**Contact:** Charles Jencks (243-7845)

**Accepting Authority:** County of Maui, Department of Public Works & Waste Management  
200 South High Street  
Wailuku, Hawaii 96793  
**Contact:** Charles Jencks (243-7845)  
Maui Fujioka & Associates  
99-1205 Halawa Valley Street, Suite 302  
Aiea, Hawaii 96701-5281  
**Contact:** Jennifer Kleveno (484-5366)

**Public Comment** October 23, 1995  
**Deadline:** First Notice, pending public comment.  
**Status:**

The County of Maui has determined that the existing Central Maui Sanitary Landfill is reaching its capacity and that an additional solid waste disposal site is needed. Instead of searching for a new landfill location, the County proposes to expand the existing Central Maui Sanitary Landfill. The proposed project includes Phases IV, V and VI. Phase IV is currently being used by a quarry operation and Phases V and VI are currently occupied by sugar cane but are scheduled for quarry operations in the future. Expanding the landfill into areas where the quarry operation is completed eliminates the need for large-scale excavation, and is a good use of quarried areas.

This site is centrally located with respect to the major population centers of Maui, yet it is also in a rural, agricultural district. This combination of a central yet rural location and compatible physical characteristics makes the site operationally and environmentally well-suited for the expansion of the landfill.

# Maui Notices

SEPTEMBER 23, 1995

The Highways Division of the State of Hawaii Department of Transportation (DOT) and the Federal Highway Administration (FHWA) are preparing an environmental impact statement (EIS) addressing the construction of a new four-lane divided rural arterial with limited access. The length of the roadway would be approximately 15.4 kilometers (9.6 miles), and would link the coastal area of Kihei (Pillani Highway) to Upcountry Maui (either Haleakala Highway or Kula Highway, reducing the existing journey by approximately 15.3 kilometers (9.5 miles). The roadway, referred to as Kihei-Upcountry Maui Highway, would be generally aligned in an east-west (mauka-makai) direction. Ten alternative roadway alignments have been developed.

The roadway would satisfy several goals:

- Enhance access between the Maui Research and Technology Park and related scientific facilities at the summit of Haleakala, called Science City;
- Provide a more efficient route for commuters traveling between Upcountry and Kihei;
- Help alleviate traffic congestion on existing roadways by providing more roadway capacity; and
- Facilitate tourist travel between Kihei and the summit of Haleakala.

Potential impacts of the proposed highway are expected to be relatively minor in the areas of water quality, air and noise emissions, and visual impact. However, the level of impact could be more severe in the following areas:

- **Social and Economic Activity** - due to possible changes to the residential character of the Upcountry area; increased land values; and increased tourist activity.
- **Traffic** - due to the creation of new intersections and roadway crossings, and the redistribution of traffic volumes.
- **Farmlands** - due to possible disturbance of important farmland soil types and farming operations.
- **Endangered and Threatened Species** - due to possible impacts on endangered plant species.
- **Historic and Archaeological Resources** - due to possible impacts on native Hawaiian archaeological resources.

An EIS is deemed appropriate because the project's potential level of impact in several areas is presently unknown, and could be significant. The EIS will evaluate ten alternative alignments and, on the basis of selection criteria,

## Withdrawals

### (17) Haiku Well Pump Station

The Final Environmental Assessment/Negative Declaration for the subject action has been withdrawn. The Notice of Availability of the Negative Declaration was published in the August 8, 1993 OEQC Bulletin.

The Maui Board of Water Supply has rescinded the negative declaration. For further information, please contact the County of Maui, Board of Water Supply, David Craddock (243-7816).

Environmental Impact Statement: Kihei-Upcountry, Maui, Hawaii

[Federal Register: November 9, 1995 (Volume 60, Number 217)] [Notices]

[Page 56632-56633]

>From the Federal Register Online via GPO Access [wais.access.gpo.gov]

DEPARTMENT OF TRANSPORTATION  
Federal Highway Administration

Environmental Impact Statement: Kihei-Upcountry, Maui, Hawaii

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice of Intent.

THIS PAGE INTENTIONALLY LEFT BLANK

**SUMMARY:** The FHWA is issuing this notice to advise the public that an environmental impact statement (EIS) will be prepared for a proposed highway project to connect the Kihei and Upcountry areas of Maui, Hawaii.

**FOR FURTHER INFORMATION CONTACT:** Mr. Abraham Wong, Division Administrator, Federal Highway Administration, Office Address: 300 Ala Moana Boulevard, Room #3202, Honolulu, Hawaii 96813; Mailing Address: P. O. Box 50206, Honolulu, Hawaii 96850. Telephone: (808) 541-2700.

**SUPPLEMENTARY INFORMATION:** The FHWA, in cooperation with the Hawaii Department of Transportation (HDOT), will prepare an EIS addressing a proposed new, four-lane divided rural arterial with limited access. The roadway would be approximately 15.4 kilometers (9.6 miles) long, and would link the coastal area of Kihei (Piilani Highway) to Upcountry Maui (either Haleakala Highway or Kula Highway), reducing the existing journey by approximately 15.3 kilometers (9.5 miles). This roadway, referred to as Kihei-Upcountry Maui Highway, would be generally aligned in an east-west (mauka-makai) direction. The roadway would satisfy several goals: enhance access between the Maui Research and Technology Park in Kihei and the related scientific facilities at the summit of Haleakala; called Science City; provide a more efficient route for commuters traveling between Upcountry, and Kihei; help alleviate traffic congestion on existing roadways by providing more roadway capacity; and facilitate tourist travel between Kihei and the summit of Haleakala.

[[Page 56633]]

Alternatives under consideration include taking no action, ten alternative roadway alignments, and a Transportation System Management alternative. Letters describing the proposed action and soliciting comments have been sent to federal, State and local agencies, and to private land owners, organizations, and citizens who have previously expressed or are known to have an interest in this project. A meeting to discuss the scope of the EIS was held October 26, 1994, in Honolulu, Hawaii. In addition, a public hearing will be held after publication of the draft EIS. Public notice will be given of the time and place of the hearing. The draft EIS will be available for public and agency review and comment prior to the public hearing. To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS should be directed to the FHWA at the above address.

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Subject: Kihai-Upcountry Maui Highway, Maui, Hawaii  
Draft Environmental Impact Statement

In accordance with the requirements of the State Environmental Impact Statement (EIS) rules (Title 11, Chapter 200 of the Hawaii Administrative Rules) and Chapter 343 of the Hawaii Revised Statutes, we are providing you a copy of your letter submitted during the Kihai-Upcountry Maui Highway project's EIS Preparation Notice comment period, along with a response to your letter, if necessary. Comments have been numbered to identify the points made in each letter, and the associated response.

Your letter and our responses are included in the upcoming Draft EIS for this project. As some of our responses may reference sections in this Draft EIS, we will send you a copy upon its publication.

Thank you for your participation in this project. If you have any question, you may contact Kenneth Au at (808) 587-1843 or you can reach him by calling Maui's toll free voice access number 984-2400 extension 71843.

Very truly yours,

Mr. Kazu Hayashida, Director  
 Department of Transportation  
 Highways Division  
 State of Hawaii  
 600 Kapiolani Boulevard  
 Honolulu, Hawaii 96813

Dear Mr. Hayashida:

Thank you for the opportunity to review and comment on the Final Environmental Assessment and Environmental Impact Statement Preparation Notice for the Kihai Upcountry Road Project, Kihai, Maui. The following comments are provided pursuant to Corps of Engineers authorities to disseminate flood hazard information under the Flood Control Act of 1960 and to issue Department of the Army (DA) permits under the Clean Water Act; the Rivers and Harbors Act of 1899; and the Marine Protection, Research and Sanctuaries Act.

- a. Based on the information provided, a DA permit will be required as there are intermittent streams located within the project area. Please contact our Regulatory Section at 438-9258 for further information and refer to file number PO96-016.
- b. The flood hazard information provided on page 13 of the environmental assessment is correct.

Sincerely,

H. Paul Mizue, P.E.  
 Acting Chief, Planning  
 and Operations Division

Dear Mr. Hayashida:

Thank you for asking the National Park Service to comment on the  
**KIHEI-UPCOUNTRY MAUI HIGHWAY ENVIRONMENTAL ASSESSMENT.**

Enclosed are our initial comments of 10/25/95 and additional information, including that submitted by the National Biological Service, concerning resources that could be impacted by the alternatives (2, 4A, 6A and possibly 6B) through or near Pu'u Kali. The Pu'u Kali area is being considered by State of Hawaii, Natural Area Reserve Commission as a potential Natural Area Reserve.

Regarding the other proposed highway routes, we have no comment.

Sincerely,

*Donald W. Reeser*

October 25, 1994

Rex Johnson, Director of Transportation  
State of Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813-5097

Dear Mr. Johnson:

Thank you for the invitation to the October 26, 1994 scoping session for the proposed Kihei-Upcountry Maui Highway. Due to the temporary absence of Haleakala National Park Superintendent Don Reeser and several other key staff, we are unable to attend this session. However, we hope to be involved as consultants as the proposed development evolves. Please accept the following comments in lieu of our attendance at tomorrow's meeting.

Alternative 6 and 6A pass through or very near what is generally recognized by biologists as one of the most intact and diverse lowland dry forests remaining in the Hawaiian Islands that contains a number of listed or proposed Endangered plant species recognized by the US Fish and Wildlife Service, i.e., the Pu'u-o-kali lava flows. The other alternative to the west appear to pass through areas of relatively little known biological value and hence may be more acceptable from that perspective versus the alternatives to the east.

Direct displacement of dryland forests in this area by highway easements are not the only threats posed by the proposed development, however. Non-native plants and animals and the effects of wildland fire are other severe causes of loss. It is well known in Hawaii that the preponderance of wildland fires are human-caused. In general the native shrublands that persist in this region are nearly invariably found in areas of rough 'a'a lava. However, the fire history of the past 50 years has shown that even in these discontinuous fuels, fire fed by surrounding or intermixed flash fuels (principally alien grasses and kiawe) burns aggressively inspite of barriers more than 60 feet wide, e.g., Honopiilani Highway. Increased public access to areas that are peripheral to dryland forests may affect them by increasing fire frequencies in the region -- a severe perturbation.

Our assessment that the more western alternative routes may be "generally more acceptable" from a biological perspective is somewhat subjective, because these are private ranchlands without easy legal access. The private lands are largely unexplored and relictuall populations of endangered species may be found among any of the proposed routes. Hence these areas largely lack the basis of biological survey which would allow approval or disapproval of particular routes on that basis. Scientists of the National Park Service and the National Biological Survey have a strong interest in assisting exploration of the proposed alternatives so that values at risk can be identified and appropriate mitigation efforts made in the planning and route selection process.

Road planners recognize that without stringent limited-access rules road development is the purveyor of a sequence of growth. We recommend considering the proposed roadway carefully so as to centralize development, thereby providing some protection to Maui's rural and wild areas.

Sincerely,

*Karen Ardoin*

**U.S. Department of the Interior, National Park Service, Haleakala  
National Park**

1. The information about the lowland dry forest, a resource containing a number of endangered plant species, is included in the Draft EIS. Alternatives 6A and 6B would have passed through or near this forest. However, both of these alternatives were eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E). The build alternatives addressed in detail in this Draft EIS would not affect individuals of endangered plant species in this forest. A botanical survey conducted for this project (see Sections 3.8.1 and Appendix J) found no other endangered or threatened plant species along the alternative alignments. Under Section 7 of the Endangered Species Act, the FHWA has determined that the proposed project will have no effect on listed endangered or threatened plant and animal species in the project area. The U.S. Fish and Wildlife Service has concurred with this determination.

MEMORANDUM

TO: ROGER C. EVANS, Administrator  
 Office of Conservation and Environmental Affairs

FROM: DON HIBBARD, Deputy State Historic Preservation Officer  
 State Historic Preservation Division

SUBJECT: National Historic Preservation Act, Section 106 Review of an Environmental Impact Statement Preparation Notice  
 Kihei-Upcountry Highway, Makawao District, Maui  
 Highway Project No HDPS-9203 (1) OCEA File No: 96-135

We have previously reviewed the preliminary plans for the proposed Kihei-Upcountry Federal Highway project, and submitted comments to R. D. Johnson (Memorandum dated October 20, 1994). At the time of our review, eight alternative highway corridors were proposed. The number of potential corridors is now ten, however, the project location region has not been substantially modified.

The information provided in the final EA regarding historic and archaeological resources (3.36, page 15) is extracted primarily from our memo to Mr. Johnson. Regarding the process of identifying significant historic sites that may be impacted by the project, the EA states that "An archaeological inventory survey would be required to determine the potential level of project impacts on archaeological resources" (page 15). It is not stated in the EA whether the inventory survey will be conducted as part of the EIS.

While we agree that an archaeological inventory survey will be required once the road corridor is selected, it is not cost effective to have an archaeological inventory survey of each road corridor alternative. It would be far too expensive. Instead, we have recommended that an overview study be conducted as part of the corridor selection process, with a survey to follow later for the selected corridor. The overview should be included in the EIS, assuming a highly expensive inventory survey of all corridors is not being planned as part of this document.

Roger Evans  
Page 2

The overview study would basically (1) review archival records and review prior archaeological survey work in the corridors and in adjacent and similar environmental areas, (2) and then predict likely land use and historic site patterns for prehistoric/early historic times and later 1800s times, so types of sites and densities of sites can be predicted for each corridor, (3) determine if some corridor areas have had their land surface extensively altered, making the survival of sites unlikely, and (4) determine through prior archaeological studies and through new aerial reconnaissances and/or brief foot reconnaissances if the predictions of the remaining corridors are accurate. This would provide a basis for evaluating likely site patterns and densities in each corridor and for selecting the final corridor. Some interviews with knowledgeable Hawaiians who are familiar with past land use of the region would also help in this overview, so traditional cultural places and/or archaeological sites that might have considerable significance could be identified. Final corridor selection can take this issue into consideration.

Thus, we urge the Department of Transportation to conduct an overview study as part of the corridor selection and feasibility process. The overview study should be included among the documents available for public and agency review prior to the final corridor selection. An archaeological inventory survey would then be conducted for the selected corridor area.

As a state funded undertaking, the project must comply with Chapter 6E, H.R.S. Also, as a federally funded project, the Kihei-Upcountry Highway project must comply with Section 106 of the National Historic Preservation Act. We recommend that DOT and FHWA coordinate with our office as soon as possible, so state and federal compliance concerns can be met in a timely and cost-efficient manner.

KD:jen

Historic Preservation Division**

1. Archaeological and historical reconnaissance surveys were conducted on the alternatives considered in the Draft EIS, as recommended by the commentor, and the results are provided in Sections 3.10 and 4.10, and Appendix I. An inventory survey will be conducted on the Preferred Alternative to be identified after issuance of this Draft EIS.
2. The recommended scope of work provided by the commentor was used in the project's archaeological and historical reconnaissance surveys.

Honolulu, Hawaii 96813-5097

Dear Mr. Hayashida,

Subject: Environmental Impact Statement Preparation Notice for the  
Kihei-Upcountry Maui Highway

Thank you for the opportunity to review the subject document. We  
have the following comments.

**State of Hawaii, Office of Environmental Quality Control**

1. As described in Section 4.11, the proposed project would improve access to Haleakala National Park. According to a Park official, approximately one million people visit the summit annually, an already substantial number in spite of the circuitous route many visitors must travel. However, the direct influence of the proposed project on the number of visitors who visit the summit would be less than the overall health of Maui's visitor industry.
2. The impacts to existing communities and neighborhoods in Upcountry are discussed in Section 4.3.1.
3. Land use development impacts are discussed in Section 4.1.1. The project's consistency with the existing community plans is discussed in Section 4.1.2.2c.

1. The proposed highway is expected to increase visitor traffic to the Haleakala National Park. The Draft Environmental Impact Statement (EIS) must analyze the impacts of this project on Haleakala National Park.

2. The proposed highway would facilitate access to Upcountry Maui and affect the character of the existing residential areas. The Draft EIS must examine the impacts of the roadway on the existing communities in Upcountry Maui.

3. The proposed highway would provide potential access to new areas and increase the use of lands adjacent to the roadway. The Draft EIS must analyze the extent of development with and without this new roadway. Please also determine the significance of these impacts in relationship to the existing community plan.

If you have any questions, please call Jeyan Thiruchanaran at 586-4185. Mahalo.

Sincerely,

Gary Gill  
Director

RE: Kihei - Upcountry Road

Mr. Kazu Hayashida  
Director, State Dept. of Transportation  
869 Punchbowl St  
Honolulu, HI 96813

Dear Mr. Hayashida:

My personal preference is that a Kihei-Upcountry road not be built. The money should be used to improve the existing roads. Maui needs this road about as much as a whale needs a bathing suite. I could not attend the meetings. I wrote for a map showing the proposed routes but I have not received it yet. I wanted to get in my comments before the deadline, so . . .

1. Roads from the Airport to Kaanapali and Kihei need to be 4 lanes.
2. Something needs to be done about the terrible design of the Hana/Dairy Road area. Ever try to make a left out of K-Mart? There needs to be a left turn lane from K-Mart all the way to Hana Highway.
3. And my personal pet peeve: to get to Kanaha Beach Park via the shortest least congested route from east Maui, I have to travel around the airport loop. Why can't Aalele Street cross Keolani Place and connect directly to Amala Place?

If a road must be built Please, Please, Please. Please. Don't have it connect anywhere near lower Pukalani or "5 trees" (Haleakala Hwy - Kula Hwy). There is much to much congestion in that area already. The connection should be south of 377 - 37 (south of Naalea Road). Over a million visitors a year visit the summit of Haleakala, most coming from Kihei-Lahaina. This will give them an alternate route and spread out traffic so no one road is totally impacted. Mile 14.5 on Hwy 37 looks good to me for a connection point if it must be done.

Thanks for listening. Good luck.

Sincerely,

Robert M. Butterfield

1. The improvements suggested are included in the Maui Long-Range Land Transportation Plan (February 1996) and are therefore included in this project's No Build condition.
2. The alternative suggested is similar to Alternatives 6a and 6b (see Section 2.2.1). These two alternatives were eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because they had inadequate benefit-cost ratios.

November 2, 1995

Mr. Kazu Hayashida, Director  
State of Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida:

We wish to add our voices to the many in our community who strongly object to the proposed Kihei-Upcountry Highway Project on Maui. Taking the list of "Purposes of the Project" in your order, following are our opinions:

1. The defense-related activities in Kihei and Science City on Haleakala will never involve the number of personnel to justify the expenditure of \$32.7 million to \$72.8 million! When speed of transport is necessary helicopters can and will be used. The legislative mandate, if such has been passed, is in error and should be repealed.
2. A roadway linkage to Kihei will encourage the growth of a suburban bedroom community to Kihei while destroying the last agricultural area for small farmers left on Maui! Our farmers and their produce are important to Hawaii. There is no question that many small farmers will not be able to survive the economic impact of the growth that would ensue.
3. The existing transportation demand and capacity for Upcountry is just fine. There are no traffic delays on Kula Highway since the Pukalani Express opened. Putting in a Kihei link will create a capacity problem.
4. Economic development is addressed in #2. Upcountry needs to be protected from regional growth of population and tourist activities to protect the agricultural jobs!
5. With funds for human services, education, control of crime, etc. being severely cut or removed, this is not the time to build new highways. There is great need for improvement of highway service from Kahului and Kihei to Lahaina. Should a severe storm, a tsunami or an airplane crash occur, those arteries would be paralyzed...as they have been from simple traffic congestion in the past.
7. It is clear that the "Purposes of the Project" are diametrically opposed to the life of Upcountry Maui as a rural-farm community. It is equally clear that the work of your department is needed elsewhere. Our plea is for reason to prevail in the protection of Upcountry and that sound planning and work be done to correct existing problem areas.

Sincerely,

*Robert M. Butterfield*  
R. Douglas Crowe

cc: Sen. Daniel K. Inouye

*Ann F. Crowe*  
Ann F. Crowe

**R. Dougal and Ann F. Crowe**

1. The Draft EIS does not contain information on the number of workers traveling between the Maui R&T Park and Science City. However, this number is probably very small in comparison to the one million visitors who travel to the summit annually, and residents who travel between their Upcountry residences and employment/recreation areas in Kihei-Makana and West Maui. These latter two travel markets would benefit from a Kihei-Upcountry Maui Highway, with improved transportation for workers traveling between the Maui R&T Park and Science City being a byproduct of the new road.
2. Potential land use development impacts are discussed in Section 4.1.1. Potential impacts to large agricultural businesses and the small Kula farms are discussed in Section 4.2.1.
3. Section 1.2.3 describes the existing traffic conditions at major intersections and roadway segments along the route between Kihei and Upcountry. As described in Section 4.4.1.1, the proposed project would improve overall regional traffic conditions because the new highway would divert a large portion of the travel demand that would have used the Haleakala Highway-Kula Highway-Mokulele Highway route between the Kihei and Upcountry regions.
4. As described in Section 1.2.2, economic development activities are expected to occur in the Kihei-Makana and West Maui regions, as part of efforts to expand Maui's visitor industry and to diversify its economy by developing high technology industries. None of these economic development activities are being proposed in the Upcountry region where agriculture is expected to remain the primary source of employment. However, the Upcountry region, particularly the Pukalani, Makawao and Haliimaile areas, is expected to accommodate more residences. Therefore, the link between Upcountry's residential communities and the employment centers of Kihei-Makana and West Maui will become more important in the future.
5. Highway projects are funded by federal and State fuel taxes. By law, these funds can only be used for highway projects and operation. Highway funds cannot be used for non-highway purposes, and therefore highway projects do not compete against other government services, programs and projects, such as education, crime control, etc.
6. The Maui Long Range Land Transportation Plan includes widening sections of Honoapiilani Highway and construction of a Lahaina Bypass. Both projects are considered part of the proposed project's No Build Alternative.
7. The project's purposes and needs, as described in Chapter 1, are based on existing and future travel demand, land use and economic development patterns, defense-related needs and the need to increase evacuation capacity of the Kihei-Makana region. However, it is understood that in achieving or satisfying these purposes and needs, the highway could have adverse effects on the "rural-farm community" of Upcountry. It is, therefore, the purpose of the Draft EIS to disclose

all potential impacts as best as possible so that full information is available prior to identification of the project's Preferred Alternative.

Department of Transportation  
State of Hawaii  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida

Re: Kihei-Upcountry Highway

We support the Department's proposal to link the Upcountry area with Kihei, however, we have some reservations regarding alignments 4A and 4B. Based upon the map provided in the Environmental Assessment, it appears that these alignments pass through TMK 2-3-8-05. We are currently under contract to purchase this property. This parcel has been urbanized and zoned (R-2, PD, and MF) since the late 1970's. It would be more beneficial to the State to route the highway through non-urbanized lands, thus, lowering the cost of right-of-way acquisition.

Thank you for allowing us to comment on this project. Please call me if you have any questions regarding our position.

Sincerely,

Don Fujimoto  
Vice President

Draft Environmental Impact Statement

Responses to EISP Comments

Dear Sir,

As a resident of Kula for  
twenty-eight years my comment  
is we have no new highway.  
My choice if we were to make  
one choice it would be to connect  
close to Puukalani # 8.  
It seems the most CENTRAL  
and cost effective.

Please don't ruin Kula side  
the rest of the island has been!

Please keep me posted w/  
all news of this project.

Thank you,

Sincerely,

Jamie Fenseca

1. Alternative 8 was eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because it is constrained to an existing government right-of-way that does not conform to modern highway design standards.
2. Your name has been placed on the project mailing list. You will receive the Draft EIS and information on the scheduling of the project's public hearings.

# HAWAIIAN COMMERCIAL & SUGAR COMPANY

P. O. BOX 266, PUUNENE, MAUI, HAWAII 96784

October 17, 1995

Mr. Kazu Hayashida  
Director  
Department of Transportation  
State of Hawaii  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida:

Re: Proposed Kihei-Upcountry Maui Highway Project  
Environmental Assessment

Thank you for this opportunity to provide comments on the Kihei-Upcountry Maui Highway Environmental Assessment. My name is Richard Cameron, Executive Vice President and General Manager of Hawaiian Commercial & Sugar Company (HC&S). HC&S cultivates 36,000 acres of sugar cane here in the central valley of Maui.

Allow me to highlight a few of our general areas of concern at this time and leave with you an attachment which more fully describes our concerns with several of the proposed alignments for this proposed highway.

We find that the Environmental Assessment fails to adequately address the impacts the several of the proposed alignments will have on HC&S' farming activities. In particular, alternatives 1,2,3, and 8, which dissect HC&S' fields, roadways, irrigation systems and drainage systems, in addition to taking cane land out of production, will significantly disrupt our operations. The result will be the need for operational changes by HC&S which will be extremely costly and will decrease our efficiency. Accordingly, mitigating measures will be needed to keep HC&S "whole". The Environmental Assessment fails to identify and address these costs, which should be considered as costs of the highway project, in addition to the cost of acquiring the right-of-way itself.

OCTOBER 20, 1995  
LADIES AND GENTLEMEN:

I WISH TO EXPRESS MY STRONG SUPPORT FOR ANY KIHEI TO UPCOUNTRY HIGHWAY.

I DO WANT TO ADD THAT I HOPE THAT ANY SUCH ROAD WILL CONNECT KIHEI WITH THE KULA HIGHWAY, TO MAKE THE MOST DIRECT ROUTE POSSIBLE FROM KIHEI TO THE SUMMIT OF HALEAKALA, AS WELL AS AFFORDING EASY ACCESS TO UPPER KULA AND ULUPALAKUA.

IT IS TIME FOR US TO FACE THE FACT THAT THIS IS 1995, AND THAT WE DO OURSELVES AND OUR CHILDREN A GREAT DISSERVICE TO IMPEDE PROGRESS.

THE POPULATION OF MAUI MUST CONTINUE TO GROW AT LEAST AS FAST RELATIVELY AS THAT OF THE REST OF THE USA. HOUSING WILL BE NEEDED AND IT IS LOGICAL THAT MORE AND MORE PEOPLE WILL NEED TO LIVE UPCOUNTRY.

A KIHEI TO KULA DIRECT ROAD WILL EASE TRAFFIC PRESSURE ON HANSEN ROAD, DAIRY ROAD, THE MOKULELE HIGHWAY, AND THE HALEAKALA HIGHWAY.

LET US FACE THE FUTURE AND MOVE INTO THE TWENTY FIRST CENTURY.

YOURS TRULY,

DENNIS EDWARD BELL  
PRESIDENT

Kihei-Upcountry Maui Highway  
Environmental Assessment

The Environmental Assessment illustrates ten alternate roadway alignments for the proposed highway. Alternatives 1, 2, 3 and 8 would have a serious effect on HC&S' operations.

Alternative 1 -- From Haleakala Highway at Haliimaile Road to Piilani Highway at Kaonoulu Street.

- a. Land area for right-of-way is 116 acres; transverses 6 miles through HC&S property.
- b. This route crosses six primary (paved) hauler roads and two secondary hauler roads.
- c. This route crosses the Kahikoa Ditch, six small ditches and numerous drip irrigation pipelines.

Alternative 2 -- From Haleakala Highway at Haliimaile Road to Maui R&T Park at Kihei.

- a. Land area for right-of-way is 78 acres; transverses 4 miles through HC&S property.
- b. This route crosses one primary (paved) hauler road and two secondary hauler roads.
- c. This route crosses three small ditches and numerous drip irrigation pipelines.

Alternative 3 -- From Haleakala Highway, between Haliimaile Road and Pukalani to Piilani Highway at Kaonoulu Street.

- a. Land area for right-of-way is 78 acres; transverses 4 miles through HC&S property.
- b. Hamakua Ditch -- This alternative passes close to the Hamakua Ditch. Serious costs associated with its relocation or replacement by a pipeline. Large siphon pipes cross two deep gulches and some long tunnels pass under pineapple fields. Several existing drip irrigation systems would be adversely affected if the ditch was relocated at a lower elevation. If the highway is located directly below the ditch, several existing drip irrigation pipelines, filter stations and pump stations would be affected.

For example, throughout Section 3.0, impacts, HC&S' sugar operations appear to be ignored as an existing "agricultural activity" in the subject (impacted) areas. Section 3.3.3, Farmlands, makes no mention of sugar as a major crop in the area. Just as the alignments which transverse grazing lands are identified, it should be pointed out that alignments which 1,2,3, and 8 transverse lands currently being cultivated in sugar. Additionally, the conclusion stated in Section 3.1, that "agricultural, social and economic activity may be enhanced by providing a more direct route between agricultural areas and the Kihei urban center" is completely untrue for HC&S. In fact, just the opposite is true -- HC&S prefers a highway route that does not divide our agricultural operations.

Accordingly, we request that the potential impacts on HC&S' existing operations be addressed in the Environmental Impact Statement for this project and that HC&S be consulted and recognized in the preparation of the EIS. Mitigating measures should be identified in the EIS, as these will be bona fide costs of the respective alignments. We offer Attachment 1 to this testimony as a summary of the impacts to HC&S of four of the identified alignments.

We look forward to future discussions with the DOT and its consultants on this proposed highway project. We believe that by working together, we can identify an appropriate roadway alignment which will benefit all parties -- farmers, residents and businesses on Maui. The over 1,000 farmers at HC&S have an important stake in the chosen alignment.

Thank you for this opportunity to express our concerns.

Sincerely,

Richard F. Cameron  
Plantation General Manager

Alternative 8 -- Route is along "old government right-of-way" from Haleakala Highway to Mokulele Highway.

- a. Land area for right-of-way is 165 acres, transverses 8.5 miles through HC&S property.
- b. This route crosses four primary (paved) hauler roads and one secondary hauler road.
- c. This route crosses the Hamakua Ditch, the Kauhikoa Ditch, the Lowrie Ditch, five small ditches and numerous drip irrigation pipelines.

In each of the above mentioned alternatives, the disruption would require mitigative measures such as:

- Land for right of way -- HC&S' lands needed for the highway would be "prime" agriculture land that will need to be purchased.
- Splitting of fields -- Compensation for the increased cost of field operations due to the additional hauling time mileage, concrete crossings for haulers and tracked equipment. Field isolation and possible abandonment may also have to be compensated for.
- Cane hauler roads intersects -- There will be a need for underpasses or traffic lights at these hauler roads to minimize hauling delays and provide a measure of traffic safety. Additional cane hauler roads that are parallel to the new road may be necessary.
- Proximity to highway -- Compensation for the additional costs of operation to control dust and cane smoke and the potential to restrict the use of chemicals currently being used would reduce operating efficiencies.
- Irrigation system intersects -- Several pipelines, ditches, supply lines and mainlines would need to be relocated and cross the new road.
- Drainage -- These highways will cross at least three major gulches, Waiakoa, Pulehu and Kaliainuji Gulches, and several smaller ones which will require the State to build bridges to traverse these gulches adding additional cost to these projects.

### Hawaiian Commercial & Sugar Company (HC&S)

1. Alternatives 1, 2, 3 and 8 were eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E). Alternative 1 was eliminated because this alternative would produce a substantially greater displacement of cultivated fields than any other alternative. Alternative 2 was eliminated because it would bifurcate the Maui Research & Technology Park. However, modifications to this alternative (Alternatives 2B and 2C) were developed in response to this and other letters from HC&S. These two alternatives are still under consideration (Alternatives U1,K1 and U1,K2). Alternative 3 was eliminated because of its poor operational aspects and because it would displace a substantial amount of cultivated fields. Alternative 8 was eliminated because it is constrained to an existing government right-of-way that does not conform to modern highway design standards.
2. The impacts to HC&S sugarcane land are discussed in Section 4.2.1 and measures to minimize or mitigate impacts to sugarcane operations are discussed in Section 4.2.4. The costs of these measures are included in the cost estimates presented in Section 2.1.2.3.
3. Additional consultation with HC&S was conducted during the preparation of the Draft EIS. Information provided by HC&S in this and other letters, and through consultation, was valuable in preparing the Draft EIS. While Alternative U1 still adversely impacts HC&S, it has been refined to reduce somewhat the level of impact.

## Kihai-Upcountry Highway Project Maui, Hawaii

State of Hawaii • Department of Transportation • Highways Division  
U.S. Department of Transportation • Federal Highway Administration

### About the Project

The Hawaii Department of Transportation and the Federal Highway Administration (FHWA) are sponsoring the construction of a rural, limited access arterial roadway that would connect the coastal area of Kihai to the Upcountry area of Maui. The proposed 15.4 kilometer (9.6 mile) highway would link the coastal area of Kihai (Piilani Highway) to Upcountry Maui at either Haleakala Highway or Kula Highway. The highway would be generally aligned in an east-west (mauka-makai) direction (see map). Two lanes of an ultimate four-lane highway is being proposed for initial construction. *WONDERFUL*

### Purposes of the Project

- FACTS*
- legislative mandate: provide improved connection between defense-related activities at the Maui Research and Technology Park and Science City at Haleakala.

- roadway system linkage: provide more efficient travel between the employment center of Kihai and residential areas upcountry.

- existing transportation demand and capacity: ease congestion and traffic delays

- economic development: support future regional growth of population, jobs, and tourist activities.

### What is Proposed

- an ultimate four-lane rural arterial that would connect Piilani Highway with either Haleakala Highway or Kula Highway within an area bounded on the east by Haleakala and Kula Highways, starting at the Haleakala/Haiimaile Road intersection, continuing south past the Kula Sanitarium, toward Ulupalakua, and turning northwest to adjoin Piilani Highway, the western boundary.

Ten alternative alignments are presently being analyzed. Based on potential impacts on social and economic activity, traffic, farmlands, air emissions, visual environment, endangered and threatened species, and historic and archaeological resources, DOT has determined that preparation of an environmental impact statement (EIS) is appropriate. *TIME IS MONEY*

### Major Project Milestones

Activity	Completion
• Planning	September 1996
• Design	1997 - 1999
• Construction	1999 - 2003

*ASAP*

### Comments

An Environmental Assessment has been issued, and the public comment period ends November 10, 1995. If you wish to comment, please mail or deliver comments to the following address:

Dear Mr. Au:  
Re: Your Invitation for Written Comments  
Highway for the Up-Country-Kihei Link

1 Thank you for your willingness to review comments for the above. We believe very strongly that the most important road to encourage and benefit tourism, ease growing traffic problems and help local residents and farmers is the COMPLETION OF THE PIILANI HIGHWAY AT WALLEA. The very short and relatively inexpensive road to complete the circle around Haleakala from Hana to Wailea will do more to satisfy our tourists than any other project. On the other hand, each day of delay means a growing number of disgruntled visitors, particularly after a long day of driving to Hana, Kipahulu and Ulupalakua. Best estimates are that there are about 12,000 guests at the Tedeschi Winery a month. Many people could save an hour of driving time back to Wailea or Kaanapali with the Piilani extension.

The local people who work or play at Wailea from the Kula-Makawao area will also benefit with less traffic problems, shorter driving time, etc. Residents from South Maui and Lahaina will also benefit in going to see friends or relatives at Kula Hospital, visit Haleakala or going fishing on the other side. Farmers will benefit too.

It may be of interest for you to learn that the 85 year old road which connected Makena to Ulupalakua was closed in March 1984 because "TOO MANY TOURISTS BEGAN USING THE ROAD TO HAVE A TASTE OF WINE, AND THE COUNTY COULD NOT MANAGE TO MAINTAIN THE ROAD IN A PROPER MANNER. Liability was a major concern and Oil to bind the dirt together was too expensive in those days. Closing an existing road because too many people began using the road doesn't make much sense.

Yes, ultimately, a road from the Pukalani or Kula area down to Kihei makes sense. But we understand that such a project will require unforeseen difficult solutions.

In the meanwhile, the Environmental Impact Study completed on February 15, 1977 by Your Department and the U.S. Dept. of Transportation known as "PIILANI HIGHWAY PROJECT NUMBERS F-031-1 (4), F-031-1 (1) and F-037-1 (10) Kihei to Makena Road/ Kula Highway, Maui, Hawaii, provides all the answers. The study made sense in 1977, and today it is much, much stronger because of ever growing traffic problems with the greatly increased number of hotels, condos, tourists and residents of Maui. If you are unable to find a copy of this somewhat ancient study in your files, I shall be glad to make a copy of this 152 page Report to you.

Thank you for your consideration of this very important matter.

Very truly yours,

*Sam S. Hironaka*

Editor, Maui News

It is the goal of the ILWU to improve the life of its members, and at the same time, help our employers as well as the community in general.

According to the State Highway Dept. the road from Keokea to Ulupalakua was greatly improved recently - the first time in nearly 100 years, after the road was transferred from the County to the State last year. All that remains now is only a short 4 miles to hookup the Up Country Area to the growing employment center of hotels in Wailea.

We learned from the State DOT that the Piilani Highway was scheduled to be completed to Ulupalakua in March 1980 after the first section in Kihei was completed. The State Legislature appropriated more than \$7 Million in 1992 to complete Piilani to the Kula Highway.

The Benefits are many:

1. Up Country employees of Wailea will save as much as 68 miles each day from Ulupalakua; 52 miles from Keokea; about 40 miles from Kula and 15 miles from Pukalani and Makawao.
2. Our Tourists, whose goodwill and business we need to provide jobs to our members will love the short cut when they go to Haleakala and Hana. They will save 34 miles just one way, when they go around the island to Hana and return to Wailea.
3. Even the Maui HI Tech Park staff will save 25 miles round trip to Haleakala from Kihei. Tourists from Kaanapali will also save mileage and time when going to Haleakala and Hana.

Every car taking Piilani Highway will mean one less car to alleviate the traffic jams now on Pukalani and Mokulele highways.

We're for the Kihei to Up Country Road too. But it may be many years before we see the road. In the meantime, Piilani is easy, short and cheap by comparison. It goes through 100% pasture land. The right of way is all set. Basic engineering was done in 1977 when the EIS was completed and approved by both the Federal and State Highway Departments. The terrain is relatively smooth with no gulches. The uphill climb is good - it goes up to only the 1,800 ft. elevation at Ulupalakua. We, of the ILWU wish to preserve our sugar and pineapple lands for our workers and companies, and also to support our employees who work in the Wailea area. Preservation of farm lands for our farmers is a must.

The 4 Mile Piilani Extension is a WIN, WIN situation for everyone, including our construction workers who need jobs on Maui. We need the support of Everyone on Maui!

Kazu Hayashida, Director  
State of Hawaii Dept. of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813

Dear Mr. Hayashida,

I am writing with reference to the proposed Kihei-Upcountry highway project now under study. As a longtime resident of Kula in Upcountry Maui, I have had ample opportunity to observe the obvious: that a more direct link between the Upcountry area and Kihei/Makera would have a very considerable impact on the nature of the mainly rural and agricultural community which I call home.

I view the building of such a link as eventually inevitable, and I also think that there is much to the argument that the highway would put an end to the rural/agricultural nature of Kula, Keokea and Ulupalakua. There are very few residents or farmers in the area who want the road to bring to their community the urbanization that might ultimately occur. On the other hand, there are many residents of Makawao, Pukalani and Haiku who now commute daily to Kihei and who would very much benefit from a more direct link to their places of employment.

I therefore think very strongly that if the road must be built, it should be along the corridors set forth currently as Alternates 1, 2 or 3. There is hardly any useful purpose in spending far more money to produce a route which will divert traffic up into the Kula area and force the great majority of those who will use the highway to have to drive further up Haleakala in order to then go down to Kihei. Keeping the eastern terminus of the road close to where most Kihei-bound traffic now actually originates will best serve both those who use the road and those who wish to preserve the country character of the greater Upcountry community.

Thank you for reading and taking note of my views.

Sincerely,

David J. Baar  
Managing Director

1. Potential impacts to Upcountry's communities and agricultural activities are discussed in Sections 4.3.1 and 4.2.1, respectively.
2. The proposed project would not cause urbanization in Kula because development in Kula is constrained by water availability (see Section 4.1.1.2).
3. Alternatives 1, 2 and 3 were eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E). Alternative 1 was eliminated because this alternative would produce a substantially greater displacement of cultivated fields than any other alternative. Alternative 2 was eliminated because it would bifurcate the Maui Research & Technology Park. However, Alternative 2 was modified to Alternatives 2B and 2C, and these two alternatives are still currently under consideration and are now called Alternatives U1,K1 and U1,K2. Alternative 3 was eliminated because of its poor operational aspects and because it would displace a substantial amount of cultivated fields.

Re: Kihei-Upcountry Highway Project on Maui, Hawaii

Dear Mr. Hayashida:

The ILWU Local 142, Maui Division enthusiastically endorses the Alternative 4-B to the Kihei-Upcountry Highway Project. We have many members who live in the upcountry area who work in Kihei. This highway will be very beneficial to these members as well as for the economy of Maui.

We have looked at other alternatives but find that this Alternative 4-B will have the least amount of impact on our sugar cane lands.

Therefore, we would appreciate your support on the Alternative 4-B project.

Sincerely,

ILWU Local 142  
Maui Division

OPINION - IS THE MAUI NEWS

While I was in the Caribbean and Florida doing hurricane relief, I missed the two meetings on the Upcountry/Kihei Highway. However, there seems to have been a few unfavorable letters in the Maui News regarding this project and son people seem to think this is a brand new idea. Having been involved in road and traffic issues more or less for the past decade, I'd like to refresh some memories.

First of all, we recognize some bananas in the commentaries, (build almost nothing anywhere near anything). It is truly difficult to grant much credibility to such extremist.

Roger I. Knox of Kihei suggested that the Kihei Community Association or somebody conduct a survey of public opinion. I'd like to refer to the Final Report by the Upcountry/Kihei Task Force which covered a period of sixteen months, involved more than 70 people on the task force, and numerous public meetings. We did surveys out the wazoo! We surveyed hotel employees in South and West Maui. We surveyed all major businesses. We put a survey in The Maui News. We had about 1500 responses. There was, and I believe, continues to be almost unanimous support for this project. Those 1500 votes from people who would use the road, vastly outweigh the few nay sayers that are now showing up. The main contention was, and continues to be, the location of the terminus for the highway and it is absolutely necessary to consider all possibilities, even those that are blatantly ridiculous.

To recognize the need for this road, it is necessary to be a bit of a visionary. Maui is growing and it will continue to grow, hopefully in an intelligent, planned, managed manner. Someday we hope to have a four year college or university. Someday South Maui will need a High School. Someday we will need a second hospital. All of these projects could easily go above the R&T Park. And South Maui will soon have a 150 acre recreational park. It would seem reasonable that the people Upcountry would want, and should have, access to all of these facilities. The Upcountry/Kihei Highway would do that.

Of a more pressing nature, please consider the safety aspect of this Highway. For years I have preached about the extreme vulnerability of South Maui to catastrophe. If a large fire started in North Kihei, fanned by trade winds blowing South, it could easily block both S. Kihei Rd. and Piliiani. There is no escape route from Kihei. A fire of this magnitude is a possibility, and we do not have the resources available to control it. Remember the Oak and Fire consumed almost 4000 homes and apartments, and it can happen here. A highway to Upcountry leaving Kihei at the R&T Park or South of that point, would provide an exit route to save lives as well as access for fire fighters to get in front of the fire.

Also, if Maui takes a direct hit by a major hurricane, large sections of South Kihei Road will cease to exist, Piliiani Highway will be in constant grid lock and relief and recovery efforts will be severely impacted. An Upcountry/Kihei Highway would be invaluable in this situation. Similarly, the highway could provide an additional exit/access route for Upcountry disasters.

It is easy to be a nay sayer and throw verbal rocks. It is much more difficult to recognize the need for managed growth and appropriate disaster preparation, and to make it happen. Recognize also that the political and financial climate is changing drastically. If the Upcountry/Kihei Highway is not built now, in the future, the cost will be higher and the availability of funds will be considerably less. The Upcountry/Kihei Highway will be a long range benefit to Maui, expensive, but worth it.

Re: Kihei/Kula proposed highway

Gentlemen:

- 1 I would like to become a consulting party and go on record with the following comments about the environmental effects of the proposed highway:
  - 2 The routing of any proposed highway that would cross both Pulehu and Omaopio Roads would destroy the rural character of the area.  
  
The topography of the Pulehu and Omaopio areas is that of a natural amphitheater, such that all of the road and traffic noise would be clearly broadcast to the higher areas.  
  
At the present time, when any of the sugar cane fields are burned and harvested, you can distinctly hear the crackling of the flames and the squeaking of the heavy equipment operating over three miles away. All traffic noise would be similarly amplified.  
  
In addition, having a proposed highway bisect both Pulehu and Omaopio Roads would create a traffic hazard. You must understand that both Pulehu and Omaopio Roads are used by many farmers, either taking their products to market or moving heavy equipment from field to field. Farming requires heavy, slow moving equipment, which would make crossing a higher speed limit highway extremely difficult, if not extremely dangerous.
  - 2 The most important thing to understand about the proposed highway is that both Pulehu and Omaopio Roads are very narrow, winding roads that simply were not engineered or built to take the increased traffic that would feed into any new highway.

Department of Transportation  
Page two  
October 23, 1995

It is obvious that all Pukalani and Kula residents who live or work south of the Kula 200 subdivision would utilize either Omaopio or Pulehu Roads to gain access to any new highway, as it would be closer for them.

Traffic presently backs up at the bottom of Pulehu Road, at Hansen Road, and we could expect the same to occur at any intersection with the proposed new highway. Attempting to cross a 55-mile an hour highway would create a worse backup than the present crossing of a 35-mile an hour Hansen Road.

Please contact me if you have any questions regarding the above.

Very truly yours,

SECTION OF TRANSPORTATION  
HAWAIIAN GOVERNMENT

Hale D. Judson III

1. The U1 and U2-A alternatives connect with Haleakala Highway.
2. There is no central Kihei terminus option. Alignment alternatives ending at the Piilani Highway/Lipoa Street intersection, which is roughly in central Kihei, were considered earlier but dropped in the alternatives screening analysis (see Section 2.2.1 and Appendix E). Maui Research & Technology Park officials requested that the highway not bifurcate the Park, which would occur if the highway's Kihei terminus is at the Piilani Highway/Lipoa Street intersection.

To whom it may concern:

I am writing concerning the proposed Kihei road. We do need the road, and a lot of uncountry folks feel the same way.

(Like the idea of people from out in Haaleka and the Haliimaile Pogo benefiting from this road. Therefore, a route that starts on Haleakala Hwy and heads towards Kihei is the preferred route. This road will intersect this Highway via Camargo, Pulehu, or wherever it sees any feeder road, so those folks will benefit, too.

As far as the arrival in Kihei, I see many points on all sides. The long term will need to have a leg head towards the upcountry area, and so if there's central/bifurcate, Kihei arrival is the best.

Just know that it will be well used and appreciated by many people, upcountry and down.

Thank you for your consideration,

RE: New road between Kihei and Upcountry

Dear Dept. of Transportation:

I am strongly in favor of having this road completed as soon as possible. The newspaper coverage of the hearings made no mention of what I perceive as the most serious reason for having this road. Should Kihei ever be subjected to tsunami flooding, we would have no way of reaching other parts of the island. All of our grocery stores are in the flood plain, and could be wiped out. We need another road to provide us a way of exiting to higher ground in case of disaster.

Why are we looking a gift horse in the face. Lets take advantage of this wonderful opportunity to expand our road system with help of federal funding and reap the fringe benefits of opening a new part of the island for sightseers, visitors and residents. Kihei deserves this. We are the last community on the island to get a public swimming pool and a decent community center and decent school buildings. Please don't deprive us of this chance to bring increased infrastructure to our area with the help of the federal government funds.

Aloha from Maui,

*I favor the route from Makena to Keolu area but would support any of the alternative routes*

CENTRAL REGISTRATION  
HONOLULU, HI 96813

Ladies and Gentlemen:

I strongly support a Kihei to Upcountry, Maui Highway.

There are so many reasons why I feel this is urgently necessary. The population on Maui is only going to increase. Over the past 20 years I have seen amazing growth, and unfortunately a tremendous lack of planning for this growth.

We rely and encourage tourism as a lead source of our economy. With these tourists come huge numbers of automobiles on the road, and accidents due to sightseeing. To be able to by-pass the lead roads for Kamaina's--so they can just drive to the Crater and beyond--quickly from their hotels in Kihei, would significantly reduce highway deadlock, and I believe road fatalities and insurance claims (thereby lowering rates--hopefully).

Now with the Hawaiian land claims on the planned new extension by-passing Dairy Road by the new shopping center, the traffic lights on Dairy Road and Hana Highway should be unpassable during AM & PM commutes times, as well as the lunch hour....Which basically means only a few hours per day, will traffic flow normally through that section. By opening the Upcountry road---we could re-route a significant number of vehicles.....The land debate could continue for years, but not be intolerable. (Plus better negotiating for the state on land swaps--if it isn't urgent).

I will be joining many Upcountry residents soon, and hope to one day soon save the 45 to 60 minutes I will be forced to drive by driving so far around.

Please guide us into the 21st Century safely and efficiently, by extending Lipoa Road up from the Research and Tech park in Kihei to Kula in the most direct and cost efficient manner. If you have a better plan -- I will support the one that goes in the fastest.

I encourage you to do this Now----Not in ten years. It will create much needed jobs and lessen the impact on our environment (via reduced gas purchasing, shipping and pollution). Please plan for planting of trees and bike pathways. (Link to Kihei 2000 and the Kealahou (Student benchmark project)).

HIGHWAYS DIVISION  
PLANNING BRANCH

November 10, 1995

Mr. Kazu Hayashida, Director  
State Dept. of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida,

Thank you for this opportunity to allow our Association to offer input on the proposed Kihei-Upcountry Highway. Our board of directors has been canvassing our community for opinions on the different alignments and options. Our current conclusions are very similar to the recommendations we submitted to the SDOT on 10/10/94 (copy enclosed). We found support for a single alignment, the 'NO BUILD' option, along with a (TSM) and Public Transit Alternative. We also came up with varied comments on the Environmental Assessment of this project.

Please allow us to continue with our observations and suggestions.

We understand the reasoning behind the 'Legislative Mandate', and agree the defense-related activities at Science City and Kihei's MRT Park should have no bearing on preference on which alignment is studied. Even the 'no build' option should qualify for the funds by getting the workers to and from the summit in a safer and more efficient manner.

We believe that a new highway between Kihei and Upcountry would greatly improve the traffic flow up and down the mountain. We also agree that the 'NO BUILD' road improvements and a future public transportation system would do the same, and more likely be the logical first step to take. Public transportation might only help a small percentage of the commuters, but it would guarantee to eliminate thousands of rented cars, adding road room for years to come.

Our board had trouble with the high estimates of growth stated in the E.A. from 1987 to 2010, jobs on south side up 83%, population Upcountry up 41%, and the visitors count up 122%.

In the past 8 years unemployment has doubled, hotels and many other businesses have streamlined operations, laying off many workers. Along with a fairly flat tourism market, no new hotels are being planned for the future for the Kihei-Wailea-Makana area. Most agree that the more Maui is developed the sooner our visitor counts and related jobs will stabilize, not increase.

Growth Upcountry in the Kula to Ulupalakua region will be restricted because of the lack of water. Hawaiian Homelands, farmers, and drought protection for the current residents are the priorities for any future water source development.

4 | Maui's real attraction is its open space. Our parks will hopefully be protected and increase in size and number, but our Ag lands; sugarcane, ranches, and truck farms are the most important assets of our unique community for the resident and visitor alike. We all must consider the trade-off if this highway is plotted through these areas.

5 | In our current Upcountry Community Plan Recommendations, commercial and light industrial lands are being designated to supply jobs and services to limit the need to travel down the hillsides. We also expect a major increase in home run businesses. This concept of Upcountry becoming a more complete community is a realistic one.

6 | Our Board of Directors has concluded that we would support only the alignment connecting Haliimaile Road and a northerly connection in Kihei, with conditions. We are concerned as many residents and farmers are that this alignment will cause unsafe and undesirable traffic to filter off the new highway onto Omaopio and Pulehu Roads. This potential impact would have to be resolved with those concerned to gain our full support.

8 | Our Board of Directors has also concluded that we support a 'No Build' Alternative as stated in the Maui Long-Range Plan. We believe all of these road improvements should be studied and funded except for one, Alternative 7 (Piihoni Highway to Ulupalakua). The State should in no way consider this connection within the No Build plan, or otherwise. Our Association and community have voiced steady opposition to this roadway, knowing full well the major social impacts it would cause. Our serene low density agriculture areas would experience a change in character threatening our country communities across the mountainside. Those few that support this road alignment can never justify the harm it would do.

We hope these thoughts and recommendations help clarify some areas that we believe to be important, and possibly overlooked in the assessment of the Kihei-Upcountry Highway Project.

Sincerely,  
  
Steve Sutrov, President  
Kula Community Association

**KULA COMMUNITY  
ASSOCIATION**

October 10, 1994

Mr. Rex Johnson, Director  
State Dept. of Transportation  
869 Puneh Bowl Street  
Honolulu, HI. 96813-5097

Subject : Kihei-Upcountry Maui Highway  
Project # HDPS-9203 (1) HWY-PA 2.2552

Dear Mr. Johnson,

Thank you once again for inviting the public into this important process. Our Association appreciates the opportunity to further study this project along with the DOT and all those who might benefit. We know this plane will never fly without widespread community acceptance. To achieve this acceptance it must be shown to benefit the many residents who travel down to work daily in a safe, efficient direction. Military purposes, visitor traffic, and definitely Hawaiian Home Lands are all important concerns, but loosing our small farms, awakening our rural communities of Omaopio, Keokea, and Waiakoa with the screams of development and transient traffic flows will be unacceptable to all but a few who live on this mountainside.

CONDITIONS OF OUR SUPPORT

We stand ready to support a final alignment only if:

1. The highway benefits the main upcountry resident commuter population base ( Pukalani, Makawao, Haiku )
2. Impacts to the future Socio-Economic environment of Kula is minimal
3. The route is safe and efficient (overpasses and underpasses, where needed.)
4. Small farms and residents will not be displaced or disadvantaged
5. The route connects directly with Halealaka Highway ( to eliminate the potential use of many narrow, steep, neighborhood roads as shortcuts.
6. The Kihei termini should be located to aid Westside commuters and a future spur road access to the Hawaiian Homes Development if possible.

General Comments, Concerns, and Information On Schematic Plan of Alternative Alignments (W. Unemori Map Revised Aug. 19, 94)

ALT 1, 2, & 3

These routes would satisfy most of our conditions if all intersections were made to be safe. The Kula C.A. would favor them in numerical order.

Alt. 1 only intersects Pulehu Rd. and intersects directly into Haliimaile Rd, routing traffic from Makawao and Haiku straight to Kihei.

Alt. 2 crosses both Pulehu and Omaopio but intersects with Haliimaile Rd.

Alt. 3 would not benefit as many people, lacking the efficiency of 1 & 2, crossing both Pulehu and Omaopio, also not connecting with Haliimaile Rd, but again meeting most of our conditions

Alt 4, 5, 6, 7

These suggested alignments would fail to meet most or all of the Kula C.A.'s conditions of support for the Kihei / Upcountry Highway

With much thought and debate the Kula C.A. concurs with the:

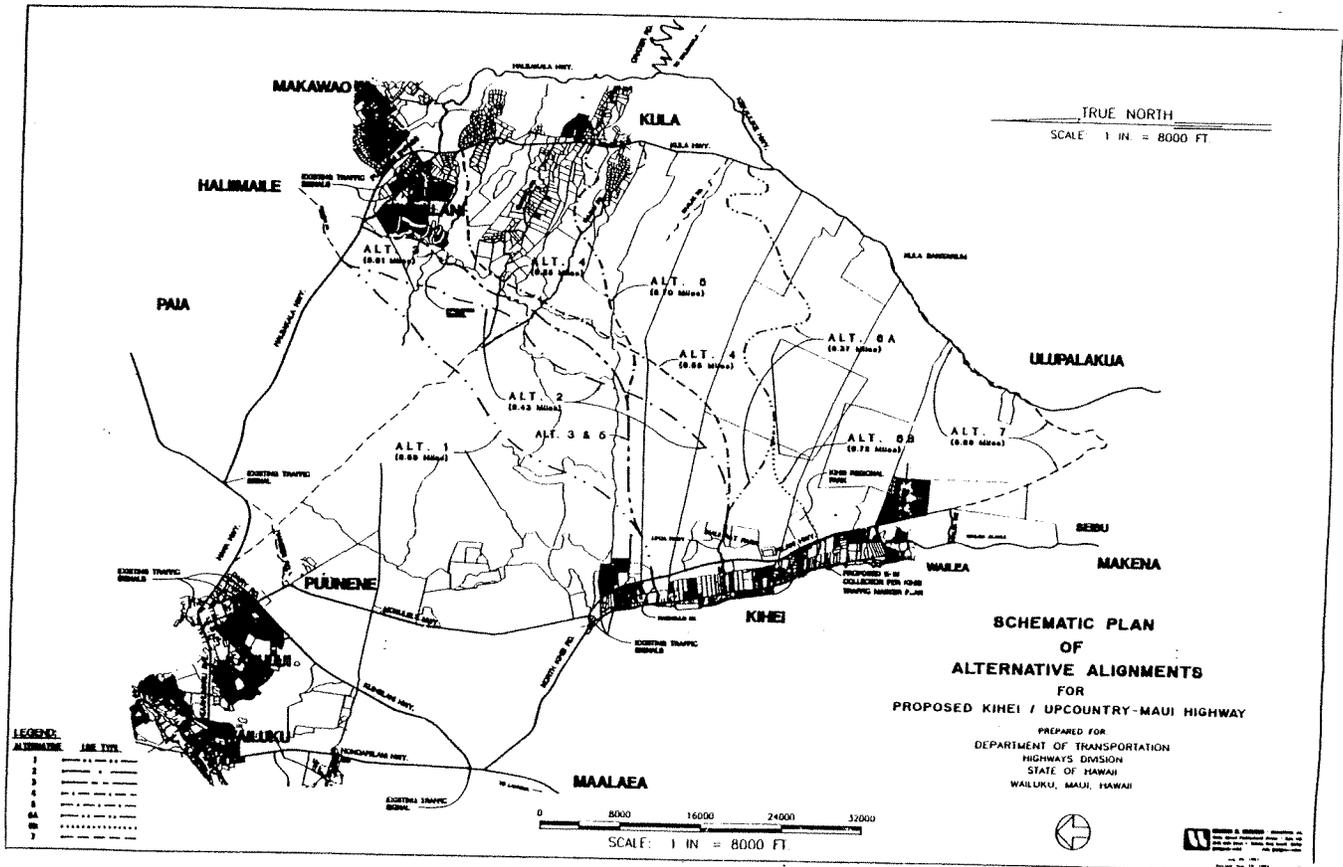

Distinguished members of the Makawao / Pukalani / Kula Citizens Advisory Committee (Re.Kihei / Upcountry Highway) And

The Maui County Planning Departments recommendations of the revisions of the M.P.K. Community Plan Update (Re.Kihei / Upcountry Highway.

That :

Kihei-Upcountry Highway: The proposed highway between Kihei and the Upcountry region is significant in terms of its land use and transportation impacts. The CAC recognized that the selection of an alignment must consider the growth inducing impacts to the region's agriculture, rural character and open spaces. The need to maintain the unique Upcountry ambiance is an essential parameter in analyzing alternative routing schemes. Recognizing that the evaluation of alternatives should weigh transportation costs and benefits as well as community and land use impacts, the CAC recommends that the Upcountry terminus intersect Halealaka Highway in the vicinity of Hali'imaile Road. The CAC further recommends that a spur off of the proposed Kihei-Upcountry Highway be provided to facilitate access to the Department of Hawaiian Home Lands development area.

The Kula C.A. also agrees with both the Upcountry CAC and the Maui Planning Dept. that the Makana-Ulupalakua Connector road be dropped as a capital improvement project thus, all planning, design, and funding be suspended. ( ALT 7 )

We also believe this route ( ALT 7 ) would benefit very few, worsen traffic safety, disrupt quiet communities, and only benefit visitor traffic and private landowners.

Some citizens in our association do believe the losses outweigh the gains connecting these mauka and makai communities, and funds should be used to improve existing roads and highways to aid the traffic flow between Upcountry and the South / West Side. The Kula C.A. also believes this is a realistic alternative and should be studied.

The Kula Community Association has followed the Upcountry Highway discussions through the Toll Road concept of former Mayor Tavares (Dec. 1990) and the hard work of the Upcountry / Kihai Highway Task Force. We are full aware of the importance of choosing a workable alignment versus one plagued with problems or weighted by special interests.

Thanks again for listening, and could you please forward the origin / destination studies and any reports filed to you on this project to help us stay current.

Much Aloha  
Sincerely,

Steve Sutrov  
President,  
Kula Community Association

**Kula Community Association**

1. The transportation systems management (TSM) alternative, which includes improvements to Maui's para-public transit system, was eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because it would not satisfy the project's goals.
2. The projections in the environmental assessment were taken from socioeconomic forecasts prepared for the County of Maui in 1994. Since that time, State of Hawaii Department of Business, Economic Development and Tourism (DBEDT) completed their year 2020 projections, which are an update of previous projections for the year 2010. In comparing both projections for the year 2010, the County population, employment and daily visitor census projections are 35 percent, 5 percent, and 14 percent higher than the DBEDT projections, respectively. Therefore, the comment is justified in questioning the County of Maui projections. However, more recent DBEDT projections indicate that the county's population, employment and daily visitor census would still increase substantially, by 22 percent, 25 percent and 52 percent from 1990 to 2010, respectively.
3. We agree that water availability has historically and will continue to be the major constraint to development in Kula (see Section 4.1.1.2).
4. One of the impacts of the proposed project is the conversion of open space, currently used for sugarcane and pineapple cultivation and cattle grazing, to a paved roadway (see Section 4.1.1).
5. Travel demand between Upcountry and the rest of Maui for employment, shopping, or other trip purposes is still expected to remain relatively high for the foreseeable future because no new major employment centers or commercial facilities are being planned for Upcountry, except those within the proposed Kulamalu development.
6. Both an Upcountry terminus at the Haleakala Highway/Halimaile intersection and a Kihei terminus at the Pili'ani Highway/Kaonoulu Street intersection are still under consideration.
7. Potential impacts to travel patterns on Omaopio and Pulehu Roads are discussed in Section 4.4.1.1. Possible mitigation measures to address these impacts are described in Section 4.4.4.
8. Alternative 7 was eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because it has an inadequate benefit-cost ratio.

DIRECTOR'S OFFICE  
DEPT. OF  
TRANSPORTATION

Oct 23 10 10 AM '95

October 19, 1995

Mr. Kazu Hayashida  
State Department of Transportation  
Highways Division  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida,

The October 18, 1995 article in THE MAUI NEWS, "Upcountry-to-Kihei road has its ruts" gave some shocking figures. The cost of this highway between Kihei and Upcountry was quoted as \$50 million. The time saved for individuals traveling this route was quoted as (a whopping!) 25 minutes. The cost for agricultural companies involved is described as "extremely costly".

Why can we not look at the situation more creatively? The travel time to Kihei is prolonged by the lack of the fourth lane of Haleakala Highway, the intersection of Hana Highway/Dairy Road, and the need to improve Pili'ani Highway to four lanes beginning at Dairy Road. Surely the addition of the fourth lane to the Haleakala Highway; an imaginative and ingenious improvement of the Dairy Road intersection, perhaps an overpass; and adding the two lanes to Pili'ani Highway would alleviate the traffic congestion that is a headache for everyone, both those in Kihei and upcountry residents.

I am sure the Waiohuli Hawaiian homelands community would be relieved to know that a large construction project and highway was not crossing their land.

Maui has the basis of a very successful public transportation system run by Maui Economic Opportunity. It would be a simple matter of upgrading their funding and expanding their facilities to have a full-scale public system. In view of our shaky economy, would it not be more economical and sensible to use our highway funds in a wise and responsible manner? Do we really need an "H-3" on Maui?

Very truly yours,

Elizabeth Marciel  
(Mrs. David Marciel)

1. Many of the improvements suggested are recommended in the Maui Long Range Land Transportation Plan and therefore are considered part of the proposed project's No Build Alternative. The impacts of the No Build Alternative are evaluated in the Draft EIS.
2. Improvements to Maui's para-public transit system were considered under the Transportation Management Systems (TSM) Alternative. The TSM Alternative was eliminated in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because it would not satisfy the project's goals.

Dear Mr. Hayashida:

Subject: Kihei-Upcountry Maui Highway  
Environmental Assessment

Pursuant to our review of the Environmental Assessment (EA) for the proposed highway project and our attendance at the public informational meeting held at the Upcountry Community Center on October 17, 1995, we offer the following comments:

1. Alternatives 2, 3, 4A, 4B, 5 and 8 will adversely impact the operations of Maui Pineapple Company, Ltd. (MPCo) in varying degrees. For each of the alternatives the EA should address the adverse impacts on existing farming operations and efficiency, existing irrigation systems, existing pineapple layouts, existing farm roadway systems, existing pineapple hauling operations, etc. In addition, for those alternatives that will bisect existing pineapple fields, the question on whether or not it would be economically feasible to continue to farm the smaller remnant parcels created by the proposed highway should be answered.
2. The EA should analyze the negative cost impacts on the existing pineapple farming operations for each alternative.
3. The EA should address the mitigating measures that will be necessary due to the adverse impacts on the existing pineapple farming operations.
4. The economic state of pineapple operations has been marginal. There is a current shortage of viable pineapple farming lands and the loss of any lands caused by the proposed highway will have further negative impacts.

Attention: Kenneth Au

Dear Mr. Au:

SUBJECT: COMMENTS ON UPCOUNTRY-KIHEI HIGHWAY LINK

1 It is my opinion that the link between Upcountry and Kihei is unnecessary and will have a negative effect on the Upcountry area. Crime reports indicate that the Upcountry area still has the lowest crime rate on the island of Maui.

2 The road between Kihei and Upcountry will lead to the expansion of development in the area which is now the buffer between the tourist and commercial areas of Kihei and the quiet bedroom communities of Kula and Pukalani. To create this corridor will be to the detriment of the Upcountry and is, in my opinion, unnecessary.

3 The present traffic is manageable and growth in the future will be dependent upon additional water which does not now, or in the very near future, seem to be available.

Thank you for your consideration.

Sincerely,

L. D. MacCluer

1. Section 3.3.6 provides information about current crime rates for both the Kihei-Makena and Upcountry communities. In comparison to Kihei-Makena, Upcountry has lower overall crime rates. The effect of the road on crime rate is discussed in Section 4.3.3.

2. Potential land use development impacts are discussed in Section 4.1.1.

3. Section 1.2.3 describes existing traffic conditions. Consultation with the Maui Board of Water Supply supports the comment that future development in Upcountry depends on the water supply.

Kazu Hayashida, Director  
State of Hawaii Dept. of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813

Dear Mr. Hayashida,

I am writing with reference to the proposed Kihei-Upcountry highway project now under study. As a longtime resident of Kula in Upcountry Maui, I have had ample opportunity to observe the obvious: that a more direct link between the Upcountry area and Kihei/Makana would have a very considerable impact on the nature of the mainly rural and agricultural community which I call home.

I view the building of such a link as eventually inevitable, and I also think that there is much to the argument that the highway would put an end to the rural/agricultural nature of Kula, Keokea and Ulupalakua. There are very few residents or farmers in the area who want the road to bring to their community the urbanization that might ultimately occur. On the other hand, there are many residents of Makawao, Pukalani and Haiku who now commute daily to Kihei and who would very much benefit from a more direct link to their places of employment.

I therefore think very strongly that if the road must be built, it should be along the corridors set forth currently as Alternates 1,2 or 3. There is hardly any useful purpose in spending far more money to produce a route which will divert traffic up into the Kula area and force the great majority of those who will use the highway to have to drive further up Haleakala in order to then go down to Kihei. Keeping the eastern terminus of the road close to where most Kihei-bound traffic now actually originates will best serve both those who use the road and those who wish to preserve the country character of the greater Upcountry community.

Thank you for reading and taking note of my views.

Lenda McGehee-Simon  
Artist/Teacher

Lenda McGehee-Simon

1. Potential impacts to Upcountry's communities and agricultural activities are discussed in Sections 4.3.1 and 4.2.1, respectively.
2. The proposed project would not cause urbanization in Kula because development in Kula is constrained by water availability (see Section 4.1.1.2).
3. Alternatives 1, 2 and 3 were eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E). Alternative 1 was eliminated because this alternative would produce a substantially greater displacement of cultivated fields than any other alternative. Alternative 2 was eliminated because it would bifurcate the Maui Research & Technology Park. However, Alternative 2 was modified to Alternatives 2B and 2C, and these two alternatives are still currently under consideration and are now called Alternatives U1,K1 and U1,K2. Alternative 3 was eliminated because of its poor operational aspects and because it would displace a substantial amount of cultivated fields.

COMMENTS ON THE PROPOSED KIHEI/UP-COUNTRY HIGHWAY

by William W. Monahan

RR2 Box 250A Kula, Hawaii 96790

To gain a perspective on the proposed highway link from Kihei to Up-Country, Maui, one must go back to the creation of the Kihei Research & Technology Park. For five years I worked for the Maui Economic Development Board (MEDB) where my chief responsibility was the development of the Park. From its very inception, we knew that it was critical to attract to the Park the defense contractor that manages the satellite tracking facility on Haleakala. During the negotiations, it became evident that the contractor and the Air Force were vehemently opposed to placing their administrative center in the Park. They could see no advantage to the Park location until Senator Inouye along with MEDB persuaded them that the move would be in their best long term interest.

The infrastructure of the Park was completed, an office building was constructed, and the defense contractor and Air Force dutifully relocated. Now after the fact came the opportunity to get funds through the defense budget for a highway to link the R&T Park with Haleakala. The military significance of the road was always recognized as negligible if not non-existent. The money to build it was what you would call pure "pork". MEDB was then "appointed" to coordinate efforts to determine the best route.

The issue really came before the public during the planning sessions of the Up-Country Community Advisory Council (CAC) to the Maui Planning Department. I was a member of that CAC. The entire report of the CAC, which met over twenty times, is replete with the message that Up-Country Maui is a precious environmental resource that should be protected for the benefit of all who live in or visit Hawaii. A highway that would create a loop from Kihei to Kula and then back down Haleakala Highway was totally rejected because it would encourage sub-division development, and it would create a tourist attraction that would change the entire nature of Up-Country. For example, it is estimated that some 500-900,000 tourists now drive annually out and back to Hana. The road to Hana has become a popular tourist attraction. The number driving a Kihei/Kula loop could well be over two million. After considering the options presented by MEDB, the CAC stated its preference for no highway at all. If construction of the highway was inexecutable, then its Up-Country link should be placed as far north as possible at the junction of Haleakala Road and Haleakala Highway. I fully concur with this conclusion by the CAC.

One need only look as far as Oahu to see what happens to rural areas when they are accessed by highways. Development is not very far behind and the rural nature of the area is gone forever. Kula should be viewed as a park. It is not just for the pleasure of those who live there, but for everyone. I have been a life time resident of Hawaii, first on Oahu and now on Maui. I have watched beautiful Oahu turn into a congested nightmare. Please, resist the pressure of developers and land owners and do something right for these islands. Don't allow a Kihei/Kula loop to happen.

William W. Monahan

1. The alternatives (6A, 6B and 7) that would create a "loop" were eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E). The two U3 alternatives would create a semi "loop" because their Upcountry terminus would be located near the Pulehu area. However, it is unlikely that a U3 alternative would induce residential subdivision development in Kula because of limited water availability (see Section 4.1.1.2).

2. An Upcountry terminus at the Haleakala Highway/Haliimaile intersection is still under consideration.

*Drop in intensity of Hawaii - Motorist always*  
*a several occasions a century ago, a lane*  
*route to Kihei, Maunaloa, Lahaie & Lihou.*  
*as well as Hale - After Maunaloa on Lihou it*  
*for access*  
*There are people working in Kihei/ Maunaloa*  
*who live in Hale Pukalani & mostly Maunaloa*  
*I see some in Kihei is going to a maintenance garage*  
*down. Most are some young people moving.*  
*Most of people would be happy to see a*  
*highway to Hale, as had more money to be able to come*  
*up to Hale, driving on other who drive to Hale or Lahaie*  
*Now, even to Hale, it's a good idea to have a road*

Christopher Perreira

1. Alternative 3 was eliminated from further study in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because of its poor operational aspects and because it would displace a substantial amount of cultivated fields. Alternative 5 is still under consideration, and is now called Alternative U3,K1.
2. As described in Section 2.1.2, right-of-way would be reserved for a four-lane divided highway, even though the proposed project would only construct a two-lane highway. It is not anticipated that a four-lane divided highway will be needed by the design year 2020. The design of the two-lane highway would be such that the future expansion to a four-lane divided highway would have minimal impacts to traffic conditions.

Christopher Perreira  
PO Box 2524  
Maui, HI 96703

Comments in the EISPN to Kihei Highway

I'm not able to see the state of Hawaii  
transportation dept. building a two-lane highway with  
a median strip. This will be the first highway on Maui  
that meets federal highway standards. It will be a  
two-lane highway and will be built to meet the growing  
population on Maui. The highway to Kihei Highway  
will benefit the tourists and residents of Maui. I would  
prefer the route B or route C alignment of the highway.  
I would prefer if the Transportation Dept. build this  
highway in City One phase. This would save the state  
\$5 Hawaii's money, and the people of Maui wouldn't  
have to put up with the construction, noise, and  
dust of the second phase. Finally, this highway  
to Kihei Highway will really be appreciated by the  
citizens of Maui and its many visitors.

1. The alternative suggested is the proposed project's Alternative 7 (see Section 2.2.1.1). This alternative was eliminated in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because it has an inadequate benefit-cost ratio.

Conference Memo 10-1-95  
Kihei

Dear Kenneth

I'd like to comment on the road from Kula to Kihei just do it! I think you could put the road through the Ulupala-Kua Ranch (the old road) to come out near Ma'eka. I think a lot of the people that would use the road are workers and tourists. That would put all these people in the Wailea area and not in Kihei. Kihei is very crowded already.

RE: DRAFT EIS FOR KIHEI-UPCOUNTRY MAUI HIGHWAY

Dear Mr. Hayashida:

I attended the Upcountry Information Hearing on the Kihei-Upcountry Highway, and have also read the Environmental Assessment. I have the following comments.

A. RATIONALE FOR FEDERAL INVOLVEMENT

I worked four years as a computer programmer on a laser project for Massachusetts Institute of Technology, dividing my time between the facilities in Science City and the base facilities at that time in Puunene. At that time and I suspect now, most of the people working at Science City went up for their shift, stayed there the entire shift, and returned to their homes. Only a handful needed to travel between Science City and the base facility during the course of the day, for purposes connected with work.

The base facilities were transferred from Puunene to the Killei Maui R&T Park, 10 miles further distant from Science City, primarily for the pork-barrel reason that after the state had spent millions to build the R&T Park, they lacked tenants. By agreeing to transfer the base facility, the defense contractors did a favor for the state.

The following questions should be considered in the Draft EIS:

1. How many people work at Science City? At the base facility in Maui R&T Park?  
Note that only a small part of the people working at Maui R&T park are connected with the facilities in Science City.
2. What estimate can be made of how many will be working there in 10 years, 20 years?  
The estimate should consider the fact that Science City lies within a National Park and is not able to expand spatially.
3. How many of those now working at Science City have a need to travel to Kihei for the purposes of their work during their shift? From Kihei to Science City?  
At present data communication facilities are out to bid for a link between Science City and the base facilities at Maui R&T Park.

Given the fact that people living on Maui do work by computer in London, i.e. doing currency trading on the London market, and also given the fact that modern telescopes can be remotely controlled from laboratories all over the world, it would seem that the need for people to travel from the base facilities to Science City is considerably less now than when the base facilities were in Puunene. In ten years that need will be considerably less than it is now.

4. What time saving would be made in the entire trip from Science City to Kihei by any of the new proposed highways?

Section 1.2 of the EA says that a 45 mile journey would be reduced by 9.5 miles. The time consuming part of the journey is the twisting switchbacks of Crater Road, which must still be traversed regardless of the new road. The roads eliminated are mostly high speed roads, Piliuni Highway, Mokulele Highway, Hana Highway, Haleakala Highway. Only the stretch of Hansen Road is two-lane and slow.

If we estimate an average speed of 55 mph for 7.5 miles and 30 mph for 2 miles, the saving of 9.5 miles in distance would mean a time saving of about 12 minutes.

5. If the federal defense benefit of this highway consists of saving 12 minutes on a journey for only a handful of people, is it worth the 80% federal funds for this highway? Is the highway needed for the stated reason, or is it a purely pork-barrel project?

As a federal taxpayer, I would much rather have my federal taxes go for health care than for this highway. As a state taxpayer, I would much rather have my state taxes go for schools and libraries than for this highway.

The true driving force for this highway is to open Upcountry to the kind of real-estate development that has taken place in Kihei. Most people Upcountry do not want that to happen.

6. If only a few people need to travel between the two sites for work-related purposes, is a new highway the best way to facilitate their travel?

At the Information Hearing, I suggested half-jokingly that helicopter trips between Kihei and the edge of the National Park, plus a van shuttle to the top, would be faster and more cost-efficient than a new highway, for the federal defense linkage requirement. The National Park begins at about 7000 feet elevation, and this alternative would eliminate a portion of the time-consuming Crater Road, as well as the portion of the route the new highway is expected to cover.

The EA does not specify elevations for the various alignments, but most seem to end between about 2000 feet elevation and 3000 feet elevation. The difficulty of travelling between Kihei and Science City lies primarily higher than that, from 4000 feet up to the summit at 10,000 feet.

The helicopter or equivalent alternatives should be explored, especially since the data link may cause the need for such transportation to dwindle even further in a few years. Such a transportation link would avoid the impacts on farmland, lifestyle, and archaeological sites that a highway would have.

Raisbeck to Hayashida, October 19, 1995, page 3

KiheiKula 1

**Sally Raisbeck**

8 improve various intersections on the current route. This also should be explored. *Hokolele Highway*

9 way to reduce travel time between Science City and the base facilities would be to relocate the base facilities to their old home near Puunene, or even to Pukalani.

B. OTHER QUESTIONS  
7. What are the criteria that will be used to decide on the alternatives to be considered in the Draft EIS?

10 At the Information Hearing, the slide showing these criteria was very difficult to read. Could the criteria be mailed to all those who attended the Information Hearings or who requested the EA?

8. Will those charged with preparing the EIS include conclusions of the relevant Community Plans now being considered by the Maui County Council?

11 A number of very public-spirited citizens spent large amounts of time preparing the General Plan, the Upcountry Community Plan, and the Kihei-Makena Community Plan, as part of the official planning process of Maui County. They have been reviewed by the Planning Department, the Planning Commission, and are now being reviewed by the County Council. Public hearings were held at each stage of the process.

The principles enunciated in those documents represent the consensus among the citizens of Maui for the future of their areas and should be considered in the EIS.

9. As noted by Dick Mayer at the Information Hearing, will the Draft EIS consider the entire four-lane proposal, as required by law, not merely the interim two-lane proposal?

13 The EIS on the airport expansion attempted to break the project into 22 discrete pieces, in order to avoid considering the impacts of the whole project. This was improper, and care should be taken to assess the entire impacts of this project.

10. Will the Draft EIS include detailed information about the sources of funding for the proposed highway? Also detailed information about the proposed costs?

I hope these questions and comments will be of assistance in the Draft EIS.

Sincerely yours,

Sally Raisbeck

1. We have no information about the number of persons employed in Science City. As of June 1997, there were 315 people employed in the Maui R&T Park. We have no information on the number of persons employed in the R&T Park's "base facility" (assuming the Air Force tenant). Science City receives technical support from key defense contractors located in the Maui R&T Park. We have no information on the number of persons providing this technical support.

2. We have no information allowing us to estimate the number of persons that would be employed in Science City in 10 or 20 years. The commentator is correct to note that Science City has limited growth potential. The Maui R&T Park is projected to grow to 168 ha (415 acres) by the year 2020. Assuming the same employee density, the number of employees in the R&T Park may grow to close to 4,000. This estimate has not been corroborated by Maui R&T Park officials.

3. We assume that everybody who travels between Science City and the Maui R&T Park has to make these trips. Whether the number of persons making these trips would decrease in the future because of improvements to Maui's telecommunications system is not known.

4. Sections 4.4.1.1 and 4.14 contain information on trip lengths with or without the proposed project. The analysis in Section 4.14 compares trip lengths under each of the alternatives using two selected centroids: "Five Trees" intersection and the Piilani Highway/Lipoa Street intersection. The route offered by the alternatives would be one leg of the trip from Kihei to Science City. Under present conditions, the travel distance of this leg is approximately 36 km (22.5 miles), and at an average speed of 64 km/h (40 mph), this trip would take approximately 34 minutes. Assuming the same travel speed, the Build alternatives would reduce the duration of this trip by a range of 11 to 17 minutes. Therefore, depending on the alternative selected, the trip duration from Kihei to Science City would be reduced by the same amounts.

5. If the proposed project qualifies for 80% federal funding, the decision of whether the project is "worth" its cost rests with the State Legislature and the Governor. The proposed project has other benefits, as described in Chapter 1 of the Draft EIS, which would be taken into account during this decision. State and federal funds for highway projects are raised through fuel taxes. By law, these funds can only be used for highway projects and operations. They cannot be used for projects or programs that are not highway related.

6. Reducing the travel distance and time between Science City and the Maui R&T Park is only one use of the highway. The highway would also reduce travel distance and time for visitors traveling between Kihei-Makena/West Maui and Haleakala National Park, and residents traveling between Upcountry and Kihei-Makena/West Maui for employment, entertainment and other purposes.

**Kihei-Upcountry Maui Highway  
Draft Environmental Impact Statement**

**Responses to EISPN Comments**

7. The use of helicopters to transport personnel between Science City and the Maui R&T Park is beyond the scope of this study. Currently, there are no plans to develop heliport facilities that would make this suggestion possible.
8. While improvements to Mokulele Highway are included in the No Build Alternative, improvements to Hansen Road are not.
9. Relocating the base facilities to Puunene or Pukalani is beyond the scope of this study. We know of no plans for such a relocation.
10. The criteria that were used to select the alternatives under consideration in the Draft EIS are described in Sections 2.2.1.2 and 2.2.2.
11. Information on County plans is provided in Section 3.1.4.2. Project consistency with these plans is discussed in Section 4.1.2.2.
12. The proposed project would only construct a two-lane highway because traffic projections indicate that two lanes should be sufficient by the design year 2020. However, we are planning at this time to reserve right-of-way for a four-lane divided highway so that we can lessen the impacts when two additional lanes are needed beyond 2020. The impact analyses of the EIS are based on this proposed action.
13. To ensure that a highway project is not broken into smaller, discrete pieces, the proposed action must (1) connect logical termini and be of sufficient length to address environmental matters in a broad scope; (2) have independent utility or independent significance, i.e., be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made; and (3) not restrict consideration of alternatives for other reasonably foreseeable transportation improvements. The Build alternatives under consideration meet these criteria.
14. Section 2.1.2.3 provides information on the estimated costs of the Build alternatives. The expected sources of funding would be the federal highway fund (80%) and the State highway fund (20%).

RE: **Kihei-Upcountry Maui Highway**

Gentlemen:

I support the planning and construction of the Kihei - Upcountry Highway and urge you to consider the following:

1. Plan the Upcountry terminus in such a way that residents living in Makawao and beyond will also benefit from this new highway. I found it significant that Makawao Avenue which terminates just above Pukalani was not even shown on the map (Figure 1-1) in your Environmental Assessment. This is a major road serving thousands of people and should be considered in your assessment.
2. Make the present Lipoa Street intersection the Kihei terminus of the new highway. It is centrally located in Kihei and has already some of the necessary infrastructure in place.
3. Route the new highway to make the Hawaiian Homeland area accessible from it without going through it.
4. Design the shoulders as bikeways.
5. Take advantage of the scenic and aesthetic opportunities the location of this highway has to offer. Provide lookouts and rest stops in as many places as possible. In the design of this highway the aesthetic quality should be considered as important as the customary engineering aspects. Top designers should be engaged to design the landscaping, signage, bridges, embankments, etc. Excessive cuts and fills should be avoided so that the road blends into the existing countryside rather than dominate it.

Very truly yours,

Hans Riecke, FAIA  
Member of the State/County Joint Task Force

cc: Mayor Linda Crockett-Lingle

HIGHWAY DESIGN  
PLANNING BRANCH

**Hans Riecke**

1. Residents of Makawao would benefit from the proposed project because it would improve their transportation to and from Kihei-Makena and West Maui. The figure has been corrected.
2. Lipoa Street will not be a Kihei terminus because Maui R&T Park officials requested that the highway not come through the Park.
3. None of the alternatives considered in the Draft EIS would be located on or near Department of Hawaiian Home Land (DHHL) homesteads in Keokea. DHHL would have to construct their own access road to the new highway if they desire a connection and SDOT would have to provide permission for the connection.
4. The roadway would have 1.8 m (6 ft) and 2.4 m (8 ft) paved shoulders (see Section 2.1.2.2), sufficient for bicyclists. Whether the roadway would be designated as a bikeway has not been determined.
5. Opportunities would be explored to develop scenic lookouts. Landscaping would also be provided to improve the aesthetics of the highway (see Section 4.8.4) both for travelers and those viewing the highway from downslope areas. The roadway would be designed to minimize and balance cuts and fills.

**COMMENTS ON PROPOSED KIHEI-UPCOUNTRY MAUI HIGHWAY**

Having been a property owner on Maui since 1970, a resident of Kula, Maui since 1984, President and/or member of the Board of the Kula Community Association since 1991, and a member of the Joint Task Force of the State and County of Maui that has studied the project, I have major concerns with this multi-million dollar proposal. The initial rationale for a new road grew out of an alleged defense requirement to connect the Air Force defense contractor office building in the Kihei R & T Park with the satellite tracking facility on the summit of Haleakala. The location of the defense contractor was itself a "bootstrap operation" to assist in shoring up the R & T Park rather than the choice of the contractor or the USAF. Hence from the outset the "defense" case for the road has rested on a foundation of senatorial "pork". (Indeed, some have characterized the project as Maui's H-3 boondoggle).

There has, moreover never been any significant demonstration of support for such proposed road by people living in Upcountry Maui. In fact, in prior discussions at public meetings of a possible toll road connecting the two areas during the administration of Mayor Hannibal Tavares, the overwhelming majority of the people of Kula strongly opposed any connecting route with small minorities favoring a Makena-Ulupalakua connection along the route of the dirt road that formerly was utilized by local people or the connection to Pukalani. In statements at recent meetings and letters to the editor and the like, it is clear that the people of Kula, Keokea, Omaoipio, and Ulupalakua are even more concerned today that their rural/farm area life style would be negatively impacted by thousands of Maui's visitors tooling through the area in their rent-a-cars not only on the new highway but also on existing narrow and, in some cases dangerous substandard county roads. One has only to look to the traffic to and from Hana - estimated at slightly less than one million vehicles a year- to realize even more would drive the circle route through Upcountry if it was made easier for them.

The task force report and EA pose a dilemma to the people of Upcountry. The various alternatives that provide a routing straight up the hill, from selected points in Kihei to several Kula points would clearly cause the aforesaid undesirable influx of tourists and

3 the inevitable "Oahu-ization" (urbanization) of Upcountry Maui. If, on the other hand the road were built across Haleakala from Kihei to the Haliimaili/Haleakala Hwy intersection it would bisect numerous large and small farms and existing back roads such as Omaopio and Pulehu and require construction of overpasses to avoid the kind of poor transportation planning that was demonstrated in connection with the Pukalani Bypass project. (That performance led to a number of accidents and severe injuries before traffic signals were installed at Makawao Rd.) Farmers on the lower slopes of Haleakala would at the least be inconvenienced and at worst put out of business. Despite this latter possibility, The Upcountry Citizens Advisory Committee in its comprehensive Community Plan Review took the view, *with which I concur* that "If there HAS TO BE a new Kihei-Upcountry road", (e.g. despite opposition from the people directly affected), its Upcountry terminus should be at the junction of Haliimaili Rd and Haleakala Hwy. It would then at least service the people living in the largest Upcountry Maui population centers of Makawao and Pukalani.

The **BOTTOM LINE**, however is that the best alternative in the EA is # 2.1 - e.g. the **NO BUILD ALTERNATIVE**.

4 In this day of "budget shortfalls" and cuts in Federal and State funding across the gamut of social programs and the lack of funding to alleviate the impacts from overcrowded prisons it is both ironic and sad that an unnecessary, largely unwanted and wasteful highway project has gotten as far as it has.

5 Without admitting to the rationality of the political reality driving the expenditure of taxpayer funds for construction work, if the money contemplated for this project were devoted to improving Mokuiele Hwy, Hansen Road and Haleakala Hwy, it would make travel between Upcountry and Kihei, and also Kahului and Kihei much safer and less time consuming without the extremely disruptive socio-economic impacts that would inevitably result from the major disruptive new route. I urge that the E.I.S. examine the benefits from applying the federal and State funds sought for this project for improvement of existing routes in Maui County or for other more necessary public construction projects in our State.

6 As with the "Field of Dreams" - *if you build it, they will come!* Please don't let that happen to our Upcountry home.

Sincerely,  

### Frederick W. Rohlfing

1. As described in Chapter 1, there are other purposes and needs for the proposed project than the R&T Park/Science City connection.
2. Potential impacts to Kula's agricultural activities, communities and neighborhood roads are discussed in Sections 4.2.1, 4.3.1 and 4.4.1.1.
3. As described in Section 4.1.1.2, land development in Upcountry, particularly in Kula, would continue to be constrained by water availability. The proposed project would not change this condition.
4. Overpasses would not be constructed at the intersections with Omaopio and Pulehu Roads. Measures to mitigate changes in traffic patterns due to the new highway intersecting these roads are discussed in Section 4.4.4.
5. An Upcountry terminus at the Haleakala Highway/Haliimaili intersection is still under consideration.
6. Highway projects are funded by federal and State fuel taxes. By law, these funds can only be used for highway purposes. Therefore, highway projects do not compete against other government services, programs and projects, such as prison construction and education.
7. Improvements to Mokuiele and Haleakala Highways are included in the Maui Long Range Land Transportation Plan (February 1996), and therefore are included as part of the project's No Build Alternative. The proposed Kihei-Upcountry Maui Highway is not a competing project.
8. The project's EIS is required to consider all reasonable alternatives that would address its purposes and needs, as described in Chapter 1 of the Draft EIS. Consideration of other projects that do not relate to the stated purposes and needs are beyond the scope of this EIS.

Letters to the Editor  
Maui News  
100 Mahalani  
Wailuku, HI 96793

Dear Editor:

The Upcountry Road info meeting recently held in Pukalani was hopefully a wake-up call to the Department of Transportation from numerous Upcountry residents who clearly oppose this misguided project. The DOT hasn't exactly distinguished itself on Maui and a lot of us suspect Mr. Maqoo is alive and well somewhere inside the department busily influencing policy.

How can we possibly justify spending 70 million dollars to enable a handful of big boys to more quickly reach their big toys on the summit of Haleakala? The 70 million is just for openers, and, get this, does not include the cost of land acquisition and/or right of ways. As indicated in a letter to the editor last week this whole thing smells like a Maui version of Oahu's H-3 disaster.

Your voice can make the difference. Public input is being sought through November 10th so it's important you quickly share your outrage with Senator Inouye (the road's prime mover) and with Kazu Hayashida (DOT chief) in the form of a letter or phone call demanding the abandonment of this expensive folly. If we have that kind of money to throw around let's throw it at something infinitely more important like education and human services, both of which continue to suffer from crippling budget cuts.

ATTENTION: KENNETH AU

Dear Kenneth,

I noticed that the EIS for the ten alternate bypass routes for the new Kihel to Upcountry highway have been recently published. I AM OPPOSED TO ALL TEN ROUTES FOR ARCHEOLOGICAL, TRAFFIC, COST, SAFETY, AND LOSS OF QUALITY OF LIFE REASONS.

It is incredible to learn that the ONE AND ONLY reasonable routing for this highway has not even been considered! Here is the route that is cost effective, sensible, and capable of delivering the least impact to traffic on Maui:

The route should start at the intersection of Highway 350 and the new Piliiani Highway in Kihel. Thereafter, two new lanes should be built on sugar land, parallel to Highway 350, with a dividing median. This would create a safe four lane highway. Proceeding north to Puunene, the new highway would fork prior to Puunene, and maintain four lanes through sugar lands to the bottom of Highway 37. This would avoid more impact on Hansen Road. At the bottom of Highway 37, a new fourth lane would be added, turning Highway 37 from a three lane debacle into a safer four lane highway. Thereafter, the four lanes would narrow at the new Pukalani Bypass above Halimaile and proceed from there AS IS into the greater Upcountry area.

Cheaper, because the highway goes through sugar land, and the route is level. Most of the roadbed is already down, and widening would be so easy to do.

Safer, because Highway 350 would become a divided highway, while now it is very unsafe. Safer and cheaper, because now Highway 37 is a three lane death trap, and the cost of daily coning is exorbitant.

Environmentally safe, since the existing roads and new roads would not create any disturbances to heiaus and other significant archeological structures.

TAKE ADVANTAGE OF WHAT WE ALREADY HAVE! CORRECT THE TRAVESTY YOU HAVE CREATED WITH THREE LANEING HIGHWAY 37! KEEP OUR EXPENSIVE

BYPASSES AS BYPASSES FOR THEIR INTENDED USE! GET RID OF THESE AWFUL PROPOSED ROUTES!

Please feel free to call me for more information or clarification. I will provide my consultation free of charge for the public good.

Sincerely,

Gordon Stellway  
572-1377

**Gordon Stelway**

1. The alternative suggested is similar to the No Build Alternative (see Section 2.1.1), except for the connection between Mokelele Highway and Haleakala Highway. A similar alternative that would improve the No Build condition was developed called the "Widening of Existing Roadways Alternative" (see Section 2.2.1.1). This alternative was eliminated in the alternatives screening analysis (see Section 2.2.1 and Appendix E) because it would not satisfy the project's goals.

Mr. Abraham Wong  
Federal Highway Administration  
P.O. Box 50206  
Honolulu, Hawaii 96850

Dear Mr. Wong:

1. I have only recently become aware of the proposal for a new limited access highway to the up-country area of Maui. I am requesting that my name be added to the Service and Distribution List for this project through the Record of Decision. I would also be interested to know if scoping documents were prepared for the public hearing in October. If so are they available? My specific comments will be reserved pending a review of the draft Environmental Impact Statement.
- 2.

I appreciate any assistance that you may be able to tender to me with this request.

Sincerely,

Edward S. Syngala

**Edward S. Syrjala**

1. Your name has been placed on the project mailing list. You will receive the Draft EIS, and information on the scheduling of the project's public hearings.
2. Chapter 5 and Appendices A and C of the Draft EIS contain information about the project's scoping activities.

RE: New road between Kihei and Upcountry

Dear Dept. of Transportation:

I am strongly in favor of having this road completed as soon as possible.

For Maui to continue to support its population we must have safe roads. It is ridiculous to drive 20 miles and overcrowd other roads to get to a place 8 miles away. Living upcountry and working in Kihei, I have driven coned highways for years. We must continue to improve our out-dated highway system.

Please take advantage of any opportunity to expand our road system with help of federal funding and reap the benefits for our residents. Please don't deprive us of this chance to bring increased infrastructure to our area, it is so outdated and we need this road so badly. I favor the Haliimaile to Lipoa connection points as it accesses Makawao and Haiku as well as the rest of upcountry.

1

Director of Health

Subject: Final Environmental Assessment  
Upcountry Highway Project  
Kihei, Maui

Thank you for allowing us to review and comment on the subject document. We have the following comments to offer:

Any work in any of the streambeds may require approval from the U.S. Army Corps of Engineers (COE). The applicant should contact the COE to identify whether a federal permit is required. If a federal permit is required, a Section 401 Water Quality Certification is required from the Department of Health's, Clean Water Branch.

If you have questions, you may call Mr. Herbert Matsubayashi, Chief Sanitarian, Maui District Health Office at 243-5255.

c: H. Matsubayashi (MDHO)

State of Hawaii Department of Health

1. The U.S. Army Corps of Engineers (USACE) has indicated that the project would require U.S. Department of Army Nationwide permit. Therefore, a Water Quality Certification would be required from the State of Hawaii Department of Health. The USACE is a cooperating agency for this project.

# Maui Notices

AUGUST 8, 1999

Construction of the project will commence upon the receipt of applicable regulatory permits and approvals. Pursuant to Chapter 343, HRS, an Environmental Assessment has been prepared since the subject property is within the boundaries of the Lahaina National Historic Landmark.

**Permits Required:** Sec. 404; NPDES; WQC; CZM consistency; grading, grubbing, stockpiling & excavation; excavation of highway

The State of Hawaii Department of Transportation and Federal Highway Administration are issuing a Draft Environmental Impact Statement for the Kihei-Upcountry Maui Highway project. This proposed two-lane limited access highway would directly link Kihei-Makena and Upcountry Maui by connecting Piilani Highway with either Haleakala Highway or Kula Highway.

The alternatives under consideration are all eight combinations of two Kihei and four Upcountry terminus options. The Kihei termini are named K1 and K2, and are located at the Piilani Highway / Kaonoulu Street intersection and the Piilani Highway / Ke Alii / Alanui Street intersection, respectively. The Upcountry termini are named U1, U2-A, U2-B and U3, and are located at the Haleakala Highway / Halimalie Road intersection, at the Haleakala Highway / Pukalani Bypass / Kula Highway ("Five Trees") intersection, on Kula Highway almost a half-a-mile south of the Five Trees intersection, and on Kula Highway just south of Pulehu Gulch, respectively. The names of the alternatives correspond to the terminus names. For example, the alignment from the Five Trees intersection to the Piilani Highway / Kaonoulu Street intersection is called Alternative U2-A-K1.

The project would facilitate transportation between Kihei and Upcountry, thereby addressing growth in regional transportation demand, economic development trends, and coastal evacuation deficiencies. In addition, there is federal interest in the project because it would facilitate transportation between defense-related research activities at Science City atop Haleakala Crater and the Maui Research and Technology Park in Kihei. The project would have both adverse and beneficial impacts. Potential impacts include substantial travel time savings, loss of open space, interference with agricultural activities, changes in transportation patterns, and savings in energy consumption. The nature of the impact varies with the alignment alternative.

To ensure that the full range of issues related to this proposed project are addressed and all significant issues are identified, comments and suggestions are invited from all interested parties.

**Issue Date:** 60 days from the issuance date of this notice.

All documents (original and eight copies) should be filed with: David P. Boegers, Secretary, Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426.

The Commission's Rules of Practice and Procedure require all intervenors filing documents with the Commission to serve a copy of that document on each person whose name appears on the official service list for the project.

Further, if an intervenor files comments or documents with the Commission relating to the merits of an issue that may affect the responsibilities of a particular resource agency, they must also serve a copy of the document on that resource agency.

The proposed project would utilize the existing U.S. Army Corps of Engineers' Corakville Dam and would consist of: (1) 2 new, 80-foot-long, 108-inch-diameter steel penstocks; (2) a new 30-foot-long, 30-foot-wide, 30-foot-high powerhouse containing 2 generating units having a total installed capacity of 1,500-kw; (3) a new exhaust apron; (4) a new 400-foot-long, 14.7-kV transmission line; and (5) appurtenant facilities.

Applicant estimates that the average annual generation would be 9.3 GWh and that the cost of the studies to be performed under the terms of the permit would be \$750,000. Project energy would be sold to utility companies, corporations, municipalities, aggregators, or similar entities.

A copy of the application is available for inspection and reproduction at the Commission's Public Reference Room, located at 888 First Street, NE, Washington, DC 20426, or by calling (202) 208-1371. This filing may be viewed on the web at <http://www.ferc.fed.us/online/rims.htm> (call (202) 208-2222 for assistance). A copy is also available for inspection and reproduction at the address in item h above.

**Preliminary Permit**—Anyone desiring to file a competing application for preliminary permit for a proposed application itself, or a notice of intent to file such an application, to the Commission on or before the specified comment date for the particular application (see 18 CFR 4.36).

Submission of a timely notice of intent allows an interested person to file the competing preliminary permit application no later than 30 days after the specified comment date for the particular application. A competing preliminary permit application must conform with 18 CFR 4.30(b) and 4.36.

**Preliminary Permit**—Any qualified development applicant, desiring to file a competing development application, must submit to the Commission, on or before a specified comment date for the particular application, either a competing development application or a notice of intent to file such an application. Submission of a timely notice of intent to file a development application allows an interested person to file the competing application no later than 120 days after the specified comment date for the particular application. A competing license application must conform with 18 CFR 4.30(b) and 4.36.

**Notice of intent**—A notice of intent must specify the exact name, business address, and telephone number of the prospective applicant, and must include an unequivocal statement of intent to submit, if such an application may be filed, either a preliminary permit application or a development application (specify which type of application). A notice of intent must be served on the applicant(s) named in this public notice.

**Proposed Scope of Studies under Permit**—A preliminary permit, if issued, does not authorize construction. The term of the proposed preliminary permit would be 36 months. The work proposed under the preliminary permit would include economic analysis, preparation of preliminary engineering plans, and a study of environmental impacts. Based on the results of these studies, the Applicant would decide whether to proceed with the preparation of a development application to construct and operate the project.

**Comments, Protests, or Motions to Intervene**—Anyone may submit comments, a protest, or a motion to intervene in accordance with the requirements of Rules of Practice and Procedure, 18 CFR 385.210, 211, 214, and 215. Comments, protests, or motions to intervene must be filed with the Commission, on or before the specified comment date for the particular application.

**Filing and Service of Responsive Documents**—Any filings must be in all capital letters, the title "COMMENTS," "NOTICE OF INTENT TO FILE COMPETING APPLICATION," "PROTEST," "MOTION TO INTERVENE," as applicable, and the Project Number of the particular

application to which the filing refers. Any of the above-named documents must be filed by providing the original and the number of copies provided by the Commission's regulations to: The Secretary, Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426. An additional copy must be sent to Director, Division of Project Review, Federal Energy Regulatory Commission, at the above-mentioned address. A copy of any notice of intent, competing application or motion to intervene must also be served upon each representative of the Applicant specified in the particular application.

**Agency Comments**—Federal, state, and local agencies are invited to file comments on the described application. A copy of the application may be obtained by agencies directly from the Applicant. If an agency does not file comments within the time specified for filing comments, it will be presumed to have no comments. One copy of an agency's comments must also be sent to the Applicant's representatives.

**Linwood A. Watson, Jr.**, Acting Secretary.

## ENVIRONMENTAL PROTECTION AGENCY

[EPA-FRL-6245-5]

### Environmental Impact Statements; Notice of Availability

**Responsible Agency:** Office of Federal Activities, General Information (202) 564-7167 OR (202) 564-7153.  
**Weekly receipt of Environmental Impact Statements Filed August 09, 1999 Through August 13, 1999 Pursuant to 40 CFR 1506.9.**

**EIS No. 990283 DRAFT EIS, NPS, PA, NJ, Delaware Water-Gap National Recreational Area (DWGNRA) Trail Plan, General Management Plan, Implementation, Delaware River, PA**  
**Contact:** J. Robert Kirby (570) 588-2418  
**EIS No. 990284, DRAFT EIS, BLM, NV, Red Rock Canyon National Conservation Area (RRCNCA), General Management Plan (GMP), Amendment to the Las Vegas Resource Management Plan, Las Vegas, NV, Due: October 04, 1999, Contact: Gene Arnesen (702) 647-5068.**

**EIS No. 990285 DRAFT SUPPLEMENT, NPS, FL, Big Cypress National Preserve, General Management Plan, Implementation, New Information on**

**Issue Date:** 60 days from the issuance date of this notice.

All documents (original and eight copies) should be filed with: David P. Boegers, Secretary, Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426.

The Commission's Rules of Practice and Procedure require all intervenors filing documents with the Commission to serve a copy of that document on each person whose name appears on the official service list for the project.

Further, if an intervenor files comments or documents with the Commission relating to the merits of an issue that may affect the responsibilities of a particular resource agency, they must also serve a copy of the document on that resource agency.

The proposed project would utilize the existing U.S. Army Corps of Engineers' Corakville Dam and would consist of: (1) 2 new, 80-foot-long, 108-inch-diameter steel penstocks; (2) a new 30-foot-long, 30-foot-wide, 30-foot-high powerhouse containing 2 generating units having a total installed capacity of 1,500-kw; (3) a new exhaust apron; (4) a new 400-foot-long, 14.7-kV transmission line; and (5) appurtenant facilities.

Applicant estimates that the average annual generation would be 9.3 GWh and that the cost of the studies to be performed under the terms of the permit would be \$750,000. Project energy would be sold to utility companies, corporations, municipalities, aggregators, or similar entities.

A copy of the application is available for inspection and reproduction at the Commission's Public Reference Room, located at 888 First Street, NE, Washington, DC 20426, or by calling (202) 208-1371. This filing may be viewed on the web at <http://www.ferc.fed.us/online/rims.htm> (call (202) 208-2222 for assistance). A copy is also available for inspection and reproduction at the address in item h above.

**Preliminary Permit**—Anyone desiring to file a competing application for preliminary permit for a proposed application itself, or a notice of intent to file such an application, to the Commission on or before the specified comment date for the particular application (see 18 CFR 4.36).

Submission of a timely notice of intent allows an interested person to file the competing preliminary permit application no later than 30 days after the specified comment date for the particular application. A competing preliminary permit application must conform with 18 CFR 4.30(b) and 4.36.

## ENVIRONMENTAL PROTECTION AGENCY

(OPPTS-51932; FRL-6098-4)

### Certain New Chemicals; Receipt and Status Information

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

**SUMMARY:** Section 5 of the Toxic Substances Control Act (TSCA) requires any person who intends to manufacture (defined by statute to include import) a new chemical (i.e., a chemical not on the TSCA inventory) to notify EPA and comply with the statutory provisions pertaining to the manufacture of new chemicals. Under sections 5(d)(2) and 5(d)(3) of TSCA, EPA is required to publish a notice of receipt of a premanufacture notice (PMN) or an application for a test marketing exemption (TME), and to publish periodic status reports on the chemicals under review and the receipt of notices of commencement to manufacture those chemicals. This status report, which covers the period from July 5, 1999, to July 30, 1999, consists of the PMNs and TMEs, both pending or expired, and the notices of commencement to manufacture a new chemical that the Agency has received under TSCA section 5 during this time period.

**FOR FURTHER INFORMATION CONTACT:** Christine Augustyniak, Associate Director, Environmental Assistance Division (7408), Office of Pollution Prevention and Toxics, Environmental Protection Agency, 401 M St., S.W., Washington, DC 20460; telephone numbers: 202-554-1404 and TDD: 202-554-0551; e-mail address: TSCA\_Hotline@epa.gov.

**I. Does this Action Apply to Me?** This action is directed to the public in general. As such, the Agency has not attempted to describe the specific entities that this action may apply to. Although others may be affected, this action applies directly to the submitter of the premanufacture notices addressed in the action. If you have any questions regarding the applicability of this action

to a particular entity, consult the person listed in the "FOR FURTHER INFORMATION CONTACT" section.

**II. How Can I Get Additional Information, Including Copies of this Document and Other Related Documents?**

A. Electronically. You may obtain copies of this document and certain other available documents from the EPA Internet Home Page at: <http://www.epa.gov/>. On the Home Page select "Laws and Regulations" and then look up the entry for this document under the "Federal Register - Environmental Documents." You can also go directly to the "Federal Register" listings at <http://www.epa.gov/homepage/fedregisr/>.

B. In person. The Agency has established an official record for this action under docket control number OPPTS-51932. The official record consists of the documents specifically referenced in this action, any public comments received during an applicable comment period, and other information related to this action, including any information claimed as confidential business information (CBI). This official record includes the documents that are physically located in the docket, as well as the documents that are referenced in the official record does not include any information claimed as CBI. The public version of the official record, which includes printed, paper versions of any electronic comments submitted during an applicable comment period, is available for inspection in the TSCA Nonconfidential Information Center, North East Rm. B-607, Waterside Mall, 401 M St., S.W., Washington, DC. The Center is open from 12 noon to 4 p.m. Monday through Friday, excluding legal holidays. The telephone number of the Center is 202-560-7099.

C. By phone. If you need additional information about this action, you may also contact the person identified in the "FOR FURTHER INFORMATION CONTACT" section.

**III. Why is EPA taking this Action?** Section 5 of TSCA requires any person who intends to manufacture (defined by statute to include import) a new chemical (i.e., a chemical not on the TSCA inventory) to notify EPA and comply with the statutory provisions pertaining to the manufacture of new chemicals. Under sections 5(d)(2) and 5(d)(3) of TSCA, EPA is required to publish a notice of receipt of a PMN or an application for a TME, and to publish periodic status reports on the chemicals under review and the receipt of notices of commencement to manufacture those

## Upcountry Maui Highway

September 29: Kihei Community Complex and Aquatics Center \* September 30: Mayor Hannibal Tavanes Community Center \* October 13: Kahului School

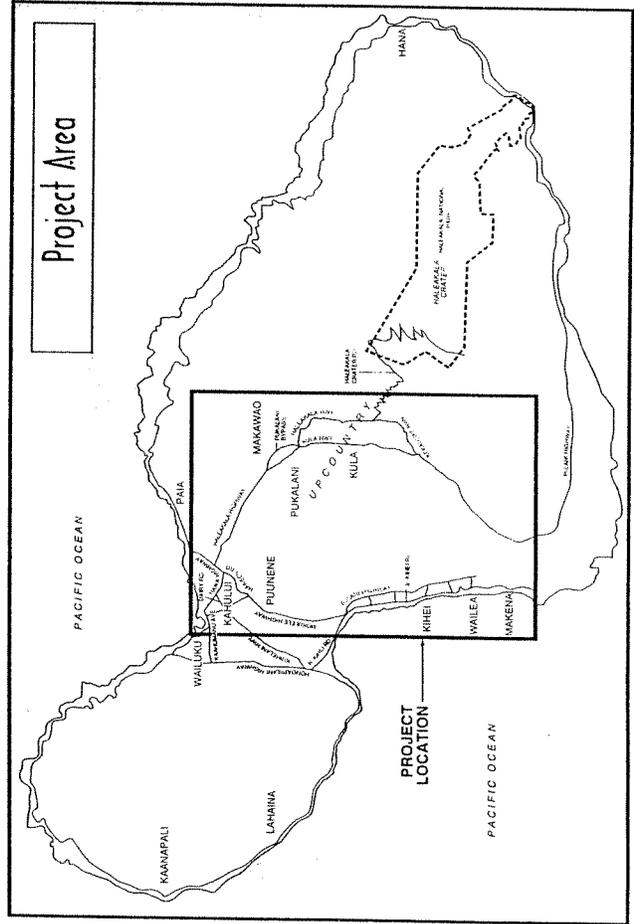

### What is the Project? Where Would it be Located?

The Hawaii Department of Transportation (HDOT) and the Federal Highway Administration (FHWA) propose to construct a new two-lane limited access highway that would directly link Kihei-Makena and Upcountry Maui. Different alternatives for the highway range between 9 and 11 miles long and would connect Pilihi Highway in Kihei to either Haleakala Highway or Kula Highway in Upcountry.

The highway would be constructed on the western slope of Haleakala (see map below). This land is currently used for sugarcane and pineapple cultivation and ranching. The communities near the proposed project include Kihei, Wailea, Makena, Pukalani, Makawao and Kula.

### What is the Status of the Project?

A State and Federal Draft Environmental Impact Statement (EIS) was prepared and announced in the August 8, 1999 edition of the State Environmental Notice and the August 20, 1999 edition of the Federal Register. The purpose of the Draft EIS is to disclose the environmental and social impacts that could result from the project, and provide the public with an opportunity to comment on the project. After the close of the public comment period, HDOT and FHWA will evaluate the information received and select a "Preferred Alternative," which could be the "No Build." HDOT will announce the selection after it is made, and the selection will be disclosed in the project's Final EIS.

## Why is this Project Needed?

### Improve Maui's Roadway System

The circuitous route between Kihei and Upcountry is 16 to 24 miles long, even though the straight-line distance between the regions is only 9 to 12 miles. A highway directly linking these regions could cut travel time and distance up to 50%.

### Relieve Congested Conditions on Other Roadways

Many major intersections along the route between Kihei and Upcountry currently operate at or near capacity during peak travel periods. A Kihei to Upcountry highway would divert some of this traffic onto an alternative route, reducing overall congestion.

### Address Increasing Travel Demand

Travel Demand (Maui Long-Range Land Transportation Plan, February 1996), is projected to increase 70% from 1990 to 2020. Many of these trips would be generated by the visitor industry, including industry workers and visitors. Many of these trips would occur between Kihei and Upcountry.

### Coastal Evacuation

Kihei-Makena is vulnerable to hazards such as tsunami, tropical storms and fire. The limited number of evacuation routes and their close proximity to one another suggests there could be substantial congestion in north Kihei during an evacuation emergency. Therefore, another evacuation route is needed.

### Research Activities at the Maui R&T Park and Science City

Activities at the Maui R & T Park and Science City are helping to diversify Maui's economy by attracting high-tech industries and creating attractive jobs. The proximity of the R & T Park and Science City produces interesting synergies, which are being used by some enterprises and help attract new endeavors. The road would facilitate transportation between these two high-tech centers.

### Support Maui's Visitor Industry

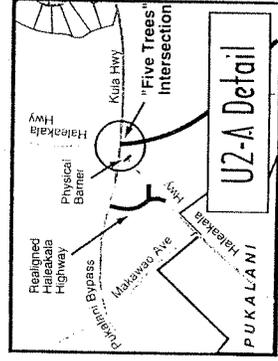

Kihei-Makena is one of Maui's principal visitor attractions. This area has an economic relationship with Upcountry Maui because of Upcountry's tourist attractions, such as Haleakala National Park, and is a popular residential area.

## What are the Alternatives?

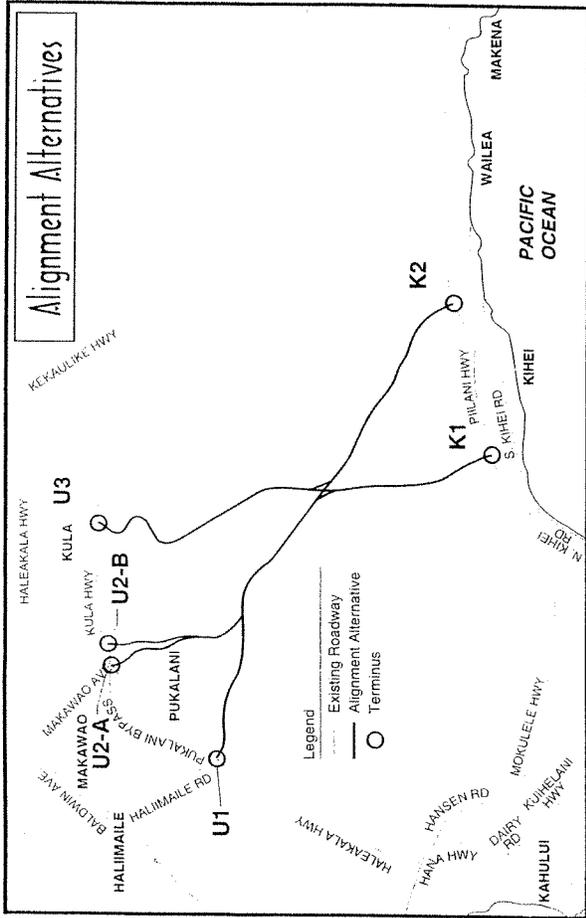

In addition to the "No-Build," eight alternative alignments are being considered that consist of all possible combinations of two Kihei and four Upcountry terminus options (see map). The Kihei termini are named K1 and K2. K1 is located at the Pilihi Highway / Kaonoulu Street intersection; K2 is located at the Pilihi Highway / Ke Aili Alanui Street intersection. The Upcountry termini are named U1, U2-A, U2-B and U3. U1 is located at the Haleakala Highway / Haliimaile Road intersection; U2-A is located at the Haleakala Highway / Pukalani Bypass / Kula Highway ("Five Trees") intersection; U2-B is located on Kula Highway almost one-half mile south of the Five Trees intersection; and U3 is located on Kula Highway just south of Pulehu Gulch. The names of the alternatives correspond to the termini names, and are listed to the right.

The U2-A alternatives (U2-A-K1 and U2-A-K2) would require the modification of the "Five Trees" intersection (see sketch). Kihei-Upcountry Maui Highway would replace the Haleakala Highway leg (Pukalani side) and Haleakala Highway would be re-aligned to link and form a T-intersection with Pukalani Bypass approximately 1200 feet north of the "Five Trees" intersection.

1. NO-BUILD
2. U1,K1
3. U1,K2
4. U2-A,K1
5. U2-A,K2
6. U2-B,K1
7. U2-B,K2
8. U3,K1
9. U3,K2

## Alignment Alternatives

## What are the Adverse Impacts of the Project? How Can These Impacts be Avoided or Mitigated?

The project's Draft EIS contains detailed information on the alternatives' beneficial and adverse impacts. It also includes measures that would help avoid, minimize or mitigate adverse impacts. Apart from impacts to large-scale agriculture, the project would not result in severe environmental impacts. Below are brief descriptions of the project's major impacts. Measures to mitigate or minimize these impacts are also provided.

### Farm/land

Certain alignments would cross and displace active sugarcane and pineapple fields. Not only would productive farmlands be lost, operations would also be hindered. The U1 alternatives would cause the greatest impact to sugarcane operations, although the U2-A and U2-B alternatives would also displace and divide active sugarcane fields. The U3 alternatives would not affect sugarcane cultivation. All the alternatives would cross and displace pineapple fields. The U3 alternatives would cross a County agricultural park.

Farmers affected by right-of-way requirements would be monetarily compensated for land acquisition and crop damage, if necessary. To retain the productivity of isolated or divided fields, mitigation measures would be implemented, such as modifying or reconstructing existing haul roads and irrigation and drainage systems. Unworkable or remnant agricultural land would be purchased.

### Traffic Patterns

A U1, U2-A or U2-B alternative may encourage some motorists traveling between Kula and Kihai to use the substandard Omaoipio or Pulehu Roads. Increasing use of these roads would interfere with farm vehicle movements and local traffic, and may increase traffic-related noise. This change in traffic patterns would be more likely under a U1 alternative because its terminus is located further from Kula.

A U3 alternative may encourage some motorists traveling to the Haleakala summit to use local residential roads running between Kula and Haleakala Highways. This may increase traffic-related noise along these roads and interfere with local traffic.

Traffic conditions at the intersections of Omaoipio and Pulehu Roads would be monitored after completion of the project to determine whether one or both warrant signalization. Signage would be provided directing motorists to the proper route to the Haleakala summit.

### Archaeological Resources

The highway would affect a number of archaeological sites important for data recovery, but not of such significance to require preservation. Depending on the alternative, up to 12 such sites may be affected.

An inventory survey will be conducted along the Preferred Alternative, which would be identified following receipt of public comments on the Draft EIS and from the public hearings. Before construction, data recovery of sites would be performed, and buffer zones would be fenced around known archaeological sites for protection during construction of the highway. If additional sites are uncovered during construction, work would stop immediately and the appropriate State and County officials would be notified.

### Visual Resources

The view of Haleakala from Kihai would be affected by a paved roadway and associated embankments climbing the slope. To lessen this impact, landscaping consistent with the climatic conditions would be provided to improve the appearance of the roadway.

## What are the Benefits of the Project?

The project would result in substantial travel time savings for motorists traveling between Kihai and Upcountry Maui. Depending on the origin and destination, the new highway could reduce trip length up to 50%. If a K1 alignment is selected, motorists traveling between Upcountry and West Maui would also benefit. As people spend less time traveling, quality of life improves.

The Maui highway system would operate better as a whole because a large portion of trips would be diverted onto the new highway, thereby improving traffic operations on other roadways, such as Mokuulele Highway, Dairy Road, Hana Highway and Haleakala Highway. A K1 alternative would divert more traffic because it serves the West Maui region better than K2 alternative.

Kihai-Makena would get another coastal evacuation route. A K2 alternative, with its more southerly terminus, would be better than a K1 alternative with regards to evacuation efficiency.

Kihai-Upcountry Maui Highway would offer motorists spectacular scenic vistas.

## What is the Cost of Each Alternative?

The total estimated cost of each alternative is provided below. These costs include construction and right-of-way acquisition.

### Estimated 1997 Dollar Cost (millions)

Alternative	Total
U1,K1	\$64.8
U1,K2	\$78.8
U2-A,K1	\$69.1
U2-A,K2	\$82.8
U2-B,K1	\$72.0
U2-B,K2	\$86.3
U3,K1	\$53.1
U3,K2	\$66.4

## When Will the Project be Constructed? How Long Will it Last?

If this project proceeds, construction is expected to begin in 2001 and would last about three years.

## What Will Happen After the Public Hearings?

HDOT and FHWA will select a Preferred Alternative which will be announced and identified in the Final EIS. If the Final EIS is accepted by the Governor of the State of Hawaii and the Division Administrator of the FHWA, a Record of Decision (ROD) will be prepared that will specify all mitigation commitments. The issuance of the ROD by the FHWA marks the completion of the project's planning phase. Next, design and right-of-way acquisition would begin, which is expected to last approximately two years.

## How Can I Comment?

You can provide comments at this public hearing. You can either write your own comments (a comment sheet is available from the sign-in attendant), or you can provide oral comments to a court reporter stationed at this hearing. If you write your own comments, you may drop them in the comment box or send them later to:

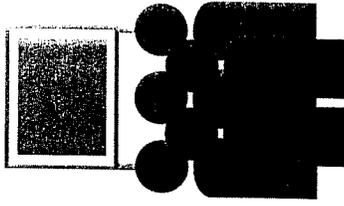

Mr. Kazu Hayashida  
Director of Transportation  
State Department of Transportation  
Highways Division  
869 Punchbowl St.  
Honolulu, Hawaii 96813

Written comments will be accepted through October 28, 1999.

## Where Can I Get More Information About this Project? Who Can I Contact If I Have Questions?

The Draft EIS for this project, which is available at Wailuku Regional Library, Kihel Public Library, Lahaina Public Library, Makawao Public Library, Kahului Public Library and the Maui District Office of the State Department of Transportation, contains more information about the project. You may also contact Mr. Kenneth Au, HDOT Advance Planning Engineer, at (808) 587-1843 (or Maui's toll-free voice access number 984-2400, ext. 71843), if you have any questions.

Transportation Engineer  
U.S. Department of Transportation  
Federal Highway Administration  
300 Ala Moana Boulevard, Room 3202  
Honolulu, Hawaii 96850

Dear Mr. Phung:

Thank you for your letter of March 18, 1998, regarding the Kihel-Upcountry Maui Highway project located on Maui, Hawaii. The proposed action is likely to require a Department of the Army (DA) permit due to work in jurisdictional waters of the U.S. In accordance with regulations at 40 CFR 1501.6 and the Memorandum of Understanding for Surface Transportation Projects in the State of Hawaii, the Corps accepts your invitation to be a cooperating agency in this project for NEPA and regulatory purposes.

Ms. Lolly Silva of my Operations staff will be the point-of-contact for initial coordination. Ms. Silva can be reached by telephone at 438-9258, extension 17, by facsimile at 438-4060, or by email at laurene.silva@pod01.usace.army.mil.

Sincerely,

George P. Young, P.E.  
Chief, Operations Branch

Subject: Kihai-Upcountry Highway, Maui, Hawaii  
Section 7 Consultation

Dear Mr. Harper:

We are currently preparing a NEPA environmental impact statement for the subject project. We request that the U.S. Fish & Wildlife Service (Service) identify the listed and proposed to be listed endangered and threatened species in the vicinity of the proposed project. A map showing the project area and the alignments of the alternatives is enclosed.

The Service was previously contacted in September, 1994. In October, 1994, the Service indicated that there are no endangered, threatened, or candidate species of birds recorded in the project area. However, we cannot find a record of this consultation in our files. For your information, the National Park Service in an October 25, 1994 letter, identified lowland dry forests in the area which contain a number of listed or proposed endangered plant species recognized by the Service (see Enclosure).

If you have any questions or need additional information, please call me at 566-2235.

Sincerely yours,

**Parsons Brinckerhoff Quade & Douglas, Inc.**

Re: Information on endangered and threatened species within the vicinity of the proposed Kihai-Upcountry Highway, Maui, Hawaii

Dear Mr. Yazawa:

The U.S. Fish and Wildlife Service (Service) has received your request dated November 27, 1996, for information on endangered and threatened species within the vicinity of the proposed Kihai-Upcountry Highway, Maui, Hawaii. Several alternative routes are proposed. This information was requested to assist in the preparation of a NEPA environmental impact statement for the proposed project located in Kihai, Maui.

The Service has reviewed the map provided with your request and pertinent information in our files, including maps prepared by The Nature Conservancy's Hawaii Natural Heritage Program and the Service's National Wetland Inventory maps. Based on a review of these maps, the Service offers the following comments for your consideration.

The alternative route beginning at K2 on the provided map, passes within a mile of Puu o Kali, one of the few remaining examples of dryland forest in the State. The Service is concerned that this alternative might impact this important ecological area as well as three federally endangered plants (*Abutilon menziesii*, *Hibiscus brackenridgei* ssp. *brackenridgei*, and *Bonania menziesii*). Other rare plant species (*Acacia koaia*, *Achyranthes splendens* var. *splendens*, *Canavalia pubescens*, and *Nesoluma polyvesicatum*) are also reported from the area. In addition, there is a reservoir within 1/3 mile of the proposed route junction of U1 and U2, near Omaopio Road. This reservoir may be used by migratory or endangered waterbirds that could be impacted by this proposed route. Our records indicate that the federally endangered Hawaiian coot (*Fulica americana alai*) was last seen in the vicinity in 1986. The Service wishes to note that the absence of rare, threatened, or endangered species locations on the Hawaii Natural Heritage Program's maps does not imply the absence of

JAN 8 - 1997

these species *per se* but may reflect the paucity of biological surveys in some areas. We therefore suggest that, where appropriate, surveys be conducted along the proposed route. The Service will be happy to assist in determination of appropriate sites to be surveyed.

The Service appreciates your concern for endangered and threatened species, and we look forward to reviewing any environmental documents that are produced in relation to the proposed project. If you have any questions regarding these comments, please contact our Program Leader for Interagency Cooperation, Ms. Margo Stahl, or Fish and Wildlife Biologists Christia Russell or Dr. Annie Marshall at 808/541-3441.

Sincerely,

  
Margo Stahl

Dear Mr. Harper:

Subject: Kihai-Upcountry Maui Highway Project  
Island of Maui, Hawaii  
Project Coordination Under Section 7, Endangered Species Act

On January 8, 1997, the U.S. Fish and Wildlife Service (Service) provided a letter regarding the subject project stating that the K2 roadway alignment alternatives pass within a mile of Puu o Kali, a dryland forest area which may contain Federal Trust species (see enclosure). The Service also reported that the U2 alternatives pass near a reservoir which may be used by migratory or endangered waterbirds. Since the January 8, 1997 letter, alignments U2-A and U2-B were developed as alternatives to the mauka portion of the original U2 alignment. However, the section of the U2 alignment near the reservoir was not affected.

Recent botanical surveys which covered all alignment alternatives being addressed in the project's forthcoming Draft Environmental Impact Statement (EIS), which is being prepared in accordance with the National Environmental Policy Act (NEPA) and the State of Hawaii EIS law, did not identify any listed, proposed or candidate threatened or endangered plant species, or any plant species of concern (see enclosed reports). Specifically, none of the plant species identified in the Service's January 8, 1997 were found. Therefore, the FHWA finds that the proposed project will have no effect on the plant species identified in the Service's January 8, 1997 letter or other listed, proposed or candidate threatened or endangered plant species known at the time the surveys were conducted.

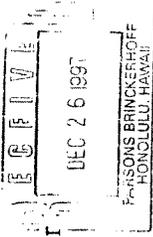

The concern about potential impacts to endangered or migratory waterbirds resulted in telephone consultations between your staff and Parsons Brinckerhoff on April 2 and May 9, 1997. Service staff indicated that the January 8, 1997 letter did not require faunal surveys of the alignments and the reservoir. Additional consultation with the Maui Nature Conservancy (telephone conversation

HONOLULU, HAWAII 96850  
PHONE: (808) 541-3441 FAX: (808) 541-3470

on April 2, 1997) supported the Service's position that there would likely be no endangered or threatened faunal species along the alignments. However, Service staff recommended that the project's EIS acknowledge that the reservoir could attract migratory or endangered waterbirds. At nearest approach, the edge of the U-2 alignment right-of-way would be approximately 230 feet from the reservoir with an elevational difference between the road and the reservoir of approximately 60 vertical feet. None of the U2 alternatives would modify the reservoir or its functions during or after construction. Therefore, the FHWA finds that the reservoir's use as habitat for migratory waterbird species would not be affected, so the project will have no effect on migratory or endangered waterbirds that use the reservoir.

Based on the information herein provided, we request that the Service provide written concurrence with these findings for each Federal Trust species listed in the January 8, 1997 letter. We also request that the Service provide information on listed, proposed or candidate endangered or threatened species likely to be in the project area that may have been added since the January 8, 1997 letter.

Please contact me at 541-2536 if you have any questions or require additional information. Thank you.

Sincerely yours,

Pat V. Phung, P.E.  
Transportation Engineer

Re: Concurrence letter and species list for the proposed Kihei-Upcountry Maui Highway project, Maui, Hawaii

Dear Mr. Phung:

The U.S. Fish and Wildlife Service (Service) has received your December 2, 1997, letter requesting concurrence under section 7 of the Endangered Species Act and an additional species list for the proposed Kihei-Upcountry Maui Highway project, Maui, Hawaii. On January 8, 1997, the Service provided a letter regarding the subject project. Since that letter, alignments U2-A and U2-B were developed as alternatives to the mauka portion of the original U2 alignment, and botanical surveys were made along the two new alternative routes.

The Service has reviewed the updated information provided with your request and pertinent information in our files. Based on our review of this information, the Service has the following comments.

The alternative routes added since January 8, 1997, pass through disturbed areas, mainly abandoned pineapple fields, mixed shrubland, mixed pasture land, and gulch vegetation, none of which include any federally listed plants. In addition, there are no federally listed, proposed or candidate endangered or threatened wildlife species known from these areas. Therefore, since the proposed routes will not affect the reservoir or the dryland forest at Puu o Kali, the Service will concur with a determination that this project is not likely to adversely affect any federally listed, proposed, or candidate endangered or threatened species. In view of this, we believe that the requirements of section 7 of the Endangered Species Act (Act) have been satisfied. However, obligations under section 7 of the Act must be reconsidered if (1) new information reveals impacts of this identified action that may affect listed species or critical habitat in a manner not previously considered, (2) this action is subsequently modified in a manner that was not considered in this assessment, or (3) a new species is listed or critical habitat determined that may be affected by the identified action.

DEC 24 1997

The Service appreciates your concern for endangered and threatened species. If you have any questions regarding these comments, please contact our Program Leader for Interagency Cooperation, Ms. Margo Stahl, or Fish and Wildlife Biologist Dr. Annie Marshall at 808.541-3441.

Sincerely,  
  
Brooks Harper  
Field Supervisor  
Ecological Services

Dear Jan,

Subject: Proposed Kihei-Upcountry Highway Alternatives

Jan, attached are Forms AD-1006, Farmland Conversion Impact Rating, covering the nine alternatives. Part III of the form was to be filled out by the federal agency involved, meaning the FHWA. I filled out the acreages noting the highway lengths times the 160 feet right of way you noted. If those figures are different, you need to inform me and I would need to recalculate the information.

Call me at (808) 244-3729 for any information.

Sincerely,

*Neal S. Fujiwara*

Subject: Kihei-Upcountry Maui Highway Project  
Fairland Protection Policy Act, Form AD-1006

Dear Mr. Fujiwara:

In July 1995, you provided Forms AD-1006 for ten alternative alignments of the above federal-aid project to Ms. Jan Reicheiderfer of Parsons Brinckerhoff (see enclosed transmittal letter and copies of Forms AD-1006). We are presently preparing a NEPA Draft environmental impact statement for this project which we hope to have completed by early next year. However, the alternative alignments now being considered are different from the alternatives in 1995. Therefore, in order to comply with the Fairland Protection Policy Act, we need Fairland Conversion Impact Ratings for our current alternatives (completed Parts II, IV and V of Form AD-1006).

The alternatives now being considered are eight possible combinations of four Upcountry termini, named U1, U2-A, U2-B and U3, and two Kihei termini, named K1 and K2 (see enclosed project location map with the alternatives). The proposed right-of-way for Kihei-Upcountry Maui Highway is still 160 feet. The current alternatives' lengths and my calculations of "Total Acres To Be Converted Directly" are as follows:

Alternative	Length (miles)	Acres
U1/K1	9.7	188
U1/K2	10.9	211
U2-A/K1	9.7	188
U2-A/K2	10.9	211
U2-B/K1	9.6	186
U2-B/K2	10.8	209
U3/K1	9.0	175
U3/K2	10.1	196

I am also enclosing soils maps with the current alignments.

We would appreciate if you can provide completed Parts II, IV and V as soon as possible. If you have any questions, please feel free to call me at (808)566-2235 or you can e-mail me at yazawa@pbworld.com.

Sincerely yours,

Jason Yazawa

Dear Mr. Fujiwara:

This letter is a follow-up to the letter I sent you on October 15, 1997. I have just received preliminary engineering data on the anticipated right-of-way requirements of each of the alternatives. Please replace the information I previously provided to you with this new information.

Alternative	Right-of Way Required (Acres)
U1/K1	241.2
U1/K2	277.3
U2-A/K1	243.3
U2-A/K2	279.4
U2-B/K1	245.6
U2-B/K2	281.7
U3/K1	219.3
U3/K2	252.5

Dear Mr. Nakamura:

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)

As per previous unofficial discussions, we are submitting the Farmland Conservation Impact Ratings [Form AD-1006(10-83)] for the Kihei-Upcountry Maui Highway project. The U. S. Department of Transportation, Federal Highway Administration, has concurred with this submittal. We, therefore, request a determination as to whether the proposed conversion is consistent with the Farmland Protection Policy Act and all Department of Agriculture's internal policies.

Very truly yours,

*Saku Nakamura*

Dear Mr. Hayashida:

Subject: Kihei-Upcountry Maui Highway  
Project No. HDPS-9203(1)  
HWY-PA 2.9503

I am returning the Farmland Conversion Impact Rating (form AD-1600) for the Kihei-Upcountry Maui Highway project. The rating is intended to guide you (on federal agency projects) to limit the conversion of productive farmland to nonagricultural uses. It is up to the federal agency (Department of Transportation) to use the rating to select the appropriate alternative site.

Because the rating total score for all sites is less than 160, only a minimum level of consideration for protection is needed, and no additional sites need be evaluated. If a site scores 160 or more, an alternate site should be considered that converts fewer acres of farmland or converts other farmland that has lower relative value.

If you have any questions, or if I can provide you with any additional information, please call me at 541-2600 ext 133.

Sincerely,

*Saku Nakamura*

Subject: Kihai-Upcountry Maui Highway, Maui, Hawaii  
Archaeological Survey of Alternatives

The State of Hawaii Department of Transportation is evaluating alternatives for a new highway that would link Kihai-Makena to Upcountry Maui. You were referred to us by the State Historic Preservation Division because of your knowledge of historic and archaeological resources in the study area.

The alternatives under consideration in the upcoming Draft Environmental Impact Statement (EIS) are all eight combinations of two Kihai and four Upcountry terminus options. The Kihai termini and segments are called K1 and K2, and the Upcountry termini and segments are called U1, U2-A, U2-B and U3. The eight alternative alignments are:

1. U1,K1
2. U1,K2
3. U2-A,K1
4. U2-A,K2
5. U2-B,K1
6. U2-B,K2
7. U3,K1
8. U3,K2

Enclosed are archaeological reconnaissance survey reports prepared for this project by Cultural Surveys Hawaii (CSH).

The following historic properties are within the path (within a 400-foot wide corridor) of the alternatives, and therefore, may be destroyed by the construction of the highway:

CSH recommended only data recovery of the above properties. An inventory-level survey will be conducted on the project's Preferred Alternative, which will be selected after receiving public comments on the project's forthcoming Draft EIS. For sites requiring additional data recovery, if any, a data recovery plan will be prepared and implemented after the Final EIS.

If you have knowledge of other traditional or historic properties at or near the proposed project, and/or have comments on the CSH reports, we would very much appreciate your input. Any comments you submit will be forwarded to the State Historic Preservation Division to assist in its evaluation of the reports. Please submit your comments by March 20, 1999.

If you have any questions, please call Kenneth Au at 587-1843.

Very truly yours,

KAZU HAYASHIDA  
Director of Transportation

Attention: Mr. Don Hibbard

Dear Mr. Johns

Subject: Kihei-Uppcountry Maui Highway, Maui, Hawaii  
Section 106 of the National Historic Preservation Act  
Request for Concurrence on Significance Evaluations and Treatment Measures of  
Sites, and Effect Determination

In accordance with Section 106 of the National Historic Preservation Act, the Federal Highway Administration (FHWA) submits the enclosed archaeological reconnaissance survey reports, prepared by Cultural Surveys Hawaii (CSH), for subject project. The project's alternatives that will be evaluated in the upcoming Draft environmental impact statement (EIS) are all eight combinations of two Kihei and four Uppcountry terminus options (see enclosed figure). The Kihei termini and segments are called K1 and K2, and the Uppcountry termini and segments are called U1, U2-A, U2-B and U3. The eight alternative alignments are:

1. U1,K1
2. U1,K2
3. U2-A,K1
4. U2-A,K2
5. U2-B,K1
6. U2-B,K2
7. U3,K1
8. U3,K2

#### Adjustments to Alternatives

The original U2 and U3 alignments were modified or shifted to avoid important archaeological sites found by CSH. These changes are described below:

- The mauka-most section of the U2 alignment was modified to Alignments U2-A and U2-B because of U2's potential impacts to CSH Sites 1 and 23 (see below). Later when important sites (CSH sites 101 and 102, see below and Alternative U2-A report) were discovered within the U2-A alignment, the alignment was shifted to Alignment U2-A.

IN REPLY, REFER TO  
HEC-HI

(New) to avoid both sites and CSH site 103. However, CSH determined that this new U2-A would indirectly affect a heiau (State Site 50-50-10-2701) because it would interfere with the heiau's makai (north to west) viewplane (see Alternative U2-A (New) report). Therefore, another U2-A alignment was developed as a combination of the original U2-A and U2-A (New). This U2-A (Hybrid) would avoid CSH sites 101, 102 and 103, and shifts the alignment to the south (mauka) of the heiau, as recommended by CSH. A reconnaissance survey of the U2-A (Hybrid) alignment is not necessary because the alignment embodies both the original U2-A and U2-A (New) alignments. CSH reviewed the U2-A (Hybrid) alignment, and determined that it would not affect the heiau.

- Part of the U3 alignment at Pulehu Gulch was shifted to avoid CSH site 7 (see below). A reconnaissance survey was not conducted on the re-aligned segment. Therefore, it is not known whether this shift would affect another site(s). However, as recommended by the State Historic Preservation Division during project scoping, an inventory survey will be conducted on the preferred alternative after the Draft EIS (see below)

#### Solicitation of Comments

Copies of the archaeological reports are being provided to the following individuals and organizations, as recommended by Mr. Boyd Dixon of your staff who provided this list in November 1997:

- Maui-Lanai Island Burial Council,
- Reverend David Ka'alakea,
- Charles Maxwell, Cultural Specialist,
- South Maui Heritage Corridor,
- Kihei Community Association,
- Waiohuli/Keokea Homestead Association,
- Ed Lindsey, Cultural Specialist; and
- Mahealani Kaiakamalie, Native Forest Specialist

In addition, the Office of Hawaiian Affairs and the Department of Hawaiian Home Lands will receive copies of the reports. We will provide copies of the transmittal letters to the State Historic Preservation Division. These individuals and organizations will have 30 days to submit comments after receiving the reports. Any comments received will be forwarded to the State Historic Preservation Division.

#### Site Evaluations

In the reports, CSH applied Significance Criteria from the National and State Registers of Historic Places and evaluated the sites. These evaluations are reported in the following sections:

- Original report (Note that the mauka-most section of the U2 alignment was modified to the U2-A and U2-B alignments):
- Section IV: Significance of the Historic Properties,

- Table 3: Significance of Sites Located During Reconnaissance Survey, and
- Section VII: Conclusions and Recommended Treatments;
- Alternative U2-A report (Note that this alignment was modified to the U2-A (new) alignment);
- Section III: Significance of the Historic Properties, and
- Section IV: Recommendations;
- Alternative U2-A (New) report (Note that this alignment was modified to the U2-A (Hybrid) alignment);
- Section IV: Significance of the Historic Properties, and
- Section V: Recommendations; and
- Alternative U2-B report;
- Section III: Significance of the Historic Properties, and
- Section IV: Recommendations

In summary, CSH had following site evaluations and recommended treatment measures. The FHWA agrees with CSH's findings and recommendations

- CSH sites 1, 7, 23, 101 and 102 were evaluated as significant under Criteria C, D and E, and these sites were recommended for preservation in a manner acceptable to the State Historic Preservation Officer (SHPO). The U2, U2-A and U3 alignments were modified or shifted to avoid all these sites.
- CSH site 103 was evaluated as significant under Criteria C and D, and was recommended for only data recovery. The U2-A alignment was shifted to avoid this site.
- State Site 50-50-10-2701 was evaluated as significant under Criteria D and E, and was recommended for preservation in a manner acceptable to the SHPO. The U2-A alignment was shifted to the south (mauka) of the heiau so that it would not affect the heiau's makai (north to west) viewplane.
- All the other sites (CSH sites 2 through 6 and 8 through 22) were evaluated as significant under Criterion D, and these sites were recommended for data recovery only. These sites are still within the path (within a 400-foot wide corridor) of the alternative alignments.

With regards to Pu'uoweli (see Alternative U2-B report), CSH requested that the SHPO determine its historic property status. CSH stated that Pu'uoweli may have a relationship with the surrounding petroglyphs (i.e. context to Hawaiian history), which would make the site significant under Criteria C, D and E. CSH also stated that the site's possible historic significance could be related to Kula's development, which would make the site significant under Criterion C. Pu'uoweli is in the path of the U2-B alignment.

- Data recovery of State Site 50-50-10-4181 was completed by others, and the site is no longer considered to be significant as an historic property.

#### Assessment of Effect and Adverse Effect

Based on the CSH's recommended treatment measures, the FHWA completed the following assessments in accordance with 36 CFR 800.5:

#### Alternative Effect Determination

- |         |  |
|---------|--|
| U1,K1   | "no adverse effect" on five (5) sites (CSH Sites 8, 16, 20, 21, 22)  |
| U1,K2   | "no adverse effect" on twelve (12) sites (CSH Sites 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 21, 22)  |
| U2-A,K1 | "no adverse effect" on four (4) sites (CSH Sites 8, 16, 20, 22); and "no effect" on four (4) sites (CSH Sites 101, 102, 103 and State Site 50-50-10-2701)  |
| U2-A,K2 | "no adverse effect" on eleven (11) sites (CSH Sites 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 22); and "no effect" on four (4) sites (CSH Sites 101, 102, 103 and State Site 50-50-10-2701)  |
| U2-B,K1 | "no adverse effect" on four (4) sites (CSH Sites 8, 16, 20, 22); and "no effect" on one (1) site (State Site 50-50-10-4181); note that an effect determination of Pu'uoweli is not included, pending the SHPO's decision of its historic property status                               |
| U2-B,K2 | "no adverse effect" on eleven (11) sites (CSH Sites 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 22); and "no effect" on one (1) site (State Site 50-50-10-4181); note that an effect determination of Pu'uoweli is not included, pending the SHPO's decision of its historic property status |
| U3,K1   | "no adverse effect" on five (5) sites (CSH Sites 6, 16, 18, 19, 20); and "no effect" on one (1) site (CSH Site 7)  |
| U3,K2   | "no adverse effect" on eleven (11) sites (CSH Sites 6, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19); and "no effect" on one (1) site (CSH Site 7)  |

#### Proposed Mitigation

Following identification of the project's preferred alternative, which will be made after receiving agency and public comments on the forthcoming Draft EIS, an inventory-level survey will be conducted on the preferred alternative to gather more information about affected sites and

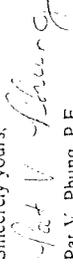

determine whether further data recovery work is required for any site. The Final EIS will not be released until after the SHPO has approved the inventory survey. For sites requiring additional data recovery, if any, a data recovery plan will be prepared and implemented after the Final EIS in coordination with the SHPO and other agencies and organizations as required by the SHPO.

During construction, fenced buffer zones will be placed around known archaeological preservation features at and near the construction site. If unknown historic or archaeological sites are uncovered during construction, work will stop immediately and the State Historic Preservation Division will be notified and consulted on the appropriate treatment measures. Construction would only resume after approval from the appropriate authorities.

#### Request to the SHPO

The FHWA requests that the SHPO concur with the significance evaluations, treatment measures and effect determinations provided in this letter. If you have any questions, please call me at (808) 541-2700 ext. 305.

Sincerely yours,

  
Pat V. Phung, P.E.  
Transportation Engineer

DIRECTOR-DESIGNATE OF TRANSPORTATION

SUBJECT: PROPOSED KIHEI-UPCOUNTRY MAUI HIGHWAY, INITIATION OF SECTION 106 AND CHAPTER 6E PROCESS, INVENTORY SURVEY OF THE U1, K1 ALTERNATIVE, CULTURAL IMPACTS STUDY

The purpose of this letter is to initiate the historic review process under Section 106 of the National Historic Preservation Act and Chapter 6E of the Hawaii Revised Statutes for the subject project. Enclosed is an inventory survey report of the U1, K1 alignment, which was selected as the preferred alternative and will be identified as such in the upcoming Final Environmental Impact Statement (EIS). The inventory survey report identifies several sites that were evaluated by Cultural Surveys Hawaii, Inc. (CSH), the author of the report, as being significant per criteria of the National and Hawaii Registers of Historic Places. Also enclosed is a cultural impacts study for all the alternatives. The cultural impacts study did not identify any traditional cultural properties (TCP) along the preferred alternative.

We respectfully ask that the State Historic Preservation Division (SHPD) review the inventory survey and TCP report. If these reports are acceptable, please provide us with a written notice of acceptance. We will also be submitting these reports to the State of Hawaii Office of Hawaiian Affairs (OHA), the Department of Hawaiian Home Lands (DHHL) and the following individuals and organizations who were recommended by your staff for consultation for this project in 1997:

- Maui/Lani Island Burial Council;
- Charles Maxwell, Cultural Specialist;
- South Maui Heritage Corridor;
- Kihei Community Association;
- Waiohuli/Keokea Homestead Association;
- Ed Lindsey, Cultural Specialist; and
- Mahealani Kakaokamalie, Native Forest Specialist.

If there are others that you feel should be consulted, please let us know. We will forward to you any comments we may receive.

To assist you in reviewing the reports, we would like to provide a summary of the public involvement activities regarding the identification and assessment of potential impacts to historic properties.

Public Review of Archaeological Reconnaissance Surveys

CSH conducted archaeological reconnaissance surveys for all proposed alternative alignments considered in the project's Draft EIS. These alternatives included all eight combinations of two Kihei and four Upcountry terminus options. The Kihei termini and segments are called K1 and K2, and the Upcountry termini and segments are called U1, U2-A, U2-B and U3. The eight alternative alignments are:

1. U1, K1
2. U1, K2
3. U2-A, K1
4. U2-A, K2
5. U2-B, K1
6. U2-B, K2
7. U3, K1
8. U3, K2

The U2 and U3 alignments were modified or shifted prior to the Draft EIS to avoid important archaeological sites identified by CSH.

In February 1999, the reconnaissance reports were submitted for comments to OHA and the DHHL as well as those individuals and organizations listed above. Since none of these organizations and individuals provided comments within the time requested, each of them were contacted by phone in March 1999. The calls resulted in comment letters from OHA, DHHL and Mr. Ed Lindsey. These letters were forwarded to SHPD in April 1999 to assist in the SHPD review of the reconnaissance reports. Copies of these letters are enclosed in this letter.

Draft Environmental Impact Statement

The project's Draft EIS, which met the requirements of both the National Environmental Policy Act and HRS Chapter 343, was announced and released to the public in August 1999. Three formal public hearings were held on September 29 and 30, and October 13, 1999 at Kihei Aquatics and Community Center in Kihei, Mayor Hannibal Tavares Community Center in Pukalani, and Kahului School, respectively. The public hearings were "open house", a format in which no formal presentation is made, but information about the project is provided by "science fair" types of displays, and experts are available to answer questions. A portion of the display area was devoted

to the subject of historic resources, and was staffed by Mr. Hallett Hammatt, principal of CSH, who was available at all three public hearings. This historic resources display area included maps showing the location of the historic sites found and photographs of some of the more notable sites (e.g., the petroglyphs that were avoided by the modifications to some of the alternatives).

Public review of the Draft EIS produced over 400 written and oral comments, of which, only one, a letter from Mr. Charles Maxwell, provided information about historic properties in the project area. OHA also provided a Draft EIS comment letter. Both letters are provided with this letter as enclosures.

Summary of Comments received Regarding Historic and Cultural Properties

DHHL - DHHL stated that they have no knowledge of historic properties in the study area.

OHA - In the letter providing comments on the reconnaissance surveys, OHA requested additional information on Site 4776 (previously identified as CSH 20) and the sites along the K2 alignment, and requested that a cultural analysis be conducted. The second request was repeated in the letter providing comments on the project's Draft EIS.

Ed Lindsey - Requested a more detailed analysis of the preferred alternative.

Charles Kauluwehi Maxwell - Provided information about burial caves in Kahuapulani and Kaliahuni Gulches in the vicinity of the U2-A and U2-B alignments, and about Site 2701, the Heiau adjacent to the U2-A alignment.

We complied with OHA's request to include a cultural assessment in the Draft EIS, the result being the cultural impacts study. The inventory survey complied with OHA and Mr. Lindsey's request for additional information. Mr. Maxwell's concern was alleviated by the selection of the U1, K1 alignment as the preferred alternative, instead of one of the U2-A or U2-B alignments.

Thank you for your time and effort. We would highly appreciate your immediate attention on this matter so that we may proceed with the Section 106 and Chapter 6E process. If you approve the reports, we will soon thereafter submit effect determinations.

Dear Mr. Ogata:

Subject: Proposed Kihei-Upcountry Maui Highway, Maui, Hawaii  
Inventory Survey of the U1, K1 Alternative, Cultural Impacts Study

Two years ago we asked for your review and comments on archaeological reconnaissance survey reports prepared for the subject project. Since then, we have completed a Draft Environmental Impact Statement (EIS) for the project, held public hearings, solicited agency and public comments on the Draft EIS, and selected a preferred alternative. The preferred alternative is the U1, K1 Alternative, an alignment from the Haleakala Highway/Haiiimaile Road intersection to the Piilani Highway/Kaonoulu Street intersection.

Following selection of the preferred alternative, Cultural Surveys Hawaii, Inc. (CSH) conducted an archaeological inventory survey of this alignment. The inventory survey report identifies several sites that were evaluated by CSH as being significant per criteria of the National and Hawaii Registers of Historic Places. In addition, Scientific Consultant Services, Inc. conducted a cultural impacts study for all the alternatives. The cultural impacts study did not identify any traditional cultural properties at or near the alternatives. Both reports are enclosed for your review and comments.

We would very much appreciate your input, and any comments you submit will be forwarded to the State Historic Preservation Division to assist in their evaluation of the reports. Please submit your comments by March 2, 2001 to:

**Parks and Recreational Facilities**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Hawaii Coastal Zone Management Program Assessment Form  
 FIGURE 4

- 3. Is the project site near a State or County Park?
- 4. Is the project site near a perennial stream?
- 5. Will the proposed action occur in or affect a popular fishing area?
- 6. Will the proposed action occur in or affect a recreational or boating area?
- 7. Is the project site near a sandy beach?
- 8. Are there swimming or other recreational uses in the area?

**Discussion:**

Kihei-Upcountry Maui Highway will connect two State highways, Piilani Highway in Kihei and Haleakala or Kula Highways in Upcountry. The SDOOT owns the right-of-way of both highways. The project will not use land from, nor adversely impair access or use of the parks and recreational resources shown on Figure 4. The nearest coastal recreational resources are parks and sandy beaches along the Kihei coastline, approximately one mile from Piilani Highway, the makai terminus of the proposed highway. Although coastal recreational activities (e.g., surfing, fishing, and boating) occur along the Kihei coastline, the roughly one-mile distance of the makai terminus of the proposed highway from coastal recreation areas indicates that the proposed highway would not adversely affect any coastal recreation activities. In contrast, Kihei-Upcountry Maui Highway will improve access to these coastal recreational areas, especially for Upcountry residents.

For more information on parks and recreational resources, please refer to Sections 3.11, 4.11, and 4.12 of the Draft EIS.

## HISTORIC RESOURCES

**Objective:** Protect, preserve, and where desirable, restore those natural and man-made historic and pre-historic resources in the coastal zone management area that are significant in Hawaiian and American history and culture.

**Policies:**

1. Identify and analyze significant archaeological resources;
2. Maximize information retention through preservation of remains and artifacts or salvage operations; and
3. Support State goals for protection, restoration, interpretation, and display of historic resources.

Check either "Yes" or "No" for each of the following questions.

	<u>Yes</u>	<u>No</u>
1. Is the project site within a historic/cultural district?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. Is the project site listed on or nominated to the Hawaii or National Register of Historic Places?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
3. Does the project site include undeveloped land, which has not been surveyed by an archaeologist?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4. Has a site survey revealed any information on historic or archaeological resources?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
5. Is the project site within or near a Hawaiian fishpond or historic settlement area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>

**Discussion:**

As suggested by the Department of Land and Natural Resources, State Historic Preservation Division (SHPD), reconnaissance-level surveys were conducted on the alignments considered in the Draft EIS. The SHPD suggested an archaeological inventory survey be conducted only on the preferred alternative, which was subsequently determined to be U1,K1. This approach was followed, with the results of the reconnaissance surveys disclosed in the Draft EIS. Subsequent to the identification of the preferred alternative, an inventory survey was performed on this alignment. Fieldwork was completed in October 2000, and the upcoming inventory survey report will be used to determine project compliance with Section 106 of the National Historic Preservation Act. It is expected that a Section 106 Memorandum of Agreement (MOA) will be signed for this project.

In addition, a traditional cultural properties / practices (TCPs) study for the project was completed in September 2000. The study did not identify any TCPs that would be affected by the proposed project. The TCP study will be submitted to the SHPD for review.

The project area is either undeveloped or agricultural land. The archaeological reconnaissance surveys conducted in 1997 identified a total of 25 sites within 400 feet corridors centered on the eight proposed alignments. Twenty of these sites were newly discovered. All of the sites were evaluated as eligible for the National Register of Historic Places. In a letter dated June 21, 1999, the Deputy State Historic Preservation Officer (SHPO) concurred that the sites found are eligible for the National Register. The archaeological reconnaissance survey report was included in the Draft EIS as an appendix. The archaeological inventory survey of the U1,K1 alternative (the preferred alternative) identified ten distinct sites that may be eligible for the National Register, which is an increase from five sites identified during the reconnaissance survey of this alignment. The inventory survey will be included in the Final EIS as an appendix.

Impacts to all sites eligible for the National and Hawaii Registers of Historic Places, and recommended for preservation-in-place, were avoided by modifying the alignments of the alternatives. These sites include petroglyphs located in the gulches crossing the alignments and one *heiau* in the vicinity of the U2-A alignment. The alignments were not adjusted to avoid those sites affected that were not recommended for preservation, such as temporary habitation sites, agricultural sites, and military sites. The upcoming MOA will specify data recovery requirements for these sites. Further details on how impacts to archaeological sites were avoided and minimized are provided in the Draft EIS.

Archaeological resources are addressed in Sections 3.10 and 4.10 of the Draft EIS. Correspondence with the SHPD and SHPO is included in Appendix C.

Hawaiian fishponds are located along the coastal area of Kinei, approximately one mile from the proposed makai terminus of the highway. Because of this geographic separation, the proposed highway will not affect the fishponds on Kinei's coast.

**SCENIC AND OPEN SPACE RESOURCES**

**Objective:** Protect, preserve, and where desirable, restore or improve the quality of coastal scenic and open space resources.

**Policies:**

1. Identify valued scenic resources in the coastal zone management area;
2. Insure that new developments are compatible with their visual environment by designing and locating such developments to minimize the alteration of natural landforms and existing public views to and along the shoreline;
3. Preserve, maintain and, where desirable, improve and restore shoreline open space and scenic resources; and
4. Encourage those developments, which are not coastal dependent to locate in inland areas.

Check either "Yes" or "No" for each of the following questions.

	Yes	No
1. Does the project site about a scenic landmark?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. Does the proposed action involve the construction of a multi-story structure or structures?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
3. Is the project site adjacent to undeveloped parcels?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
4. Does the proposed action involve the construction of structures visible between the nearest coastal roadway and the shoreline?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5. Will the proposed action involve construction in or on waters seaward of the shoreline? On or near a beach?	<input type="checkbox"/>	<input checked="" type="checkbox"/>

**Discussion:**

Kihei-Upcountry Maui Highway will convert about 10 miles of open space used for grazing and agriculture to a transportation use. Hawaiian Commercial & Sugar Company, the owner of the agricultural land, has indicated that they will continue to cultivate sugarcane on parcels adjacent to the highway. Kihei-Upcountry Maui Highway is not expected to cause substantial urban development in Upcountry because the urban growth potential of Upcountry is limited by scarce water availability, not limited transportation infrastructure. Despite the recent development of a well in Haiku, and diversion of a portion of the well production to the Kulamau development, Upcountry will continue to rely on surface water resources which are highly vulnerable to drought conditions. Therefore, as stated in the Makawao-Pukalani-Kula Community Plan, the County does not intend to allow substantial urban development in Upcountry, despite the proposed Kihei-Upcountry Maui Highway.

Views from Upcountry feature panoramic scenes of Central Maui and its open agricultural lands, the rugged and picturesque West Maui Mountains, and the open ocean and shoreline. Kihei-Upcountry Maui Highway will not affect views from Upcountry because the terrain drops away towards Central Maui and the ocean. The views of the ocean, West Maui Mountains, and Central Maui from Upcountry will not be affected.

Views from Kihei offer near sea-level perspectives of the ocean and coastline, distant vistas of the West Maui Mountains and uphill views of Haleakala. Kihei-Upcountry Maui Highway will affect the view of Haleakala from Kihei. A paved roadway and associated embankments climbing the slope will be visible, similar to the view of Haleakala Highway from Kahului.

Visual resources and impacts are discussed in Sections 3.12 and 4.13 of the Draft EIS.

## COASTAL ECOSYSTEMS

**Objective:** Protect valuable coastal ecosystems from disruption and minimize adverse impacts on all coastal ecosystems.

**Policies:**

1. Improve the technical basis for natural resource management;
2. Preserve valuable coastal ecosystems of significant biological or economic importance;
3. Minimize disruption or degradation of coastal water ecosystems by effective regulation of stream diversions, channelization, and similar land user uses, recognizing competing water needs; and
4. Promote water quantity planning and management practices, which reflect the tolerance of fresh water and marine ecosystems and prohibit land and water uses, which violate State water quality standards.

Check either "Yes" or "No" for each of the following questions.

	Yes	No
1. Does the proposed action involve dredge or fill activities?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
2. Is the project site within the Shoreline Setback Area (20 to 40 feet inland of the shoreline)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
3. Will the proposed action require some form of effluent discharge into a body of water?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4. Will the proposed action require earthwork beyond clearing and grubbing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
5. Will the proposed action include the construction of special waste treatment facilities, such as injection wells, discharge pipes, or cesspools?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6. Is an intermittent or perennial stream located on or near the project site?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
7. Does the project site provide habitat for endangered species of plants, birds, or mammals?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
8. Is any such habitat located nearby?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
9. Is there a wetland on the project site?	<input type="checkbox"/>	<input checked="" type="checkbox"/>

10. Is the project site situated in or abutting a Natural Area Reserve?

11. Is the project site situated in or abutting a Marine Life Conservation District?

12. Is the project site situated in or abutting an estuary?

**Discussion:**

Surface water resources in the study area consist of intermittent streams that flow in gulches on the western flank of Haleakala, down slope of Kula and Haleakala Highways. The more prominent gulches are Kailiinui, Kaluapalani, Pulehu, Kolaiba, Keahua Iwi, Waiakoa, Kulanihako, Waipuilani, Kaonoulu, and Waiohuli. These gulches collect rainfall and direct flows toward the ocean. However, the gulches are usually dry, and in many places their streambeds have eroded to bedrock. There are no perennial streams in the project area.

Kihei-Upcountry Maui Highway will cross several of these gulches. These crossings will either be by bridge or embankment. Embankments will include culverts to maintain the flow of water in the gulch. The decision to use a bridge or embankment partially depends on storm water flow in the affected gulches. Culverts would be used for those gulches with storm water flows below 3,500 cubic feet per second from a 100-year design storm. In gulches where there would be peak flows greater than 3,500 cubic feet per second from a 100-year design storm, bridges would be constructed. In either case, the crossing will not create upstream impoundments, and there will be no hydraulic impacts, except perhaps during conditions that exceed the 100-year design storm. As shown on Figure 5, the preferred alternative would require seven bridges, including two underpasses where the highway crosses cane haul roads.

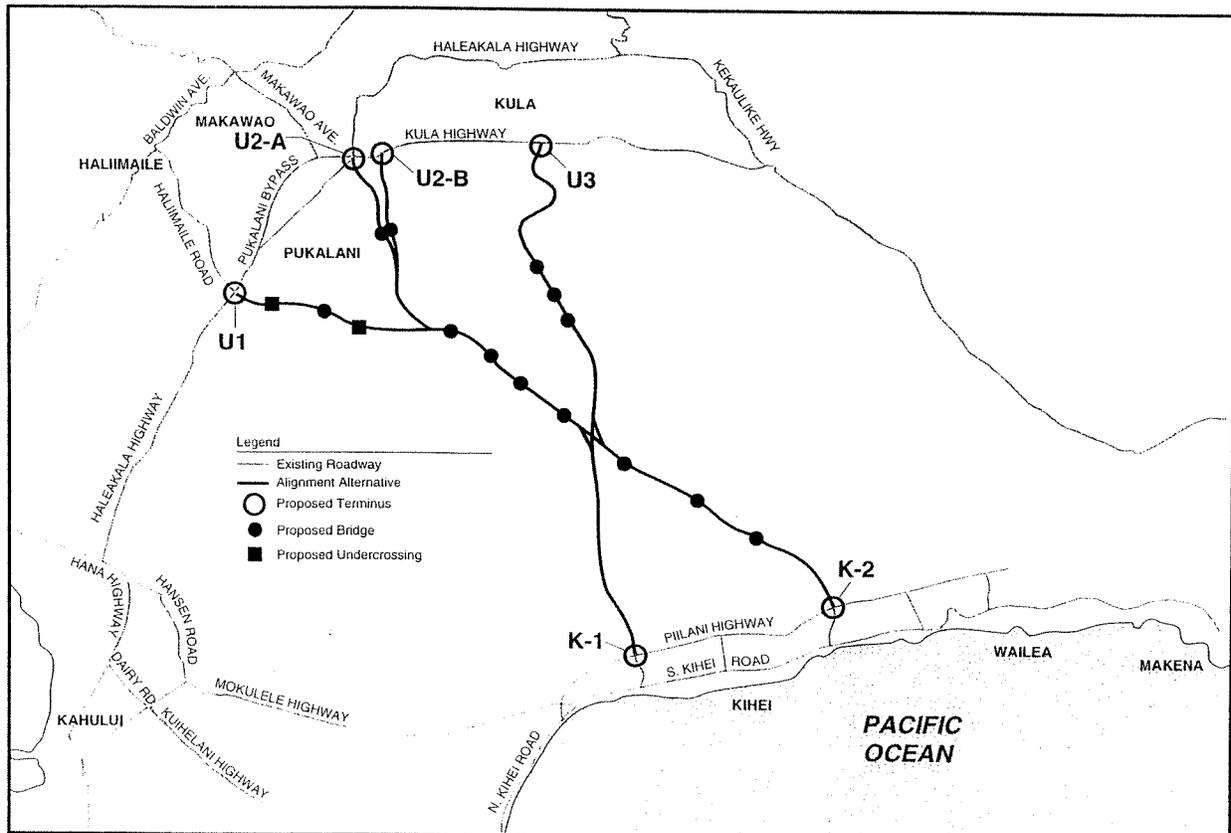

Storm water runoff containing roadway pollutants (petroleum products, rubber), will drain into the gulches and in most cases percolate into the ground. However, during heavy rain, storm water runoff could enter coastal waters. Since roadway pollutant levels are related to vehicle-miles traveled (VMT), a reduction of total regional VMT would reduce the pollutant loading of coastal waters from roadways. Kihei-Upcountry Maui Highway will reduce total regional VMT because it will substantially shorten the travel distance between some of Maui's major travel markets. Therefore, the Kihei-Upcountry Maui Highway would reduce roadway pollutant discharges to Maui's coastal waters in comparison to the future No-Build condition.

Although U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory Maps show wetlands within some of the gulches that would be crossed by the proposed highway, botanical surveys did not identify any evidence (vegetation, soils, or hydrology) of wetlands in any of the gulches where they would be crossed by any of the alternatives. Therefore, no wetlands would be affected by construction of Kihei-Upcountry Maui Highway.

The USFWS stated that certain alternatives, namely the K2 alignments, would pass within one mile of Pu'u o Kali, one of the few remaining examples of dryland forest in the State, which may contain three federally endangered plants (*Abutilon menziesii*, *Hibiscus brakenridgei* spp., *Brackenridgei*, and *Bonania menziesii*) and some rare plant species (*Acacia koala*, *Achyranthes splendens* var. *splendens*, *Canavalia pubescens*, and *Nesoluma polymericum*). None of the alternatives would affect Pu'u o Kali and this special forest. In fact, of all the

alternatives, the preferred alternative is furthest from this resource. Botanical surveys of the alternative alignments did not identify any listed, proposed, or candidate threatened or endangered plant species, or any plant species of concern.

The mammal and bird species found in the project area are common throughout the Hawaiian Islands, although the USFWS noted that the U2-A and U2-B alternatives would pass near a reservoir that was used by the endangered Hawaiian coot (*Fulica americana alai*), last seen in 1986. However, the U2-A or U2-B alignment would not affect this reservoir, and therefore, not affect endangered water birds that may be using this water body. USFWS agreed with this assessment.

 Hawaii Coastal Zone Management Program Assessment Form  
 FIGURE 5

## ECONOMIC USES

**Objective:** Provide public or private facilities and improvements important to the State's economy in suitable locations.

### Policies:

1. Concentrate in appropriate areas the location of coastal dependent development necessary to the State's economy;
2. Insure that coastal dependent development such as harbors and ports, visitor industry facilities, and energy generating facilities are located, designed, and constructed to minimize adverse social, visual, and environmental impacts in the coastal zone management area; and
3. Direct the location and expansion of coastal dependent developments to areas presently designated and used for such development and permit reasonable long-term growth at such areas, and permit coastal dependent development outside of presently designated areas when:
  - a) Utilization of presently designed located is not feasible;
  - b) Adverse environmental effects are minimized; and
  - c) Important to the State's economy.

Check either "Yes" or "No" for each of the following questions.

	<u>Yes</u>	<u>No</u>
1. Does the project involve a harbor or port?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. Is the project site within a designated tourist destination area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
3. Does the project site include agricultural lands or lands designated for such use?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
4. Does the proposed activity relate to commercial fishing or seafood production?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5. Does the proposed activity relate to energy production?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6. Does the proposed activity relate to seabed mining?	<input type="checkbox"/>	<input checked="" type="checkbox"/>

### Discussion:

Kihei-Upcountry Maui Highway links Kihei-Makena, Maui's second largest visitor accommodation region, with Upcountry Maui, an area containing visitor attractions in its own

right, lying on the way to Haleakala National Park. The new highway will enhance the visitor experience by providing a more direct vehicular access between Kihei, Upcountry, and Haleakala National Park. Socio-economic impacts of the project not related to agriculture are discussed in Section 4.3 of the Draft EIS.

In terms of agricultural impacts, the mauka portion of Kihei-Upcountry Maui Highway will cross agricultural lands, and the makai portion will cross grazing lands (see Figure 6). The preferred alternative would cause the greatest impact on active sugarcane land, and it will bisect one pineapple field. The U2-A and U2-B would also cross sugarcane land, as well as bisecting two pineapple fields. The U3 alternatives would not affect any sugarcane land, but will cross two pineapple fields and the Maui County agricultural park. No privately-owned Kula small-scale farm would be directly affected by any of the alternatives.

To maintain the productivity of agricultural lands adjacent to the highway, mitigation measures will be implemented. These mitigation measures will include modifying or reconstructing irrigation and drainage systems and haul routes affected by the highway. The preferred alternative will not create isolated, unworkable remnant parcels.

Some of the alternatives, including the preferred alternative, could modify travel patterns in a manner that may adversely affect certain Kula farms. Traffic on Omaopio and Pulehu Roads may increase, potentially interfering with farm vehicle movements.

To minimize impacts to ranching activities, stock-proof fencing will be erected along both sides of the highway in grazing areas. Provisions will also be made so cattle may be herded from one pasture to another without disrupting traffic.

A detailed discussion of farmlands in the project area is provided in Sections 3.2 and 4.2 of the DEIS.

## COASTAL HAZARDS

**Objective:** Reduce hazard to life and property from tsunami, storm waves, stream flooding, erosion, and subsidence.

**Policies:**

1. Develop and communicate adequate information on storm wave, tsunami, flood erosion, and subsidence hazard;
2. Control development in areas subject to storm wave, tsunami, flood, erosion, and subsidence hazard;
3. Ensure that developments comply with requirements of the Federal Flood Insurance Program; and
4. Prevent coastal flooding from inland projects.

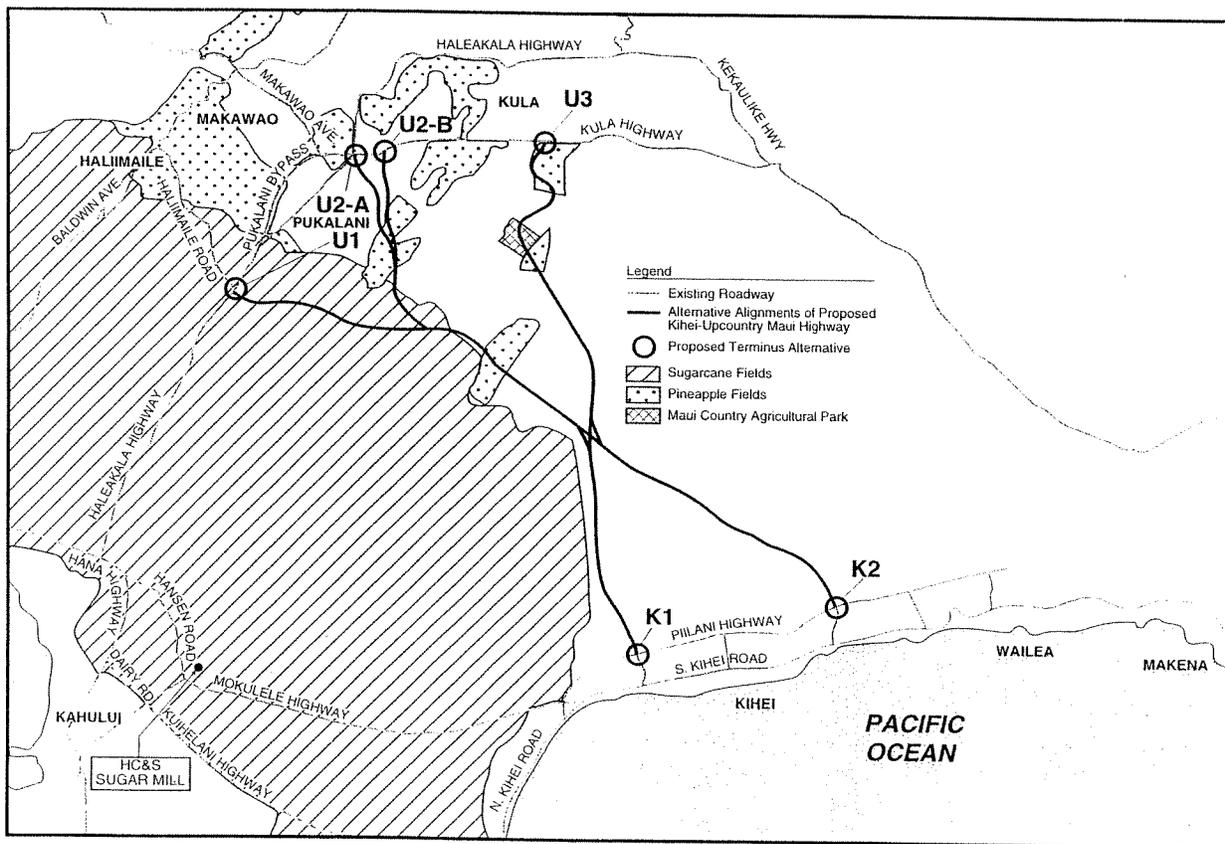

Check either "Yes" or "No" for each of the following questions.

- |   | Yes | No |
|---|-----|----|
| 1. Is the project site on or abutting a sandy beach?  |     | X  |
| 2. Is the project site within a potential tsunami inundation area as depicted on the National Flood Insurance Program flood hazard map? |     | X  |
| 3. Is the project site within a potential flood inundation area according to a flood hazard map?  |     | X  |
| 4. Is the project site within a potential subsidence hazard area according to a subsidence hazard map?                                  |     | X  |
| 5. Has the project site or nearby shoreline areas experienced shoreline erosion?  |     | X  |

**Discussion:**

The tsunami evacuation areas along the Kihei-Makena coastline are shown in Figure 7. As shown in the figure, the proposed highway is mauka of the tsunami inundation area. Moreover, Kihei-Upcountry Maui Highway will increase the evacuation capacity of the Kihei-Makena region. This is one of the purposes of the project

The Kihei coastline has experienced shoreline erosion. However, since Kihei-Upcountry Maui Highway will terminate approximately one mile away from the shoreline, it will not have an affect on shoreline erosion.

Source: Warren S. Unemori Engineering, Inc., May 1997

## MANAGING DEVELOPMENT

**Objective:** Improve the development review process, communication, and public participation in the management of coastal resources and hazards.

**Policies:**

1. Effectively utilize and implement existing law to the maximum extent possible in managing present and future coastal zone development;
2. Facilitate timely processing of application for development permits and resolve overlapping or conflicting permit requirements, and
3. Communicate the potential short- and long-term impacts of proposed significant coastal developments early in their life cycle and in terms understandable to the general public to facilitate public participation in the planning and review process.

Check either "Yes" or "No" for each of the following questions.

	Yes	No
1. Will the proposed activity require more than two (2) permits or approvals?	X	
2. Does the proposed activity conform with the State and County land use designations for the site?	X	
3. Has or will the public be notified of the proposed activity?	X	
4. Has a draft or final environmental impact statement or an environmental assessment been prepared?	X	

**Discussion:**

Public participation has been an important element of this project. Many scoping and coordination meetings have been held with government agencies, elected officials, and the general public throughout the planning process, as described in detail in Chapter 5 of the Draft EIS, which was published in July 1999.

Construction of Kihei-Upcountry Maui Highway will require the federal, State, and County permits listed in Section 4.18 of the Draft EIS. Aside from a Coastal Zone Management consistency determination concurrence, those permits pertaining to the protection of coastal resources include:

- Section 404 permit (Nationwide) from the U.S. Department of the Army;
- Stream Channel Alteration Permit from the State Department of Land and Natural Resources; and
- NPDES and Water Quality Certification permits from the State Department of Health.

SOURCE: Joint Institute for Marine and Atmospheric Research, University of Hawaii, in cooperation with the State of Hawaii Civil Defense System.

**Tsunami Evacuation Areas**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Hawaii Coastal Zone Management Program Assessment Form  
 FIGURE 7

The highway will traverse land designated Agricultural and Urban by the State Land Use Commission. A State highway is an allowable use in these zones.

Piliāni Highway, at the makai terminus of the project, forms the mauka boundary of the Special Management Area (SMA). Because project work would be limited to the mauka side of the highway, an SMA permit from the County is not needed.

## **PUBLIC PARTICIPATION**

**Objective:** Stimulate public awareness, education, and participation in coastal management.

### **Policies:**

1. Maintain a public advisory body to identify coastal management problems and to provide policy advice and assistance to the coastal zone management program;
2. Disseminate information on coastal management issues by means of educational materials, published reports, staff contact, and public workshops for persons and organizations concerned with coastal-related issues, developments, and government activities; and
3. Organize workshops, policy dialogues, and site-specific mediations to respond to coastal issues and conflicts.

### **Discussion:**

Public participation has been an important element of this project. Many scoping and coordination meetings have been held with government agencies, elected officials, and the general public throughout the planning process, as described in detail in Chapter 5 of the Draft EIS, which was published in July 1999.

## BEACH PROTECTION

**Objective:** Protect beaches for public use and recreation.

**Policies:**

1. Locate new structures inland from the shoreline setback to conserve open space and to minimize loss of improvements due to erosion;
2. Prohibit construction of private erosion-protection structures seaward of the shoreline, except when they result in improved aesthetic and engineering solutions to erosion at the sites and do not interfere with existing recreational and waterline activities; and
3. Minimize the construction of public erosion-protection structures seaward of the shoreline.

**Discussion:**

Construction of Kihei-Upcountry Maui Highway will not affect the shoreline setback area or have an impact on coastal erosion. The highway will not be adjacent to or abut the shoreline. At the point of closest approach to the shoreline, the proposed roadway would be approximately one mile from the coastline.

## MARINE RESOURCES

**Objective:** Implement the State's ocean resources management plan.

**Policies:**

1. Exercise an overall conservation ethic, and practice stewardship in the protection, use, and development of marine and coastal resources;
2. Assure that the use and development of marine and coastal resources are ecologically and environmentally sound and economically beneficial;
3. Coordinate the management of marine and coastal resources and activities management to improve effectiveness and efficiency;
4. Assert and articulate the interests of the State as a partner with federal agencies in the sound management of ocean resources within the United States exclusive economic zone;
5. Promote research, study, and understanding of ocean processes, marine life, and other ocean resources in order to acquire and inventory information necessary to understand how ocean development activities relate to and impact upon ocean and coastal resources; and
6. Encourage research and development of new, innovative technologies for exploring, using, or protecting marine and coastal resources.

**Discussion:**

Kihei-Upcountry Maui Highway will not directly affect marine and coastal resources. Some indirect impacts are possible because of erosion during construction, and roadway runoff during extreme storm events. A NPDES permit will be obtained prior to construction. The permit application will specify Best Management Practices (BMPs) to be implemented to minimize erosion. Since Kihei-Upcountry Maui Highway will reduce total regional VMT by shortening trip lengths, roadway pollutant loading of coastal waters will be less than under the future No-Build condition.

Kihei-Upcountry Maui Highway will improve access to coastal areas, especially from the Upcountry region. Improving accessibility to coastal resources will help raise public awareness and support of ecologically-minded coastal resource management. The Draft EIS and the project's public outreach efforts have included discussions about the importance of minimizing the project's impact on the natural environment.

Dear Mr. Galicinao:

Subject: Hawaii Coastal Zone Management (CZM) Program  
Federal Consistency Review for the Proposed Kihei-Uppcountry Maui Highway, Island of Maui, Hawaii

This is to update you on the status of our CZM federal consistency review. To date we have reviewed the CZM Assessment and Draft Environmental Impact Statement (EIS) and have consulted with the public and various government agencies. After thorough review of the information provided, it is determined that we require additional information critical to our review. Information and discussion of impacts to scenic and open space resources, public participation and historical resources which will be included in the Final EIS is essential for review.

We understand that the Final EIS will not be complete until June 2001, however we have a federally mandated deadline of April 16, 2001. Therefore, we recommend the agreement of an alternative review schedule with a deadline of 30 days after receipt of the Final EIS.

Please submit a notification of your agreement to an alternative review schedule with a deadline of 30 days after receipt of the Final EIS. After concurrence of the alternative review

Mr. Domingo Galicinao, P.E.  
Page 2  
March 30, 2001

schedule, the CZM review will resume upon receipt of the additional information and/or the Final EIS. Should you have questions, please call Debra Tom of our CZM Program at 587-2840.

Sincerely,

From: Kali Watson, Chairman  
Hawaiian Home Commission

Subject: Kihei-UpCountry Maui Highway: HWY-PA 2.7195

Thank you for sending a copy of the subject map (Revised: July 3, 1996) showing alternative termini and alignment segments for the proposed Kihei/UpCountry Maui Highway. The Department of Hawaiian Home Lands (DHHL) supports the proposed U2-K2 alignment.

DHHL has 6,111 acres at Kula comprised of TMK 2-2-02: 14, 55, & 56. The K2 alignment runs within 0.5 miles of the makai portion of DHHL's Kula property and a road connection may be possible in the future. This would provide access to the Kihei-waialea area.

The U2 alignment provides a connection to the Kulamalu Project above Pukalani which includes sites for a Hawaiian agency complex, such as a DHHL office and new Kamehameha School.

DHHL is currently working on water system improvements to serve a residential subdivision at Waiohuli (318 lots) below Polipoli Road and an agricultural subdivision of (72 lots) below the Kula Hospital. Construction of onsite improvements will proceed over the next 2-5 years.

We would like to undertake a review and update of our existing plans in conjunction with the results of DOT planning efforts for the Kihei-UpCountry Maui Highway. We request that DHHL be consulted as part of your process to finalize the alignment selection and the locations of possible on/off ramps.

If you have any questions, please call Joe Chu of our Planning Office at 586-3836.

Dear Mr. Lindsey:

Subject: Proposed Kihei-Upcountry Maui Highway, Maui, Hawaii  
Inventory Survey of the U1, K1 Alternative, Cultural Impacts Study

Two years ago we asked for your review and comments on archaeological reconnaissance survey reports prepared for the subject project. Since then, we have completed a Draft Environmental Impact Statement (EIS) for the project, held public hearings, solicited agency and public comments on the Draft EIS, and selected a preferred alternative. The preferred alternative is the U1, K1 Alternative, an alignment from the Haleakala Highway/Haliimaile Road intersection to the Piilani Highway/Kaonolu Street intersection.

Following selection of the preferred alternative, Cultural Surveys Hawaii, Inc. (CSH) conducted an archaeological inventory survey of this alignment. The inventory survey report identifies several sites that were evaluated by CSH as being significant per criteria of the National and Hawaii Registers of Historic Places. In addition, Scientific Consultant Services, Inc. conducted a cultural impacts study for all the alternatives. The cultural impacts study did not identify any traditional cultural properties at or near the alternatives. Both reports are enclosed for your review and comments.

We would very much appreciate your input, and any comments you submit will be forwarded to the State Historic Preservation Division to assist in their evaluation of the reports. Please submit your comments by March 2, 2001 to:

Subject: Proposed Kiheti-Upcountry Maui Highway, Maui, Hawaii  
Inventory Survey of the U1, K1 Alternative, Cultural Impacts Study

Dear Mr. Minnai:

Thank you for the opportunity to comment on the above referenced project. We apologize for our late response.

The Office of Hawaiian Affairs previously commented on the need for the preparation of a cultural impact statement. The cultural impacts study prepared by Scientific Consultant Services, Inc. concluded that there were no Traditional Cultural Properties within the project area. Consultation with 50 individuals knowledgeable about Hawaiian culture confirmed the existence of archeological sites but did not reveal any cultural practices.

The archeological inventory survey recommends data recovery of three identified sites and preservation of two sites. OHA requests the opportunity to review the data recovery plan and preservation plan prepared for these sites.

If you have any questions, please contact Sharla Manley, assistant policy analyst at 594-1944, or e-mail her at [sharlam@oha.org](mailto:sharlam@oha.org).

Subject: Proposed Kihei-Upcountry Maui Highway  
Archaeological Inventory Survey Report and  
Cultural Impacts Assessment Report

STATE OF HAWAII  
DEPARTMENT OF TRANSPORTATION  
HIGHWAY DIVISION  
PLANNING BRANCH  
MAR 6 11 27 AM '01

Makai (West) to use the new route, competing with those headed to Kahului-Mailuku. When they exit at K1, they will be at the busiest section of the Piilani Highway in Kihei. During the afternoon peak hours, the same conflicts will occur, only in reverse.

DHHL would like to review Origin-Destination studies that support the U1-K1 Alternative as the most reasonable (preferred) alternative.

We have reviewed the archaeological and cultural reports provided and have no comments to offer.

If you have any questions, please call me at 586-3801, or have your staff call Joe Chu of our Planning Office at 587-6421.

Thank you for providing copies of the assessment reports on the archaeological and cultural significance of the lands and features within the proposed U1-K1 Alternative highway corridor proposed to connect Upcountry Maui and Kihei.

Your cover letter (HWY-PA 2.1544) advises us that this U1-K1 Alternative, connecting the Haleakala Highway/Halimaile Road intersection to the Piilani Highway/Kaonoulu Street intersection, is the preferred alternative.

In our January 15, 1998, and March 24, 1999, responses regarding the highway project, the Department of Hawaiian Home Lands (DHHL) gave support to the proposed U2-K2 alignment and asked that we be consulted as part of the process to finalize the alignment selection and the locations of possible on/off ramps. We believe that the U2,K2 alignment will offer more opportunities for more drivers to avoid the high traffic concentrations that will occur at the busiest highway segments and intersections during peak hours.

It appears that the U1-K1 Alternative will not relieve the traffic along already heavily-used portions of the Haleakala and Piilani Highways. In the morning, residents of Makawao-Pukalani wishing to go to Kihei will still head

Hallett H. Hammatt, Ph.D.  
Cultural Surveys Hawaii  
733 North Kalaheo Avenue  
Kailua, Hawaii 96734

LOG NO: 27374 ✓  
DOC NO: 0104MK01

Dear Dr. Hammatt,

**SUBJECT:** Review of An Archaeological Inventory Survey of the Proposed  
Kihei to Kula Road Corridor,  
Kailua to Ka'ono'ulu ahupua'a, Makawao and Wailuku, Maui  
TMK 2-05-001: por. 001, 002, 003, 009,  
2-05-002: por. 001, 002, 005, 015, 016  
3-09-001: por. 016

Thank you for the opportunity to review this report which our staff received on 12 February 2001 (Collin, Shideler, Creed, Bush, and Hammatt, 2000, *Archaeological Inventory Survey of the Proposed Kihei to Kula Road Corridor, Kailua to Ka'ono'ulu ahupua'a, Makawao and Wailuku, Maui*, TMK 2-05-001: por. 001, 002, 003, 009, 2-05-002: por. 001, 002, 005, 015, 016, 3-09-001: por. 016... Cultural Surveys Hawaii ms.). We apologize for the delay in our response.

The background section acceptably establishes the ahupua'a settlement pattern and predicts the likely site pattern in the project area.

The survey has adequately covered the project area documenting 17 historic properties in the project area (six of which were previously identified). The site descriptions and interpretations are acceptable. The functional classifications for the historic properties include seven temporary habitation sites (3742, 3743, 3745, 5032, 5033, and 5035), three agricultural sites (3728 and 3729 precontact, 4765 historic), two petroglyph sites (5029 and 5031, each with only 3 petroglyphs), one catla wall site (5030), one marker (3729), and three sites related to historic military training activities (4773, 4776, and 4778).

We agree that 15 of the sites are significant solely for their information content (Criterion "D" of the National Register of Historic Places). We believe, however, that the two petroglyph sites are significant for their information content (D) and also as representative examples of small petroglyph sites in the lower Kula gulches (criterion C). If you agree, please correct the significance evaluation for these two sites to include Criterion "C" and send us a replacement

Hallett H. Hammatt, Ph.D.  
Page 2

page. If you disagree, please contact our Maui Archaeologist to discuss the situation. Regardless of the resolution of the specifics of significance, we can agree by consensus that all 17 historic properties are technically eligible for inclusion on the National Register of Historic Places.

We agree with the mitigation proposals. No mitigation (preservation or data recovery) is warranted for 12 of the sites (3727, 3728, 3729, 3742, 3743, 3745, 4765, 4773, 4776, 4778, 5030, and 5034). These are small sites and a reasonable and adequate amount of their significant information was recovered during the survey, and in the cases of 3742, 3743, and 3745 (temporary habitations sites) during a prior survey which identified and documented them. The two small petroglyph sites are to be preserved. Three of the temporary habitation sites which have deposits (5032, 5033, and 5035) are to undergo archaeological data recovery.

We understand that this is a project with federal involvement (Federal Highways Administration). Thus, following the rules of the U.S. Advisory Council on Historic Preservation, mitigation of the 5 sites is required to take place under a Memorandum of Agreement (MOA). We see this as a very simple MOA with a stipulation for preservation (and an attached preservation plan) and another stipulation for archaeological data recovery (with an attached data recovery plan). Please be sure that your client and the federal agency that is involved consult with native Hawaiian groups and the interested public on the findings and the proposed mitigation. Parties that wish to be involved should have the opportunity to comment on the MOA. We will await receiving a copy of the draft MOA.

If you have questions, please contact Dr. Melissa Kirkendall (Maui/Lana'i SHPD 243-5169) as soon as possible to resolve these concerns.

Aloha,

Sam Hibbard, Administrator  
State Historic Preservation Division

IN REPLY REFER TO  
 HEC-HI

With due consideration for both the results of the inventory survey report and input from public review, the Federal Highway Administration (FHWA) renders "no adverse effect" determinations on State sites 50-50-10-3727, 3728, 3729, 3742, 3743, 3745 4765, 4773, 4776, 4778, 5030, and 5034. None of these sites warrant preservation and sufficient documentation of these sites has been previously collected by CSH and others. The SHPD agreed in the May 10, 2001 letter that no further work is needed on these sites.

The FHWA renders "adverse effect" determinations on State sites 50-50-10-3032, 5033 and 5035, sites that functioned as temporary habitation. Two of the sites (5032 and 5033) are located 190 to 150 feet from the alignment centerline, just inside the APE. None of these temporary habitation sites warrant preservation. However, additional data recovery is needed if subsequent project planning confirms that these sites will be displaced by the project. A draft Memorandum of Agreement (MOA) is enclosed.

Two petroglyph sites (State sites 5029 and 5031) are located approximately 200 feet from the alignment centerline in Kaliatinui and Waiakoa Gulches. Because of this distance, and since Kihei-Upcountry Maui Highway will cross both gulches via two-lane bridge, both petroglyph sites are outside the APE. Nevertheless, the project's Record of Decision (ROD) will specify that buffer zones around the petroglyphs, demarcated with bright colored markers, be established during construction to prevent accidental damage to the sites. The ROD will instruct the State Department of Transportation to consult with the SHPD to determine adequate buffer zones.

If you have any questions of require additional information, please do not hesitate to call me at 541-2700 (ext. 302).

Sincerely yours,

Domingo Galicinao, P.E.  
 Structural Engineer

Attention: Mr. Ross Cordy

Subject: Proposed Kihei-Upcountry Maui Highway  
 County of Maui, Hawaii  
 Section 106 of the National Historic Preservation Act  
 Request for Concurrence on Effect Determinations

Dear Mr. Coloma-Agaran:

In accordance with Section 106 of the National Historic Preservation Act, this letter requests that the State Historic Preservation Officer (SHPO) concur on effect determinations regarding historic properties in the subject project's Area of Potential Effect (APE).

The U1,K1 alignment has been identified as the preferred alternative. The U1,K1 alignment would run from the Haleakala Highway / Halimaile Road intersection to the Piilani Highway / Kaonoulu Street intersection.

An inventory survey of this area was conducted by Cultural Surveys Hawaii (CSH). The survey report (Archaeological Inventory Survey of the Proposed Kihei to Kula Road Corridor, Kailua to Kaono'ulu Ahupua'a, Makawao and Waialuku Districts, Island of Maui, December 2000) was reviewed by the State Historic Preservation Division (SHPD), with review comments provided in the letter of May 10, 2001 (ref. LOG NO: 27374, DOC NO: 0104MK01). The report has been accepted by the SHPD.

The following historic properties were identified in the APE of the preferred alternative:

State Site Number	Function
50-50-10-3727	Agriculture
50-50-10-3728	Agriculture
50-50-10-3729	Marker
50-50-10-3742	Temporary Habitation
50-50-10-3743	Temporary Habitation
50-50-10-3745	Temporary Habitation
50-50-10-4765	Agriculture

Enclosure: Draft Memorandum of Agreement Among the Federal Highway Administration, and the Hawaii State Historic Preservation Officer Regarding the Displacement of Three Temporary Habitation Sites for the Kihei-Upcountry Maui Highway, County of Maui, Hawaii, Project No. HDPS-9203(1)

Dear Mr. Galbraith:

SUBJECT: Review of MOA for the Proposed Kihui-Upcountry Maui Highway  
Section 106 Historic Preservation Review

LOG NO. 28189  
DOC NO. 016544/04

Thank you for the opportunity to review the Draft MOA which was sent to our office on June 29, 2001.

We have reviewed MOA and find it acceptable. Submission acceptance and implementation of the data recovery plans (Site 5052, 5053, and 5055) and the preservation plan (Sites 5029 and 5037) will acceptably treat the impacts of this project on significant historic sites.

We will await the receipt of the official MOA for the State Historic Preservation Officers signature.

Thank you for working with our office. Should you have any questions, please contact Dr. Melissa Kirkendall at 243-8188.

Subject: Proposed Kihei-Upcountry Maui Highway  
County of Maui, Hawaii  
National Historic Preservation Act, Section 106 Consultation  
Memorandum of Agreement

Dear Mr. Namu'o:

The State of Hawaii Department of Transportation (SDOT) and the Federal Highway Administration (FHWA) thank the Office of Hawaiian Affairs for its participation in the planning of this project. OHA has provided valuable comments on numerous occasions, most recently through the OHA review of the cultural impact study and archaeological inventory survey of the preferred alignment alternative (from the Haleakala Highway / Hallimale Road intersection in Upcountry to the Piliuni Highway / Kaonouli Street intersection in Kihei).

In accordance with Section 106 of the National Historic Preservation Act, the FHWA has "ordered" adverse effect determinations on three historic properties that functioned as temporary habitation (State Sites 50-50-10-5032, 5033 and 5035). Although these sites do not warrant preservation, additional data recovery is needed if subsequent project planning confirms that these sites will be displaced by the project. The State Historic Preservation Officer (SHPO) is expected to concur with these effect determinations.

Enclosed please find a draft Memorandum of Agreement (MOA) between the FHWA and the SHPO regarding the three sites. The State Historic Preservation Division has already reviewed the draft MOA. We respectfully ask the OHA to also review the MOA before it is signed. Please provide any comments you may have by October 26, 2001.

Please do not hesitate to call me at 566-2235 should you have any questions. I will be on vacation from October 10 to October 29. If you need to contact us during this period, please call Mr. David Atkin at 566-2205.

Sincerely yours,

**MEMORANDUM OF AGREEMENT**

Among the

**FEDERAL HIGHWAY ADMINISTRATION and the**

**HAWAII STATE HISTORIC PRESERVATION OFFICER**

Regarding the Displacement of Three Temporary Habitation Sites  
for the Kihai-Upcountry Maui Highway, County of Maui, Hawaii  
Project No. HDPS-9203(1)

**WHEREAS**, the Federal Highway Administration (FHWA) has determined that State Sites 50-10-5032, 5033 and 5035, which functioned as temporary habitation, are eligible for inclusion in the National Register of Historic Places (NRHP), and that their displacement by the construction of Kihai-Upcountry Maui Highway will have an adverse effect, and FHWA has consulted with the Hawaii State Historic Preservation Officer (SHPO) and the Advisory Council on Historic Preservation (Council) pursuant to 36 CFR Part 800, regulations implementing Section 106 of the National Historic Preservation Act (16 U.S.C. 470f);

**WHEREAS**, the State of Hawaii Department of Transportation (HDOT) participated in the consultation and has been invited to concur in this Memorandum of Agreement (MOA);

**WHEREAS**, the State of Hawaii Office of Hawaiian Affairs participated in the consultation; and

**NOW, THEREFORE**, the FHWA and the Hawaii SHPO agree that the displacement of State Sites 5032, 5033 and 5035 shall be implemented in accordance with the following stipulations in order to take into account such action's effect on historic properties.

**STIPULATIONS**

FHWA will ensure that the following measures are implemented.

1. Prior to the displacement of State Sites 5032, 5033 and 5035 (the undertaking), the HDOT shall arrange the preparation of a data recovery plan for these sites. HDOT will submit this plan to the State Historic Preservation Division (SHPD) for review. Once approved by the SHPD, HDOT shall arrange the data recovery of State Sites 5032, 5033 and 5035.
2. Upon SHPD's acceptance of the data recovery report, HDOT will be allowed to commence the undertaking.
3. The FHWA shall submit a copy of the executed MOA to the Council with the appropriate documentation pursuant to 36 CFR Section 800.11 prior to the undertaking.
4. Should a party to this agreement object within 30 days to any items submitted pursuant to this agreement, the FHWA shall consult with the objecting party to resolve the objection. If the FHWA determines that the objection cannot be resolved, the FHWA shall request comments of the Council pursuant to 36 CFR Section 800.9. Any Council comment provided in response to such a request will be taken into account by the FHWA with reference only to the subject of the dispute; the FHWA's responsibility to carry out all actions under this agreement that are not the subjects of the dispute will remain unchanged.

5. Any party to this MOA may request that it be amended, whereupon the parties shall consult in accordance with 36 CFR Section 800 to consider such amendment.

6. Should the undertaking not take place within five (5) years of the executed MOA, the parties shall consult in accordance with 36 CFR Section 800 to determine whether amendments should be considered.

Execution of this MOA by the FHWA and the Hawaii SHPO, and implementation of its terms shall be evidence that FHWA has afforded the Council the opportunity to comment on the project entitled, "Kihai-Upcountry Maui Highway, Island of Maui, Hawaii, Project No. HDPS-9203(1)", and its effects on historic properties, and that FHWA has taken into account the effects of the undertaking on State Sites 50-50-10-5032, 5033 and 5035.

THIS PAGE INTENTIONALLY LEFT BLANK

Dear Mr. Phung:

This letter is in regards to the Kihei-Upcountry Maui Highway project located in Maui, Hawaii.

Based on information contained in the Environmental Assessment and a meeting held on February 9, 1999 with Mr. Farley Watanabe of my staff, Mr. Steven Chang, State DOT and yourself, it was determined that a Department of the Army permit would be required. The proposed project appears to have minor environmental impacts, therefore could possibly be authorized under Nationwide Permit #14, Road Crossing. In addition, a Coastal Zone Management Federal Consistency determination from the Office of Planning will be required. The State Department of Health has issued a blanket Section 401 Water Quality Certification for this NW permit and a Best Management Plan addressing any discharge of fill material into intermittent streams will need to be submitted.

File number 990000206 has been assigned to this project. Please refer to this number in any future correspondence with this office. Should you have additional questions or need further information, you may call Mr. Watanabe at 438-9258, extension 14.

Sincerely,

George P. Young, P.E.  
 Chief, Operations Branch

**HAWAII COASTAL ZONE MANAGEMENT PROGRAM  
 ASSESSMENT FORM**

For

**Kihei-Upcountry Maui Highway  
 Maui County, Hawaii**

Mr. David W. Blane, Director  
 Office of Planning, Department of Business, Economic  
 Development and Tourism  
 Hawaii Coastal Zone Management Program  
 P.O. Box 2359  
 Honolulu, HI 96804

Subject: Kihei-Upcountry Maui Highway, Federal Activity Consistency,  
 Hawaii Coastal Zone Management (CZM) Program

Dear Mr. Blane:

We have enclosed for your review a CZM Program Assessment Form for the above Federal-aid highway project. The proposed project is located within the State's CZM area. As required by 15 CFR 930.32, federal activities undertaken in or affecting Hawaii's coastal zone must be consistent with the State's CZM objectives and policies.

The Draft Environmental Impact Statement for this project was completed in July 1999. We provided your office with a copy of this Draft EIS for your review. The Final EIS is expected to be completed by this spring, so we are requesting a CZM Consistency Determination prior to issuance of the Final EIS.

If there are any questions or comments, please call me at 541-2700 ext. 302. We appreciate your assistance in making the determination.

Sincerely yours,

  
 Domingo Galicinao, P.E.  
 Structural Engineer

## INTRODUCTION

This assessment describes the impacts that the proposed Kihei-Upcountry Maui Highway project would have on recreational resources, historic resources, scenic and open space resources, coastal ecosystems, economic uses, coastal hazards, managing development, public participation, beach protection, and marine resources. These topics areas were reviewed to assess the project's conformance with Hawaii's Coastal Zone Management (CZM) program.

The State of Hawaii Department of Transportation (SDOT) and the Federal Highway Administration (FHWA) propose to construct a two-lane limited access highway connecting the Upcountry area of East Maui with the coastal Kihei area. The purposes of the project are the following:

- improve Maui's roadway system by providing a direct link between Upcountry Maui and the Kihei-Makena region;
- support further economic development of the established visitor industry, and the growing "high technology" industry centered at the Maui Research and Technology (R&T) Park in Kihei and Science City on the summit of Haleakala;
- address vehicular capacity deficiencies of existing highways;
- satisfy the increasing travel demand of Maui's growing population;
- promote the national interest as expressed through a legislative directive supporting research activities being conducted at the Maui R&T Park and Science City; and
- increase the coastal evacuation capacity of the Kihei-Makena region.

Construction of a two-lane highway is proposed initially because projections indicate that two lanes will be sufficient to accommodate travel demand in the design year, 2020. However, right-of-way will be acquired for a four-lane highway. The width of the right-of-way will be at least 160 feet in rural areas and at least 120 feet in urban areas. The precise width of the right-of-way at a given point will depend on local terrain features. Along most of the alignment, earthwork will only be done for a two-lane roadway. However, where the highway crosses certain gulches, and where an urban design (provision of gutters, sidewalks, etc.) is proposed, earthwork for the ultimate four-lane configuration will be conducted during the initial construction phase.

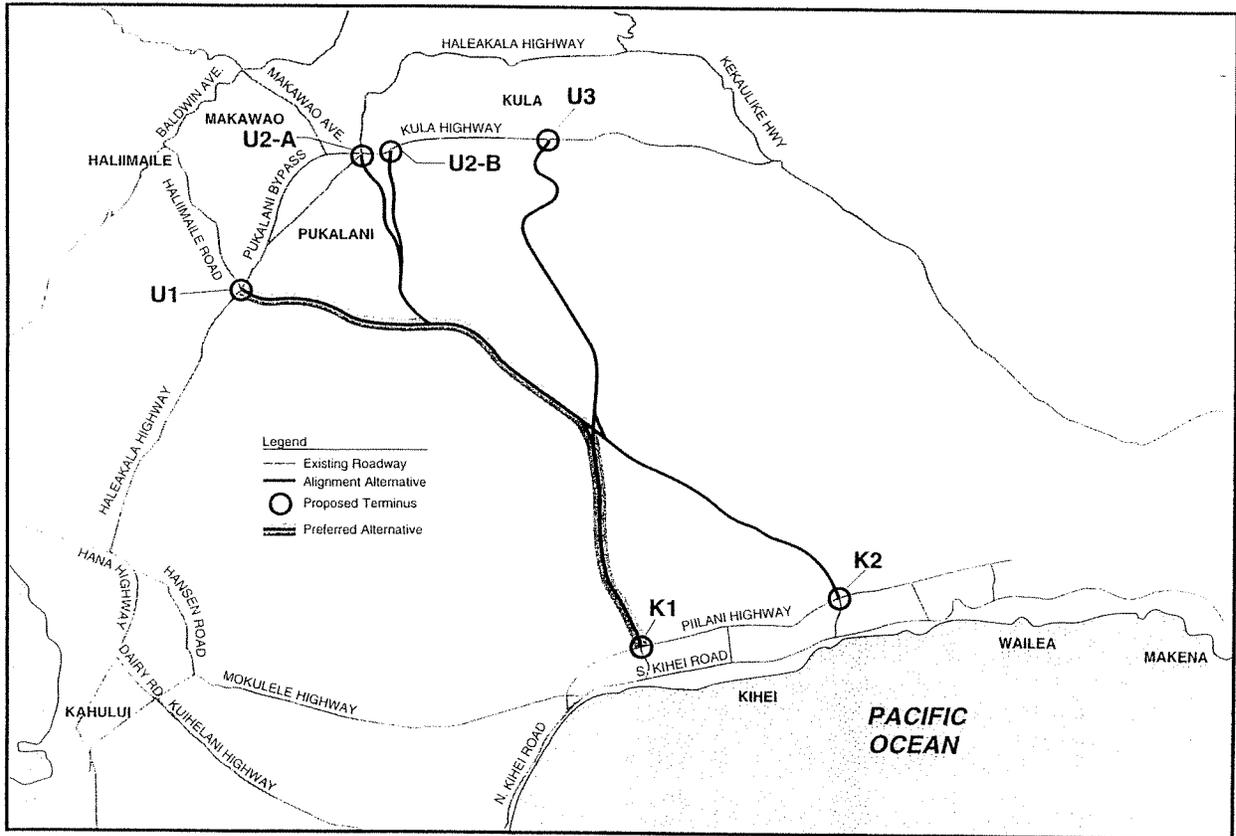

The alignments that were considered in this project's Draft Environmental Impact Statement (EIS) are the eight possible combinations of four Upcountry and two Kihei termini options (see Figures 1 and 2). The Kihei termini and segments are named K1 and K2, and the Upcountry termini and segments are named U1, U2-A, U2-B and U3. Both of the makai termini options in Kihei fall on the mauka boundary of the Special Management Area (see Figure 3). A No-Build alternative was also considered. Brief descriptions of the build alternatives are provided below:

1. Alternative U1,K1: This alternative would start at the Haleakala Highway / Halimaile Road intersection in Upcountry and follow a south to southwest alignment to the Kaonoulu Street / Piliiani Highway intersection. The length of this alternative is approximately 9.8 miles.

2. Alternative U1,K2: This alternative shares the same Upcountry terminus as Alternative U1,K1. However, this alternative would proceed southwest to the Ke Alii Alanui Street / Piliiani Highway intersection. The length of Alternative U1,K2 is approximately 10.9 miles.
3. Alternative U2-A,K1: This alternative would extend from the Pukalani Bypass / Haleakala Highway / Kula Highway "Five Trees" intersection in Upcountry, and follow a generally west to southwest alignment to the Piliiani Highway / Kaonoulu Street intersection in Kihei. The length of this alternative is approximately 9.8 miles.
4. Alternative U2-A,K2: This alternative would extend from the "Five Trees" intersection to the Ke Alii Alanui Street / Piliiani Highway intersection. The length of this alternative is approximately 10.9 miles.
5. Alternative U2-B,K2: This alternative would extend west from a point on Kula Highway approximately 2,300 feet south of the "Five Trees" intersection. The alignment runs parallel to Segment U2-A for about 10,000 feet, and then joins the U2-A alignment. This alternative's Kihei terminus is at the Piliiani Highway / Kaonoulu Street intersection. The length of this alternative is approximately 9.6 miles.
6. Alternative U2-B,K1: This alternative shares the same Upcountry terminus as Alternative U2-B,K2. This alternative's Kihei terminus is at the Piliiani Highway / Ke Alii Alanui Street intersection. The length of this alternative is approximately 10.8 miles.
7. Alternative U3,K1: This alternative would extend west from Kula Highway, south of Pulehu Gulch in Kula, to the Piliiani Highway / Kaonoulu Street intersection in Kihei. The length of this alternative is approximately 9.0 miles.
8. Alternative U3,K2: This alternative shares the same Upcountry terminus as Alternative U3,K1. This alternative's Kihei terminus is at Piliiani Highway / Ke Alii Alanui Street. The length of this alternative is approximately 10.0 miles.

The Department of Business, Economic Development and Tourism, Office of Planning, Coastal Zone Management Program was mailed a copy of the Draft EIS for this project. Please refer to the Draft EIS for additional information.

After analyzing a wide range of factors including cost, transportation benefits, potential environmental impacts, comments received on the Draft EIS, conformance with government plans and policies, and community sentiment, SDOT selected the U1,K1 alignment as the preferred alternative. The FHWA approved this decision. The forthcoming Final EIS will identify the U1,K1 alignment as the preferred alternative. The selection of the preferred alternative was announced through the island of Maui news media.

## RECREATION RESOURCES

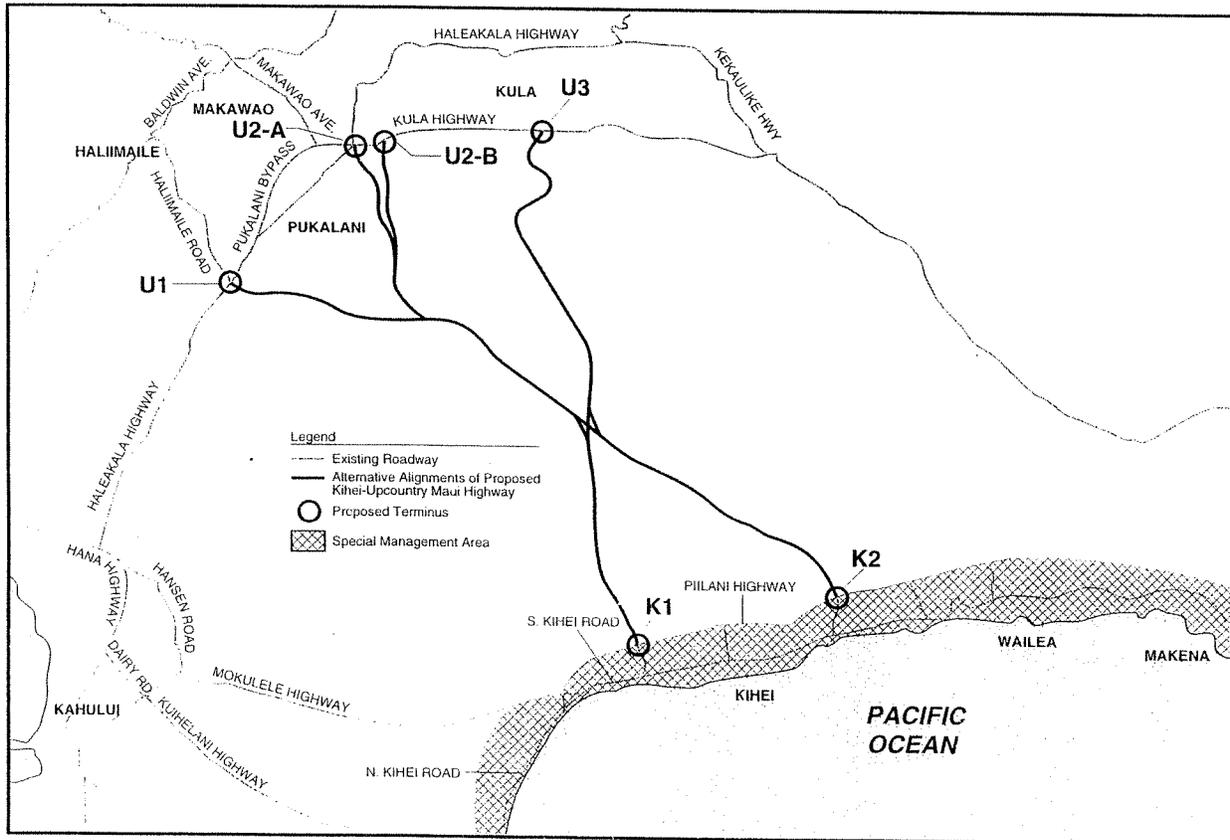

**Objective:** Provide coastal recreational opportunities accessible to the public.

**Policies:**

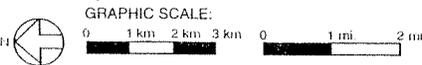

1. Improve coordination and funding of coastal recreation planning and management.
2. Provide adequate, accessible, and diverse recreational opportunities in the coastal zone management area by:
  - a) Protecting coastal resources uniquely suited for recreational activities that cannot be provided in other areas;
  - b) Requiring replacement of coastal resources having significant recreational value, including but not limited to surfing sites and sandy beaches, when such resources will be unavoidably damaged by development; or requiring reasonable monetary compensation to the State for recreation when replacement is not feasible or desirable;
  - c) Providing and managing adequate public access, consistent with conservation of natural resources, to and along shorelines with recreational value;
  - d) Providing an adequate supply of shoreline parks and other recreational facilities suitable for public recreation;
  - e) Encouraging expanded public recreational use of County, State and Federally owned or controlled shoreline lands and waters having recreational value;
  - f) Adopting water quality standards and regulating point and non-point sources of pollution to protect and where feasible, restore the recreational value of coastal waters;
  - g) Developing new shoreline recreational opportunities, where appropriate, such as artificial reefs for surfing and fishing; and
  - h) Encouraging reasonable dedication of shoreline areas with recreational value for public use as part of discretionary approvals or permits by the land use commission, board of land and natural resources, County planning commissions; and crediting such dedication against the requirements of Section 46-6.

Check either "Yes" or "No" for each of the following questions

**1.0 PURPOSE OF AND NEED FOR ACTION**

**1.1 Introduction**

The Highways Division of the State of Hawaii Department of Transportation (SDOT) is filing this Environmental Assessment (EA) with the Office of Environmental Quality Control (OECC) as the lead local agency for the Kihei-Uppcountry Maui Highway project.

Figure 1-1 shows the general project location in Maui County, Hawaii. The proposed highway would connect Piilani Highway with either Haleakala Highway or Kula Highway within an area bounded on the east by Haleakala and Kula Highways, starting at the Haleakala/Haliimaile Road intersection, continuing south past the Kula Sanitarium, toward Ulupalakua, and turning northwest to adjoin Piilani Highway, the western boundary of the area.

The proposed project would be a rural, limited access arterial roadway between the coastal area of Kihei and Uppcountry Maui. Design speeds would vary along the roadway depending on the terrain, as indicated below:

- Level Terrain 100 km/h (62 mph)
- Rolling Terrain 80 km/h (50 mph)
- Mountainous Terrain 60 km/h (37 mph)

Depending on the alignment selected, the roadway length would range from 14.3 kilometers (8.9 miles) to 17.0 kilometers (10.6 miles) in an east-west (mauka-makai) direction. The minimum width of the roadway right-of-way would be 49 meters (160 feet) and would include two 3.6 meter (12.0-foot) lanes in each direction and a 6.8 meter (22.2-foot) median. The roadway shoulders would be paved, with a 1.8 meter (6.0-foot) shoulder between the median and the travel lane, and a 2.4 meter (8.0-foot) shoulder outside of the roadway (see Figure 1-2). Although the highway would ultimately have four lanes, an interim phase may be constructed initially which would consist of one through-lane in each direction and a truck climbing lane in the eastern (mauka) direction.

The planning phase of the project is projected for completion by September 1996; final design would occur from 1997 to 1999; and construction would begin in 1999 and be completed by 2003. The estimated cost of the project is \$50 million.

Upon completion, the highway would satisfy the following four needs: roadway system linkage; existing and projected transportation demand and capacity requirements; economic development requirements; and legislative mandates.

## 1.2 Roadway System Linkage Needs

There is a need to provide more efficient travel between the Maui Research and Technology (R&T) Park in Kihei and the related scientific facilities at the summit of Haleakala, called Science City. Currently, motorists must traverse Piilani Highway, Mokulele Highway, Puunene Highway, Hansen or Dairy Road, Hana Highway, Haleakala Highway, and finally Haleakala Crater Road to travel from Kihei to Science City. A new highway would provide a more direct route and reduce the 72 kilometer (45-mile) journey by approximately 15.3 kilometers (9.5 miles). In addition to facilitating trips between Kihei and Science City, a more direct roadway would facilitate travel between Kihei and the Upcountry area.

## 1.3 Transportation Demand and Capacity Needs

The Kula-Kihei Road Study Travel Demand Forecast and Benefit Cost Analysis (1989) estimated existing and future levels of travel demand between Kihei and Upcountry. This study identified a roadway alignment with a benefit/cost ratio greater than one.

Subsequently the Maui Long-Range Highway Planning Study Island-Wide Plan (1991) (hereinafter referred to as the Maui Long-Range Plan) identified several areas where roadway and intersection capacity was deficient, including the Hana Highway/Haleakala Highway intersection. Based on 1987 traffic data collected by SDOT, this study concluded that Haleakala Highway southeast (mauka) of this intersection exceeds a volume/capacity (v/c) ratio of 90 percent during both the a.m. and p.m. peak hour travel periods, producing a level of service (LOS) of 'E' during these periods. The segment of Hana Highway

<sup>1</sup> LOS E and F indicate near congested and congested levels of operation, respectively.

southwest of Haleakala Highway operates at LOS F in the outbound direction during the p.m. peak hour.

Since the completion of the 1991 Maui Long-Range Plan, SDOT has monitored traffic conditions at the Hana Highway/Haleakala Highway intersection on a biennial basis. The latest traffic data were collected in June 1993. These data indicate that daily traffic volume on Haleakala Highway southeast of the Hana Highway/Haleakala Highway intersection has grown approximately 24 percent since 1987, and daily traffic volume on Hana Highway southwest of this intersection has grown approximately 29 percent. Given the levels of congestion in 1987, the 1993 data indicate that congestion has worsened substantially. The proposed highway would help alleviate existing and projected future traffic congestion by providing more roadway capacity between Kihei and the Upcountry area.

## 1.4 Economic Development Needs

Projected economic growth in West and South Maui is expected to result in the Kihei-Makena area becoming one of the island's major employment centers. The number of jobs in this area is expected to increase from 5,644 in 1987 to 19,353 in 2010 (Maui County Community Plan Update Program, Socio-Economic Forecast Report (Volume 1), 1994 -- hereinafter referred to as the Maui County Community Plan). Growth in the visitor industry is expected to stimulate most of this 83 percent growth.

Population increases in Kihei-Makena are not expected to be sufficient to fully satisfy the local labor market, however. Most of the population increases are expected in the Wailuku-Kahului and Upcountry areas. According to the Maui County Community Plan, population in the Wailuku-Kahului area is expected to increase from 29,839 in 1987 to 48,132 in 2010 (61 percent). Likewise, population in the Upcountry area (Makawao-Pukalani-Kula) is expected to increase by 41 percent, from 17,339 in 1987 to 24,613 in 2010. Consequently, increased commuter travel is expected between the employment center (Kihei) and the growing residential communities of Upcountry and Wailuku-Kahului.

In addition, the average daily visitor count for Maui is expected to increase by 122 percent between 1987 and 2010, from 32,195 to 71,520 visitors (Maui County Community Plan).

Therefore, visitor travel, such as trips between Kihei, Upcountry and Haleakala National Park, is expected to increase.

The proposed highway would help satisfy future economic demands by linking the growing residential area of Upcountry with the growing labor market of Kihei, and by facilitating growing volumes of tourist travel.

**1.5 Legislative Mandate**

Federal funding for this project was appropriated because the highway would provide an improved connection between defense-related activities at the Maui R&T Park in Kihei and Science City at the Haleakala summit.

**2.0 PROPOSED PROJECT ALTERNATIVES**

The No Build alternative, one transportation system management (TSM) and public transit alternative, and ten Build alternatives are considered in this EA. Section 3.0 of this EA discusses the possible level of impact associated with the Build alternatives.

**2.1 No Build Alternative**

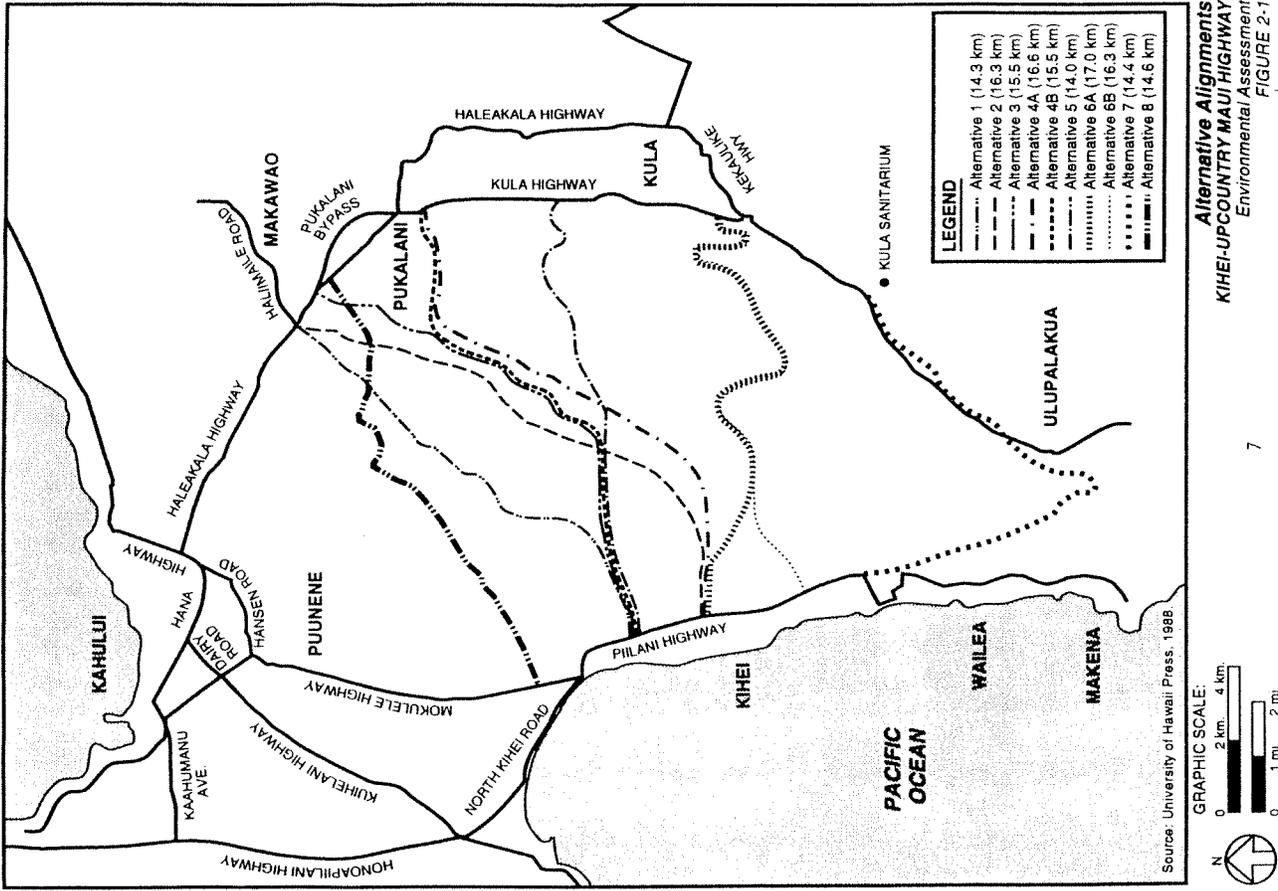

The No Build alternative consists of those roadway improvements apart from this project that are expected to be implemented by 2022 as stated in the Maui Long-Range Plan.

**2.2 Transportation System Management (TSM) and Public Transit Alternative**

The TSM and public transit alternative to the project would consist of implementing transit or para-transit systems in the region and selected transportation control measures (TCMs), such as High Occupancy Vehicle (HOV) lanes and ridesharing programs. New roadways would not be built.

**2.3 Build Alternatives**

Ten alignments are being considered in this EA (see Figure 2-1). The Build alternatives are numbered 1 through 8, and include 4A, 4B, 6A, and 6B. These alignments were generated from:

- alignments that were proposed in prior studies and reports;
- a new examination of the study area, and
- other input provided to SDOT through scoping activities that have occurred to date.

Study of a Kihei-Upcountry Highway began more than 20 years ago when, in 1970, the County studied the feasibility of a road between Upcountry and Kihei. The next study, the County of Maui Toll Road Study (1988), developed Alternatives 5, 6B, and 7. The next study, the Maui Long-Range Plan (1991), developed Alternative 3. Alternatives 1, 2, 4, and 6A were derived from the eight alternatives contained in the State/County Joint Task Force Upcountry/Kihei Highway Final Report (1993). Alternatives 4B and 8 were developed subsequently to link more roadway termini.

The alternatives are described below:

- **Alternative 1.** This alignment would extend from the Haleakala Highway/Halimaile Road intersection in the Upcountry area to Piilani Highway/Kaonoulu Street in Kihei. The minimum horizontal radius would be 610 meters (2,000 feet). The alignment's maximum grade would be 3.5 percent. This 14.3 kilometer (8.9-mile) alignment would traverse Agriculture zoned land, affecting five large agricultural parcels. Approximately 9.7 kilometers (6.0 miles) of the alignment would traverse cane fields.
- Alternative 2.** This alignment would extend from the Haleakala Highway/Halimaile Road intersection in the Upcountry area to the Maui R&T Park in Kihei. The minimum horizontal radius would be 915 meters (3,000 feet). The alignment's maximum grade would be 5.0 percent. This 16.3 kilometer (10.1-mile) alignment would traverse about 6.4 kilometers (4.0 miles) of cane field and would affect six large Agriculture zoned parcels
- Alternative 3.** This alignment would extend from Haleakala Highway, between Halimaile Road and Pukalani in the Upcountry area, to the Piilani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 535 meters (1,750 feet). The alignment's maximum grade would be 4.2 percent. This 15.5 kilometer (9.6-mile) alignment would affect approximately five large parcels zoned for Agriculture. The alignment would also skirt the east (mauka) edge of approximately 6.4 kilometers

(4.0 miles) of cane field. The uppermost portion of the alignment is immediately west of Urban zoned lands.

- **Alternative 4A.** This alignment would extend from Kula Highway, east of the Pukalani Bypass Road in the Upcountry area, to the Maui R&T Park in Kihei. The minimum horizontal radius would be 715 meters (2,350 feet). The alignment's maximum grade would be 6.7 percent. This 16.6 kilometer (10.3-mile) alignment would affect approximately 12 parcels, most of which are used for grazing. At least two parcels are being used for pineapple cultivation. All except the uppermost 1.5 kilometer (0.9 mile) of this alignment traverses agricultural lands. The uppermost portion traverses land designated for urban residential use in the Makawao-Pukalani-Kula Community Plan (1981).
- **Alternative 4B.** This alignment would extend from Kula Highway, east of the Pukalani Bypass Road in the Upcountry area, to the Piilani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 790 meters (2,600 feet). The alignment's maximum grade would be 6.6 percent. This 15.5 kilometer (9.6-mile) alignment would affect approximately 8 parcels, most of which are used for grazing. At least two parcels are being used for pineapple cultivation. All except the uppermost 1.5 kilometer (0.9 mile) of this alignment traverses agricultural lands. The uppermost portion traverses land designated for urban residential use in the Makawao-Pukalani-Kula Community Plan (1981).
- **Alternative 5.** This alignment would extend from Kula Highway, south of Pulehu Gulch in Kula, to the Piilani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 275 meters (900 feet). The alignment's maximum grade would be 6.8 percent. This 14.0 kilometer (8.7-mile) alignment would affect approximately eight parcels zoned as Agriculture land. One parcel near the Kula terminus is in pineapple cultivation, and another is being utilized for truck farming. The other parcels are used for grazing.
- **Alternative 6A.** This alignment would extend from Kula Highway, approximately 1.2 kilometers (0.5 mile) north of the Kekaulike Highway/Kula Highway intersection in Kula,

to the Maui R&T Park in Kihei. The minimum horizontal radius would be 245 meters (800 feet). The topography is fairly steep and would require switch backs in order to keep maximum grade below 6.8 percent. This 17.0 kilometer (10.6-mile) alignment would traverse five parcels, two of which are owned by the Department of Hawaiian Home Lands.

- Alternative 6B. This alignment would extend from Kula Highway, west of the Kekaulike Highway/Kula Highway intersection in Kula, to Piliāni Highway, next to the Kihei Regional Park. The location of the Kihei terminus would be across from the proposed east-west collector (Kihei Traffic Master Plan (1989)). The minimum horizontal radius would be 245 meters (800 feet). The topography is fairly steep and would require switch backs in order to maintain a maximum grade of 7.0 percent. This 16.3 kilometer (10.1-mile) alignment would traverse five parcels, two of which are owned by the Department of Hawaiian Home Lands.

- Alternative 7. This alignment would connect Kula Highway to Piliāni Highway by extending Kula Highway south from the Kula Sanitarium to Ulupalakua, and turning northwest toward Piliāni Highway. The minimum horizontal radius would be 150 meters (500 feet). The grade of this alignment between the Kihei terminus and Ulupalakua would be nearly the 7.0 percent maximum desired grade. The 14.4 kilometer (8.9-mile) alignment would traverse approximately 12 parcels. In order to meet current highway safety standards, about 6.0 kilometers (3.7 miles) of the existing substandard section of road between Ulupalakua and the Sanitarium would be reconstructed.

- Alternative 8. This alignment would extend from Haleakala Highway below Pukalani to Mokulele Highway, along the old Government right-of-way. The minimum horizontal radius would be 60 meters (200 feet). The maximum grade along the existing alignment would be about 10.0 percent. This 14.6 kilometer (9.1-mile) alignment would traverse 13.6 kilometers (8.5 miles) of cane land.

### 3.0 IMPACTS

Adverse and beneficial impacts would result from the construction of the Kihei-Upcountry Highway. The following sections summarize the current understanding of potential impacts.

#### 3.1 Social and Economic Activity

Construction and operation of the Kihei-Upcountry Highway would potentially affect the following components of the existing social and economic conditions:

- residential communities;
- land use values;
- commercial activities, including agriculture and tourism; and
- transportation service.

Although no residential relocations would be required for any of the Build alternatives, the Kihei-Upcountry Highway would potentially affect the character of existing residential areas, particularly Upcountry. Facilitation of access to this area, and increased traffic volumes, could be perceived as incongruent with the current character of the Upcountry area. However, even without the proposed roadway, the population of Makawao-Pukalani-Kula is projected to increase by 41 percent between 1987 and 2010. Therefore, some change in the character of this area seems inevitable regardless of the roadway. In addition, the highway could enhance access to Hawaiian Home Lands located in the eastern portion of the project area, thus helping to satisfy residential demand.

The highway could also increase land values in the area by enhancing circulation and access, providing potential access to new areas, and increasing the highest and best use of lands adjacent to the roadway.

The roadway would encourage tourist activity by enhancing access to popular tourist destinations, such as Upcountry and Haleakala. The enhancement of access would facilitate other types of economic activities as well.

Although agricultural activities on or immediately adjacent to the roadway alignment could be adversely impacted, agricultural activity in the general area may be enhanced by providing a more direct route between agricultural areas and the Kihei urban center.

Another beneficial economic impact would be the expenditure of approximately \$50 million of construction funds.

Although the Kihei-Upcountry Highway would have beneficial impacts on residential, commercial, and tourist activities, and increase business opportunities by enhancing accessibility, regional circulation, and the level of transportation service, the full range of social and economic impacts of the project are presently unknown. Therefore, further study is appropriate to better determine the potential level of impact.

### **3.2 Traffic**

The project would create new intersections and roadway crossings and produce a redistribution of traffic volumes on roadways in the region. More detailed traffic studies must be performed to better understand the potential level of impact.

## **3.3 Environmental Resources**

### **3.3.1 Air and Noise**

Construction of the highway would have localized, short-term air quality impacts, primarily caused by air-born particulate matter (dust). There would also be an air quality impact from vehicles on the new highway after the roadway opens.

Trucks, construction vehicles, and construction equipment would temporarily affect ambient noise levels, and after the roadway opens, traffic would affect ambient noise levels.

Additional analysis is necessary to determine the potential level of air quality and noise impacts.

### **3.3.2 Water Resources**

#### Surface Water

Surface water resources in the area consist primarily of intermittent streams (gulches) within the project corridor. The more prominent gulches include:

- Kolaloa Gulch;
- Waiakoa Gulch;
- Kulanihakai Gulch;
- Waipuilani Gulch; and
- Kaonoulu Gulch.

Although the roadway would cause surface water runoff to increase because of an increase in impermeable surface, with appropriate mitigation, the roadway is not expected to have an adverse impact on surface water resources in the vicinity. Mitigation measures would include maintenance of flow in the gulches at points where the proposed roadway crosses the gulches.

#### Wetlands

Wetlands are not expected to be encountered along any of the alignments.

#### Floodplains

According to Flood Insurance Rate Maps (FIRM), the project area is contained within Zone C, indicating that the land is prone to minimal flooding.

#### Special Management Area (SMA)

The proposed Kihei-Maui Highway would not be located within the County's Special Management Area (SMA).

### Ground Water

Maui's four principal groundwater sources are fresh basal water, brackish basal water, dike-confined water, and perched water. With appropriate mitigation, the roadway is not expected to have an adverse impact on groundwater resources.

### **3.3.3 Farmlands**

Agriculture is the dominant economic activity in the Upcountry area, a major vegetable and flower producing region of the State. Major crops include pineapple, cabbage, lettuce, onions, and ornamental flowers. There is also ranching activity, with 80 to 85 percent of the length of Alternatives 4B, 5, 6A, 6B, and 7 traversing lands presently used for grazing.

Agricultural areas within the footprint of the project would be converted to a transportation use. Access to agricultural areas could also be affected. One of the alternative alignments would divide a County agricultural park.

The roadway would traverse soils which have been ranked as "prime"<sup>2</sup> and "important"<sup>3</sup> by the federal and State Departments of Agriculture. "Prime" farmlands proposed for conversion to a transportation corridor, are subject to the Farmland Protection Policy Act.

Further study is required to evaluate the level of potential impact on current agricultural activities and "prime" and "important" farmlands.

### **3.3.4 Terrestrial Flora**

Vegetation communities would be cleared for the roadway. However, it is expected that the vegetational communities which would be affected are abundant in the region.

<sup>2</sup> "Prime" agricultural land is land readily suited for the production of food, feed, forage and fiber crops. This quality of land has the soil quality, growing season, and moisture supply needed to produce sustained high yields of crops.

<sup>3</sup> "Important" agricultural land is land of statewide or local value for the production of food, feed, fiber, and forage crops that do not qualify to be considered prime or unique due to various soil differences.

### **3.3.5 Endangered and Threatened Species**

Information on the occurrence of endangered and threatened species was requested from the U.S. Fish and Wildlife Service (FWS) on September 1, 1994. In October, the U.S. FWS indicated that there are no endangered, threatened, or candidate species of birds recorded in the project area. However, an October 25, 1994 letter from the National Park Service identified "lowland dry forests...that contain a number of listed or proposed endangered plant species recognized by the U.S. FWS." Therefore, a botanical survey and a biological assessment may be necessary to determine the presence of any listed or proposed endangered species, and the potential impact of the project on such species.

### **3.3.6 Historic and Archaeological Resources**

The State Historic Preservation Division (SHPD) has stated that few archaeological surveys have been conducted in the undeveloped areas between Kula and Kihei. However, a number of historic sites are known to exist in the gulches of Kula. These include:

- Hawaiian petroglyphs;
- burial caves;
- habitational shelters (occurring in Kaluapulani, Kaliainui, Pulehu, Hapapa, Waiahoa, and Alae Gulches); and
- heiau sites (occurring on ridges to the west of Kula Highway in Omaopio, Waiahoa, Keokea, Waiohuli, Kaonoulu, and Kamaole).

In addition, the following traditional Hawaiian sites could occur in areas not previously disturbed by agricultural activities:

- east-west (mauka-maka) trails and associated temporary shelters;
- ahupua'a boundary walls;
- burial caves;
- special purpose resource gathering sites; and
- dry land agricultural features.

An archaeological inventory survey would be required to determine the potential level of project impact on archaeological resources. The discovery of such sites within the project area could lead to consultations with the SHPD, the Maui County Burial Council, the

Advisory Council on Historic Preservation, the Office of Hawaiian Affairs, Hui Malama I Na Kupuna O Hawaii Nei, and other concerned parties.

### **3.3.7 Parklands and Preserves**

Kihei Regional Park and Harold M. Rice Memorial Park are in proximity to the project area. The proposed highway is not expected to affect either park although Alternative 6B would be located immediately east of Kihei Regional Park, and Alternatives 6A and 6B would be adjacent to Rice Memorial Park. In general, the proposed highway would enhance access to the parks, and adverse impacts are not anticipated.

### **3.3.8 Visual and Aesthetic Setting**

The Kihei area is primarily commercial and will be undergoing further urbanization, while the Upcountry area is generally rural. The proposed highway would be visible from both project termini, and would create new vistas for highway users. Depending on the alternative selected, the earthmoving required and the width of the construction zone would vary. After the establishment of the landscaping to be provided as part of the project, the project is not expected to alter viewsheds or have significant adverse visual impacts, and would create new vistas for highway users.

Enhancement of access to Upcountry could have an adverse impact on Kula's aesthetic setting, however. Some adverse impacts are expected in any case because of the population increase projected for the area.

In summary, the project's adverse visual impact, with mitigation, is expected to be minor, and would be offset by the creation of new vistas.

### **3.4 Permits**

The following permits or approvals may be required prior to the construction of the highway. Additional permits and approvals may also be necessary.

#### State

- State Department of Health - National Pollutant Discharge Elimination System (NPDES) Permit (storm water from construction site)

- Office of State Planning - Coastal Zone Management Consistency Concurrence
- State Department of Land and Natural Resources - Historic Sites Review

#### County

- Department of Public Works - Grading, Grubbing, Stockpiling and Excavation Permit
- Department of Public Works - Permit for Excavation of Highway

### **4.0 DETERMINATION**

In consideration of the information presented in Section 3.0, an Environmental Impact Statement (EIS) is deemed appropriate because the potential level of project impact in several areas is presently unknown and could be significant. Additional investigations are warranted and their results would be reported in the draft EIS. The potential need for mitigation measures would also be disclosed in the draft EIS.

The draft EIS would address all of the topics included in this EA. Based on the information analyzed to date, it is expected that the following areas would be emphasized:

- Social and Economic Activity;
- Traffic;
- Air and Noise;
- Farmlands;
- Endangered and Threatened Species;
- Historic and Archaeological Resources; and
- Visual and Aesthetic Setting.

In addition, the draft EIS would assess the alternatives described in Section 2.0 in more detail, and select from those the three most meriting detailed investigation in the draft EIS.

### **5.0 PUBLIC AND AGENCY COORDINATION AND CONCERNS**

In May 1992, SDOOT and the County of Maui appointed a joint task force to assist and advise in the planning of the Kihei-Upcountry Highway. In its final report, the Task Force provided conclusions and recommendations for the proposed roadway. Some of the concerns documented in that report included:

Table 5-1

- directness to Haleakala;
- access to the Hawaiian Home Lands tract near Kekaulike;
- identification of existing areas of Hawaiian interest and reverence;
- safety of future intersections with secondary roads; and
- minimizing negative impacts on rural residential areas and farmlands.

SDOT initiated its consultation process on September 1, 1994, by issuing a letter to the agencies and individuals shown in Table 5-1. Responses to the September 1 correspondence identified the following key concerns:

- Alignment selection;
- Directness between the Maui R&T Park and Science City;
- Proposed highway termini;
- Land use and transportation impacts;
- Existing travel demand and traffic congestion;
- Improved commuter and tourist accessibility;
- Socio-economic impacts on existing communities;
- Disruption to agricultural lands and farming activities;
- Endangered species; and
- Archaeological features.

In addition, an EIS scoping meeting for governmental agencies was held on October 26, 1994. Invitations were mailed, and those agencies in attendance are shown in Table 5-1. Concerns raised at the scoping meeting included:

- Congestion at the Maui R&T Park/Piilani Highway intersection;
- Access to Hawaiian Home Lands;
- Farmland impacts; and
- Criteria to be used to select the three alternatives to receive detailed investigation in the draft EIS.

During preparation of the EIS, coordination with the agencies listed above would continue.

January 1997

**EXECUTIVE SUMMARY AND FINDINGS**

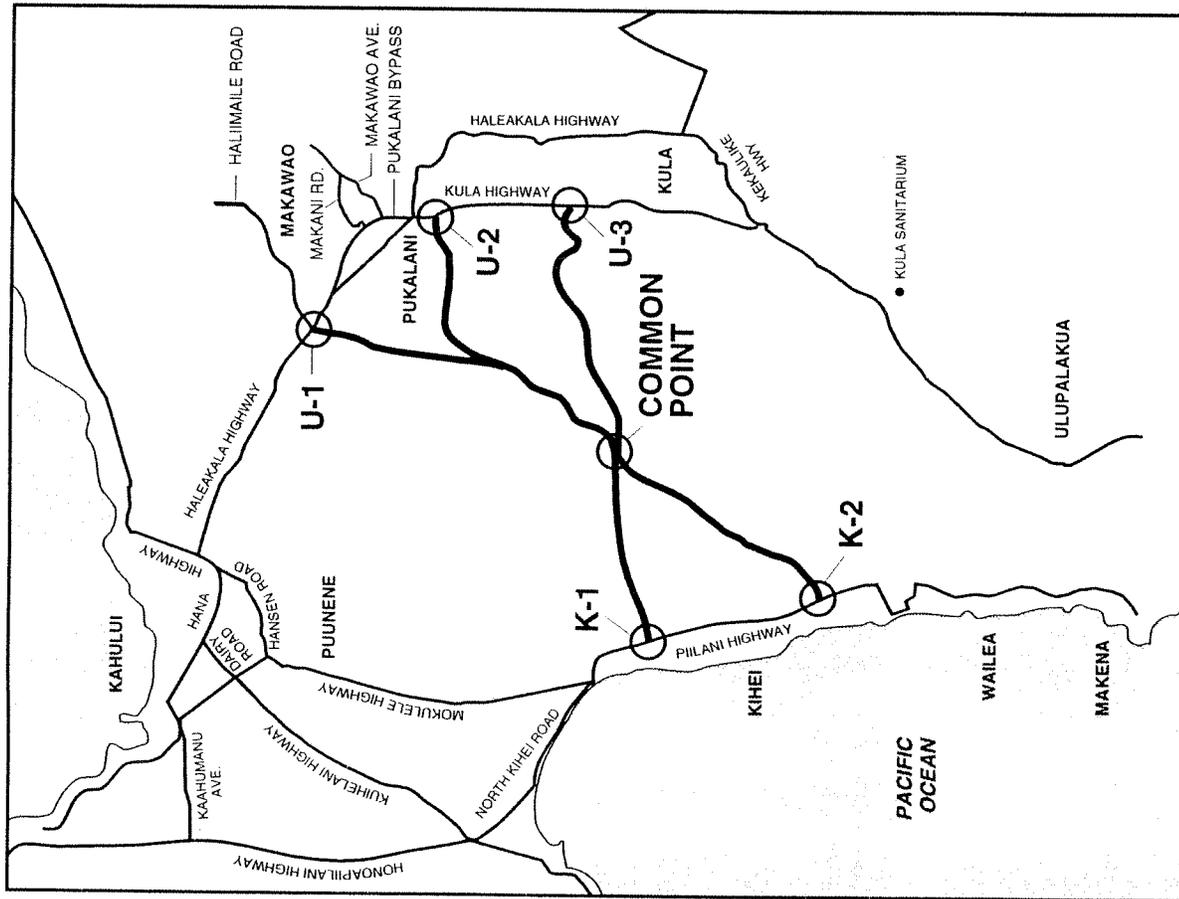

A two-tiered alternatives screening analysis was performed to evaluate alignment alternatives, a widening of adjacent roadways alternative and a transportation systems management (TSM) alternative for the Kihei-Upcountry Maui Highway Project, Maui County, Hawaii. The purpose of the screening was to eliminate alternatives that would have no chance of being selected as the preferred alternative, and to reduce the number of alternatives to a more limited number to receive detailed analysis in the project's draft environmental impact statement (EIS). The No-Build alternative was not evaluated in this screening analysis because it is automatically included in the draft EIS as a reference against which the project impacts are assessed. The No-Build alternative entails the recommended roadway improvements contained in the Maui Long Range Land Transportation Plan (Draft Final Report, February 1996), except for the proposed Kihei-Upcountry Highway.

Alternatives were developed from planning studies, scoping and public participation activities, and FHWA requirements. The screening criteria, developed from technical and planning documents and the project's public participation activities, were separated into two groups. The first group (tier one) consisted of "fatal flaw" criteria. An alternative had to satisfy all of these criteria to be considered under tier two, a group of criteria relating to the nature or degree of adverse or beneficial impact. An alternative did not have to satisfy all the tier two criteria to pass the evaluation.

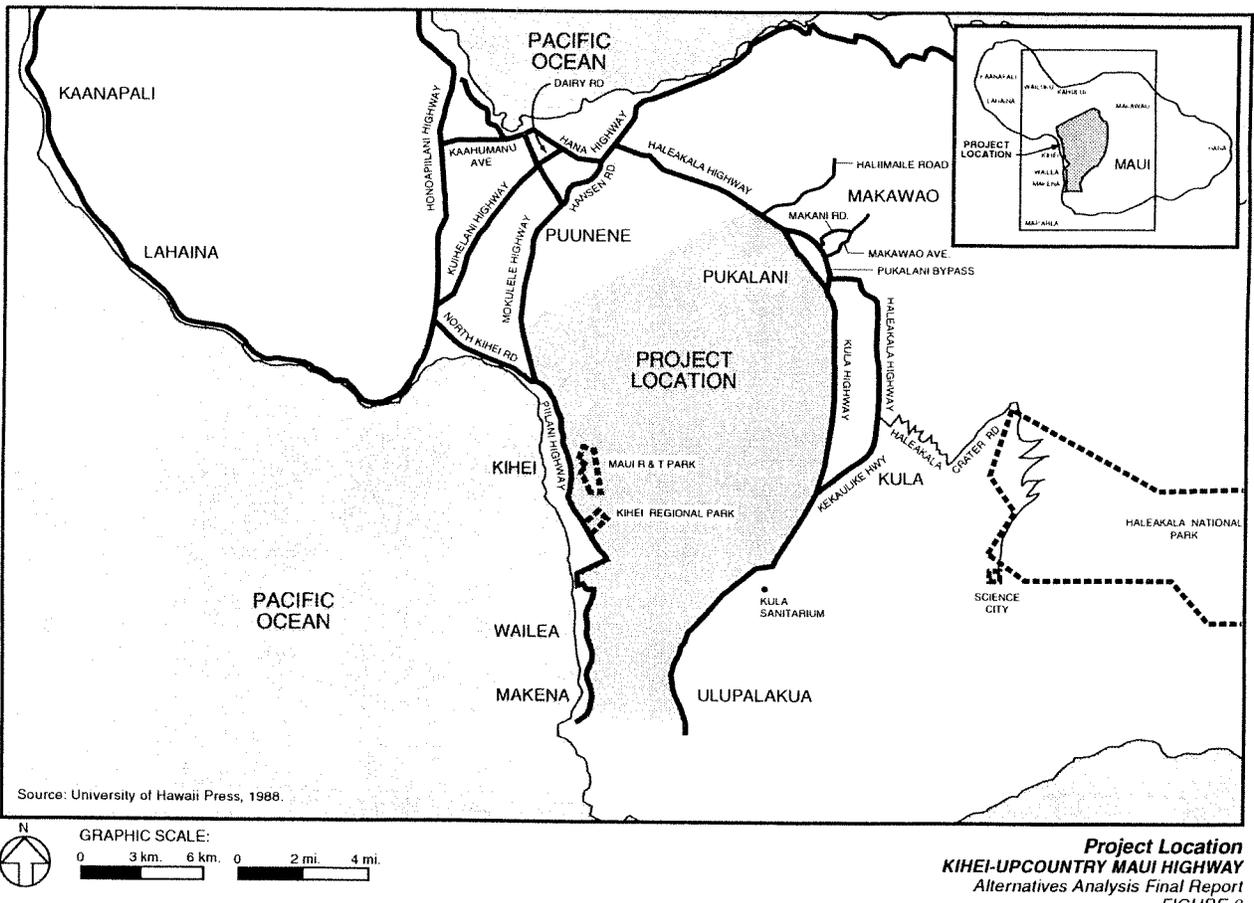

Four alternatives passed the screening evaluation:

- Alternative 2B: Halimaile Road/Haleakala Highway intersection to Kaonoulu Street/Piilani Highway intersection;
- Alternative 2C: Halimaile Road/Haleakala Highway intersection to the proposed Road F/Piilani Highway intersection (south of the Kihei Regional Park);
- Alternative 4B: Kula Highway east of Pukalani Bypass Road to Kaonoulu Street/Piilani Highway intersection; and
- Alternative 5: Kula Highway south of Pulehu Gulch to Kaonoulu Street/Piilani Highway intersection.

The selection of these four alternatives, however, forced the consideration of two new alternatives produced by combining the mauka and makai portions of the alternatives passing the screening analysis (see Figure 1). Using the same alignment segments that passed the screening, the two new alternatives would link the proposed Road F/Piilani Highway intersection terminus with termini at Kula Highway east of Pukalani Bypass Road and Kula Highway south of Pulehu Gulch. Therefore, it is recommended that these two new alternatives join the four alternatives that passed the screening analysis and move forward for detailed analysis as the build alternatives in the forthcoming draft EIS. It is also recommended that the existing alternative naming system be changed to identify alternatives by their Upcountry and Kihei termini as shown on Figure 1.

 Alternatives Analysis Final Report  
 FIGURE 2

**1. INTRODUCTION**

The proposed Kihei-Upcountry Highway would be located in Maui County, Hawaii (see Figure 2). The proposed highway would connect Pihani Highway and either Haleakala Highway or Kula Highway within a study area bounded on the east by Haleakala and Kula Highways, continuing south past the Kula Sanitarium, toward Ulupalakua, and turning northwest to join Pihani Highway, the western boundary of the study area.

The project would satisfy several goals:

- improvement of the connection between the Maui Research and Technology (R&T) Park and Science City, at the summit of Haleakala;
- establishment of a roadway linkage between Kihei and the Upcountry area;
- provision of additional roadway capacity to meet existing and future travel demand in the region; and
- provision of roadway infrastructure to accommodate projected growth and development.

**2. PURPOSE OF REPORT**

The purpose of this report is to:

- restate the project alternatives that were identified in the project's Environmental Assessment (EA) (Kihei-Upcountry Maui Highway Environmental Assessment, May, 1995);
- examine whether input received through project scoping activities conducted since publication of the EA warrants the development of additional alternatives;
- present the methodology used to reduce the number of alternatives to be carried forward in the planning phase; and
- present the alternatives that have been selected for detailed study in the forthcoming draft EIS.

An evaluation of the No-Build alternative is not included in this report because this alternative is required to be analyzed in the project's draft EIS as reference against which the selected alternatives' impacts are assessed. The No-Build alternative includes the recommended roadway improvements contained in the Maui Long Range Land Transportation (Draft Final Report, February, 1996) except for the Kihei-Upcountry Highway, and consists of primarily widening existing roadways.

**3. ALIGNMENT ALTERNATIVES**

Ten alignment alternatives were developed during the public and agency scoping process that preceded the issuance of the project's EA (noticed in the OEQC Bulletin on September 23, 1995 and the Federal Register on September 22, 1995). Descriptions of these ten alignment alternatives (see Figure 3) are provided in the Appendix.

The alignment alternatives were developed from:

- Prior studies and reports: The County of Maui Toll Road Study (1988) produced Alternatives 5, 6A, 6B, and 7. The Maui Long-Range Highway Planning Study (1991) contained Alternative 3. The State/County Joint Task Force Upcountry/Kihei Highway Final Report (October 1, 1993) contained Alternatives 1, 2, 4A, 4B, 6A and 6B.
- Scoping input received before the publication of the EA (May, 1995): Alternative 8, utilization of an abandoned government right-of-way, was suggested at an agency scoping meeting held in October, 1994.

Federal Highway Administration (FHWA) participation in this project requires that Transportation Systems Management (TSM) be considered among the alternatives. TSM would consist of implementing a transit system and/or augmenting Maui's para-transit system in the region and selected transportation control measures (TCMs), such as high-occupancy vehicle (HOV) lanes and ridesharing.

#### 4. SCOPING ACTIVITIES FOLLOWING PUBLICATION OF THE EA

Four major scoping activities have taken place since publication of the EA: written comments generated in response to the EA, oral testimony given at two public information meetings held in October, 1995; testimony provided during a second round of public information meetings held in May 1996; and written comments following the May 1996 information meetings. Information received was reviewed to determine whether additional alternatives were warranted. Most of the testimony focused on the need for the project, its cost, or characteristics of specific alignments. Some comments suggested potential new alignment alternatives.

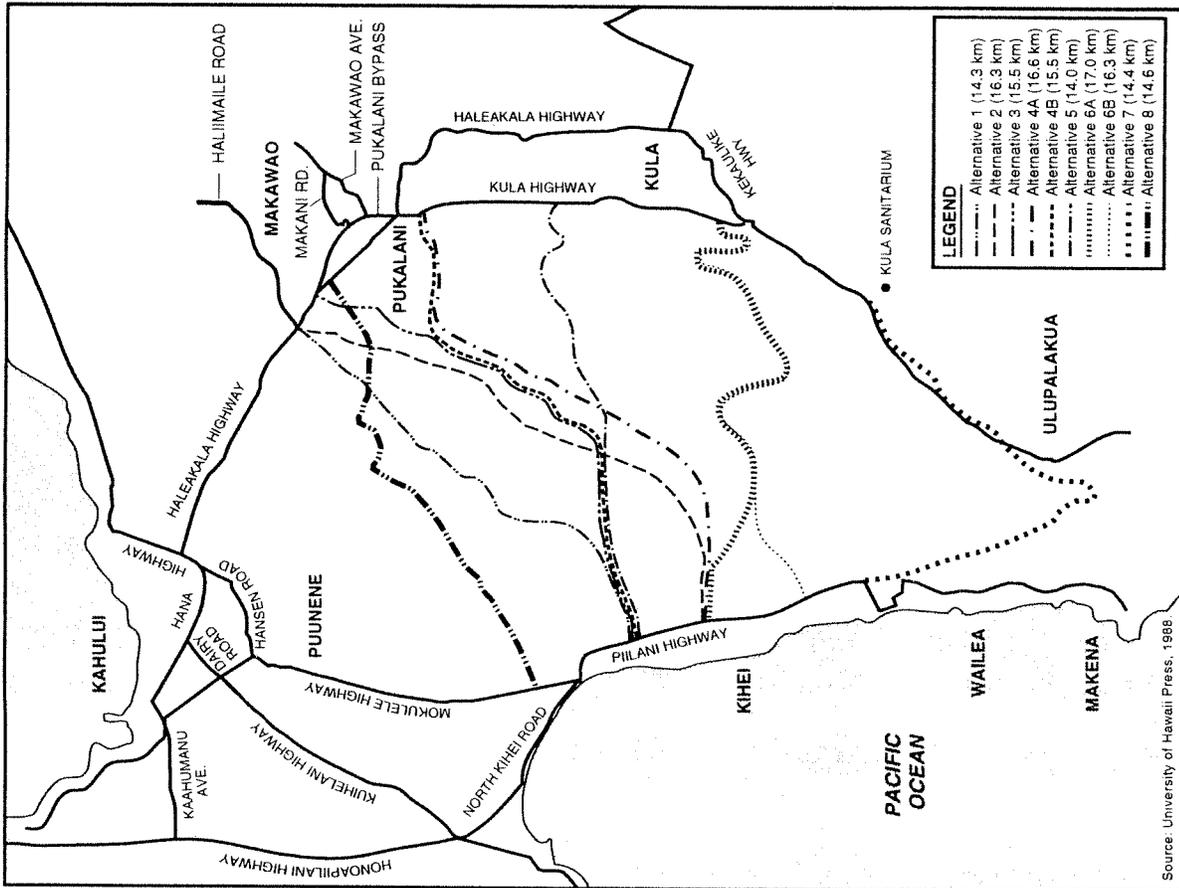

Analysis of public comments resulted in the conceptual engineering of three new alternatives: Alternatives 2B and 2C (modifications of Alternative 2) and the "widening of adjacent roadways" alternative (see Figure 4).

Alternative 2B would extend from Haleakala Highway/Halimaile Road intersection in the Upcountry area, as Alternative 2, but would then share portions of Alternative 4B's mauka alignment near the Hawaiian Commercial & Sugar Company (HC&S) land to Kihei at Kaonoulu Street. The length of this alternative would be approximately 15.64 kilometers (9.72 miles).

Alternative 2C would maintain the Halimaile Junction Upcountry terminus and share Alternative 4B's alignment near the HC&S land. However, its Kihei terminus would be located at the intersection of Pilihi Highway and the proposed Road F. The length of alternative 2C would be approximately 17.5 kilometers (10.9 miles).

Alternatives 2B and 2C were developed in response to comments such as minimizing impacts to Hawaiian Commercial and Sugar (HC&S) Company land, not having the highway bisect the Maui R&T Park, and moving the Kihei terminus as far south as possible to create an alternative evacuation route for South Kihei and to support hotels and resorts in Wailea / Makena.

The "widening of adjacent roadways" alternative was also developed in response to public comments provided since issuance of the EA. This alternative provides an additional lane in each direction beyond the widening improvements proposed in the Maui Long Range Land

Transportation Plan (February 1996). The following roadways are included in the widening of adjacent roadways alternative:

- Haleakala Highway (12.4 kilometers (7.7 miles))
- Hana Highway (3.2 kilometers (2.0 miles))
- Dairy Road (1.3 kilometers (0.8 miles))
- Puunene Avenue/Mokulele Highway (10.5 kilometers (6.5 miles))
- Piilani Highway (4.8 kilometers (3.0 miles))

**5. SCREENING ANALYSIS**

The screening analysis is used to review candidate alternatives and eliminate those with the fewest benefits or overriding adverse characteristics so that only those alternatives that best maximize benefits while minimizing adverse impacts are examined in detail in the project's draft EIS. This section presents the methodology and results of the screening analysis conducted for this project.

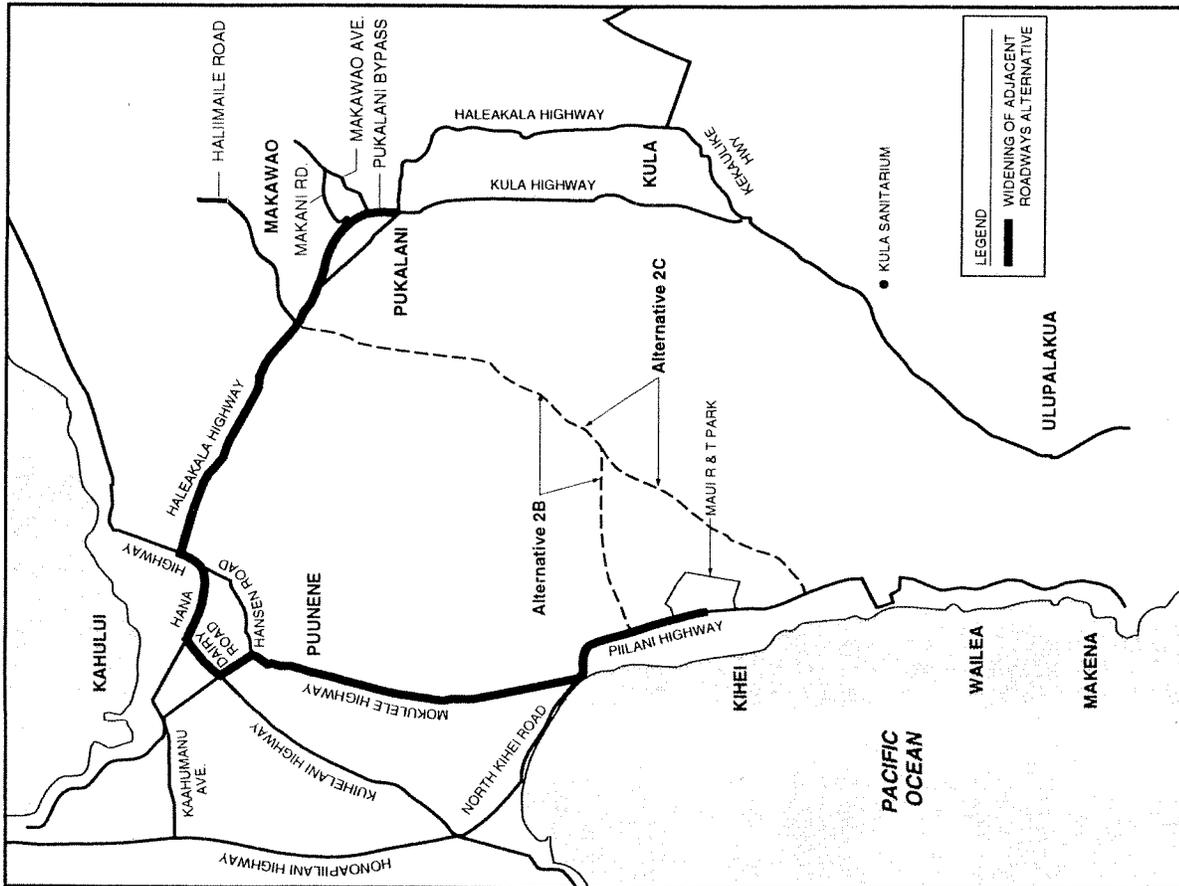

**5.1 Sources Of Candidate Criteria**

The following sources were used to develop possible criteria for evaluating the project alternatives:

- Federal Highway (FHWA) Technical Advisory Guide (October 1987);
- State/County Joint Task Force Upcountry/Kihei Highway Final Report (October 1993);
- Federal, State, County, and local comments to a project initiation letter issued by SDOT on September 1, 1994;
- An agency scoping meeting held on October 26, 1994;
- Engineering standards (Hawaii Statewide Uniform Design Manual for Streets and Highways, American Association of State Highway and Transportation Officials (AASHTO), and American Standard for Testing and Materials (ASTM);
- Kihei-Upcountry Maui Highway Environmental Assessment (EA) (May 1995);
- Written comments received in response to publication of the EA; and
- Comments (oral and written) made at the public information meetings held on Maui on October 17 and 18, 1995, and on May 15 and 16, 1996.

Forty-two letters were received in response to the project's EA and the October 1995 informational meetings. Nine of the letters addressed alignment selection criteria, as summarized in Table 1

The May public information meetings generated oral comments and 11 subsequent comment letters. Table 2 summarizes the written and oral comments relating to alignment selection criteria.

**(Oral and Written Comments)**

Noise impacts	Impacts to Agriculture	Access to HHL	Evacuation from Kihei	Bifurcate R&T Park
Amaral	HC&S Maui Planning	Thompson	Thompson Maui Planning Joiner Hironaka	Maui R&T Park

Based on the sources discussed above, candidate evaluation criteria were generated, and are shown below. These criteria were sorted into two groups, Tier One (fatal flaws) and Tier Two. Nonconformance with any Tier One criterion was considered a "fatal flaw," a feature of the alternative rendering it impractical, unfeasible or unfundable given the constraints associated with the anticipated federal participation in project construction. The Tier Two criteria relate primarily to nature and degree of adverse impact or benefit. An alternative not satisfying these criteria could be feasible, but would not be advantageous with respect to the criterion in question.

**Tier One (Fatal Flaw)**

- Satisfaction of project goals
- Conformance with engineering design criteria
- Benefit/cost ratio
- Bifurcate Maui R&T Park

**Tier Two**

- Adverse agricultural impact
- Cost
- Conformance with community plans
- Potential impact on historic and archaeological resources
- Highway operations
- Potential impact on endangered and threatened species
- Enhancement of access to Hawaiian Home Lands (HHL) parcel (TMK 2-02-002-014)
- Visual impacts
- Noise impacts
- Displacements/relocations
- Beneficial and adverse impacts on existing communities
- Enhancement of evacuation from Kihei
- Impact on prime, unique or important soils
- Extent of Right of Way Acquisition

**5.2 Evaluation Process**

A two-tiered evaluation process was used for this project. An alternative must satisfy all of the Tier One criteria to be considered in Tier Two.

**5.2.1 Tier One Screening**

**5.2.1.1 Satisfaction of Project Goals**

The alternatives were evaluated with respect to whether they satisfied the project goals stated in Section 1, such as establishing a roadway linkage between the Kihei and Upcountry areas. An alternative received a "Y" (yes) score if it would satisfy the project goals. A "N" (no) score would mean the alternative would not satisfy the project goals.

**5.2.1.2 Design Feasibility**

The alternatives were evaluated to determine whether they met engineering design criteria for a rural, limited access arterial roadway, such as minimum curve radius and design speed. A "Y" (yes) would signify that the alternative would have a conforming design, whereas a "N" (no) would mean that its design would not conform to the criteria.

**5.2.1.3 Benefit-Cost Ratio**

A preliminary benefit-cost analysis to the year 2023 (completion of construction plus 20 years) was performed to eliminate alternatives that would clearly not be cost-effective in achieving the goal of linking Kihei and Upcountry Maui. Calculation of the benefit-cost ratio (BCR) for each alternative was based on its differential comparison with the future No-Build Alternative of travel time between two centroids, one located at the Maui R&T Park in Kihei and the other in Pukalani, Upcountry Maui. Other factors used to calculate the BCRs included:

- cost of each alternative, consisting of initial cost (construction, right-of-way acquisition, design) and annual roadway maintenance;
- user costs for vehicle operation and maintenance; and
- economic factors, such as the expected long-term inflation rate and discount rate.

The methodology conformed to procedures described in the Manual On User Benefit Analysis of Highway and Bus Transit Improvements (AASHTO, 1977). Normally, an alternative's BCR would have to be greater than one (1) in order for the investment to be economically justified (the benefits of the project are greater than its cost). However, because of the preliminary nature of the analysis and the limited definition of what is considered a benefit, an alternative would have to have an extremely low BCR to be considered to have a BCR-related "fatal flaw" at this stage. A more precise benefit-cost analysis will be performed for the alternatives receiving detailed analysis in the draft EIS.

**5.2.1.4 Bifurcate Maui R&T Park**

The master plan for the Maui R&T Park has recently been revised to create a more campus-like atmosphere, in contrast to the light industrial park atmosphere that was originally envisioned. The revised draft master plan (February 1996) has, as its central roadway element, a large roundabout or "green" located at the core of the park. This master plan is being coordinated with the County Council as part of the Kihei-Makena Community Plan update. Any alignment that divides the Maui R&T Park would be inconsistent with the park's proposed campus-like roadway system. Because the Maui R&T Park is intended to be one of the major beneficiaries of the proposed highway, conformance with the draft master plan's proposed campus-like roadway system was elevated to a Tier One level of significance. Those alternatives that bifurcate the R&T Park were given a "Y" (yes), while those that did not were given a "N" (no). A "Y" score for this criterion indicates that the alternative has a "fatal flaw."

**5.2.1.5 Evaluation of Alternatives Considered in Tier One**

Table 3 summarizes the outcome of the Tier One evaluation. Scores not satisfying the criteria are shaded in summary, Alternatives 4A, 6A through 8, the widening of adjacent roadways alternative, and the TSM alternative were eliminated from further study.

Non-satisfaction of the project goals eliminated the widening of adjacent roadways and TSM alternatives. The widening of adjacent roadways alternative would not establish a roadway linkage between Kihei and the Upcountry area. The TSM alternative would also not satisfy this goal, nor other goals, such as providing additional roadway capacity and infrastructure to meet existing and future travel demand in the region.

The design feasibility criterion eliminated Alternative 8 because it is constrained to an existing government right-of-way that does not conform modern highway design standards.

The preliminary benefit-cost analysis generated BCRs ranging from -0.04 to 1.53 (see Table 3). After noting the spread of the results and considering the preliminary nature of the analysis, the allowable threshold was set at 0.67 which eliminated Alternatives 6A, 6B, and 7.

**Table 3  
Tier One Screening**

Criteria	Alternative													WR	TSM
	1	2	2B	2C	3	4A	4B	5	6A	6B	7	8			
Satisfies Project Goals	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	N
Design Feasibility	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	N	Y	N.A.
Benefit-Cost Ratio	1.00	1.00	1.06	0.67	1.01	0.94	1.34	1.53	0.42	0.28	-0.04	1.10	Low <sup>1</sup>	N.A. <sup>2</sup>	N.A. <sup>2</sup>
Bifurcate Maui R&T Park	N	Y	N	N	N	Y	N	N	Y	N	N	N	N	N.A.	N.A.

Notes: WR: Widening of Adjacent Roadways Alternative  
TSM: Transportation Systems Management Alternative  
Y: Yes  
N: No  
N.A.: Not Applicable.

<sup>1</sup> The BCR for the NBE Alternative was not calculated because it failed to satisfy the project goals criterion. If the BCR for the NBE Alternative was calculated, it would be expected to be quite low because the method of calculating BCRs is based on the differential comparison with the future No-Build Alternative of travel time between Kihei and Upcountry Maui. When compared to the No-Build Alternative, the NBE Alternative would offer a slight decrease in travel time because of marginally less congestion along the same circumferential route. This travel time savings, however, would not compare favorably to the decrease in travel time that would be achieved by shortening the distance between Kihei and Upcountry Maui through a new roadway. Therefore, along with its large capital cost (\$78 million), its BCR, as calculated here, would be small.

<sup>2</sup> The BCR for the TSM Alternative was not calculated because it failed to satisfy the project goals criterion.

The minimum passing BCR would have to be lowered to 0.42 to affect these results. However, lowering the BCR to this threshold would not have affected the overall screening because Alternative 6A, with its 0.42 BCR, would have been eliminated anyway because it bifurcates the Maui R&T Park, the last Tier One criterion. This last criterion also eliminated Alternatives 2 and 4A.

**5.2.2 Tier Two Screening**

The candidate Tier Two criteria (listed in Section 5.1) were evaluated to determine whether they would be useful in screening the remaining alternatives (1, 2B, 2C, 3, 4B and 5). Criteria rejected for the Tier Two screening and the rationale for rejection are described below:

- Potential Impacts on Historic and Archaeological Resources: The overview analysis that would have been conducted for this screening would not satisfy Section 106 requirements of the National Historic Preservation Act. Section 106 can only be fulfilled by conducting an inventory survey. Furthermore, the overview analysis would lengthen the project schedule and increase costs. Therefore, the appropriate level of archaeological detail will be conducted in the EIS phase of work. Should archeological resources be encountered, the alternatives are still sufficiently conceptual to allow refinement of the alignment to avoid the resource, or the alternative should not be selected as the preferred alternative.
- Noise impacts: FHWA STAMINA 2.0 Highway Traffic Noise Modeling Program will be used to predict future noise levels for this project for the alternatives carried into the draft EIS. If appropriate, noise mitigation would be provided. Therefore, because noise impacts can be mitigated, potential noise impacts are not viewed as an alignment selection criterion.
- Displacements/Relocations: None of the alignment alternatives involve relocations or displacements of residential or commercial structures. Therefore, this criterion would not discriminate among the alternatives.
- Beneficial and Adverse Impacts on Existing Communities: This criterion was not selected for Tier Two screening because of its importance. For example, the potentially adverse social impacts of the highway on the Upcountry Kula area would be a key concern in the draft EIS. Therefore, it was determined that a cursory examination of this criterion in the initial screening analysis would not be sufficient. A detailed analysis of community impacts of those alternatives that satisfy the other Tier Two criteria is deferred to the draft EIS.
- Enhancement of evacuation from Kihei: At present, evacuation of Kihei must be funneled through the critical junction of Mokulele Highway, Piilani Highway and Kihei Road. While a second access route may be highly desirable to relieve this choke point, enhancement of evacuation from Kihei is not a goal of this project. However, with the exception of Alternative 8 which was eliminated in Tier One, all the alternatives would provide additional evacuation capacity.

- Impacts on prime, unique or important soils: The alignment alternatives have all been rated by the US Natural Resources Conservation Service for their impacts on special soil types. Scores ranged from 51 to 77. In order to trigger the provisions of the Farmland Protection Policy Act, a score of 160 is necessary. Therefore, because all of the alternatives rated similarly, and far below the threshold of 160, this criterion does not indicate substantial differences among the alternatives with respect to this criterion.
- Extent of right-of-way acquisition: This criterion was not selected because it is a component of the project's cost, and cost was retained as a Tier Two criterion.

The remaining Tier Two criteria include adverse agricultural impacts, cost, conformance with community plans, highway operations, potential impacts on endangered and threatened species, enhancement of access to HHL parcel, and visual impacts. Six of the selected Tier Two criteria were mentioned in the public comment letters and oral comments received on the project's EA and public information meetings (see Tables 1 and 2). The selected Tier Two criteria are now described.

**5.2.2.1 Adverse Agricultural Impact**

The number of hectares presently used for agriculture, such as pineapple or sugarcane cultivation and Upcountry truck farms, which each alternative would displace was calculated. Impacts on pasture lands were not considered as important because of the abundance of pasture land in the area and its substantially reduced investment in irrigation, drainage and other infrastructure. The following five-point scale was defined based on the acreage of encroachment for each alternative:

- (1): less than 10 hectares
- (2): 10 to 20 hectares
- (3): 20 to 30 hectares
- (4): 30 to 40 hectares
- (5): over 40 hectares

The draft EIS will contain a more complete analysis of impacts on agricultural activity for those alternatives selected for detailed study.

**5.2.2.2 Cost**

This criterion compares the estimated cost of land acquisition, site work, roadway construction, and drainage system of each alternative. The following four-point scale was used to score these costs:

- (1): less than \$45 million
- (2): \$45 to \$55 million
- (3): \$55 to \$65 million
- (4): over \$65 million

5.2.2.3 Conformance with Community Plans

There are nine planning regions in Maui County for which community plans have been prepared. The plans report current and anticipated conditions, and stipulate advance planning goals, objectives, policies and implementation considerations to guide decision making for each region. The study area overlaps planning areas addressed by the Kihei-Makena Community Plan and the Makawao-Pukalani-Kula Community Plan. Although the community plans are not official until adopted by the County Council and the Mayor, it is customary on Maui to use the most recent proposed update to the community plans to assess conformance with county planning.

The most recent proposed update for the Kihei area is the Proposed Kihei-Makena Community Plan (October 1993). This proposed plan recommends a roadway that would link the primary residential area of Upcountry and job centers within the Kihei region. The Plan, therefore, favors those alternatives with mauka termini near Pukalani, and makai termini at or north of the Maui R & T Park. The 1993 plan is now in the early stages of being updated.

The proposed Community Plan Update of Makawao-Pukalani-Kula (July 1996) "files" the proposed Kihei-Upcountry Maui Highway, and states that the No-Build alternative is favored over any build alternative. However, the recommendations also include provisions that if the roadway is built, the preferred Upcountry terminus should be in the vicinity of Halimalie Road. This Plan has recently passed second reading by the County Council, and the Mayor is expected to officially approve the plan shortly.

The alternatives that best conform to the community plans were scored "Y" (yes). Alternatives that did not conform as well were scored "P" (poor). Alternatives that do not conform to the plans were scored "N" (No).

The draft EIS will contain an updated and more complete analysis of conformance with community plans for those alternatives selected for detailed study.

5.2.2.4 Highway Operations

While all of the alternatives entering the Tier Two screening can be designed to conform with applicable engineering standards (see Section 5.2.1.3), there may be operational problems with certain alternatives when connected to the existing roadway network. Those alternatives that would connect well with the existing roadway network were scored a "B" (better), those that did not, were scored a "W" (worse).

5.2.2.5 Impact on Endangered and Threatened Species

A botanical reconnaissance was conducted to rank the alternatives in terms of their relative adverse impact on those areas where endangered or threatened plant species might exist. The survey included:

- a helicopter reconnaissance of the project area.
- government agency interviews and literature search;

- a comparative ranking of the alternatives for potential botanical impacts, emphasizing impacts on rare species; and
- a general assessment of the level of potential impact of each alternative.

Based on the botanical reconnaissance, alternatives were scored numerically, from "1" (alternatives that were least likely to threaten endangered species) to "5" (alternatives with a higher possibility of displacing endangered species). Potential impacts on endangered species was not considered a "fatal flaw" because at this stage of project planning, the alignment alternatives are considered wide enough to allow some latitude to bypass particularly sensitive locations, if warranted. The draft EIS will contain a more complete analysis of potential impacts on sensitive habitat areas for those alternatives selected for detailed study.

5.2.2.6 Enhancement of Access to Hawaiian Home Lands Parcel

The Kihei-Upcountry Maui Highway State/County Joint Task Force's Final Report (October 1, 1993) identified access to the Hawaiian Home Lands parcel (TMK 2-02-002-014) as a desirable benefit of this project. Alignment alternatives that would enhance future access to the HHL parcel received a "B" (better), while those alternatives that would not enhance access received a "W" (worse).

5.2.2.7 Visual Impact

Since all of the alternatives share a common typical design (see Figure 5: Typical Section) and a similar setting (agricultural lands on the western flank of Haleakala), the amount of earthmoving (cut plus fill) required for roadway construction was used as an approximate indicator of the project's long-term aesthetic impacts. It is assumed that the more material moved during construction, the greater the potential for visual disturbance of the existing landscape, even after the establishment of new plantings.

A four-point scale was developed to score the total amount of cut and fill material required for each alternative. Alternatives requiring less earthmoving received lower scores, while those requiring the most activity received a "4."

- (1): less than 1.5 million cubic meters
- (2): 1.5 to 2.0 million cubic meters
- (3): 2.0 to 2.5 million cubic meters
- (4): over 2.5 million cubic meters.

The draft EIS will contain a more complete analysis of potential visual impacts for those alternatives selected for detailed study.

5.2.2.8 Evaluation of Alternatives Considered in Tier Two

Table 4 summarizes the Tier Two screening analysis. An alternative need not satisfy every criteria to pass the screening and move forward to the draft EIS. However, in certain

instances, a particular score or group of scores disqualified the alternative in question from moving forward. These disqualifying scores are shaded.

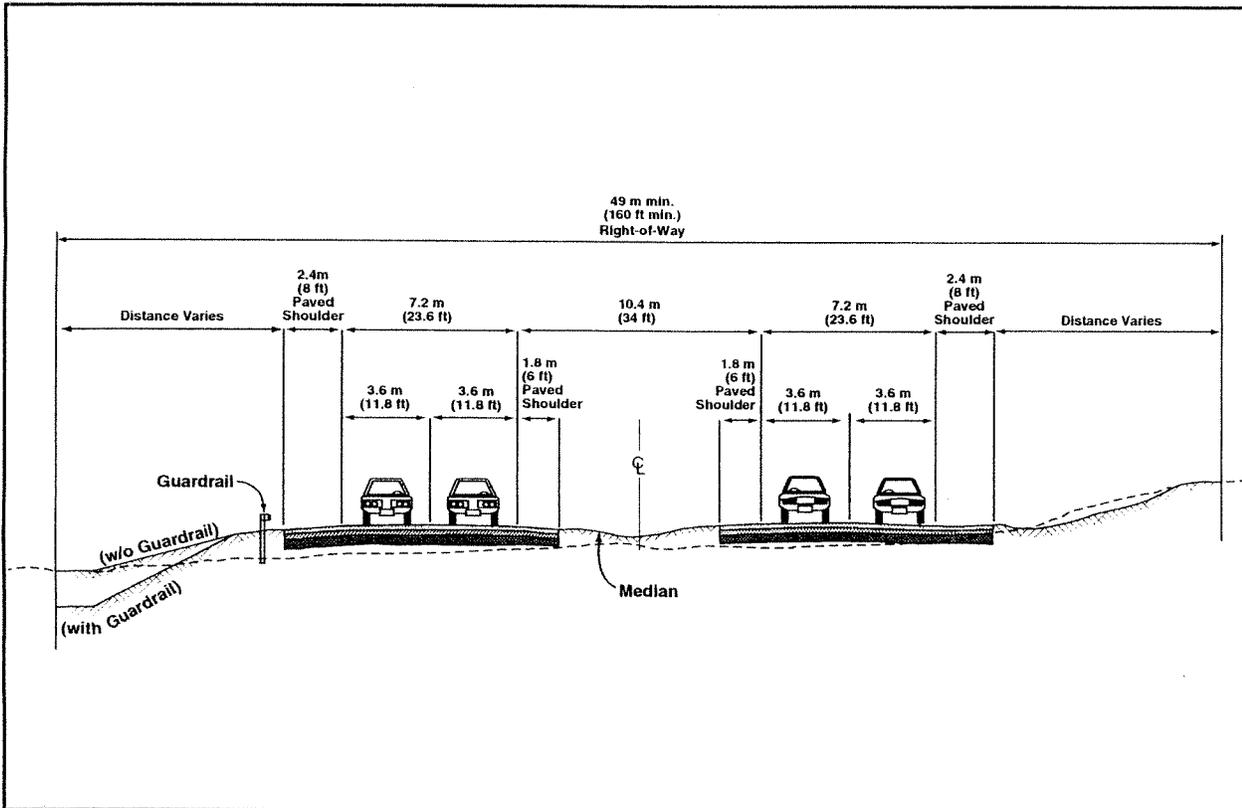

**Table 4  
Tier Two Screening**

Criteria	Alternative					
	1	2B	2C	3	4B	5
Adverse Agricultural Impact Score	5	3	3	4	3	2
Encroachment (hectares)	56.2	27.1	27.1	32.6	21.6	13.3
Cost Score	3	2	3	2	2	1
Estimated Cost (\$ millions)	57	47	57	54	52	40
Conformance with Community Plans Kihei-Makena Makawao-Pukalani-Kula	Y	Y	Y	Y	Y	P
Highway Operations	N	N	N	N	N	N
Potential Impact to Endangered & Threatened Species	B	B	B	W	B	B
Enhancement of Access to HHL	1	1	2	2	3	5
Visual Impacts	W	W	B	W	W	W
Visual Impacts Score	3	1	2	2	2	1
Est. Earthmoving (millions of cubic meters)	2.1	1.4	1.7	1.9	1.8	1.4

Notes: B: Better  
P: Poor  
W: Worse  
Y: Yes  
N: No

Based on the Tier Two criteria, Alternatives 1 and 3 were dropped from future study in the draft EIS for the following reasons:

- Alternative 1. This alternative would produce a substantially greater displacement of cultivated fields than any other alternative. It would displace approximately 56.2 hectares (139 acres), while the alternative with the next largest impact, Alternative 3, would displace approximately 32.6 hectares (81 acres), 42 percent less.
- Alternative 3. This alternative was eliminated because of its poorer operational aspects, particularly at its mauka terminus at the intersection of Haleakala Highway and Pukalani Bypass Highway where there is a seven percent grade. Because of this steep grade, a very long left turn storage lane would be required for makai-bound traffic on

Not to Scale

**Typical Section**  
KIHEI-UPCOUNTRY MAUI HIGHWAY  
Alternatives Analysis Final Report  
FIGURE 5

Haleakala Highway turning left onto Kihei-Upcountry Highway. The length of this left turn lane plus the proximity of the two intersections would cause a conflict in turning movements. Furthermore, this alternative scored a four (4) in terms of displacement of cultivated acreage.

Alternatives 2B, 2C, 4B and 5 passed the screening evaluation for the following reasons:

- Alternative 2B. The advantages of Alternative 2B are its cost (the second cheapest alternative), and its relatively minimal environmental impacts in those disciplines selected for this screening analysis. Although this alternative scored a three (3) in the agricultural impact criterion, the alignment was coordinated with HC&S officials to minimize adverse impacts to their sugarcane operations.
- Alternative 2C. Since this alternative is similar to Alternatives 2B and 4B, it too passed the Tier Two screening. The major disadvantage of this alternative, in comparison to these other two alternatives, is its cost (21 percent greater than Alternative 2B and 10 percent greater than Alternative 4B). Its advantages are that it is the only remaining alternative that may facilitate access to the HHL parcel and it provides another Kihei terminus option (Alternatives 2B, 4B and 5 all have the same Kihei terminus at Kaonoulu Street).
- Alternative 4B. This alternative compares favorably against other alternatives regarding level of impact, such as its moderate cost, impacts to cultivated fields and visual environment. It scores relatively high (3) under the "potential impact to endangered and threatened species" criterion. However, because the botanical reconnaissance was done from the air and because there is some latitude in modifying alternatives to avoid sensitive locations (see Section 5.2.2.5), this moderately high score did not warrant eliminating this alternative at this stage.

- Alternative 5. The primary benefits of this alternative are its cost (the least expensive alternative) and its least impact on cultivated fields. The negative aspects of this alternative are its higher probability of encountering endangered species habitats, and its "P" (poor) score in regards to conformance to the *Kihei-Makena Community Plan* (October 1993). However, these factors did not warrant eliminating this alternative.

In general, the alternatives passing Tier Two would generate comparatively fewer adverse environmental impacts in the topics selected for the screening analysis, and would not present operational difficulties interfacing with the existing roadway network. Only one of the selected alternatives would facilitate access to the HHL parcel. Potential community impacts, such as air quality and noise impacts, and other impact categories, such as potential impacts to archaeological resources, were not included in this analysis. However, these types of impacts will be addressed in detail in the draft EIS.

## **6. FINDINGS AND RECOMMENDATIONS**

Twelve alignment alternatives, a widening of adjacent roadways alternative, and a TSM alternative for a Kihei-Upcountry Maui Highway were evaluated using two sets of screening criteria that were developed from previous planning efforts: engineering guides and public

input. Eight alternatives (2, 4A, 6A, 6B, 7 and 8, widening of adjacent roadways, and TSM) were dropped because they did not satisfy the first tier of screening criteria.

The Tier Two criteria were used to evaluate the remaining six alternatives. The Tier Two criteria eliminated Alternatives 1 and 3 because of their agricultural impacts and operational difficulties.

The remaining four alternatives (2B, 2C, 4B and 5) were then reconceptualized as combinations of mauka and makai segments. By combining two makai termini with three mauka termini, it became possible to generate six alternatives comprised of common roadway segments.

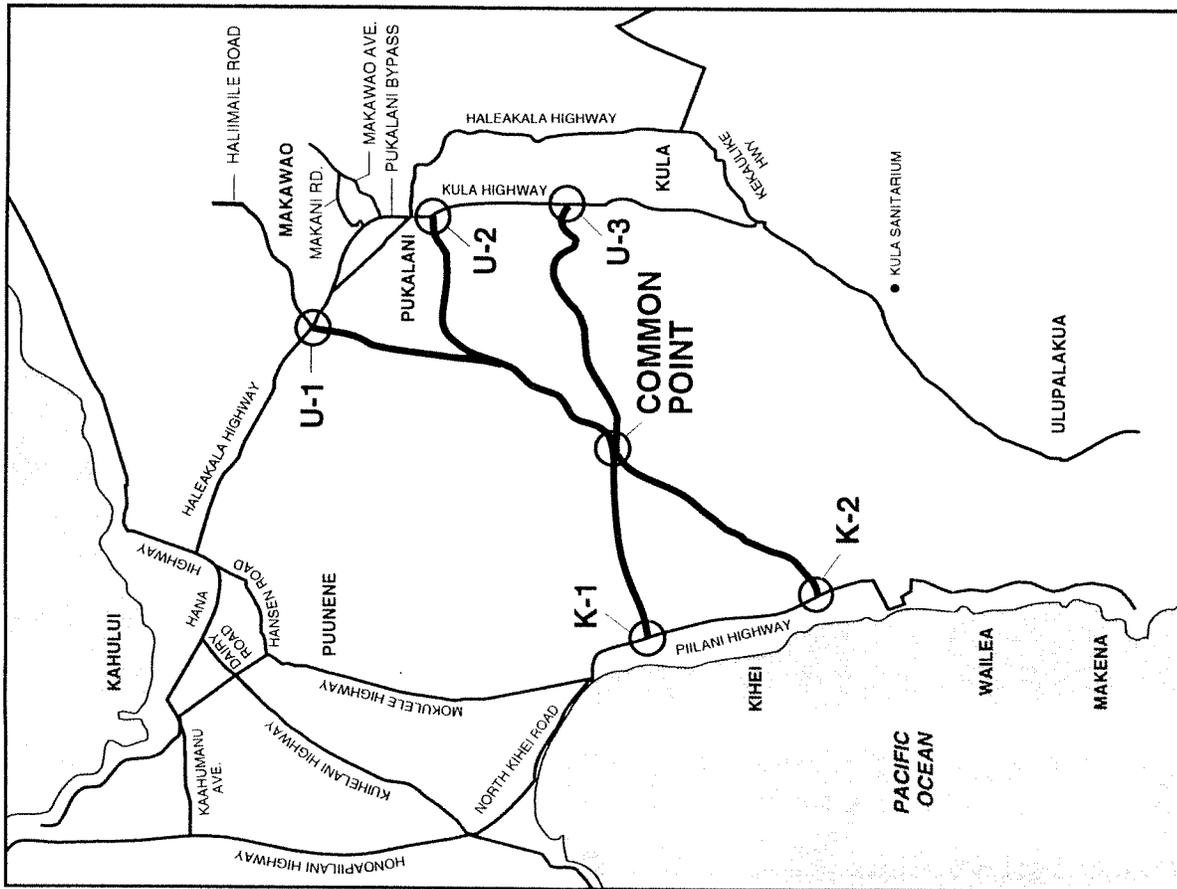

Figure 6 shows the Upcountry and Kihei termini choices and the alignment segments or "footprints" that would be used by the six alternatives. As shown on this figure, it is recommended that the Upcountry termini and segments be named U-1, U-2 and U-3 and the Kihei termini and segments be named K-1 and K-2. The descriptions of these segments are as follows:

- Segment U-1: Halimaile Road/Haleakala Highway intersection to Omaopio Road, and ending at the common point of all the segments located on Waiaikoa Ridge approximately 5.75 km (3.5 miles) mauka (east) from Pilihi Highway (see Figure 6).
- Segment U-2: Kula Highway east of Pukulani Bypass Road to Omaopio Road and ending at the common point.
- Segment U-3: Kula Highway south of Pulehu Gulch, down Waiaikoa Ridge and ending at the common point.
- Segment K-1: Kaonoulu Street/Pilihi Highway intersection up Waiaikoa Ridge and ending at the common point.
- Segment K-2: proposed Road F/Pilihi Highway intersection to the common point.

Table 5 provides the suggested naming system for the alternatives.

**Table 5**  
**Suggested Alternative Naming System**

Old Name	Suggested New Name	Description
2B	U-1, K-1	Haliimaile Road/Haleakala Highway Intersection to Kaonoulu Street/Piilani Highway Intersection.
2C	U-1, K-2	Haliimaile Road/Haleakala Highway Intersection to proposed Road F/Piilani Highway Intersection
4B	U-2, K-1	Kula Highway east of Pukalani Bypass Road to Kaonoulu Street/Piilani Highway Intersection.
5	U-3, K-1	Kula Highway south of Pulehu Gulch to Kaonoulu Street/Piilani Highway Intersection.
None	U-2, K-2	Kula Highway east of Pukalani Bypass Road to proposed Road F/Piilani Highway Intersection.
None	U-3, K-2	Kula Highway south of Pulehu Gulch to proposed Road F/Piilani Highway Intersection.

## APPENDIX

### KIHEI-UPCOUNTRY HIGHWAY MAUI, HAWAII

#### INITIAL TEN ALTERNATIVES FROM THE ENVIRONMENTAL ASSESSMENT

**Alternative 1.** This alignment would extend from the Haleakala Highway/Halimaille Road intersection in the Upcountry area to Piilani Highway/Kaonoulu Street in Kihei. The minimum horizontal radius would be 610 meters (2,000 feet). The alignment's maximum grade would be 3.5 percent. This 14.3 kilometer (8.9-mile) alignment would traverse Agriculture zoned land, affecting five large agricultural parcels. Approximately 9.7 kilometers (6.0 miles) of the alignment would traverse cane fields.

**Alternative 2.** This alignment would extend from the Haleakala Highway/Halimaille Road intersection in the Upcountry area to the Maui R&T Park in Kihei. The minimum horizontal radius would be 915 meters (3,000 feet). The alignment's maximum grade would be 5.0 percent. This 16.3 kilometer (10.1-mile) alignment would traverse about 6.4 kilometers (4.0 miles) of cane field and would affect six large Agriculture zoned parcels.

**Alternative 3.** This alignment would extend from Haleakala Highway, between Halimaille Road and Pukalani in the Upcountry area, to the Piilani Highway/ Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 535 meters (1,750 feet). The alignment's maximum grade would be 4.2 percent. This 15.5 kilometer (9.6-mile) alignment would affect approximately five large parcels zoned for Agriculture. The alignment would also skirt the east (mauka) edge of approximately 6.4 kilometers (4.0 miles) of cane field. The uppermost portion of the alignment is immediately west of Urban zoned lands.

**Alternative 4A.** This alignment would extend from Kula Highway, east of the Pukalani Bypass Road in the Upcountry area, to the Maui R&T Park in Kihei. The minimum horizontal radius would be 715 meters (2,350 feet). The alignment's maximum grade would be 6.7 percent. This 16.6 kilometer (10.3-mile) alignment would affect approximately 12 parcels, most of which are used for grazing. At least two parcels are being used for pineapple cultivation. All except the uppermost 1.5 kilometer (0.9 mile) of this alignment traverses agricultural lands. The uppermost portion traverses land designated for urban residential use in the Makawao-Pukalani-Kula Community Plan (1981).

**Alternative 4B.** This alignment would extend from Kula Highway, east of the Pukalani Bypass Road in the Upcountry area, to the Piilani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 790 meters (2,600 feet). The alignment's maximum grade would be 6.6 percent. This 15.5 kilometer (9.6-mile) alignment would affect approximately 8 parcels, most of which are used for grazing. At least two parcels are being used for pineapple cultivation. All except the uppermost 1.5 kilometer (0.9 mile) of this alignment traverses agricultural lands. The uppermost portion traverses land designated for urban residential use in the Makawao-Pukalani-Kula Community Plan (1981).

**Alternative 5.** This alignment would extend from Kula Highway, south of Pulehu Gulch in Kula, to the Piilani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 275 meters (900 feet). The alignment's maximum grade would be 6.8 percent. This 14.0 kilometer (8.7-mile) alignment would affect approximately eight parcels zoned as Agriculture land. One parcel near the Kula terminus is in pineapple cultivation, and another is being utilized for truck farming. The other parcels are used for grazing.

**Alternative 6A.** This alignment would extend from Kula Highway, approximately 1.2 kilometers (0.5 mile) north of the Kekaulike Highway/Kula Highway intersection in Kula, to the Maui R&T Park in Kihei. The minimum horizontal radius would be 245 meters (800 feet). The topography is fairly steep and would require switch backs in order to keep maximum grade below 6.8 percent. This 17.0 kilometer (10.6-mile) alignment would traverse five parcels, two of which are owned by the Department of Hawaiian Home Lands.

**Alternative 6B.** This alignment would extend from Kula Highway, west of the Kekaulike Highway/Kula Highway intersection in Kula, to Piilani Highway, next to the Kihei Regional Park. The location of the Kihei terminus would be across from the proposed Road F (Kihei Traffic Master Plan (1989)). The minimum horizontal radius would be 245 meters (800 feet). The topography is fairly steep and would require switch backs in order to maintain a maximum grade of 7.0 percent. This 16.3 kilometer (10.1-mile) alignment would traverse five parcels, two of which are owned by the Department of Hawaiian Home Lands.

**Alternative 7.** This alignment would connect Kula Highway to Piilani Highway by extending Kula Highway south from the Kula Sanitarium to Ulupalakua, and turning northwest toward Piilani Highway. The minimum horizontal radius would be 150 meters (500 feet). The grade of this alignment between the Kihei terminus and Ulupalakua would be nearly the 7.0 percent maximum desired grade. The 14.4 kilometer (8.9-mile) alignment would traverse approximately 12 parcels. In order to meet current highway safety standards, about 6.0 kilometers (3.7 miles) of the existing substandard section of road between Ulupalakua and the Sanitarium would be reconstructed.

**Alternative 8.** This alignment would extend from Haleakala Highway below Pukalani to Mokuiele Highway, along the old Government right-of-way. The minimum horizontal radius would be 60 meters (200 feet). The maximum grade along the existing alignment would be about 10.0 percent. This 14.6 kilometer (9.1-mile) alignment would traverse 13.6 kilometers (8.5 miles) of cane land.

**APPENDIX A  
KIHEI-UPCOUNTRY HIGHWAY  
MAUI, HAWAII**

**INITIAL TEN ALTERNATIVES FROM THE  
ENVIRONMENTAL ASSESSMENT**

Alternative 1. This alignment would extend from the Haleakala Highway/Halimalie Road intersection in the Upcountry area to Piliiani Highway/Kaonoulu Street in Kihei. The minimum horizontal radius would be 610 meters (2,000 feet). The alignment's maximum grade would be 3.5 percent. This 14.3 kilometer (8.9-mile) alignment would traverse Agriculture zoned land, affecting five large agricultural parcels. Approximately 9.7 kilometers (6.0 miles) of the alignment would traverse cane fields.

Alternative 2. This alignment would extend from the Haleakala Highway/Halimalie Road intersection in the Upcountry area to the Maui R&T Park in Kihei. The minimum horizontal radius would be 915 meters (3,000 feet). The alignment's maximum grade would be 5.0 percent. This 16.3 kilometer (10.1-mile) alignment would traverse about 6.4 kilometers (4.0 miles) of cane field and would affect six large Agriculture zoned parcels.

Alternative 3. This alignment would extend from Haleakala Highway, between Halimalie Road and Pukalani in the Upcountry area, to the Piliiani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 535 meters (1,750 feet). The alignment's maximum grade would be 4.2 percent. This 15.5 kilometer (9.6-mile) alignment would affect approximately five large parcels zoned for Agriculture. The alignment would also skirt the east (mauka) edge of approximately 6.4 kilometers (4.0 miles) of cane field. The uppermost portion of the alignment is immediately west of Urban zoned lands.

Alternative 4A. This alignment would extend from Kula Highway, east of the Pukalani Bypass Road in the Upcountry area, to the Maui R&T Park in Kihei. The minimum horizontal radius would be 715 meters (2,350 feet). The alignment's maximum grade would be 6.7 percent. This 16.6 kilometer (10.3-mile) alignment would affect approximately 12 parcels, most of which are used for grazing. At least two parcels are being used for pineapple cultivation. All except the uppermost 1.5 kilometer (0.9 mile) of this alignment traverses agricultural lands. The uppermost portion traverses land designated for urban residential use in the Makawao-Pukalani-Kula Community Plan (1981).

Alternative 4B. This alignment would extend from Kula Highway, east of the Pukalani Bypass Road in the Upcountry area, to the Piliiani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 790 meters (2,600 feet). The alignment's maximum grade would be 6.6 percent. This 15.5 kilometer (9.6-mile) alignment would affect approximately 8 parcels, most of which are used for grazing. At least two parcels are being used for pineapple cultivation. All except the uppermost 1.5 kilometer (0.9 mile) of this alignment traverses agricultural lands. The uppermost portion traverses land designated for urban residential use in the Makawao-Pukalani-Kula Community Plan (1981).

Alternative 5. This alignment would extend from Kula Highway, south of Pulehu Gulch in Kula, to the Piliiani Highway/Kaonoulu Street intersection in Kihei. The minimum horizontal radius would be 275 meters (900 feet). The alignment's maximum grade would be 6.8 percent. This 14.0 kilometer (8.7-mile) alignment would affect approximately eight parcels zoned as Agriculture land. One parcel near the Kula terminus is in pineapple cultivation, and another is being utilized for truck farming. The other parcels are used for grazing.

Alternative 6A. This alignment would extend from Kula Highway, approximately 1.2 kilometers (0.5 mile) north of the Kekaulike Highway/Kula Highway intersection in Kula, to the Maui R&T Park in Kihei. The minimum horizontal radius would be 245 meters (800 feet). The topography is fairly steep and would require switch backs in order to keep maximum grade below 6.8 percent. This 17.0 kilometer (10.6-mile) alignment would traverse five parcels, two of which are owned by the Department of Hawaiian Home Lands.

Alternative 6B. This alignment would extend from Kula Highway, west of the Kekaulike Highway/Kula Highway intersection in Kula, to Piliiani Highway, next to the Kihei Regional Park. The location of the Kihei terminus would be across from the proposed Road F (Kihei Traffic Master Plan (1989)). The minimum horizontal radius would be 245 meters (800 feet). The topography is fairly steep and would require switch backs in order to maintain a maximum grade of 7.0 percent. This 16.3 kilometer (10.1-mile) alignment would traverse five parcels, two of which are owned by the Department of Hawaiian Home Lands.

Alternative 7. This alignment would connect Kula Highway to Piliiani Highway by extending Kula Highway south from the Kula Sanitarium to Ulupalakua, and turning northwest toward Piliiani Highway. The minimum horizontal radius would be 150 meters (500 feet). The grade of this alignment between the Kihei terminus and Ulupalakua would be nearly the 7.0 percent maximum desired grade. The 14.4 kilometer (8.9-mile) alignment would traverse approximately 12 parcels. In order to meet current highway safety standards, about 6.0 kilometers (3.7 miles) of the existing substandard section of road between Ulupalakua and the Sanitarium would be reconstructed.

Alternative 8. This alignment would extend from Haleakala Highway below Pukalani to Mokuule Highway, along the old Government right-of-way. The minimum horizontal radius would be 60 meters (200 feet). The maximum grade along the existing alignment would be about 10.0 percent. This 14.6 kilometer (9.1-mile) alignment would traverse 13.6 kilometers (8.5 miles) of cane land.

**INTRODUCTION**

The purpose of this report is to describe the air pollutants associated with motor vehicle exhaust, discuss applicable air quality standards and regulations, summarize the existing air quality conditions in the study area, and identify and quantify the potential air quality impacts of Kihei-Upcountry Maui Highway.

**1. PROJECT DESCRIPTION**

The Highways Division of the State of Hawaii Department of Transportation (SDOT), and the Federal Highway Administration (FHWA) are proposing the Kihei-Upcountry Maui Highway project on the island of Maui, Hawaii. Figure 1 shows the general project location. The proposed federal-aid two-lane limited access highway would link the Kihei-Makana and Upcountry Maui regions.

The alternatives under consideration are all eight possible combinations of two Kihei terminus options and four Upcountry terminus options. The Kihei termini and segments are named K1 and K2, and the Upcountry termini and segments are named U1, U2-A, U2-B and U3.

Descriptions of the alternatives are as follows:

1. Alternative U1,K1. This alternative would start at the Haleakala Highway / Halimale Road intersection in Upcountry and follow a south to southwest alignment to the Kaonoulu Street / Piiilani Highway intersection. The length of this alternative is approximately 15.8 km (9.8 miles).
2. Alternative U1,K2. This alternative is the same as Alternative U1,K1 from the Upcountry terminus to where the alternative alignments cross. However, this alternative would proceed southwest to the Ke Alii Alanui Street / Piiilani Highway intersection. The length of Alternative U1,K2 is approximately 17.5 km (10.9 miles).
3. Alternative U2-A,K1. This alternative would extend from the existing Pukalani Bypass/Haleakala Highway/Kula Highway "Five Trees" intersection in Upcountry, to an alignment common with U1. The Kihei terminus would be at the Kaonoulu Street/Piiilani Highway intersection.
4. Alternative U2-A,K2. This alternative would be from the "Five Trees" intersection to the Ke Alii Alanui Street/Piiilani Highway intersection.
5. Alternative U2-B,K1. This alternative would extend from Kula Highway at approximately 700 m (2300 ft) south of the "Five Trees" intersection to the Piiilani Highway/Kaonoulu Street intersection.

6. Alternative U2-B,K2. This alternative shares the same Uppcountry terminus and alignment as the Alternative U2-B,K1. This alternative's Kihei terminus is at the Piilani Highway/Ke Alii Alanui Street intersection.
7. Alternative U3,K1. This alternative would be from Kula Highway, south of Pulehu Gulch in Kula, to the Piilani Highway/Kaonoulu Street intersection in Kihei.
8. Alternative U3,K2. This alternative would extend from Kula Highway, south of Pulehu Gulch in Kula, to the Ke Alii Alanui Street/Piilani Highway intersection.

The proposed highway would be a limited access arterial roadway with one 3.6 m (12 ft) lane in each direction. The minimum width of the roadway right-of-way would be 49 m (160 ft) in rural areas and at least 37 m (120 ft) in urban areas. Additional right-of-way is being reserved to allow for future widening to a four-lane divided highway if appropriate in the future. Posted speed limits would vary from 70 km/h (45 mph) in urban areas to 90 km/h (55 mph) in rural areas.

## 2. RELEVANT POLLUTANTS

Potential air quality impacts are estimated by quantifying the change in estimated air quality levels anticipated under each Build alternative with the levels estimated under the No Build alternative. "Air Pollution" is a general term that refers to one or more chemical substances that degrade the quality of the atmosphere. Individual air pollutants degrade the atmosphere by reducing visibility, damaging property, reducing the productivity or vigor of crops or natural vegetation, or by reducing human or animal health.

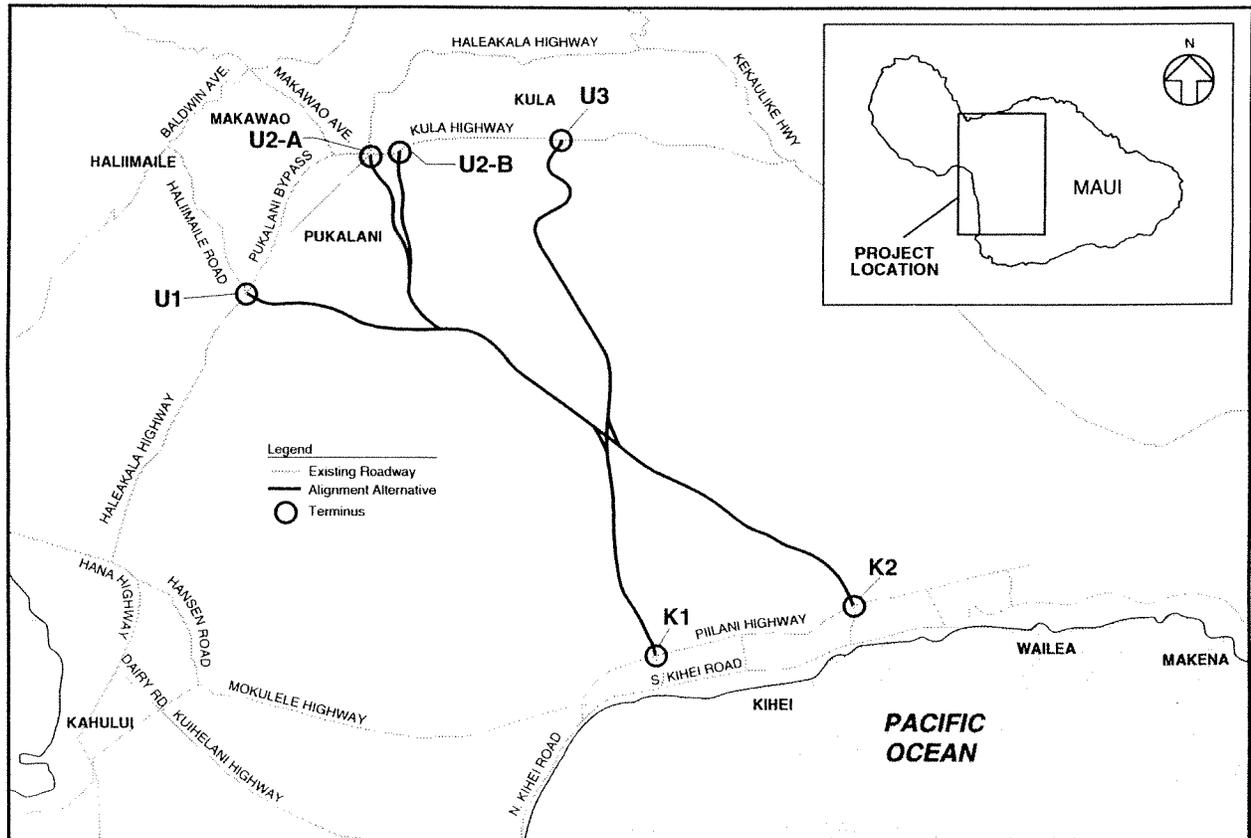

Seven air pollutants have been identified by the U.S. Environmental Protection Agency (EPA) as being of concern nationwide. The pollutants are carbon monoxide, hydrocarbons, nitrogen oxides, ozone, particulate matter, sulfur oxides, and lead.

### 2.1 Carbon Monoxide

Carbon monoxide (CO) is a colorless and odorless gas, which is generated in the urban environment primarily by the incomplete combustion of fossil fuels in motor vehicles. Relatively high concentrations of CO are typically found near crowded intersections and along heavily used roadways carrying slow-moving traffic. CO chemically combines with the hemoglobin in the red blood cells to decrease the oxygen-carrying capacity of blood. Prolonged exposure can cause headaches, drowsiness, or loss of equilibrium.

### 2.2 Hydrocarbons

Hydrocarbons (HC) include a wide variety of organic compounds emitted principally from the storage, handling, and use of fossil fuels. Though HC can cause eye irritation and breathing difficulty, their principal health effects are related to their role in the formation of ozone.

Source: Warren S. Unemori, Engineering, Inc.

Project Location  
 KIHAI-UPPCOUNTRY MAUI HIGHWAY  
 Air Quality Analysis Technical Memorandum  
 FIGURE 1

### 2.3 Nitrogen Oxides

Nitrogen oxides (NOx) constitute a class of compounds that includes nitrogen dioxide (NO<sub>2</sub>) and nitric oxide (NO); both of which are emitted by motor vehicles. Although NO<sub>2</sub> and NO can irritate the eyes and nose and impair the respiratory system, NOx is also of concern primarily because of its role in the formation of ozone.

### 2.4 Ozone

Ozone (O<sub>3</sub>), or photochemical oxidants, is a major cause of lung and eye irritation in an urban environment. It is formed through a series of reactions involving HC and NOx, which take place in the atmosphere in the presence of sunlight. Relatively high concentrations of O<sub>3</sub> are normally found only in the summer.

### 2.5 Particulate Matter

Particulate matter includes both liquid and solid particles of a wide range of sizes and composition. Of particular health concern are those particles that are smaller than or equal to 10 microns (PM<sub>10</sub>) in size. The principal health effects of airborne particulate matter are on the respiratory system. Relatively little particulate matter is emitted by gasoline-fueled motor vehicles. On July 16, 1997, EPA established a new standard for particulates with a diameter smaller than 2.5 microns (PM<sub>2.5</sub>). Medical evidence indicated that these much smaller particles are also of serious concern to human health, since they lodge deeply in the lungs and can cause premature deaths and respiratory problems.

### 2.6 Sulfur Oxides

Sulfur oxides (SOx) constitute a class of compounds of which sulfur dioxide (SO<sub>2</sub>) and sulfur trioxide (SO<sub>3</sub>) are of great importance. The health effects of SOx include respiratory illness, damage to the respiratory tract, and bronchioconstriction. Relatively little SOx is emitted from motor vehicles.

### 2.7 Lead

Lead is a stable element that persists and accumulates both in the environment and in animals. Its principal effects in humans are on the blood-forming, nervous, and renal systems. Historically, motor vehicles constituted the major source of lead emissions to the atmosphere. Lead levels in the urban environment from motor vehicles have significantly decreased due to the federally mandated switch to lead-free gasoline and are, in general, no longer of concern.

On the island of Maui ambient concentrations of carbon monoxide and hydrocarbons (and thus ozone) are predominantly influenced by motor vehicle activity. Emissions of nitrogen oxides come from both mobile and stationary sources, and emissions of particulate matter, sulfur oxides and lead are associated mainly with various stationary sources of emissions.

Pollutants that can be traced principally to motor vehicles are of primary importance in evaluating the potential air quality impacts of the proposed project. Of these pollutants, carbon monoxide is evaluated on a localized or "microscale" basis and hydrocarbons, and nitrogen oxides, as precursors to ozone, are evaluated on a regional or "mesoscale" basis.

## 3. NATIONAL AND STATE AMBIENT AIR QUALITY STANDARDS

As required by the Clean Air Act, National Ambient Air Quality Standards ("NAAQS") have been established for seven major air pollutants: carbon monoxide, nitrogen oxides, ozone, particulate matter smaller than 10 microns (PM-10), particulate matter smaller than 2.5 microns (PM-2.5), sulfur oxides, and lead. The State of Hawaii has also established its own standards for these pollutants.

Both the National and State ambient air quality standards are summarized in Table 1. The "primary" standards have been established to protect the public health. The "secondary" standards are intended to protect the nation's welfare and account for air pollutant effects on soil, water, visibility, materials, vegetation, and other aspects of the general welfare. The State of Hawaii issues its ambient air quality standards in terms of a single standard that is designed "to protect public health and welfare and to prevent the significant deterioration of air quality".

## 4. AIR QUALITY REGULATIONS AND PLANNING

The Clean Air Act Amendments of 1990 (Amendments) direct the EPA to implement strong environmental policies and regulations that will ensure cleaner air quality. These Amendments will affect proposed transportation projects such as the proposed Kihei-Upcountry Maui Highway. According to Title I, Section 101, Paragraph F of the Amendments, "No federal agency may approve, accept or fund any transportation plan, program or project unless such plan, program, or project has been found to conform to any applicable state implementation plan (SIP) in effect under this act." Title I of the Amendments defines conformity as follows:

- Conformity to an implementation plan's purpose of eliminating or reducing the severity and number of violations of the National Ambient Air Quality Standards (NAAQS) and achieving expeditious attainment of such standards; and
- That such activities will not:
  - (i) Cause or contribute to any new violation of any National Ambient Air Quality Standard (NAAQS) in any area;
  - (ii) Increase the frequency or severity of any existing violation of any NAAQS in any area; or
  - (iii) Delay timely attainment of any NAAQS or any required interim emissions reductions or other milestones in any area.

The determination of conformity is to be based on the most recent estimates of pollutant emissions, and such estimates are to be determined from the most recent population, employment, travel and congestion estimates as determined by the responsible metropolitan planning organizations or other agency authorized to make such estimates.

**Table 1  
National and State Ambient Air Quality Standards**

**5. AMBIENT AIR QUALITY IN THE STUDY AREA**

**5.1 Local Meteorology**

The large Pacific semipermanent high pressure cell, which is usually centered north of the Hawaiian Islands, is one of the important climatic controls affecting the circulation of air in the islands. Over the central North Pacific, this cell produces a rather

persistent flow of air from the northeast known as the Northeast Trades. The trade-wind flow are almost constant during the spring and summer months, from May to October. In the fall and winter months, wind is more variable although, on average, the trades persist more than 50 percent of the time during these seasons.

Maui's climate varies according to altitude and leeward/windward location. Lowland areas tend to have a semi-tropical climate, while higher elevations are characterized by temperate climates. Maui is cooled by northeast trade winds approximately 70 percent of the year. Trade winds are affected by local topographic conditions. The northeast trade winds become northerly as they are funneled between the West Maui Mountains and Haleakala, often attaining speed of 65 to 72 km/h (40 to 45 mph) at Kahului Airport. Areas in the "wind shadows" are shielded.

The climate of Upcountry Maui is conducive to farming, being mild with warm days and cool evenings. Pukalani and Kula are relatively dry with rainfall ranging between 50 to 100 cm (20 to 40 inches) annually. The amount of rainfall increases northeastward towards Makawao and Haku to approximately 125 to 250 cm (50 to 100 inches) annually. Temperatures range from around 15 (C) (60s (F)) during the winter to the high 20s (C) (mid 80s (F)) in the summer.

Kihei-Makena is on the south side of the island, in the rain shadow of Haleakala. The region is generally sunny, warm and dry the entire year. Temperatures range from a minimum of 17 degrees (C) (62 degrees (F)) in February to a maximum of 32 degrees (C) (90 degrees (F)) in July. Average annual precipitation is less than 38 cm (15 inches) per year. Most of this precipitation occurs during the winter months when storms are usually accompanied by south winds.

**5.2 Attainment Status of Study Area**

Section 107 of the 1977 Clean Air Act Amendment requires the EPA to publish a list of all geographic areas in compliance with the NAAQS, as well as those not attaining the NAAQS. Areas not in compliance with the NAAQS are termed nonattainment areas. Areas that have insufficient data to make a determination are unclassified, and are treated as being attainment areas until proven otherwise. The designation of an area is made on a pollutant-by-pollutant basis.

The State of Hawaii is designated as an attainment area for all of the applicable pollutants.

**5.3 Monitored Air Quality**

The State of Hawaii Department of Health (HDOH) monitors air pollutant levels in Hawaii are through a network of sampling stations. There are two stations on Maui at Kihei and Paia. The stations were established in mid 1996, and are strategically located downwind of several sugarcane fields as special PM-10 sampling stations for sugarcane burning activities. Currently there are no other pollutants monitored on Maui by HDOH other than PM-10.

Ambient background air quality data for other criteria pollutants on the island of Maui was obtained from the air quality study for the Proposed Kahului Airport Improvements, Kahului, Maui (B.D. Neal & Associates, December 1995). Monitored data cited in the above report was from the Prevention of Significant Deterioration Permit Application for Maalaea Combined Cycle Project, Maui Electric Company (MECO), August 1990.

The pollutant data monitored at the HDOH stations and by MECO are presented in Table 2, and are the best representation of the air quality conditions in the project area. All of the monitored levels are well below the applicable standards.

**Table 2  
Air Quality Summary for Study Area

## 6. IMPACT ASSESSMENT

### 6.1 Pollutants for Analysis

Pollutants that can be traced principally, or in large measure, to motor vehicles are those that are of relevance in evaluating the impacts of the project. These pollutants include CO, HC, NO<sub>x</sub> and O<sub>3</sub>. Transportation sources account for a very small percentage of regional emissions of SO<sub>x</sub> and particulate matter (PM-10), and detailed analyses for these contaminants are not warranted.

Motor vehicles have historically constituted a major source of lead emissions to the atmosphere. As already noted, lead levels have decreased significantly and will continue to do so, due to the mandated decrease and elimination of lead in gasoline. Therefore, a detailed analysis of the impact of lead emissions is also not warranted.

CO impacts are localized. Even under the worst meteorological conditions and most congested traffic conditions, high concentrations are limited to within a relatively short distance (300 to 600 feet) of heavily traveled roadways. Consequently, it is appropriate to predict concentrations of CO on a localized or "microscale" basis.

HC and NO<sub>x</sub> emissions from automotive sources are of concern primarily because of their role as precursors in the formation of ozone. Ozone is formed through a series of reactions that take place in the atmosphere in the presence of sunlight. Since the reactions are slow and occur as the pollutants are diffusing downwind, elevated ozone levels are often found many miles from sources of the precursor pollutants. The effects of HC and NO<sub>x</sub> emissions are therefore generally examined on a regional or "mesoscale" basis.

### 6.2 Mesoscale Analysis

Changes in "pollutant burdens" (i.e. the tons of pollutants emitted in the study area each day or year) provide an indication of the general change in air quality in the region. This analysis is useful in assessing relative changes in the concentrations of CO, HC and NO<sub>x</sub> between the Build and No Build alternatives. These pollutant burdens are computed based on the estimated vehicle miles traveled (VMT), vehicle hours traveled (VHT), average travel speed and vehicle types for all major roadways in the study area.

### 6.3 Microscale Analysis

The analysis of mobile sources, which must be undertaken for a localized (microscale) area, applies mathematical models that simulate physical conditions to predict carbon monoxide (CO) concentrations at specific receptor locations. Mobile source dispersion models are the basic analytical tools used to estimate carbon monoxide concentrations expected under given conditions of traffic, roadway geometry and meteorology. The mathematical expressions and formulations that comprise the various models attempt to describe an extremely complex physical phenomenon. However, because all models contain simplifications and approximations of actual conditions, most results obtained from these dispersion models tend to be conservative.

## 6.4 Methodology

The potential adverse impacts of the Kihei-Upcountry Maui Highway due to increased vehicular activity in the study area must be investigated. Localized areas of concern for CO, such as heavily utilized and/or congested intersections, referred to as potential "hot spots", were analyzed consistent with FHWA and EPA project impact review requirements.

As stated in the EPA Conformity Guidelines, the need for a hot spot analysis is determined as follows:

- A hot spot analysis may be necessary if the project worsens an intersection's traffic level of service (LOS) from C or D.
- A hot spot analysis may be necessary if the intersection LOS is D or worse and the project substantially increases vehicular delay.

After reviewing the traffic data developed for the Kihei-Upcountry Air Quality Analysis, and based on FHWA and EPA project impact review requirements, it was determined that a detailed microscale "hot spot" analysis would not be required to meet federal air quality requirements. However, Hawaii's 1- and 8-hour SAAQS for CO are 4.5 and 9 ppm, respectively, much more restrictive than the NAAQS of 9 and 35 ppm, respectively. Therefore, to insure conformity to both the SAAQS and NAAQS, study intersections were ranked according to build LOS and volumes, and only the following two sites received detailed CO analysis because they represent the termini with the worst predicted traffic conditions:

- Site #1: Haliimaile Road / Haleakala Highway / Kihei-Upcountry Maui Highway intersection - Alternatives U1,K1 and U1,K2; and
- Site #2: Kaonoulu Street / Pilihi Highway / Kihei-Upcountry Maui Highway intersection - Alternative U1,K1

The two sites are worst-case representatives of predictions for all study area intersections under Build conditions, and for that reason an intersection by intersection comparison with estimated No Build levels was not necessary to determine conformity to both the SAAQS and NAAQS.

Microscale air quality modeling was performed using the most recent version of the EPA mobile source emission factor model (MOBILE 5A) and the CAL3QHC version 2 air quality dispersion model to estimate Build CO levels.

### 6.4.1 Vehicular Emissions

Vehicular Emissions were estimated using the EPA Mobile 5A vehicular emission factor model (User's Guide to MOBILE 5A, Mobile Source Emission Factor Model, Publication No. EPA-AA-TEB-92, Ann Arbor, Michigan, March 1993).

The type of vehicles using the facility affects total emissions. The percentages of each type of vehicle used for this analysis were based on the EPA's recommended national average fleet mix.

Emissions estimates account for three possible vehicle operating conditions: cold-vehicle operation, hot-start operation and hot stabilized operation. CO emissions are greatest when engines are cold (cold-vehicle operation) and when engines are restarted shortly after they were shut off (hot-start operation). EPA-recommended vehicular operating conditions were used in this analysis (20.6% cold, 27.3%, hot).

Emissions are also greatly affected by speed, ambient temperature, vehicle age and mileage distribution. Ambient temperature was recommended by EPA, as was the usage of national average vehicle age and mileage distribution. Emission estimates used for this analysis can be found in Appendix B.

### 6.4.2 Dispersion Model

Mobile source models are the basic analytical tools used to estimate CO concentrations expected under given traffic, roadway geometry, and meteorological conditions. The mathematical expressions and formulations that comprise the various models attempt to describe an extremely complex physical phenomenon as closely as possible. The dispersion modeling program used in this study for estimating pollutant concentrations near roadway intersections is the CAL3QHC dispersion model (Version 2.0) developed by the U.S. Environmental Protection Agency. Version 2, released in 1992, allows a more specific determination of the traffic characteristics occurring at a roadway intersection.

CAL3QHC is a Gaussian model recommended in the EPA Guidelines for Modeling Carbon Monoxide from Roadway Intersections (EPA-454/R-92-005). Gaussian models assume that the dispersion of pollutants downwind of a pollution source follow a normal distribution around the center of the pollution source.

Different emission rates occur when vehicles are stopped (idling), accelerating, decelerating and moving at different average speeds. CAL3QHC simplifies these different emission rates into the following tow components:

- Emissions when vehicles are stopped (idling) during the red phase of a signalized intersection.
- Emissions when vehicles are in motion during the green phase of a signalized intersection.

The CAL3QHC version 2 air quality dispersion model has undergone extensive testing by the EPA and has been found to provide reliable estimates of inert (non-reactive) pollutant concentrations resulting from emissions from motor vehicles. A complete description of the model can be found in the User's Guide to CAL3QHC version 2.0: A Modeling Methodology for Predicting Pollutant Concentrations near Roadway Intersections, EPA-454/R-92-006.

Appendix C contains all CAL3QHC version 2 data and output information.

#### 6.4.3 Receptor Locations

CO levels resulting from motor vehicles using the proposed project and associated roadways were estimated near the two sites selected for detailed analysis based on the ranking of termini intersections as outlined above. The sites were modeled using the CAL3QHC version 2 model and receptors were placed in accordance with EPA's *Guidelines for Modeling Carbon Monoxide from Roadway Intersections*, EPA-454/R-92-005.

#### 6.4.4 Meteorological Conditions

The transport and concentration of pollutants emitted from motor vehicles are influenced by three principal meteorological factors: wind direction, wind speed, and the temperature profile of the atmosphere. The values for these parameters were chosen to maximize pollutant concentrations at each prediction site (i.e., to establish a conservative worst case situation).

- Wind Direction.** Maximum CO concentrations are normally found when the wind is assumed to blow approximately parallel to a single roadway adjacent to the receptor location. At complex intersections, however, it is difficult to predict which wind angle will result in maximum concentrations. At each receptor location, therefore, the approximate wind angle that would result in maximum pollutant concentrations was used in the analysis. All wind angles from 0° to 360° (in 5° increments) were considered.
- Wind Speed.** CO concentrations are greatest at low wind speeds. A conservative wind speed of 4 meters per second (8.8 miles per hour) was used to predict CO concentrations during peak traffic periods. This wind speed is the lowest average monthly wind speed recorded at the Kahului Airport in Local Climatological Data Annual Summary for 1980.
- Temperature and Profile of the Atmosphere.** An ambient temperature of 76.1°F, a "mixing" height (the height in the atmosphere to which pollutants will rise) of 1000 meters, and "D" or neutral atmospheric stability conditions were used in estimating mesoscale CO concentrations. The selection of these meteorological parameters was based on recommendations from the Hawaii Department of Transportation and the EPA. This data was found to be the most representative of the conditions existing along the project area.

The estimated CO levels will be the maximum concentrations which could be expected to occur at each air quality receptor site analyzed because they result from assuming the simultaneous occurrence of all worst case parameters (peak hour traffic conditions, conservative vehicular operating conditions, low wind speeds, low atmospheric temperature, neutral atmospheric conditions, and the maximizing wind direction).

#### 6.4.5 Persistence Factor

Peak 8-hour concentrations of CO were obtained by multiplying the highest peak hour CO estimates by 0.7. This factor, recommended by USEPA, takes account of the fact

that over eight hours (as distinct from a single hour) vehicle volumes will fluctuate downwards from the peak, vehicle speeds may vary, and meteorological conditions including wind speeds and wind direction will change to some degree as compared to the very conservative assumptions used for the single hour.

#### 6.4.6 Analysis Years

Microscale carbon monoxide analyses have been performed using traffic for the project's design year of 2022.

#### 6.4.7 Background Concentrations

Microscale modeling is used to predict CO concentrations resulting from emissions from motor vehicles using roadways immediately adjacent to the location at which predictions are being made. A CO "background" level must be added to this value to account for CO entering the area from other sources upwind of the location at which predictions are being made.

A background level of 0.012 ppm was used for both the one- and eight-hour study periods. This level was based on 1989 ambient CO background monitored data used in the PSD Permit Application for Maalaea Combined Cycle Project, Maui Electric Company (MECO), August 1990.

#### 6.4.8 Traffic Information

Traffic data for the air quality analysis was derived from a traffic inventory provided by the State DOT and traffic developed for the air quality analysis. The microscale carbon monoxide analysis was performed based on data from this network for the AM and PM peak traffic periods. These are the periods when maximum traffic volumes are expected to occur, and when the greatest traffic and air quality impacts of the proposed project are expected.

Appendix D contains all traffic information used for the air quality analysis.

## 7. POTENTIAL IMPACTS

### 7.1 Mesoscale Impacts

Since the change in regional VMT levels is predicted to be smaller under the Build condition than under the No Build condition, no quantified regional air quality analysis was conducted. In addition, a mesoscale analysis is not required as the Kihai-Upcountry Maui Highway is included in the current State of Hawaii Statewide Transportation Improvement Program (STIP), 1997, for Fiscal Years 1998-2000, and the regional affects of this project are incorporated into and satisfied the requirements of the conforming SIP.

**7.2 Microscale Impacts**

Maximum 1-hour and 8-hour carbon monoxide levels were predicted at sensitive receptor sites within the proposed Kihei-Upcountry's study area. The results of this analysis are given in Tables 3 and 4.

The levels predicted in this analysis are expected to be the highest microscale impacts due to the project within the study area. The three study intersections are worst-case representatives of predictions for all study intersections under Build conditions. No violations of the Federal or State one or eight hour CO standards are predicted.

As the project is not predicted to cause or exacerbate a violation of the applicable air quality standards, it conforms to the goals set forth in the Clean Air Act Amendments.

**Table 3  
Predicted Worst-Case 1-Hour Carbon Monoxide Concentrations (ppm)\***

Site	Description	Alter.	State Std.	Build (Year 2022)	
				AM	PM
1	Haleakala Road / Haleakala Highway Intersection	U1,K1	9	0.81	0.71
1	Haleakala Road / Haleakala Highway Intersection	U1,K2	9	0.91	0.61
2	Kaonolu Street / Pihani Highway Intersection	U1,K1	9	0.81	0.81

Note: \* 1-hour CO Background = .012 ppm

**Table 4  
Predicted Worst-Case 8-Hour Carbon Monoxide Concentrations (ppm)\***

Site	Description	Alternative	State Standard	Build (Year 2022)
1	Haleakala Road / Haleakala Highway Intersection	U1,K1	4.5	0.07
1	Haleakala Road / Haleakala Highway Intersection	U1,K2	4.5	0.08
2	Kaonolu Street / Pihani Highway Intersection	U1,K1	4.5	0.07

Note: \* 8-hour CO Background = .012 ppm

**8. CONFORMANCE WITH THE STATE IMPLEMENTATION PLAN (SIP) FOR AIR QUALITY**

The State of Hawaii has been classified as an attainment area for ozone, PM<sub>10</sub> and carbon monoxide. As an attainment area, the State must demonstrate that the National Ambient Air Quality Standards will continue to be observed. The microscale analysis for the Kihei-Upcountry Maui Highway demonstrates that no violations of the National Ambient Air Quality Standards are predicted. The goals set forth in the New Clean Air Act Amendments of 1990 are to insure that no violations of these standards are created or worsened. The project meets these goals and as such will not affect the State of Hawaii's current attainment status.

The Kihei-Upcountry Maui Highway project has been included in the current STIP, 1997, for Fiscal Years 1998-2000. As described earlier, the STIP is a multi-year, multi-modal transportation improvement program that has been developed using existing transportation plans and policies, and current highway, transit, and transportation programming processes as required under the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA).

**9. CONSTRUCTION IMPACTS**

The air quality impacts of the proposed action would be limited to short-term increased fugitive dust and mobile source emissions during construction.

**9.1 Fugitive Dust Emissions**

Fugitive dust is airborne particulate matter, generally of a relatively large particulate size. Construction-related fugitive dust would be generated by haul trucks, concrete trucks, delivery trucks, and other earth moving vehicles operating around the construction sites. This would be due primarily to particulate matter resuspended ("kicked up") by vehicle movement over paved and unpaved roads and other surfaces, dirt tracked onto paved surfaces from unpaved areas at access points, and material blown from uncovered haul trucks.

Generally, the distance that particles drift from their source depends on their size, emission height, and wind speed. Small particles (30 to 100 micron range) can travel several hundred feet before settling to the ground, depending on wind speed. Most fugitive dust, however, is made up of relatively large particles (i.e., particles greater than 100 microns in diameter). These particles are responsible for the reduced visibility often associated with this type of construction. Given their relatively large size, these particles tend to settle within 20 to 30 feet of their source.

In order to minimize the amount of construction dust generated, the guidelines below should be followed. Since the project is in a PM<sub>10</sub> non-attainment area, all the proposed particulate control measures related to construction activities should be

followed. The following preventative and mitigative measures should be taken to minimize the possible particulate pollution problem:

- I. Site Preparation
  - A. Minimize land disturbance;
  - B. Use watering trucks to minimize dust;
  - C. Cover trucks when hauling dirt;
  - D. Stabilize the surface of dirt piles if not removed immediately;
  - E. Use windbreaks to prevent any accidental dust pollution;
  - F. Limit vehicular paths and stabilize these temporary roads; and
  - G. Pave all unpaved construction roads and parking areas to road grade for a length no less than 50 feet where such roads and parking areas exit the construction site to prevent dirt from washing onto paved roadways.
- II. Construction
  - A. Cover trucks when transferring materials;
  - B. Use dust suppressants on traveled paths which are not paved;
  - C. Minimize unnecessary vehicular and machinery activities; and
  - D. Minimize dirt track-out by washing or cleaning trucks before leaving the construction site (alternative to this strategy is to pave a few hundred feet of the exit road, just before entering the public road).
- III. Post Construction
  - A. Revegetate any disturbed land not used;
  - B. Remove unused material;
  - C. Remove dirt piles; and
  - D. Revegetate all vehicular paths created during construction to avoid future off-road vehicular activities.

**9.2 Mobile Source Emissions**

As discussed previously, carbon monoxide (CO) is the principal pollutant of concern when considering localized air quality impacts of motor vehicles. Since emissions of CO from motor vehicles increase with decreasing vehicle speed, disruption of traffic during construction could result in short-term elevated concentrations of CO, the temporary reduction of roadway capacity, and the increased queue lengths. In order to minimize the amount of emissions generated, every effort should be made during the construction phase to limit disruption to traffic, especially during peak travel periods.

	24-hour	5	13	4	4
	Annual	1	3	4	4
Nitrogen Dioxide	Annual	3	6	9	6
Ozone	1-hour	44	86	86	37
	Annual	16	31	-	-
Carbon Monoxide	1-hour	12	14	<1	<1
	8-hour	5	6	<1	<1
Particulate Matter	24-hour	-	56	37	37
	Annual	-	14	28	28

Notes:

- The data given in the table were obtained by Maui Electric Company at Site No. 233 located approximately 1 mile north of Maalaea Power Plant. Concentrations shown in the table for averaging times shorter than annual are the highest concentrations recorded during the period June 10, 1989 through December 31, 1989. Annual average concentrations for all pollutants are based on the 7-month period.
- Concentrations shown in the table for averaging times shorter than annual do not include periods when the on-shore flow (southerly flow between 130 and 230 degrees) persists, as this would include the Maalaea Generating Station emissions.

## 1. INTRODUCTION

This report documents an analysis of potential traffic noise impacts of the proposed Kihei-Upcountry Maui Highway project on the island of Maui, Hawaii. This study was prepared in accordance with Federal Highway Administration (FHWA) rules and procedures and the State of Hawaii Department of Transportation (SDOT) Noise Analysis and Abatement Policy (October 1996, approved by FHWA on June 26, 1997) (hereinafter referred to as Noise Policy). Its elements include:

1. Measurements of existing noise levels at representative noise sensitive receptors;
2. Prediction of future traffic noise levels;
3. Comparison of existing and predicted future traffic noise levels with the FHWA Noise Abatement Criteria (NAC);
4. Recommendations to reduce noise impacts;
5. Evaluation of possible noise barriers; and
6. The effects of construction noise and proposed mitigation measures.

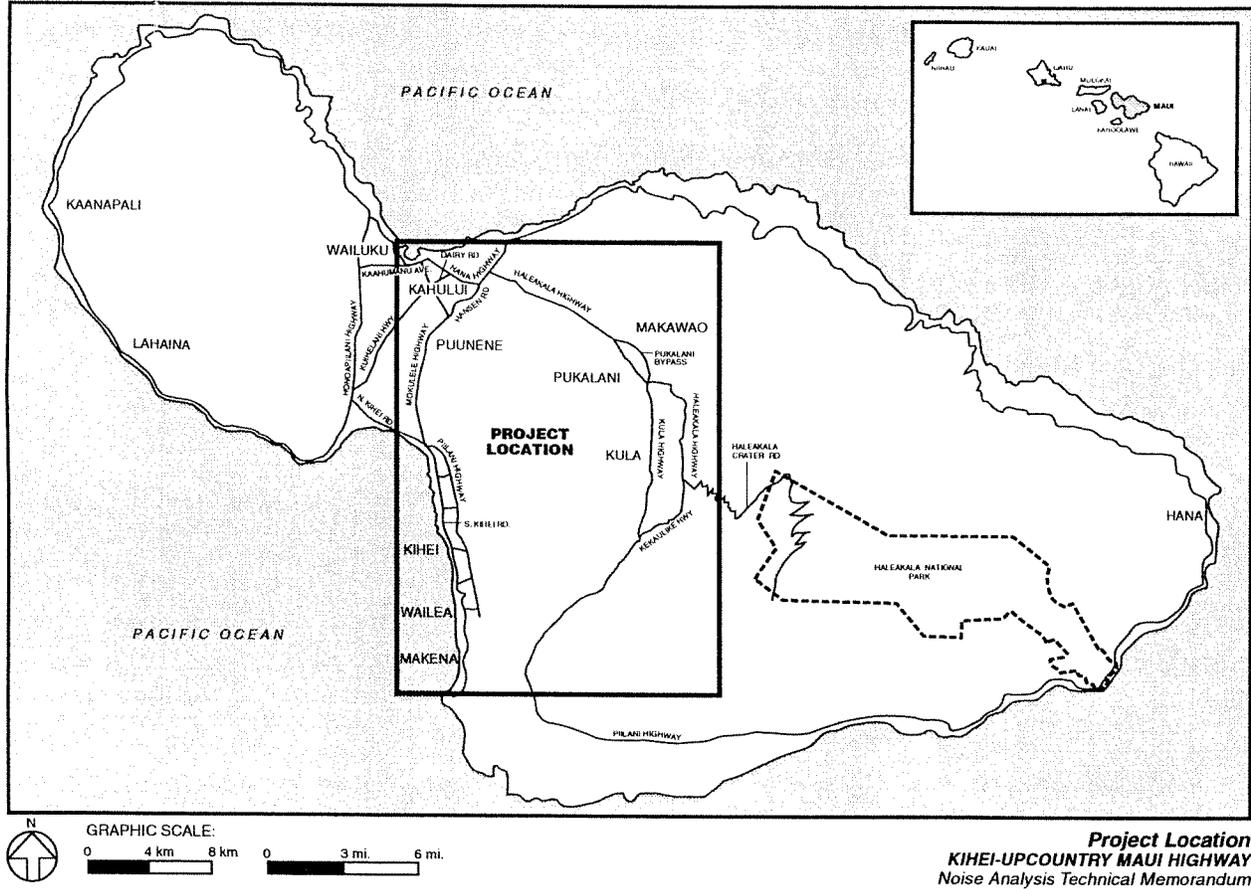

## 2. PROJECT DESCRIPTION

The Highways Division of the State of Hawaii Department of Transportation (SDOT) and the Federal Highway Administration (FHWA) are proposing the Kihei-Upcountry Maui Highway project on the island of Maui, Hawaii. Figure 1 shows the general project location. The proposed highway would connect Piilani Highway with either Haleakala Highway or Kula Highway, directly linking the Kihei-Makena region with the Upcountry Maui region.

The alternatives under consideration are eight possible combinations of two Kihei terminus options and four Upcountry terminus options. Figure 2 shows the candidate Upcountry and Kihei termini and the alignment segments or "footprints" that would be used to link the termini. As shown on this figure, the Kihei termini and segments are named K1 and K2, and the Upcountry termini and segments are named U1, U2-A, U2-B and U3.

Descriptions of the alternatives are as follows:

1. Alternative U1,K1. This alternative would extend from the Haleakala Highway/Haliimaile Road intersection in Upcountry, following a south to southwest alignment for approximately 10 km (6.25 miles), and then a western alignment to the Kaonoulu Street/Piilani Highway intersection.
2. Alternative U1,K2. This alternative is the same as Alternative U1,K1 from the Upcountry terminus. However, instead of terminating at the Kaonoulu

**Project Location**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Noise Analysis Technical Memorandum  
 FIGURE 1

Street/Piilani Highway intersection, this alternative would proceed in a southwest direction to the Ke Alii Alanui Street/Piilani Highway intersection.

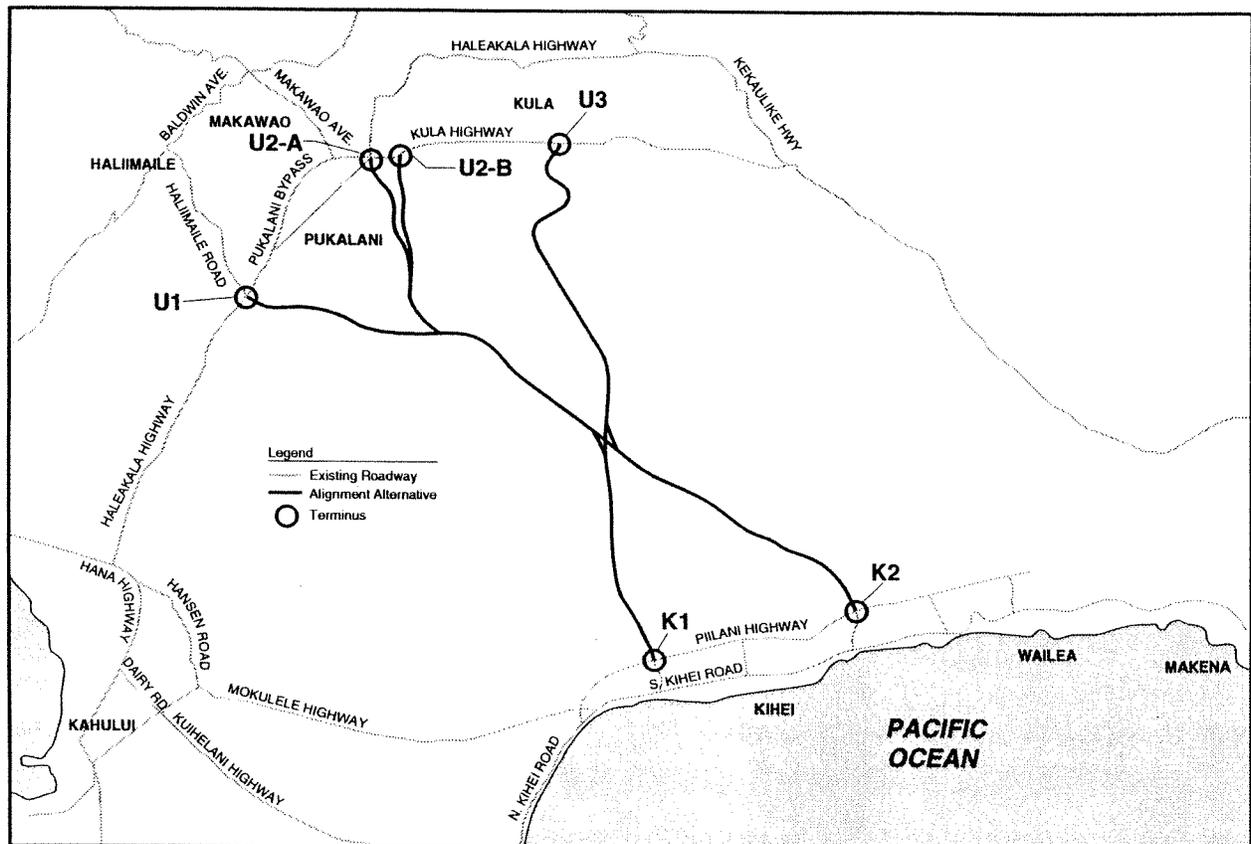

3. Alternative U2-A,K1. This alternative would extend west from the existing Pukalani Bypass/Haleakala Highway/Kula Highway "Five Trees" intersection in Upcountry, to an alignment common with U1. The Kihei terminus would be at the Kaonoulu Street/Piilani Highway intersection.
4. Alternative U2-A,K2. This alternative would be from the "Five Trees" intersection to the Ke Alii Alanui Street/Piilani Highway intersection.
5. Alternative U2-B,K1. This alternative would extend west from Kula Highway at approximately 700 m (2300 ft) south of the "Five Trees" intersection. The alignment runs parallel with Segment U2-A for about 3000 m (10,000 ft), and then shares the same U2-A alignment and U1/U2 alignment. The U2-B,K1 alternative's Kihei terminus is at the Piilani Highway/Kaonoulu Street intersection.
6. Alternative U2-B,K2. This alternative is shares the same Upcountry terminus and alignment as the Alternative U2-B,K-1. This alternative's Kihei terminus is at the Piilani Highway/Ke Alii Alanui Street intersection.
7. Alternative U3,K1. This alternative would extend west from Kula Highway, south of Pulehu Gulch in Kula, to the Piilani Highway/Kaonoulu Street intersection in Kihei.
8. Alternative U3,K2. This alternative would extend west from Kula Highway, south of Pulehu Gulch in Kula, to the Ke Alii Alanui Street/Piilani Highway intersection.

The roadway right-of-way would be a minimum 49 m (160 ft) in rural areas and a minimum 37 m (120 ft) in urban areas. The roadway would include one 3.7 m (12 ft) lane in each direction, and paved shoulders. The minimum 49 m (160 ft) right-of-way is being reserved because the highway may be expanded to four lanes (two lanes in each direction) in the future.

### 3. EXISTING CONDITIONS

#### 3.1 Background

Noise is defined as any sound that is undesirable or interferes with normal human activities. The decibel (dB) scale is used to quantify sound intensity and represents the ratio between a given sound and the faintest sound detectable by human hearing. Because sound pressure levels vary widely within the range of human hearing, the dB scale is logarithmic. The human ear is not equally sensitive to all frequencies within the entire sound spectrum. Accordingly, noise measurements are made using an A-weighting (dBA) scale to correspond to human perceptions of noise. A-scale sound levels are currently in use in many community and city noise ordinances and in state and city highway or traffic noise codes.

GRAPHIC SCALE:

**Alternatives**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Noise Analysis Technical Memorandum  
 FIGURE 2

Time variation in noise exposure is typically accounted for as a constant energy level equivalent ( $L_{eq}$ ) for a given time period. The  $L_{eq}$  is the constant noise level over some specified period of time that is equivalent in energy to a fluctuating (or brief) noise "averaged" over that period of time.  $L_{eq}$  is also a function of time and is expressed as  $L_{eq}$  (time period). For example,  $L_{eq}(h)$ , expressed in A-weighted decibels (dBA), is the calculated constant noise over one hour which is equivalent in total energy to the varying noise levels actually measured during that one hour.

**3.2 Noise Standards**

The SDOT Noise Policy implements FHWA regulations on noise abatement (23 CFR 772) for the State of Hawaii. The regulations and policy require that a noise analysis be performed whenever potentially affected receptors exist, either as developed lands or lands that are planned, designed or programmed for future use.

The FHWA has established Noise Abatement Criteria (NAC), shown on Table 1, for different exterior and interior land use activities. The NAC do not constitute legally enforceable noise standards, but represent a yardstick for evaluating the effect of project noise on the surrounding community. The NAC have been adopted by the State of Hawaii as its standard.

Under SDOT policy, a noise impact occurs when the predicted traffic noise levels approach or exceed the NAC, or when the predicted traffic noise levels substantially exceed the existing noise levels. "Approach" means at least 1 dBA less than the NAC, and "substantially exceed the existing noise levels" means an increase of at least 15 dBA. If the NAC are approached or exceeded, or if there is a substantial increase above the existing noise level, noise abatement measures must be considered.

Changes in traffic noise are assessed using human perceptions of sound level changes. Generally, changes in noise levels of less than 3 dBA are barely perceptible to most listeners, but a 10 dBA change is perceived as a doubling (or halving) of noise levels. These guidelines permit estimation of an individual's probable perception of changes in noise levels.

**3.3 Noise Sensitive Sites and Existing Noise Levels**

Existing and future planned noise sensitive land uses, and activities adjacent to the project alternatives were identified from site inspections and existing mapping. These land use activities include residences, recreation and park areas, and institutions such as schools. A total of thirteen sites were selected as representative of existing and future noise sensitive land uses, and their locations area shown on Figure 3. Only Site 4 does not represent a noise sensitive land use. The area surrounding Site 4 is presently used for sugarcane cultivation, and there are no official plans to convert this area to an urban land use. Therefore, this site is considered Activity Category D (see Table 1) and has no NAC. This site was selected because this is the location of the U1 terminus. The other 12 sites are considered Activity Category B (see Table 1), and have a NAC of  $L_{eq}(h)$  67 dBA.

**Table 1  
Noise Abatement Criteria (NAC)**

Activity Category	$L_{eq}(h)$ for Noisiest Traffic Hour - dBA	Description of Activity
A	57 (Exterior)	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B	67 (Exterior)	Picnic areas, recreation areas, playgrounds, active sports areas, parks, residences, motels, hotels, schools, churches, libraries, and hospitals.
C	72 (Exterior)	Developed lands, properties, or activities not included in Categories A or B.
D	----	Undeveloped lands
E	52 (Interior)	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums.

Notes:  $L_{eq}(h)$  is the one-hour energy equivalent sound level.

Interior noise level standards apply to:

1. Indoor activities for those parcels where no exterior noise sensitive land use or activities have been identified; and
2. Situations where the exterior activities are either remote from the highway or shielded, so that while the exterior activities remain undisturbed, noise nevertheless affects interior activities.

Source: Federal Highway Administration

Noise measurements at the noise receptor sites were taken in June, 1997, from between the hours of 9:00 a.m. to 5:00 p.m. Only Site 1, which is located in a residential community east (mauka) of Pihani Highway near the K1 alignment, was not measured between these hours. This site is approximately 600 m (2000 ft) from the K1 alignment, and under normal circumstances would probably not have been selected as noise receptor site because of this far distance. It was selected because of comments, from people living in that community, that noise impacts would occur from early morning transports (buses, vans, cars) to the Haleakala Summit. Many tourists staying in West Maui and Kihei-Makena travel to the summit daily to watch its

spectacular sunrise. Noise measurements at this site were taken 5:00 a.m. All noise measurements were sampled for 20-minute periods, and the results are presented in Table 2.

Existing noise levels at the 13 noise receptor sites range from 39 dBA to 68 dBA. The only site that approaches the NAC of  $L_{eq}(h)$  67 dBA is Site 7. The high noise level at this site, and the noise levels at many of the other sites, are primarily caused by traffic movements on nearby roadways.

**Table 2  
Existing Noise Levels**

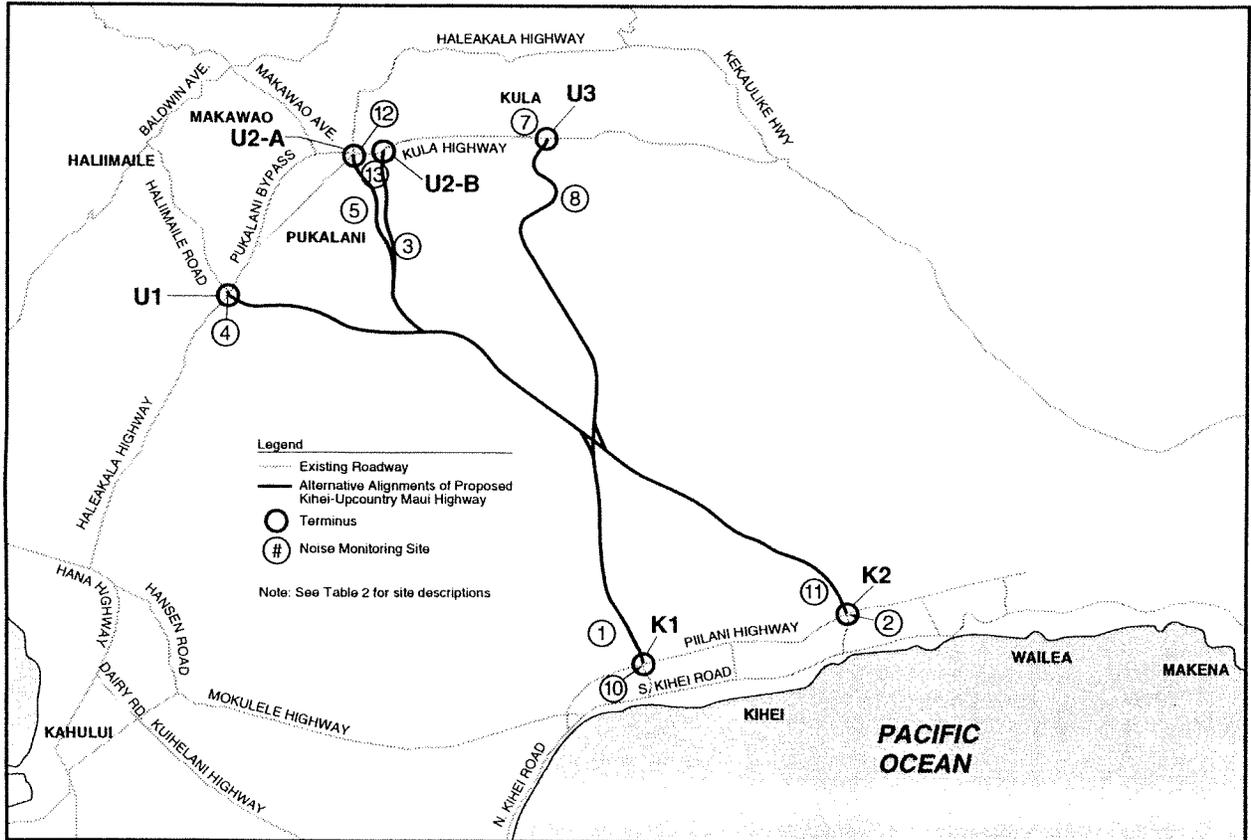

Site No.	Location	Land Use Activity	Noise Level ( $L_{eq}$ (dBA))
1	Ohukai community (Ohukai St.)	Residential	39
2	Kamalu Elementary School	School	58
3	Omaopio Homesteads	Residential	53
4	Haleakala Hwy. / Halimale Rd. Intersection	Agriculture	68
5	Pukalani community (Aliani St.)	Residential	57
6	Kula 200 community	Residential	51
7	Kula residence along Kula Hwy.	Residential	66
8	Pulehu community (Holopuni Rd.)	Residential	47
9	Future Kamehameha School	School	53
10	Pilani Hwy. / Kaonoulu St. Intersection	Residential	60
11	Future Kihei Regional Park	Park	45
12	King Kekaulike High School	School	49
13	Unnamed Road off of Kula Hwy. near Five Trees Intersection	Residential	49

## 4. FUTURE TRAFFIC NOISE IMPACTS

### 4.1 Prediction Methodology

The future year Build traffic noise levels were modeled at thirteen noise sensitive sites along the proposed project alternative alignments using the STAMINA 2.0 Highway Traffic Noise Modeling Program (FHWA, 1982). Impacts were calculated for the Year 2020.

**Noise Monitoring Sites  
KIHEI-UPCOUNTRY MAUI HIGHWAY**  
Noise Analysis Technical Memorandum  
FIGURE 3

Input variables to noise modeling and analysis include traffic volumes, speeds and vehicle fleet mix (auto, medium truck, and heavy truck percentages). The noise analysis considers the following traffic scenarios:

- Two-lane facility - sunrise hours (5:00 a.m. to 6:00 a.m.);
- Two-lane facility - peak hour;
- Two-lane facility - roadway operating at level of service (LOS) C; and
- Four-lane facility - roadway operating at LOS C.

LOS C is a qualitative traffic condition, on a scale from A to F, where traffic volume is at the capacity of the roadway and vehicles operate at the allowable speed limit. This is considered to be the noisiest of the six level of service conditions. The analysis assumes that existing and future traffic conditions have the same vehicle mix and vehicle speeds. The traffic modeling assumptions are presented in Appendix A.

**4.2 Noise Impact Analysis**

In terms of the one-hour  $L_{eq}(h)$  noise descriptor, noise impact could potentially require mitigation if either of the following conditions is predicted to occur:

- future year traffic noise approaches or exceeds the FHWA NAC, or
- future year traffic noise substantially exceeds (15 dBA or more) the existing ambient noise level.

Table 3 summarizes the results of the noise modeling at the thirteen receptor sites.

**4.2.1 No-Build Alternative**

Under the No-Build alternative, predicted future traffic noise levels are expected to be no more than a 1 dBA over the existing noise levels. The NAC of  $L_{eq}(h)$  67 dBA is predicted to be approached at Site 7 (see Table 3). All other sites are predicted to remain below the NAC.

**4.2.2 Build Alternatives**

This section describes the noise impacts of Kihei-Upcountry Maui Highway under the four traffic scenarios described in Section 4.1. The predicted Build noise levels presented in Table 3 were modeled under certain alignments (e.g. U1, U2-A, K2, etc.). The "Segment" column in Table 3 specifies the alignment. The discussion in this section describes the noise impacts from a particular alignment, which in effect, applies to two or four alternatives. For example, if a statement is made, "a U1 alternative is predicted to cause a X dBA increase at Site Y," then the impact would come from Alternatives U1, K1 and U1, K2.

**Two-Lane Facility - Sunrise Hours**

The predicted sunrise noise levels, presented in Table 3, represent the effects of traffic using the proposed highway and other roadways during the early morning hours. As described in Section 3.3, much of the early morning travel demand is caused by

**Table 3  
Predicted Year 2020 Noise Levels**

Site	Location	Segment	Noise Levels ( $L_{eq}(h)$ ) (dBA)					
			Existing	No-Build	Build Condition			
					Sunrise	Peak Hour	LOS C 2 Lanes	LOS C 4 Lanes
1	Ohukai community (Ohukai St.)	K1	39	40	42	46	48	55
2	Kamalu Elementary School	K2	58	59	46	60	61	63
3	Omaopio Homesteads	U2-A	53	54	52	59	63	66
		U2-B	53	54	52	59	63	66
4	Haleakala Hwy. / Haliimalile Rd. Intersection	U1	68	69	49	69*	69*	69*
5	Pukalani community (Alani St.)	U2-A	57	58	48	56	59	62
		U2-B	57	58	45	58	60	62
6	Kula 200 community	U2-B	51	52	48	55	59	61
7	Kula residence along Kula Hwy.	U3	66	67	33	67*	67*	67*
8	Pulehu community (Holopuni Rd.)	U3	47	48	50	56	57	60
9	Future Kamhehameha School	U2-B	53	54	42	54	56	58
10	Piilani Hwy. / Kaonoulu St. Intersection	K1	60	61	52	62	63	70
11	Future Kihei Regional Park	K2	45	46	55	63	70	70
12	King Kekaulike High School	U2-A	49	50	40	51	53	55
		U2-B	49	50	38	50	52	53
13	Unnamed Road off of Haleakala Hwy. near Five Trees Intersection	U2-A	49	50	46	56	60	63
		U2-B	49	50	44	52	58	58

Notes: (XX)- Values that are underlined approach or exceed the Noise Abatement Criteria.

\* The predicted future traffic at Sites 4 and 7 results in noise levels that are lower than the predicted future No-Build noise levels. Therefore, future noise levels at these sites are assumed to be the same as the future No-Build levels.

Source: Parsons Brinckerhoff, 1997

tourists traveling to the Haleakala summit to watch its spectacular sunrise. However, these predicted noise levels do not include the cumulative effects of ambient early morning noise from other activities. Only Site 1 includes the effects of ambient early morning noise because measurements at this site were taken at 5:00 a.m. (see Section 3.3). The results in Table 3 indicate that the effects of early morning traffic would not cause future noise levels at the receptor sites to approach or exceed the NAC, including the effects of the K1 alternatives' traffic noise on Site 1. Site 1's sunrise noise levels are predicted to increase by 3 dBA over the existing ambient levels, which is considerably lower than the "substantial increase" definition of the SDOT Noise Policy. A 3 dBA increase is barely perceptible to the human ear.

#### Two-Lane Facility - Peak Hour

Under a two-lane Kihai-Upcountry Maui Highway, peak hour traffic noise levels at 12 of the 13 receptor sites are predicted to increase in the range of 1 dBA to 9 dBA over their existing ambient noise levels (see Table 3). If a K2 alternative is implemented, Site 11 peak hour noise levels are predicted to increase by 18 dBA over its existing ambient level. This is considered "substantial" according to the SDOT Noise Policy. If a U3 alternative is implemented, Site 7 is predicted to have peak hour noise levels ( $L_{eq}(h)$ ) 67 dBA that approach the NAC. However, this predicted  $L_{eq}(h)$  is slightly lower, but assumed to be the same, as the predicted  $L_{eq}(h)$  under the No-Build alternative. Therefore, there is no noise impact at this site. No other site is predicted to approach or exceed the NAC, including Site 4, which is predicted to have a peak hour  $L_{eq}(h)$  of 69, because this site is considered an Activity Category D (see Section 3.3).

#### Two-Lane Facility - LOS C

Under a two-lane Kihai-Upcountry Maui Highway, LOS C noise levels at 12 of the 13 receptor sites are predicted to increase in the range of 1 dBA to 11 dBA over their existing ambient noise levels (see Table 3). Similar to the noise impacts under peak hour conditions (see above), Site 11 is predicted to have a "substantial increase" of 25 dBA, 7 dBA higher than under the peak hour condition, if a K2 alternative is implemented. The predicted  $L_{eq}(h)$  of 70 dBA exceeds the NAC. Site 7 is also predicted to approach the NAC, with an  $L_{eq}(h)$  of 67 dBA, if a U3 alternative is implemented. However, similar to the assessment above, there would be no noise impact because the No-Build  $L_{eq}(h)$  is slightly higher than the LOS C  $L_{eq}(h)$ . No other site is predicted to approach or exceed the NAC.

#### Four-Lane Facility - LOS C

Under a four-lane Kihai-Upcountry Maui Highway, LOS C noise levels at 11 of the 13 receptor sites are predicted to increase in the range of 1 dBA to 14 dBA over their existing ambient noise levels (see Table 3). Similar to the two-lane facility (peak hour and LOS C) conditions, Site 11 is predicted to have a "substantial increase" of 25 dBA and will exceed the NAC. Under this traffic scenario, Site 3 is predicted to have an  $L_{eq}(h)$  of 66 dBA, Site 7 is predicted to have an  $L_{eq}(h)$  of 67 dBA, and Site 10 is predicted to have an  $L_{eq}(h)$  of 70 dBA, if a U2 (A or B), U3 or K1 alternative is implemented, respectively. These noise levels either approach or exceed the NAC. However, only Sites 3 and 10 are considered to have noise impacts under the four-lane facility - LOS C traffic scenario. Site 7 would not have a noise impact (see above).

## 5. CONSTRUCTION NOISE IMPACTS

Construction noise represents a short term impact on the noise environment. The duration and level of construction noise depend on the phase of activity, such as:

- ground clearing, demolition and removal of existing structures, trees, rocks and soil;
- excavation;
- placement of foundations and roadbeds;
- erection of structures including retaining walls; and
- finishing, including filling, grading, paving, landscaping and cleanup operations.

The first two phases, ground clearing and excavation, typically generate the highest noise levels. Noise generated by construction equipment, including trucks, graders, bulldozers, concrete mixers and portable generators can reach levels from 67 dBA to 98 dBA at 15 m (50 ft). Construction equipment noise emissions are regulated by the Environmental Protection Agency's Noise Control Program (Part 204 of Title 40, Code of Federal Regulations). Presently, air compressors are the only equipment under regulation, and no new regulations are currently under consideration. The State of Hawaii, Department of Health also regulates noise from construction activities (Hawaii Administrative Rule, Chapter 11-46, Community Noise Control).

Noise levels for equipment which might be used during the excavation and construction of the proposed project are presented in Table 6. The noise levels presented are at a reference distance of 15 m (50 ft). Since construction equipment noise levels decrease at a rate of approximately 6 dBA per doubling of distance, at 30 m (100 ft) the noise levels would be about 6 dBA less than the levels shown at 15 m (50 ft). Similarly, at 60 m (200 ft) the noise levels would be 12 dBA less than shown. Intervening structures or topography can act as a noise barrier to further reduce noise levels.

**Table 4**  
**Construction Equipment Noise Levels**

Source	L <sub>max</sub> at 15 m (50 feet)	Model Tested
Backhoe	85 dBA	John Deere 609A
Front Loader	84 dBA	Caterpillar 980
Dozer	84 dBA	Caterpillar D7e
Grader	91 dBA	Caterpillar 16
Scraper	92 dBA	Caterpillar 660
Compressor	80-89 dBA	Various Tested
Pile Driver	95-100 dBA	Various Tested

## 6. MITIGATION MEASURES

### 6.1 Future Traffic Noise

Noise abatement measures must be considered as part of the project if traffic noise impacts are identified. An impact occurs when traffic noise levels approach or exceed the NAC or if traffic noise levels substantially exceed (15 dBA or more) the existing ambient levels. The SDOT Noise Policy is used to determine whether noise abatement measures can be implemented, depending on whether these measures are reasonable and feasible based on the following criteria:

- Provides a minimum noise reduction of 5 dBA.
- Cost of noise abatement is not to exceed \$35,000 per residence benefited. The number of residences protected will include all dwelling units - owner occupied houses, rental units, mobile homes, etc. All units benefited by a 5 dBA or more noise reduction will be counted regardless of whether or not they were identified as impacted.
- Views from impacted residences are a major consideration in the reasonableness of noise abatement measures.
- Greater considerations to residential areas where absolute traffic noise levels are expected to occur, e.g., greater than 70 dBA, or where large increases over existing noise levels are anticipated.
- Greater consideration to residential areas along highways in a new location, residential areas constructed before an existing highway, residential areas in place along an existing highway for an extended period of time.
- Consideration of adverse environmental effects and beneficial reduction of construction noise.

Noise abatement would only be considered at existing residential or planned development sites where building permit approvals have been obtained. The abatement would only apply to outdoor ground level areas.

According to Section 4.2.2, noise impacts are predicted to occur at Site 11 under three of the four traffic scenarios (two-lane facility - peak hour, two-lane facility - LOS C, and four-lane facility - LOS C), and at Sites 3 and 10 under the four-lane facility - LOS C traffic scenario.

At Site 11, a noise barrier does not appear to be a reasonable abatement measure because this site represents a future regional park and the barrier would have adverse visual affects and would not be appropriate in a park setting. An abatement measure that appears to be reasonable and feasible is buffer zones between the roadway right-of-way and areas of the park where human activities would occur.

Noise impacts at Sites 3 and 10 could be mitigated with a 3 to 3.8 meter (10 to 12 foot) noise barrier walls or earthen berms at the roadway right-of-way. For Site 3, the wall or berm would be located along Kihei-Upcountry Maui Highway (U2-A or U2-B alternatives). For Site 10, the wall or berm would be located along Pihani Highway. If a noise barrier wall or berm is considered, the height, length and location of the barrier would be determined during preliminary engineering design.

### 6.2 Construction Phase

Noise control measures during construction would be required to minimize impacts on existing noise sensitive land uses. The measures recommended in this section should be re-evaluated in greater detail during preliminary design because impacts to residences cannot be accurately determined without detailed construction plans and schedules. General mitigation measures presented below are recommended as guidelines in developing construction plans that consider the adverse impacts of construction noise.

1. Design Considerations - During the early stages of construction plan development, natural and artificial barriers, such as ground elevation changes and existing buildings, can be considered for use as shielding against construction noise. Strategic placement of stationary equipment, such as compressors and generators, could reduce impacts at the sensitive receptors.
2. Construction of Noise Barriers During Initial Stages - Noise barriers planned to ultimately be constructed along the right-of-way for traffic noise abatement could be constructed during the initial stages to reduce the impacts of construction. Initial construction of noise barriers would significantly reduce construction noise impacts at the sensitive receptors.
3. Alternate Construction Methods - Certain phases of highway construction work such as pile driving may produce noise levels in excess of acceptable limits, even when feasible noise reduction methods are used. These impacts may be reduced by using alternate methods of construction. In the case of pile driving, vibration or hydraulic insertion could be used. Drilled holes for cast-in-place

piles are another alternative that would produce significantly lower levels of noise.

4. Source Control - The contractor shall comply with SDOT Standard Specifications and all local sound control and noise level rules, regulations and ordinances which apply to any work performed pursuant to the contract. Each internal combustion engine used for any purpose on the job or related to the job shall be equipped with a muffler of a type recommended by the manufacturer. No internal combustion engine shall be operated on the project without a muffler.
5. Time and Activity Constraints - The noisier activity involving large machinery could be limited to daytime hours when most people normally impacted are either not present or engaged in less noise sensitive activities. Nighttime construction would require a variance. Compliance with local Noise Ordinances will mitigate impacts associated with construction noise. To comply with the ordinance, all construction activities adjacent to residential uses will be limited to daytime hours (7:00 a.m. to 7:00 p.m.) on Monday through Saturdays.
6. Community Relations - Community meetings can be held to explain the construction work, time involved, and the control measures to be taken to reduce the impact of the construction noise.

The measures above can be incorporated into site specific construction plans to minimize noise impacts to sensitive receptors along the project corridor. Noise emission limits could be developed. Construction hours could be set, and noise level criteria could be decided upon and adhered to during construction.

## **Kihei-Upcountry Maui Highway Project**

**Project Number: HDPS-9203(1)**

### **Community Impact Assessment**

### **SUMMARY**

The Highways Division of the State of Hawaii Department of Transportation (SDOT) the Federal Highway Administration (FHWA) are proposing the Kihei-Upcountry Maui Highway project, on the island of Maui, Hawaii. The proposed highway would link the Kihei-Makena and Upcountry Maui regions. Eight alternative alignments are under consideration, representing all possible combinations of two candidate Kihei terminals and four candidate Upcountry terminals (the two alternatives with the U2-B terminus has since been eliminated).

This community impact assessment was prepared in response to comments expressed during public meetings and correspondence received from government agencies and community organizations. The comments intended to be addressed by this report expressed concern about the impacts of the road on the existing character of the communities at the termini, especially the existing rural character of the Upcountry area. To address these concerns, the scope of study was designed to assess potential neighborhood, agricultural, land use, social and economic impacts of the proposed project. Mitigation measures are also suggested.

The project area includes the coastal communities of Kihei, Wailea and Makena, and communities on the Haleakala Crater slope known as Upcountry Maui. Kihei-Makena is a dichotomous community characterized by the urban mixed-use, working class environment of Kihei and the well-planned "upscale" hotel resort districts of Wailea and Makena. Mostly developed during the 1970s and 1980s, this community is the second largest visitor accommodation area on Maui. Upcountry Maui consists of the suburban/rural communities of Pukalani, Makawao and Halimalele, and the more rural communities of Kula. Kula is famous for its small farms which produce some of the best vegetables and flowers in the State, but it is also sought after for residences due to its cool climate, spectacular vistas and rural environment. The project area is also used for large-scale sugarcane and pineapple cultivation, and ranching.

are not likely to cause secondary land development in Kula, an area in which urban land uses are discouraged and constrained by a limited water supply system.

The highway would change existing travel patterns. The obvious intended change would be the diversion of some travel demand from Haleakala Highway, Hana Highway, Dairy Road, Mokulele Highway and perhaps even Kuihelani Highway, onto Kihei-Upcountry Maui Highway. However, the upper or lower Pukalani alternatives would encourage some motorists traveling between Kula and Kihei to use the narrow and winding Omaoio and Pulehu Roads as a "short-cut." Similarly, the Kula terminus alternatives would encourage some motorists traveling to the summit of Haleakala to use local residential roads running between Kula and Haleakala Highways. Increasing vehicular use of these roads would adversely affect farmers and residents along these roads by interfering with farm vehicle movements, jeopardizing roadway safety and increasing highway-related noise.

No alternative would cut through or isolate portions of existing neighborhoods. Some of the alternatives would, however, cut through sugarcane and/or pineapple fields adversely affecting the current operating practices of large-scale agricultural enterprises which have been experiencing suburban encroachment for several decades. The alternatives would increase accessibility to certain pasture land, however. No small privately-owned Kula farm would be directly affected. However, the U3 alternatives would cross a County agricultural park. Mitigation measures would have to be implemented to offset adverse impacts to agricultural production, and to prevent cattle from entering the highway right-of-way.

The economic impacts of the project are mostly beneficial. The project would infuse up to \$66 million of federal funds into the local economy, increasing short-term employment and the purchase of local goods and services. Longer-term employment opportunities would depend on how well the alternatives facilitate urban development and employment-producing land uses in areas approved by the County. Impacts to existing highway-dependent businesses and business districts are expected to be minimal or non-existent.

**1. INTRODUCTION**

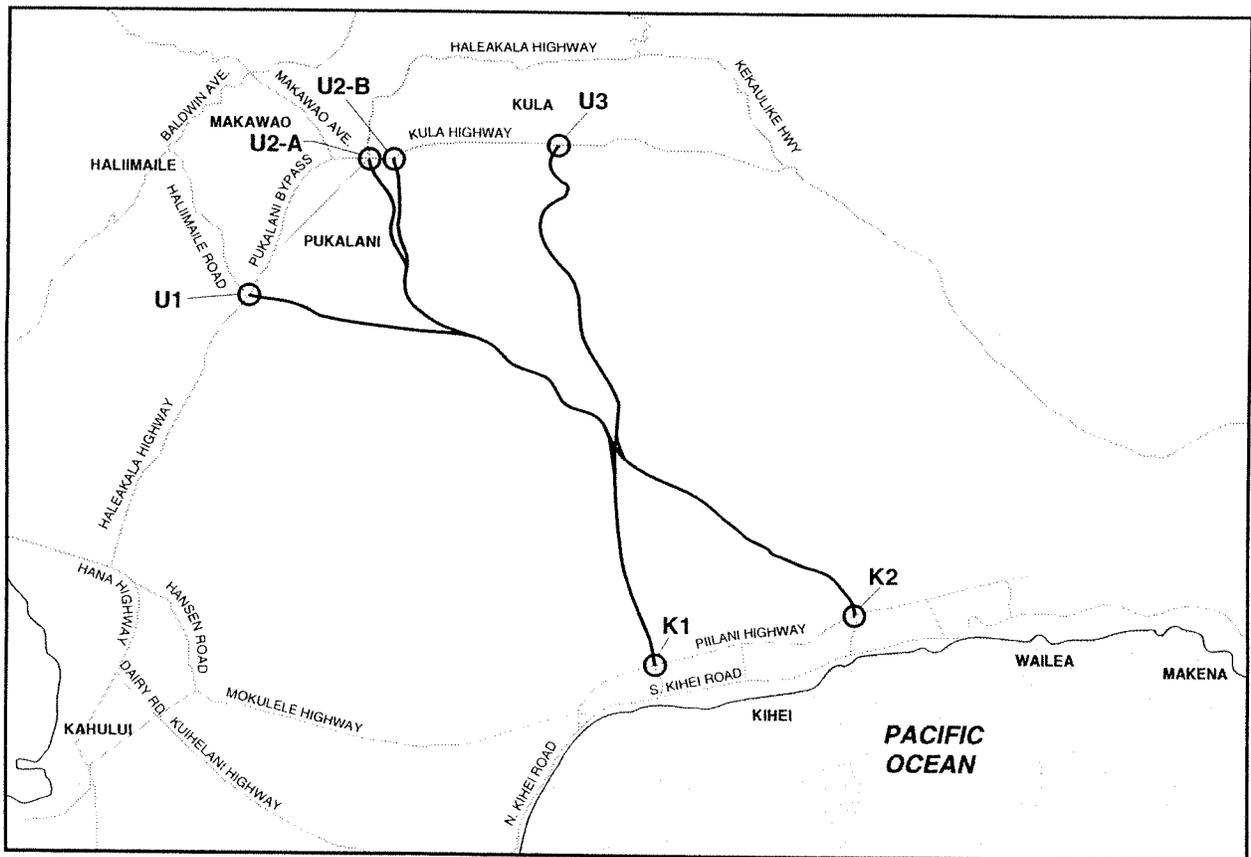

The Highways Division of the State of Hawaii Department of Transportation (SDOT) and the Federal Highway Administration (FHWA) are proposing the Kihei-Upcountry Maui Highway project on the island of Maui, Hawaii. Figure 1-1 shows the general project location. The proposed federal-aid two-lane limited access highway would link the Kihei-Makana and Upcountry Maui regions.

**1.1 Description of the Proposed Action**

The alternatives under consideration are all eight possible combinations of two Kihei terminus options and four Upcountry terminus options. Figure 1-2 shows the candidate Upcountry and Kihei termini and the alignment segments or "footprints" that would be used to link the termini. As shown on this figure, the Kihei termini and segments are named K1 and K2, and the Upcountry termini and segments are named U1, U2-A, U2-B and U3. (The U2-B alternatives has since been eliminated from consideration.)

Descriptions of the alternatives are as follows:

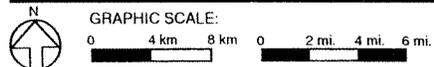

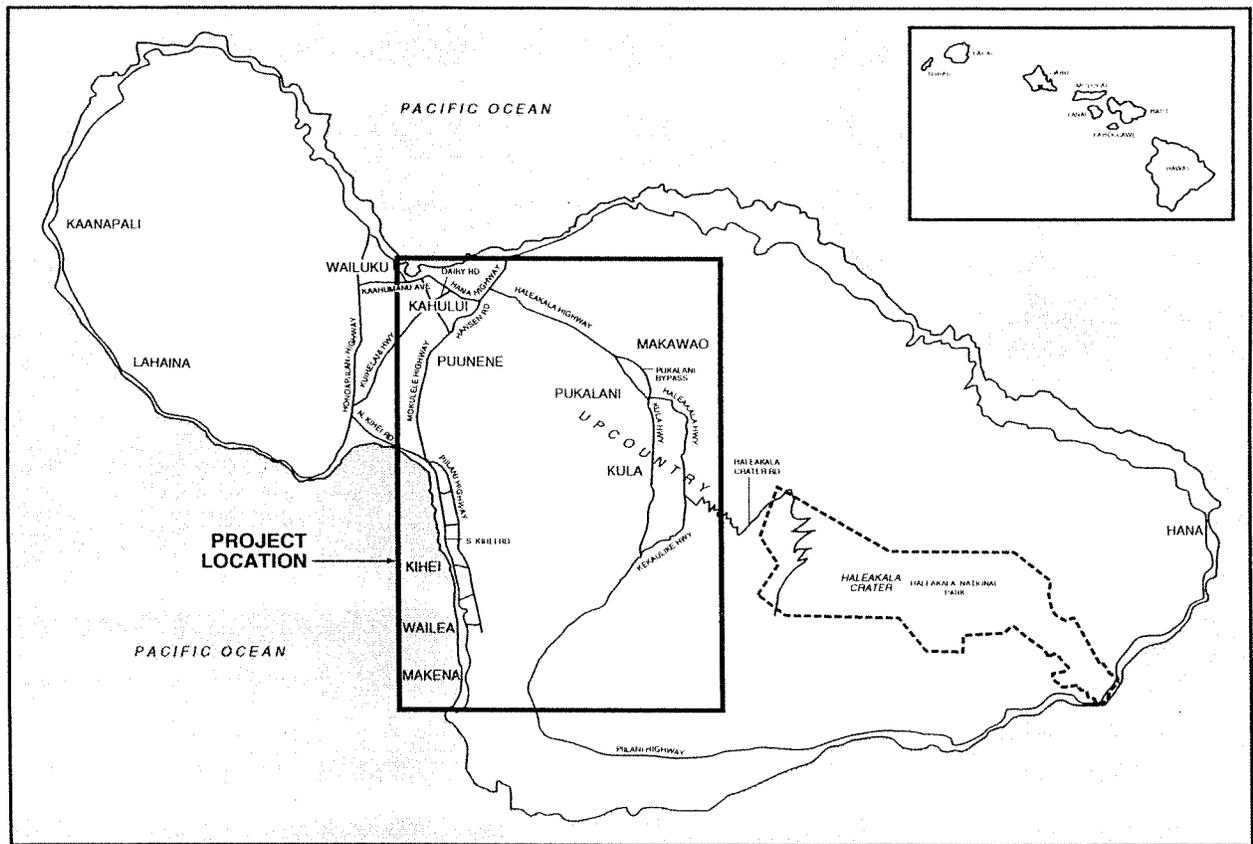

1. Alternative U1.K1. This alternative would start at the Haleakala Highway / Halimaile Road intersection in Upcountry and follow a south to southwest alignment to the Kaonoulu Street / Piliiani Highway intersection. The length of this alternative is approximately 15.8 km (9.8 miles).
2. Alternative U1.K2. This alternative is the same as Alternative U1.K1 from the Upcountry terminus to where the alternative alignments cross. However, this alternative would proceed southwest to the Ke Alii Alanui Street / Piliiani Highway intersection. The length of Alternative U1.K2 is approximately 17.5 km (10.9 miles).
3. Alternative U2-A.K1. This alternative would extend from the existing Pukalani Bypass/Haleakala Highway/Kula Highway "Five Trees" intersection in Upcountry, to an alignment common with U1. The Kihei terminus would be at the Kaonoulu Street/Piliiani Highway intersection.
4. Alternative U2-A.K2. This alternative would be from the "Five Trees" intersection to the Ke Alii Alanui Street/Piliiani Highway intersection.
5. Alternative U2-B.K1. This alternative would extend from Kula Highway at approximately 700 m (2300 ft) south of the "Five Trees" intersection to the Piliiani Highway/Kaonoulu Street intersection.
6. Alternative U2-B.K2. This alternative shares the same Upcountry terminus and alignment as the Alternative U2-B.K1. This alternative's Kihei terminus is at the Piliiani Highway/Ke Alii Alanui Street intersection.

**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Community Impact Assessment  
 FIGURE 1-1

7. Alternative U3.K1. This alternative would be from Kula Highway, south of Pulehu Gulch in Kula, to the Pilihi Highway/Kaonoulu Street intersection in Kihei.
8. Alternative U3.K2. This alternative would extend from Kula Highway, south of Pulehu Gulch in Kula, to the Ke Ahi Alanui Street/Pilihi Highway intersection.

The proposed highway would be a limited access arterial roadway with one 3.6 m (12 ft) lane in each direction. The minimum width of the roadway right-of-way would be 49 m (160 ft) in rural areas and at least 37 m (120 ft) in urban areas. Additional right-of-way is being reserved to allow for future widening to a four-lane divided highway if appropriate in the future. Posted speed limits would vary from 70 km/h (45 mph) in urban areas to 90 km/h (55 mph) in rural areas.

### 1.2 Purpose of this Report

This community impact assessment report was prepared in response to comments expressed during public meetings and correspondence from government agencies and community organizations. During the public meetings, participants expressed concern that the proposed roadway would:

- increase crime in the Upcountry area;
- introduce an urban environment into the rural environment of Upcountry; and
- adversely affect agricultural activities in Upcountry by:
  - increasing the housing supply and water demand which would accelerate the loss of agricultural land;
  - bringing more tourists to the Upcountry area causing a nuisance to farmers;
  - adversely affecting access to Kahului Harbor for trucks carrying agricultural products from Upcountry via Omaopio and Pulehu Roads; and
  - creating hazardous conditions at the intersection of Omaopio and Pulehu Roads and the proposed highway

Comments received from the County of Maui and community organizations regarding potential socio-economic impacts of the proposed project included:

- concern about the loss of small farms and exposing rural communities, such as Omaopio, Keokea, and Waiakoa, to development and transient traffic flows;
- a perceived adverse effect on efforts to preserve the unique Upcountry lifestyle and ambiance; and
- an opinion that the roadway should provide relatively inexpensive access to future Department of Hawaiian Home Lands (DHHL) homesteads that would extend from Keokea to Kihei, and that the selected route should benefit both present and future residents.

To address these and similar comments, detailed analyses of the alternatives' potential impacts on existing and future neighborhoods, land use development trends, and social, agricultural and economic activities were needed.

### 1.3 Scope of this Report

This community impact assessment examines potential impacts to social and economic conditions of the affected neighborhoods and the region, existing and future land uses, mobility and access, safety, and the provision of public services. The FHWA's Guidance for Preparing and Processing Environmental and Section 4(f) Documents (1987), the draft report, Community Impact Assessment: A Quick Reference for Transportation (March 1996) prepared by Apogee Research, Inc. for the FHWA, and the California Department of Transportation report, Conducting Socioeconomic Analysis: Guidance for Consultants (May 1988) were used as technical guides in preparing this report. Other sources of information included U.S. Census data, the Maui County Data Book (December 1994), the Kihei-Makena Community Plan (July 1985), the Makawao-Pukalani-Kula Community Plan (July 1996), and interviews of "key informants" from the community.

The report is organized in the following manner:

- Description of study area and affected communities:
  - brief history of study area;
  - physical characteristics;
  - demographic, housing and income characteristics;
  - general economic characteristics;
  - issues, concerns and views of the community; and
  - development trends.
- Analysis of impacts on:
  - neighborhood cohesion;
  - agriculture;
  - land use patterns and development trends;
  - displacement;
  - mobility and access;
  - provision of public services;
  - crime and safety; and
  - economic impacts on:
    - \* tax revenues,
    - \* public expenditures,
    - \* employment opportunities, and
    - \* businesses.
- Suggested avoidance, minimization and mitigation measures.

## 2. STUDY AREA AND COMMUNITY PROFILE

This chapter presents a summary of the history, present land use and socio-economic conditions of the study area. This chapter also presents a summary of major concerns and issues expressed by residents within the context of the County of Maui's community planning process, the Kihei-Upcountry Maui Highway Task Force process, and interviews conducted for this report.

### 2.1 Definition of the Study Area

The project is located in the area between the coastal community of Kihei and areas on the Haleakala Crater slope known as Upcountry Maui (see Figure 1-1). This study area is within the County of Maui's Kihei-Makena and Makawao-Pukalani-Kula Community Planning Areas. Defined neighborhoods or communities in the vicinity of the proposed project include Makena, Wailea, Kihei, Pukalani, Haliimaile, Makawao, and the Kula communities of Omaoio, Pulehu, Waiakoa, and Keokea. The locations of these neighborhoods or communities are shown on Figure 2-1. For some of the sections in this chapter, the study area is divided into two regions, for descriptive purposes, Kihei-Makena and Upcountry Maui.

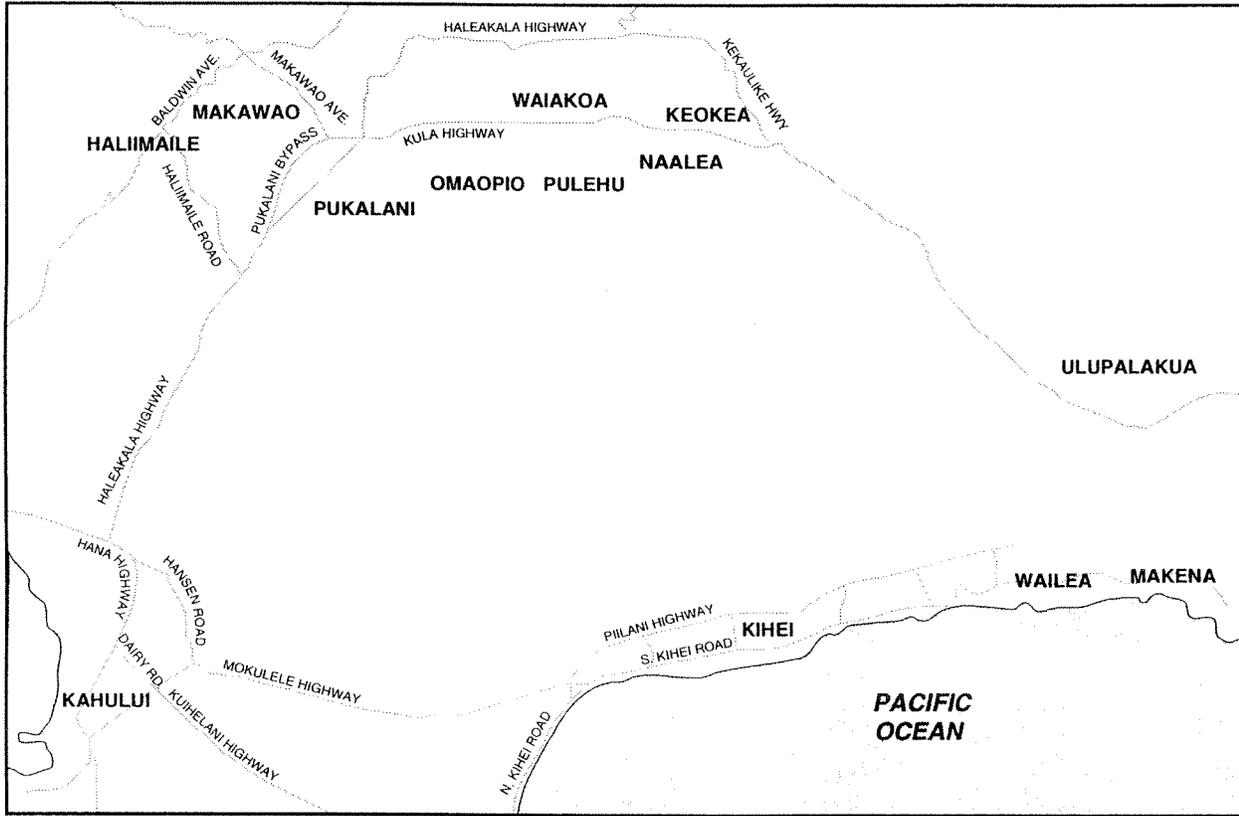

### 2.2 History and Physical Character of the Study Area

This section briefly describes the Kihei-Makena and Upcountry regions' history and physical makeup. Histories of the regions are taken from the Kihei-Makena and Makawao-Pukalani-Kula Community Plans.

#### 2.2.1 Kihei-Makena Region

The Kihei-Makena region was well populated prior to western contact. Between 1840 and 1860, large expanses of land were acquired by foreigners and native Hawaiians were displaced. By 1841, sugar being produced in Ulupalakua for Kamehameha III was being shipped out from a government landing at Makena. A second private landing established at Makena Bay became one of the three busiest leeward ports on Maui in the nineteenth century. It was phased out after a government landing was built at Keawekapu in the early 20th century.

Development of the Kihei-Makena region has occurred primarily because of the phenomenal growth of Maui's visitor industry since the 1960s. Today, the Kihei-Makena region is comprised of the urban mixed-use environment of Kihei and the resort land uses of Wailea and Makena. This region is the second largest visitor accommodation area on Maui (behind the Kapalua-Kaanapali-Lahiana region on the western side of the island). Kihei, the largest and most populous of these coastal communities, consists of a wide mix of housing types from single-family to multi-family low to medium density units, small to medium-sized commercial malls, and small to medium sized hotels along South Kihei Road. The Wailea-Makena area is a resort community, similar in size and scale to other resort communities on Maui such as

Existing Neighborhoods and Communities  
KIHEI-UPCOUNTRY MAUI HIGHWAY  
Community Impact Assessment  
FIGURE 2-1

Kapalua and Kaanapali, and in terms of urban design and socio-economic conditions, it is vastly more "upscale" than Kihei which is basically a working class community. Wailea-Makena contains some of Maui's most luxurious condominiums and resort hotels, such as the Grand Wailea Resort & Spa, the Maui Inter-Continental Resort, the Four Seasons Resort, and the Maui Prince Hotel.

### 2.2.2 Upcountry Maui Region

Hawaiian settlement in Upcountry Maui prior to western contact is evident from the large numbers of archaeological sites within the region. There are numerous recorded and unrecorded *heiau*, stone walls, building platforms and petroglyphs which evidence intensive habitation and land use.

Large scale sugarcane production was established from the 1850s to the 1870s. A partnership between S.T. Alexander and H.P. Baldwin in 1870 began the large sugarcane plantation which is now Hawaiian Commercial and Sugar Company, Inc. (HC&S). In 1876, the construction of Hamakua Ditch brought water to the dry central Valley of Maui and northwestern slopes of Haleakala, making sugarcane production possible where only scrub land had existed.

In terms of total acreage, cattle ranching ranks second to sugarcane in the Upcountry area. Haleakala, Kaonoulu, Erewhon and Ulupaiaukua Ranches were the largest, and still raise cattle. Pineapple, first grown in Makawao in the 1920s, is now grown at generally higher elevations than sugarcane.

The availability of homesteads in Kula began the tradition of family farms in this area. The cool and relatively dry climate, good soil, and elevation makes the Kula area exceptional for a number of crops, such as the famous Maui onions, cabbages and cut flowers.

Culturally, Upcountry Maui became home to immigrants from Portugal, Japan, Russia, Germany, Philippines, Puerto Rico and China. Most were recruited as contract workers for the sugarcane plantations. When their contracts were fulfilled, many immigrants settled in the Upcountry area.

In general, the Portuguese gravitated towards ranching and related vocations such as blacksmithing and operating feed stores. The region's ranching "paniolo" heritage and activities were centered in Makawao. The Chinese settled largely in Keokea and Makawao, working as farmers and merchants. The Japanese arrived somewhat later, but contributed significantly to the formation of the area's character and development.

Since the early seventies, Upcountry Maui has experienced significant residential growth because the region's cool climate, rural setting and spectacular views make this area a desirable place to live. In particular, the Kula area has attracted luxury residences. This has sometimes conflicted with farming activities through the loss of agricultural lands and the inherent incompatibilities between the two uses.

Today, the Upcountry Maui communities of Makawao, Pukalani and Halimaile are characterized as a mixture of suburban and rural, with Pukalani being the most

suburban of the three. Pukalani and Makawao contain most of Upcountry's commercial land uses. Pukalani's businesses are mostly located along Haleakala Highway and are typical of a suburban community (neighborhood shopping center, convenience stores, small offices, etc.). Businesses in Makawao, centered around the intersection of Makawao and Baldwin Avenues, are generally smaller and more pedestrian-oriented than the businesses in Pukalani. Makawao's businesses consist of restaurants, gift stores, and art galleries. Recently created urban design guidelines for Makawao maintains storefronts, prevent frontage parking, and preserve the town's historic architecture.

The Kula region contains a mixture of rural and agricultural uses with human settlement most concentrated at Waiahoa. Single-family residences, on lots up to 0.4 ha (1 acre), are generally found between Haleakala Highway/Kekaulike Avenue and Kula Highway. This area and the area west (maka) of Kula Highway is also used for small truck farms and agricultural lots. The small two to four hectare (five to ten acre) farms produce vegetables, such as the famous Maui onions, and flowers. Large-scale sugarcane and pineapple activities extend from the west slopes of Haleakala, generally west (maka) of the small truck farms, to central Maui. Cattle ranching occurs in the area east (mauka) of Haleakala Highway/Kekaulike Avenue, and on the lower west and south slopes of Haleakala. On the summit is Haleakala National Park. The few commercial activities in Kula are located primarily along the route to Haleakala National Park and in central Kula around Waiahoa.

## 2.3 Demographic, Housing and Income Characteristics

As shown on Figure 2-2, U.S. census tracts (CTs) 303.01, 303.02, 304.01, 304.02, and 307 generally encompass the study area. CT 303.01 covers the Kula neighborhoods of Puiehu, Waiahoa, Waohuli and Keokea. CT 303.02 includes Wailea and Makena. CT 304.01 includes Makawao and Halimaile. CT 304.02 includes Pukalani and parts of Kula, and CT 307 includes Kihei.

### 2.3.1 Demographic Characteristics

Table 2-1 exhibits selected demographic characteristics of the Kihei-Upcountry Maui study area. In 1990, the population of the study area as delineated by the above CTs was 34,171, or 34 percent of the County of Maui's total population. Population growth in the study area was rapid during the 1980s, growing by an annual average of 5.6 percent. In comparison, County of Maui and State of Hawaii annual average population growths in the same period were 3.5 percent and 1.4 percent, respectively. The Kihei area (CT 307) experienced the greatest population increase both in absolute terms (6,863) and by percentage--an average of 7.9 percent per year. The Pukalani-Kula area (CT 304.02 -- partial) had the smallest average annual growth rate within the study area of 3.5 percent per year. Kula (CT 303.01), Wailea-Makena (CT 303.02) and Makawao-Halimaile (CT 304.01) had annual growth rates of 3.8 percent, 7.3 percent, and 5.1 percent, respectively.

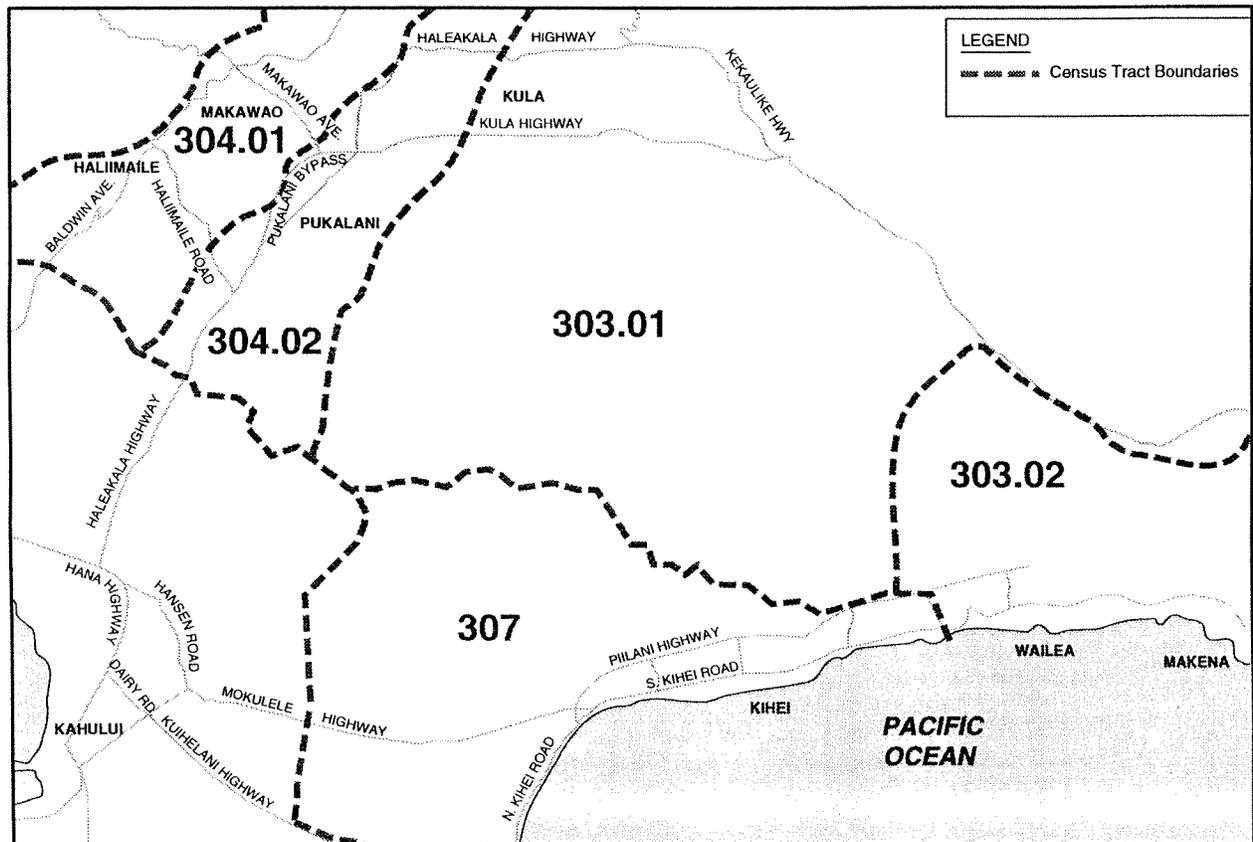

Table 2-1 also displays the number of households, families, ethnicity and age distributions for the study area in 1990. Overall whites made up 60 percent of the total

**Table 2-1

Community Impact Assessment  
FIGURE 2-2

population of the study area. Japanese, Filipinos and Hawaiians were the second, third and fourth next most common racial groups, respectively. Within the study area, the proportion of whites as compared to the total ranged from a high of 80 percent in the Wailea-Makana area to a low of 43 percent in the Pukalani-Kula (partial) area. The age distribution of residents in the study area does not appear to be substantially different than the age distribution for the entire county.

**2.3.2 Housing Characteristics**

Table 2-2 exhibits certain housing characteristics of selected Kihei-Upcountry areas in 1990. Overall, 54 percent of the housing units were one-unit structures. However, this ratio varied by community within the study area. In the Upcountry areas, such as Kula (CT 303.01), Makawao-Pukalani (CT 304.01), and Pukalani-Kula (partial) (CT 304.02), one-unit housing types made up more than 90 percent of all housing units, consistent with Upcountry's suburban and rural characteristics. The coastal areas of Wailea-Makana (CT 303.02) and Kihei (CT 307) have a mix of housing types consistent with these areas' more urban characteristics.

The age ratios of structures (see Table 2-2) is a good indicator of the ages of the neighborhoods within the CTs. From the information presented in Table 2-2, Wailea-Makana (CT 303.02) and Kihei (CT 307) are relatively young communities in comparison to all communities combined on the island. Very few of the houses in these areas are older than 20 years. In terms of age of their communities, Kula (CT 303.01) and Pukalani-Kula (partial) (CT 304.02) are very similar to the island overall. The age ratios of Halimaile-Makawao indicate that they are older communities that have recently experienced surges in residential growth.

Overall the owner versus renter occupancy ratio for the study area was 58.42 in 1990, roughly the same as the owner-renter occupancy ratio for the county. Within communities of the study area, this ratio varied from 65.35 in Makawao-Pukalani to 51.49 in Kihei. According to the Maui County Data Book (December 1994), approximately 32 percent of the housing units in the Kihei to Makana area were used for seasonal or recreational purposes in 1990. In the Upcountry areas, only two to three percent of the housing units were used for such purposes.

**2.3.3 Income Characteristics**

Table 2-3 exhibits certain income characteristics for selected Kihei-Upcountry areas in 1990. Median household incomes in the study area were higher than the median for the County of Maui, which was \$38,771 in 1989. Incomes varied from a low of \$40,483 in Kula (CT 303.01) to a high of \$45,694 in Wailea-Makana (CT 303.02). The poverty rates of residents in Kihei-Upcountry areas were slightly higher than the rate for the County. The percentage of households with incomes below the poverty level ranged from a low of six percent in Pukalani-Kula (partial) (CT 304.02) to a high of 12 percent in Wailea-Makana (CT 303.02). From 1980 to 1993, the unemployment rate for Maui island ranged from 2.2 percent in 1989 to 7.6 percent in 1992. The average in this period was 4.9 percent. The Kihei to Makana region is one of the island's major employment centers.

**Table 2-2  
Housing Characteristics in Selected Kihei-Upcountry Areas, 1990**

	Kula	Wailea-Makana	Halimaile-Makawao	Pukalani-Kula (Partial)	Kihei	Maui County

Note: CT = Census Tract

Source: U.S. Census Bureau, 1990 Census of Population and Housing, Hawaii

**2.4 Economic Characteristics**

Maui's most important industry is tourism. From 1989 to 1993, an average of over 2.3 million visitors arrived on Maui per year. The peak for this period was 1989 when there was over 2.5 million visitors. Most of Maui's hotels, resorts, and visitor-related businesses are located in West Maui from Lahaina to Kapalua, and in South Maui from Kihei to Makena. In the latter area, there were 84 visitor-accommodation facilities in 1993 providing a total of 7,318 visitor rental units, approximately 40 percent of all visitor-related units on Maui. In contrast, the Upcountry areas had only 63 visitor-related units. The Kihei-Makena region held about 14.6 percent of the employment on Maui, ranking third behind West Maui and Wailuku-Kahului in the number of jobs on the island.

Unlike Kihei-Makena, agriculture is Upcountry Maui's prime economic activity. Major crops or agricultural activities in Upcountry Maui include large-scale sugarcane and pineapple cultivation, and ranching. Sugarcane and pineapple activities are located on the west slopes of Haleakala Crater to central Maui. Cattle ranching generally occurs in the area east (mauka) of Haleakala Highway/Kekaulike Avenue and on the lower west and south slopes of Haleakala Crater. In Kula, major agricultural crops include vegetables, such as head cabbage, lettuce, round onions, and flowers, such as carnations and protea. Unlike sugarcane and pineapple cultivation, agricultural activities in Kula are on much smaller farm lots of about two to four hectares (five to ten acres). Upcountry Maui also has some small to medium size commercial activities mostly within Pukalani and Makawao. The medium size commercial land uses are exclusively within Pukalani. Makawao's business district contains pedestrian-oriented small retail stores and restaurants. Kula has very few commercial activities.

Scientific research is becoming an increasingly important industry on Maui. This industry is located primarily at Science City on the summit of Haleakala and at the Maui Research and Technology (R&T) Park in Kihei. Science City, a federal facility, is used for space- and defense-related research and development. The Maui R&T Park currently houses the Maui High Performance Computing Center, Boeing-Rocketdyne, Sunsource, the U.S. Air Force, the Pacific Disaster Center, Lockheed Martin, the University of Hawaii, the University of New Mexico, and a number of small companies.

**2.5 Community Facilities, Parks and Services**

The Kihei-Makena region contains three major beach parks, Kalamia, Kamaole I, II and III and Mai Poina Oe Lau, as well as other smaller beach parks along the Kihei to Makena coastline. This community also supports a county recreation center, Silversword Golf Course, and two private golf courses in Wailea. A Kihei District Regional Park is being planned for the area east (mauka) of Piliani Highway near its intersection with Ke Alii Alanui Street. Parks and recreation facilities in Upcountry Maui include the Makawao Park/Mayor Eddie Tam Memorial Center, the Upcountry Youth Center, Pukalani Park and Community Center, Kula Botanical Garden, Harold F. Rice Park, Keokea Park, and the Pukalani Country Club Golf Course.

**Table 2-3  
Income Characteristics in Selected Kihei-Upcountry Areas, 1990**

Households Below Poverty Level	11%	12%	10%	6%	8%	8%

Note: CT = Census Tract

Source: U.S. Census Bureau, 1990 Census of Population and Housing, Hawaii

There are three schools in the Kihei-Makena region: Kihei Elementary School, Lokelani Intermediate School, and the new Kamalii Elementary School. Schools in Upcountry Maui include Makawao Elementary, Haiku Elementary, Pukalani Elementary, Kula Elementary, Paia Elementary, Kalama Intermediate, Seabury Hall (private), and the new King Kekaulike High School which opened in 1995.

Police patrols for Kihei-Makena and Upcountry Maui operate out of the main police headquarters in Wailuku. The Makawao Community Police Officer maintains an office in the town. There are plans to construct a police sub-station in Kihei. Fire stations are located on South Kihei Road near Kalama Park, in Makawao, and in Kula near Waiakoa.

Maui Memorial Hospital in Wailuku is the principal hospital on Maui. Smaller hospitals are in Hana and Kula. The general hospital in Kula provides care for tubercular, mental and long-term patients. An ambulance stationed in Makawao provides emergency service between the Upcountry area and Maui Memorial Hospital. There is no 24-hour ambulance service in Kula. Emergency medical service in Kihei is provided by Maui Memorial Hospital.

**2.6 Community Issues and Concerns**

This section describes community issues and concerns expressed through the update processes of the Kihei-Makena and Makawao-Pukalani-Kula Community Plans and the State/County Joint Task Force on the Upcountry/Kihei Highway.

**2.6.1 Community Plans**

In the Proposed Kihei-Makena Community Plan (October 1993), the Kihei-Makena Community Plan Citizens Advisory Committee (CAC) expressed the following problems, issues and concerns regarding their community:

- Transportation. Inadequate traffic circulation and lack of public transportation.
- Community Facilities. Lack of youth programs, community facilities and playing fields in relation to its size as the third largest residential community on Maui. Recreation facilities such as a community swimming pool and sports fields, and a community center to house forums and events are particularly needed.
- School Environment. Problems expressed included an overall shortage of educational facilities, an overuse of portable structures, and the school's proximity to Piliuni Highway. These circumstances result in overcrowded, uncomfortable and generally poor classroom learning environments.
- Public Services. The lack of emergency medical facilities is a concern because of Maui Memorial Hospital's distance from Kihei. Greater police presence is needed to control crime. A ladder truck at Kihei Fire Station is needed to fight high-rise fires. A new Kihei community library would enhance learning for students. A general lack of social services, including child day care, was noted.

- Upcountry Transportation Connection. A transportation connection to the Upcountry area would save valuable commuter time between residential areas of Upcountry and job centers in the Kihei region. In choosing the alignment for this connection, the major concern should be improving transportation services for the maximum number of residents.

The Makawao-Pukalani-Kula Community Plan (July 1996) CAC expressed the following problems, opportunities and interregional issues regarding their community:

Problems

- Water. Limited development of water resources and distribution systems to meet the needs of the region. Water resources should be allocated in the following order of priority: (1) preservation of agriculture and development of Department of Hawaiian Home Lands parcels; (2) ensure the long-term viability of the region's residences and economic base.
- Loss of Rural Character. The loss of Upcountry's rural ambience is a significant concern. Preservation of the rural setting and open space of Upcountry is an important goal for the region.
- Transportation. Issues of concern include the inadequate transportation network, the need to address interregional access, and the need to provide alternative modes of transportation.
- Public/Quasi-Public Services and Facilities. Inadequate public and quasi-public facilities are cited as a major community issue. These facilities should be upgraded, expanded, or constructed to meet the growing needs of the region's residents.

Opportunities

- Rural Community Character. The region's rural qualities, characterized by its low crime rate, clean environment, abundant outdoor recreation opportunities, and vast open space and natural resources provide an opportunity to preserve Upcountry Maui's unique identity.
- Land Use. The land use patterns of the region should provide an opportunity to preserve the region's rural and agricultural setting. Planning of existing and future communities should retain their rural character, and agricultural lands and related activities must be recognized as key land use elements. To retain the integrity of the region's land use character, agricultural lands and related activities must be recognized as key land use elements which make Upcountry a special place.

Interregional Issues

- Kihei-Upcountry Highway. The selection of an alignment must consider the growth-inducing impacts on the region's agriculture, rural character and open

spaces. The need to maintain the unique Upcountry ambiance should be an essential criterion in analyzing alternatives.

- **Economic Well-Being.** The Upcountry region should continue to contribute to the overall economic health and stability of the county by maintaining sugarcane and pineapple cultivation, the region's rural character, and scenic and recreational resources.
- **Water.** A comprehensive water management strategy must be developed to balance various interests and accommodate environmental, agricultural and residential needs.

**2.6.2 Joint Task Force on the Kihei-Upcountry Highway**

A task force made up of citizens, businesses, and State and county officials was created in 1993 to explore and recommend alternatives for the Kihei-Upcountry Maui Highway. The goal of the task force was to facilitate early community participation in the project's planning process to provide the SDOT with useful information and enhance the acceptance of the project.

As part of the Task Force effort, opinion surveys were conducted to obtain input on termini preferences. These surveys consisted of a questionnaire appearing in the July 19, 1993 addition of the Maui News, and surveys of hotel and HC&S employees. Table 2-4 displays the results.

Two Task Force meetings were held to discuss project alternatives. The first meeting on May 14, 1992 introduced the project and task force process to participants. The second meeting, held on April 8, 1993, surfaced more substantive comments, such as the highway's potential impacts on agricultural activities in Upcountry Maui. These concerns included taking agricultural land for the highway's right-of-way, dividing farms which would reduce their efficiency or make them non-viable, and adversely impacting agriculturally-related traffic movements on Omaopio Road and other roadways. A sampling of these concerns follows:

- "Major consideration should be given to the conservation of productive agricultural lands and the economic impact of withdrawal of such land for the highway. There is the potential that the most productive of these agricultural lands will be impacted by the highway."
- "I don't know how practical it is to have a road running right through some of the best farm land on Maui."
- "If we had any road coming down through here connected to Kihei, Pulehu and Omaopio Roads will become the main link connecting with the upper Kula Highway. Right now Omaopio and Pulehu are loaded with fast movers. Half of the guys are speeders."
- "If there is going to be any road coming down through here, it is going to be murder trying to cross that (Kihei-Upcountry Maui Highway) road from (Omaopio Road). Try getting to Hansen Road from Puunene in rush hour. Can't do it. Only way you can do it is because there are nice guys on the road (that give you a chance. But not on the highway, nobody is going to stop for you."

Source: State/County Joint Task Force Upcountry/Kihei Highway, Final Report, October 1, 1993.

- "Nothing would be worse to a small farmer than to have the highway cut his ten acre farm in half. (if you) subdivide even HC&S into a hundred little plots, (it is) no longer a farm."
- "About 150,000 acres of prime agricultural land from Kaupo to Waipihio is going to have nothing but guava trees and pakalolo. There is not going to be any legal farming there because there is no legal prosperous crop including cattle or anything else that we can make any money on. Consequently it's no longer prime agricultural land; it's waste."
- "If we are going to really preserve agriculture, a lot of the issues brought up here are extremely important. If you subdivide and don't provide agriculture with easy access and easy transportation, you create a real problem."
- "I have a major problem on Mokulele. In fact, the first day we tried to cross, we had haulers piled up for four hours without being able to cross the highway. (On) the first day, we had six accidents."
- "I know the (Omaopio) land around there. There are a lot of gullies, a lot of hard rock. But there is not a lot of good soil where farmers can grow onions and grow cabbage. I don't think that should be disrupted with a bunch of tourists in automobiles and everything coming through there."
- "Any one of these alternatives will encourage more Upcountry development. If people working in Kihei, wouldn't it make sense to have more development in Kihei than encourage people to move to Upcountry and put more strain on existing resources?"

There were also disagreements on which type of agricultural land (small farmers or large-scale agriculture) should bear the brunt of impacts. Comments related to this issue are stated below:

- "When you mention the plantation and sugar, I think people, the agricultural lots are more important than the sugar because it's lifestyle of the people."
- "There's a lot of operating farms there. And if I had to trade off obviously small operating farms in the Omaoipo homesteads versus cane or pineapple land, I think the trade should be in favor of the (smaller) land owners versus the larger land owners."
- "I can understand wanting to preserve HC&S land, but the bread basket of our agricultural industry are independent farms in the Omaoipo, Pulehu, Naalea areas--this is the area that should be protected."
- "Good farm land is only good if you can make a profit on it. If you can't make a profit on it, it doesn't matter what else it has. It has to have economic viability. So if you take away economic viability from 1,500 farmers (working for HC&S), you destroy their 36,000 acres of what was prime agricultural land and turn it in to 36,000 acres of unusable farm land."

## 2.7 Interviewee Information

Often key individuals who are well informed about community issues, expectations and concerns can often provide good insight into the existing social condition of the affected neighborhoods. The three types of "key informants" were used for this study: community leaders, business owners and government agency personnel. Many of the key informants are present or past leaders of neighborhood or community organizations, and were interviewed for their knowledge of social groups, networks and activities. The business owners interviewed represented both large and small business enterprises. They provided insight into the project's potential impacts to their businesses. Government agency personnel were interviewed for their particular knowledge of certain key information or issues.

This section summarizes some of the information obtained from "key informants" in the community. Specifically:

- how "key informants" feel about their communities;
- how their communities have changed; and
- recent issues or problems their communities have faced.

### 2.7.1 Kihei-Makena Region

"Key informants" from Kihei generally thought of their communities as being working class and tourist-oriented. They noted that the de facto population (inclusive of visitors) is almost twice the residential population. However, they identified certain neighborhoods in Kihei as sharing some of the qualities characterizing Upcountry communities, such as rural setting. The Wailea-Makena communities are very different from Kihei in that the majority of their population, at any one time, is visitors or hotel employees. There are over two thousand condominium units in Wailea-Makena. However, most of these units are owned by absentee owners. Only a small fraction of the owners are full-time residents.

"Key informants" described Kihei's sandy beaches as being "great" with good public access. Although parking is a problem, they consider these beaches to be one of Kihei's most valuable assets.

The "key informants" stated that Kihei has not changed very much in the last few years, mainly because the visitor industry has flattened since the early 1990s which caused the construction industry to wane. During the 1980s, Kihei to Makena experienced phenomenal residential and hotel/resort growth in response to growing visitor counts. The resident population doubled and the de facto population quadrupled during this period. The peak of this development growth spurt occurred from 1988 to 1992.

When asked about present or recent community problems and issues, "key informants" identified traffic congestion, especially in the vicinity of North Kihei, and crime as being the major complaints of the community. They believed that little can be done about the crime problem because of Kihei's heavy reliance on the visitor industry. Efforts in recent years that have helped alleviate crime include rental car companies unlabeing their cars and a citizens' patrol along South Kihei Road. Unfortunately, these efforts forced criminals into other types of property crime and caused criminal activities to increase in inner neighborhoods.

### 2.7.2 Upcountry Maui Region

"Key informants" from Kula, regardless of where they live, almost unanimously identified their communities as being rural or country. They also identified the importance of agriculture, the quietness of the area, and similar lifestyles and values among neighbors. "Key informants" from Makawao and Pukalani gave slightly different responses, defining their neighborhoods as being more suburban. However, they also identified certain rural qualities, such as the pedestrian orientation of Makawao and open space.

All the "key informants" mentioned substantial increases in population and housing, especially from ten to 20 years ago. This has caused overcrowding of schools and increased traffic. Some of the "key informants" mentioned that 20 years ago, there were a lot more horseback riders.

"Key informants" noted that a substantial number of newcomers came from the mainland. Their impact on the social and cultural environment of Upcountry elicited mixed reactions. For example, some felt that most newcomers fit in well to the community, and were credited with reviving Makawao's business district. Negative comments about newcomers, regardless of whether they came from the mainland or within the State, included an assessment that they brought increased crime and drug use into the community, and that they do not share the same lifestyles and interests of long-time residents.

Recent or current community issues identified by interviewees included water availability; increasing traffic which raises safety concerns; the controversial location of the new King Kekaulike High School; a divisive issue that occurred a few years ago involving a proposal for hotel zoning near the Pukalani Golf Course which led to the disbanding of the Pukalani Community Association; teenagers loitering in Makawao

supposedly, adversely affecting businesses; and the lack of 24-hour ambulance and other medical services in Kula.

Water availability for Kula farmers is a critical issue that can affect their business. For residents, it is more of an inconvenience. A Kula resident stated the problem succinctly: it has been "a blessing and a hardship." The blessing is that the lack of water has prevented development and maintained open space. The hardship is that residences frequently have to endure restrictions on water use.

### 3. DEVELOPMENT TRENDS

This chapter describes current land use and development trends from the perspective of the County of Maui's Community Plans for the affected regions, and the wishes and desires of the "key informants."

#### 3.1 Community Plans

The County prepares nine Community Plans to help guide its decisions regarding development. Two of these plans are of relevance to the proposed project--the Kihei-Makana Community Plan (July 1985) and the Makawao-Pukalani-Kula Community Plan (July 1996). Their planning areas are displayed on Figure 3-1.

##### 3.1.1 Kihei-Makana Community Plan

The Kihei-Makana Community Plan (July 1985) is currently being updated, and a Proposed Plan (October 1993) is under review by the County Council. As shown on Figure 3-1, the planning region stretches from the southern shoreline to Wailuku and Lahaina. However, most of the population and development in this region is centered around the Kihei to Makana area.

The Proposed Plan raised issues regarding Kihei-Makana's physical and social infrastructure, emphasizing that community facilities are not keeping up with growth. Therefore, objectives were established to limit hotel and residential development until adequate public facilities and services, such as schools, are established to meet existing needs. The exception to this recommendation is that the Proposed Plan encouraged development of appropriate commercial and light industrial activities to diversify the region's economic base.

Based on the Proposed Plan, the following land use trends can be expected:

- Vacant land between Piihoni Highway and South Kihei Road to Kilohana Road would be developed as an urban mix, such as single-family and multi-family residences and commercial land uses (shopping centers, hotels, etc.). The pace of this development would depend on market conditions and the availability of long-term employment.
- Limited commercial/light industrial expansion in areas mauka of Piihoni Highway would be developed, such as the Kaonoulu parcel and the build-out of the Maui R&T Park.
- Resorts and resort-related activities (some residences, retail commercial, etc.) would continue to be developed in the existing resort area of Wailea and Makana.

##### 3.1.2 Makawao-Pukalani-Kula Community Plan

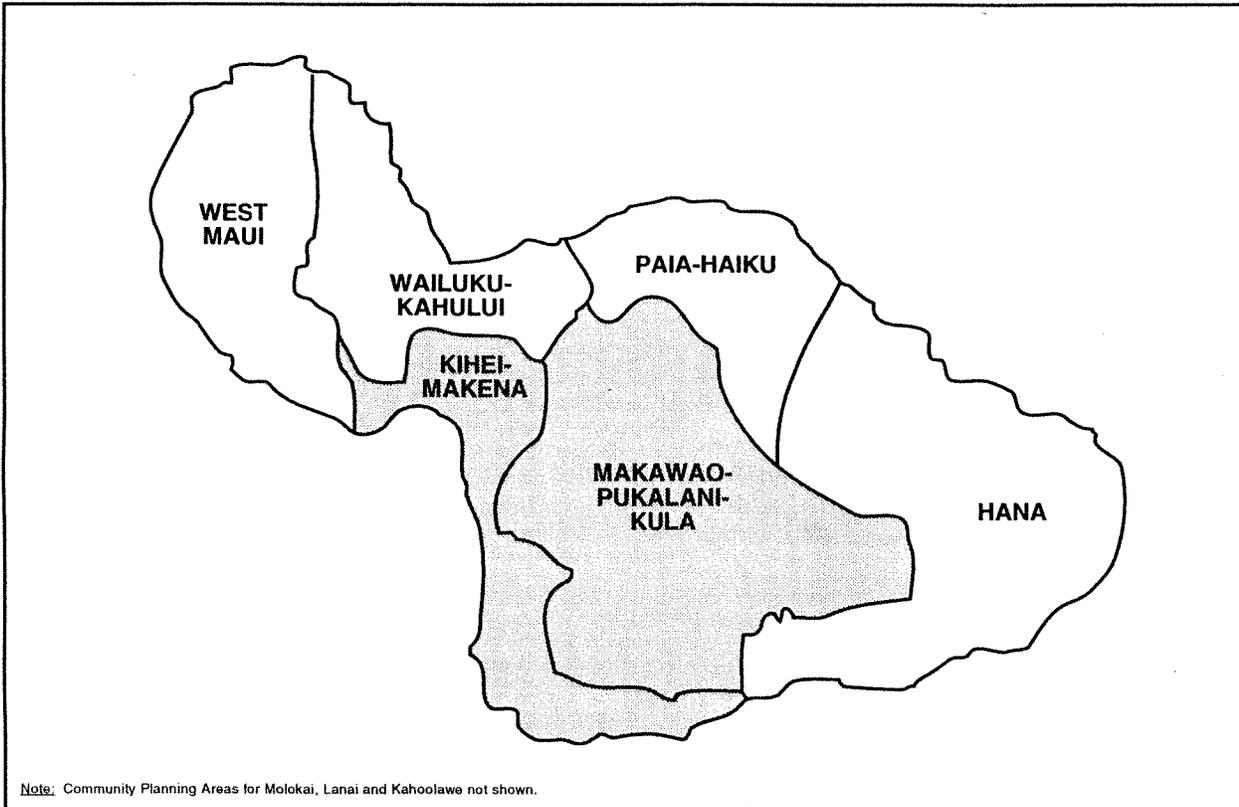

The Makawao-Pukalani-Kula Community Plan (July 1996) seeks to protect and enhance the unique qualities of this region through policies and recommendations to expand the

region's agricultural base and enhance the rural and agricultural qualities associated with Upcountry Maui. The Plan seeks to accomplish this by directing growth into and adjacent to already established urbanization centers. For example, Pukalani would be the region's "hub" for business, commercial and housing land uses. Makawao's and Waiako's unique town ambience and Kula's rural and agricultural atmosphere are intended to be maintained. According to the Community Plan, the following land use trends can be expected:

- Agriculture and open space would be maintained.
- Residential growth would be directed into and adjacent to the established urbanized communities of Pukalani, Makawao and Halimaile. These areas would accommodate most of the residential growth (about 5,000 to the year 2010).
  - In Makawao:
    - \* businesses would develop around the established central core; and
    - \* the country town ambience would be maintained.
  - In Pukalani:
    - \* residential growth would be located within (in-fill) and to the north (makai) and south (mauka) of the community;
    - \* multi-family residences (for senior housing in the Kulamalu development) would be consistent with community's size and character; and
    - \* would be developed as Upcountry's geographic, public service and commercial hub.
  - In Halimaile:
    - \* some small-scale commercial uses would serve existing and proposed residences; and
    - \* limited single-family residential growth would be contiguous with existing residences.
- Small-scale agriculture in Kula, particularly on the west (makai) side of Kula Highway, would be preserved.
- Waiako developed as Kula's town center:
  - some low density residential uses;
  - some small scale commercial; and
  - no urban sprawl.
- Some residences in Kula would generally be allowed in the area between Kula Highway and Haleakala Highway. The lot sizes would be no larger than 0.2 ha (1/2 acre).
- The Keokea area would be developed for homesteads by the Department of Hawaiian Home Lands (DHL).
- No large-scale retail or heavy industrial land uses.
- Existing communities would remain separated with no in-fill development between communities.

**3.2 General Economic Trends**

Maui's visitor industry is expected to continue to be its most important in the future. Economic forecasts (land use constrained) conducted for the County of Maui indicate that the number of visitor accommodation units and visitors for the county would

Source: County of Maui

**Community Planning Areas**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Community Impact Assessment  
 FIGURE 3-1

increase by 55 percent and 78 percent from 1990 to 2010, respectively. (Unconstrained forecasts would have had these indicators double from 1990 to 2010) Recently completed 2020 socio-economic projections prepared by the State of Hawaii Department of Business, Economic Development and Tourism (DBEDT) indicates that these two indicators would increase by 44 percent and 52 percent, respectively. The two existing visitor-accommodation regions, Lahaina-Kaanapali-Kapalua and Kihei-Makena, would continue to be the primary resort areas.

HC&S, ML&P, the ranches, and the Kula small farms are expected to continue to be viable businesses into the 21st century, and constitute a fair portion of the county's economy. However, their growth would likely be moderate at best. These businesses may continue to face many of the same obstacles that have adversely affected them in the past, such as urban encroachment and world competition.

Maui's high technology industry is growing. Although the Maui R&T Park has currently a little more than 300 employees, it is only eight percent built-out. By the year 2020, Park officials estimate the entire 168 ha (415 acres) complex would be completed. Per County ordinance, fifty percent of the R&T Park must be dedicated to research and development, forty percent to support facilities and only ten percent to light manufacturing and general industrial. Park officials expect new major industries to locate in the park, such as bio- and medical-technology; arts and entertainment; environmental, earth and ocean sciences; information processing and exchange; defense missions; and education and international training and technology conferencing.

### **3.3 Interviewee Views**

#### **3.3.1 Kihei-Makena Region**

"Key informants" from Kihei stated that they do not anticipate a lot of changes in Kihei because there is little incentive for developers to construct new hotels and housing. They noted that most of the prime resort locations are already developed, and the only areas to develop are in south Makena. With very little anticipated hotel development, the "key informants" believed that job growth would be modest. Therefore, they believe residential development would be slow, even though the area between Piilani Highway and South Kihei Road is only about one-third developed.

"Key informants" expressed the desire to prevent or limit shoreline development and maintain coastal access. They also stated that Kihei, as a tourist town, should have a network of greenways running along the coastline and parallel to and between Piilani Highway and South Kihei Road, with several east-west (mauka-makai) collectors (looking like a ladder). These greenways would be used for cycling and other recreational activities, and would support the tourist industry.

#### **3.3.2 Upcountry Maui Region**

Upcountry "key informants" almost unanimously stated that they want to maintain Upcountry's rural, country setting; its agricultural base; its open space; and its quiet

atmosphere. Some spoke about the need for residents to maintain their "local" values and culture. Those who spoke about this "local" culture defined it as having "Aloha," caring about the land and their communities, having similar goals for their communities, and having tolerance of other people's beliefs and lifestyles. "Key informants" generally wanted the Upcountry's "urban" area to remain in Pukalani and Makawao. They believed these towns to be appropriate areas for Upcountry's businesses and community and public services. "Key informants" from Pukalani and Makawao spoke about responsible zoning, and residential and commercial land uses that are consistent with the size and scale of the existing towns. For example, commercial uses in Makawao should be consistent with the country town atmosphere of its main street, and as a "bedroom community," Pukalani should not have inappropriate land uses such as bars and lounges.

According to the "key informants", threats to this desired future, include uncontrolled or inappropriate development; newcomers (from the mainland and in-State) not having "local" Upcountry values; increased tourism activities; and the water supply problem. One commenter specifically identified the proposed Kihei-Upcountry Highway as a threat to his desired future, stating that the highway would "single-handedly wipe out the community."

No "key informant" desired zero growth. Some said that without growth, the community would die. One person said that they need to provide land for their children so they too can live in the country. Another said that opportunities were needed for other Maui residents to move to Upcountry. The concern among all "key informants" was that too much or inappropriate development would destroy many of the things people value about Upcountry. For example, if the number of residences near the Kula farms increase, these farms may not survive. One person thought that if development cannot be controlled, Upcountry would not be a desirable place to live.

"Key informants" were willing to accepted the changes to Upcountry from the DHHL development.

Those who spoke about tourism see it as a threat or obstacle to their ideal future if a "Disney-type" tourist attraction is allowed. "Key informants" do not object to tourists traveling to the Haleakala summit now or in the future. They did, however, object to tourists driving through Upcountry's rural neighborhoods.

The water availability problem was seen as a threat primarily to Kula farmers who depend on a steady supply of water.

#### 4. POTENTIAL SOCIAL IMPACTS

This chapter analyzes potential social impacts of the six alternative alignments for the Kihei-Upcountry Highway.

The impact analyses of this chapter are based on the guidance documents identified in Section 1.3. Impacts identified if any of the following project-related effects occur:

- For neighborhood impacts:
  - Changes in neighborhoods or community cohesion. These changes may include splitting neighborhoods or isolating portions of neighborhoods or ethnic groups.
  - Impacts on specific social groups, such as the elderly, handicapped, non-drivers, transit-dependent and minority and ethnic groups.
- For impacts on agriculture:
  - Would there be a loss of farmland? If so, which farmland would be affected?
  - How would current agricultural practices be affected?
- Effect on current land use patterns and development trends. Questions to be answered for this type of impact include:
  - What is the growth inducement potential of each alternative and where would its generated growth be located?
  - Would the project be in compliance with local land use plans and zoning?
  - Are there other factors to be considered in determining land use patterns and development trends?
- If there are displacement or relocation impacts, the following questions would determine the level of impacts:
  - How many residences would be displaced?
  - How many businesses and farms would be displaced?
  - Are there available sites to accommodate those displaced?
- Changes in mobility and travel patterns and their effects on existing socioeconomic activities.
- Impacts on school districts, recreation areas, churches, businesses, police and fire protection, etc., including any changes in accessibility.
- Impacts of alternatives on highway and traffic safety as well as on overall public safety, including crime.

#### 4.1 Neighborhood Impacts

Figure 2-1 identifies the neighborhoods or communities in the study area. Portions of the study area midway between Upcountry and Kihei are owned by a few large land

owners, such as Alexander & Baldwin and Haleakala Ranch, and are used for large scale sugarcane and pineapple cultivation and pasture. The following describes the alignments' physical relationships with existing neighborhoods:

- Segment U1 is located approximately 1200 to 1400 m (4000 - 4500 ft) west to northwest (maka) of Pukalani.
- At its closest point, Segment U2-A is located approximately 150 m (500 ft) south of Pukalani and approximately 300 m (1000 ft) north of a few Omaopio homesteads.
- Segment U2-B is located approximately 275 m (900 ft) south of Pukalani and approximately 240 m (800 ft) of the Omaopio homesteads. The lower part of a residential subdivision, Kula 200, is directly east (mauka) of the U2-B/Kula Highway intersection. However, this subdivision is upslope from the terminus.
- Segment U3 is located approximately 240 to 700 m (800 to 2300 ft) north of residences along Pulehu Road. U3's intersection with Kula Highway is approximately 500 m (1600 ft) southwest of the Kula Kai Subdivision which is located east (mauka) of Lower Kula Road.
- Segment K1 is located approximately 500 m (1600 ft) at its closest point from a residential subdivision located mauka of Pilihi Highway. West (maka) of K1's intersection with Pilihi Highway, Kaonoulu Estate, is the nearest residential subdivision.
- At the K2/Pilihi Highway intersection, the nearest residential area is approximately 500 m (1600 ft) north of this location, located west (maka) of Pilihi Highway.

Based on the information above, none of the alternatives would split any existing neighborhood, nor isolate parts of neighborhoods from the greater community. Therefore, the alternatives would not in themselves adversely affect community cohesion. However,

Although none of the alternatives would change land use patterns in Upcountry in a way different from the future development described in the Community Plan (see Section 4.3), implementation of the Community Plan may affect the rural country lifestyle of Upcountry by increasing the population and density, increasing traffic and associated roadway noise, and encroaching onto agricultural land.

Some of the alternatives have the potential to change existing travel patterns in a way that could adversely affect certain existing neighborhoods. These potential impacts are discussed in Section 4.5.

#### 4.2 Agricultural Impacts

Hawaiian Commercial and Sugar Company (HC&S) cultivates approximately 14 000 ha (35,000 acres) of sugarcane on land on the west slopes of Haleakala and in Central

Maui (see Figure 4-1). HC&S operates two sugar mills, located in Puunene and Paia, which also export electricity to the Maui electrical grid. Other highways, such as Haleakala and Hana Highways, already cross HC&S fields (see Figure 4-1), and these highways adversely affect productivity for several reasons. For example, only some public road-haul road crossings are signalized, and these crossings delay the transport of sugarcane to the mills. In addition, suburban encroachment interferes with operations, such as cane burning and aerial spraying.

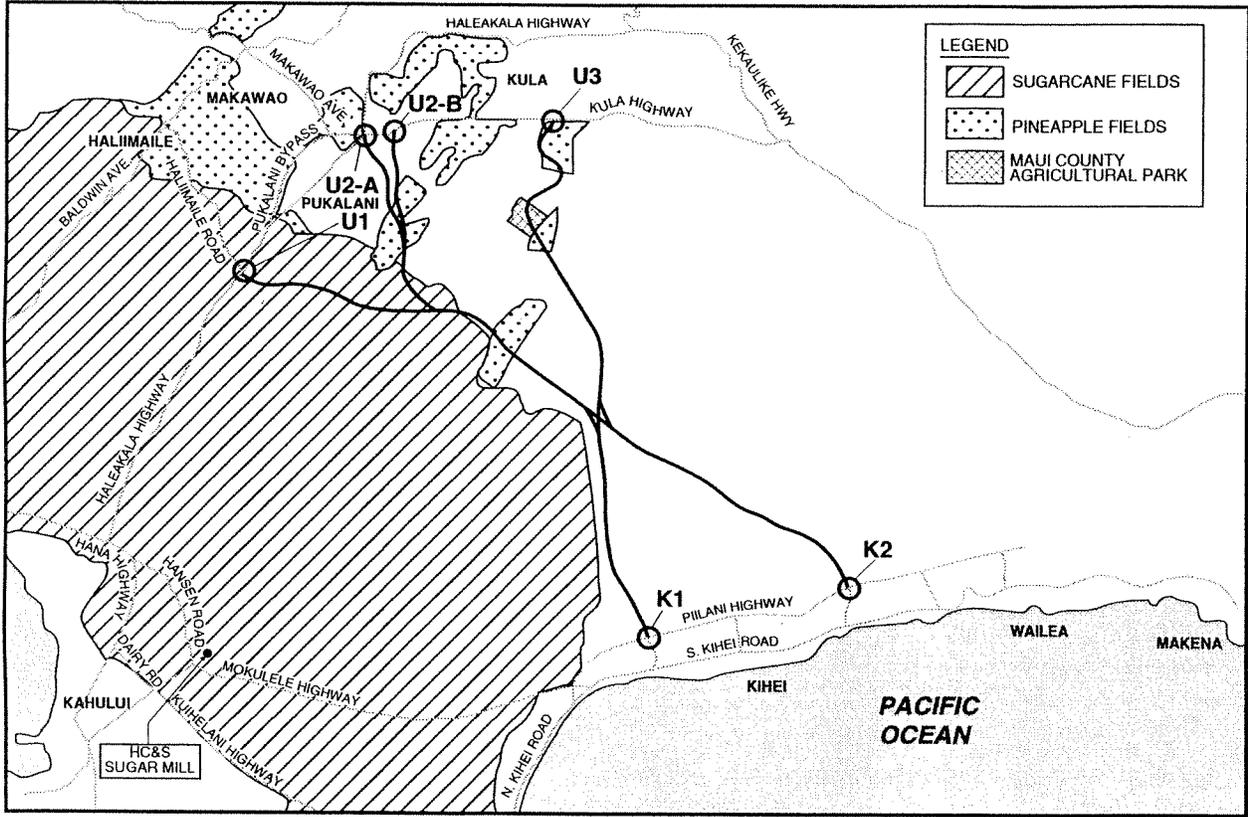

Proximity to urban areas adversely affects the efficiency of HC&S sugarcane operations because cane burning has to be regulated (i.e., no cane burning during Kona (south wind) weather), dust control measures have to be used (the 136,000 kg (300,000 lb.) cane hauling vehicles traveling on unpaved cane roads produce tremendous amount of dust), and trespassers are more frequent, leaving derelict vehicles and other waste in the fields. As one of the few remaining sugar producing companies in Hawaii, HC&S believes that to remain competitive in the world market they must be as efficient as possible, and continue to produce high yields at least cost. HC&S feels that any project that brings more urbanization near their fields detracts from efficiency.

The other large-scale crop production business in the study area is Maui Land & Pineapple Company (ML&P), the last pineapple processor in the State. ML&P's pineapple fields are located around Halimaile, Makawao and Pukalani, and in lower Kula (see Figure 4-1). In addition to their own land holdings, ML&P leases land to cultivate pineapple because market demand exceeds supply. ML&P selected these areas to cultivate pineapple because they have good soil conditions and access to water. Similar to HC&S, urban encroachment has adversely affected ML&P productivity. The other major constraint for ML&P is obtaining land with access to water.

Cattle ranching generally occurs east (mauka) of Haleakala Highway/Kekaulike Avenue and on the lower west and south slopes of Haleakala. Ranching enterprises in the study area are the Haleakala and Kaonoulu Ranches. Similar to HC&S and ML&P, urban encroachment has adversely affected the ranches because of complaints about noise and cattle crossing public roadways.

Small farms are located in Kula around Omaopio, Pulehu Naalae, Waiakoa, and Keokea. As described in Sections 2.2 and 2.4, these two to four hectare (five to ten acre) farms cultivate vegetables and flowers. Kula farmers face problems similar to those expressed by HC&S and ML&P: urban encroachment and periodic water use restrictions during drought conditions. Urban encroachment affects Kula farmers through speculation (increasing land values), neighbor complaints of chemical use by farmers, and increased traffic (see Section 4.5).

The alternatives would cross agricultural land, and convert it to a transportation use (see Figure 4-1). Most of the agricultural impacts would occur on existing sugarcane and pineapple fields (see below). The degree of impact would depend on the alignment selected. No privately-owned Kula small-scale farm would be directly affected by any of the alternatives, although leased fields located in the Kula Agricultural Park owned by Maui County could be affected depending on the alignment

Source: Warren S. Unemori Engineering, Inc.

GRAPHIC SCALE:

**Cropland Impacts**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Community Impact Assessment  
 FIGURE 4-1

selected (see below). Also, some of the alternatives could modify travel patterns in a way that may adversely affect certain Kula farms. This is discussed in Section 4.5, "Traffic Patterns and Highway Safety."

When an alternative encroaches on land used for cultivation, it would adversely affect agricultural operations, such as planting, aerial spraying, irrigation, drainage and harvesting, for several reasons. For example, the roadway could interfere with agricultural infrastructure, such as existing service roads and irrigation and drainage systems. In addition, the roadway could isolate portions of fields, making them inaccessible and unworkable for cultivation. However, this project would not create unworkable remnant parcels in most cases because mitigation measures to maintain the productivity and workability of the affected fields would be implemented.

The impacts of alternative alignments are described below:

- Segment U1 would cross sugarcane fields owned by Hawaiian Commercial and Sugar Company (HC&S) west (makai) of Pukalani (see Figure 4-2). The alignment would separate approximately 400 ha (1000 acres) of sugarcane land from larger fields, and cross existing cane haul roads and irrigation and drainage systems. The isolated parcel would remain productive because mitigation measures, as described in Section 6.1, would be implemented if a U1 alternative is constructed.
- Segment U1/U2-A/U2-B would cross a Maui Land and Pineapple Company (ML&P) pineapple field located along Pulehu Road, affecting internal roadways, water conveyance infrastructure and drainage patterns (see Figure 4-1). The two newly created parcels would remain productive because mitigation measures, as described in Section 6.1, would be implemented if either a U1 or U2-A alternative is constructed.
- Segment U2-A or U2-B would separate approximately 25 ha (60 acres) of HC&S sugarcane land from a larger field (see Figure 4-1). It would also cross two major water ditches, the Hamakua Ditch and the Reservoir 40 ditch. The U2-A or U2-B alignment would also cross a ML&P pineapple field located south (mauka) of Pukalani, separating two parcels from a larger field. These affected fields would remain productive because mitigation measures, as described in Section 6.1, would be implemented if a U2-A or U2-B alternative is constructed.
- Segment U3 would cross two ML&P fields located along Pulehu Road (see Figure 4-1). At the western (makai) field, two fields would be created. However, both fields would remain productive because mitigation measures, as described in Section 6.1, would be implemented if a U3 alternative is constructed. At the eastern (mauka) field, unworkable remnant parcels may be created because of the small size of the isolated field. The U3 alignment would also cross the Kula Agricultural Park owned by Maui County (see Figure 4-1). The Ag Park leases low-rent parcels to small-scale farmers. Some of the parcels would be converted to the roadway. The remaining parcels and parcels modified because of the roadway alignment would remain productive because

mitigation measures, as described in Section 6.1, would be implemented if a U3 alternative is constructed.

Segments K1 and K2 do not affect existing cropland.

The alternatives would also cross land used for cattle ranching and grazing. Segments U1/U2-A/U2-B, U3, K1 and K2 would traverse cattle ranching/pasture land located toward the southern portion of the study area, south of the sugarcane fields and west (makai) of the small Kula farms. The proposed highway would increase accessibility to pasture land.

The U3 alignment would be located approximately 90 m (300 ft) from a working corral and water system (tank and troughs). The owner of the corral, Haleakala Ranch, has indicated a preference that the highway not be within visual distance of the corral to prevent highway users from interfering with cattle operations. The U3 alignment would therefore interfere with corral operations.

Haleakala Ranch also stated that they would have to herd cattle across the K1 alignment several times a year. Herds may reach 1,500 cows, and it would take about 10 to 15 minutes for the animals to cross the highway. However, impacts are not anticipated because mitigation measures would be provided as described in Section 6.1.

**4.3 Land Use Impacts**

To evaluate the potential urban development impacts of a highway project, one compares the proposed transportation project to the extent of planned growth within the project area. Highway projects often remove impediments to urban growth by enhancing access to vacant land or increasing transportation capacity. Therefore, assessment of the potential urban growth impacts of the proposed roadway is based on the question of whether the transportation infrastructure would facilitate planned growth, or induce unplanned growth. In this case, the planned growth would be according to the Proposed Kihei-Makena Community Plan (October 1993) and the Makawao-Pukalani-Kula Community Plan (July 1996) (see Section 3.1.4.2d).

The alternatives would support planned growth because all of them would improve transportation between Kihei and Upcountry by reducing travel time (see Section 1.2.1). The issue of whether Kihei-Upcountry Maui Highway would induce unplanned growth is addressed below.

**Kihei-Makena**

Growth facilitation would be beneficial in Kihei-Makena where there is ample room between Pilihi Highway and South Kihei Road. Additional development would conform to Kihei's visitor-based urban environment. However, other factors, such as future hotel and resort development and the pace of development of Maui's "high-technology" industry, are expected to determine the speed and extent of growth in Kihei more than the Kihei-Upcountry Maui Highway. As indicated in the Kihei-Makena

Community Plan, only limited commercial and business development would be allowed mauka of Piliāni Highway, primarily the build out of the Maui R&T Park. State and county zoning east (mauka) of Piliāni Highway would remain in agriculture. Therefore, neither K1 or K2 segments would facilitate development in areas east (mauka) of Piliāni Highway. If the alternatives facilitate in-fill development between Piliāni Highway and South Kihei Road, this would be considered a positive impact because it would be consistent with the Kihei-Makkena Community Plan.

#### Upcountry

The Makawao-Pukalani-Kula Community Plan indicated maintenance of low densities, open space and agricultural activities in Upcountry's rural communities. In addition, in interviews with "key informants," many stated a broad concern about the proposed highway facilitating urban development and increasing traffic volumes in Upcountry, elements that are inconsistent with the articulated vision for the area. However, it is appropriate to look beyond these concerns to other factors that could affect land use trends in Upcountry, and to the relative differences among the alignment alternatives.

The project could facilitate planned residential and commercial developments in Upcountry because it would provide a transportation link between the Kihei-Makena employment center and the popular Upcountry Maui residential area. However, regardless of whether areas are available to be developed (i.e., have appropriate zoning or are identified for growth in official County land use plans), the greatest obstacle to further development in parts of Upcountry is water availability, which has historically constrained urban growth. According to the Maui Board of Water Supply (BWS), there is currently barely enough capacity to serve current customers in Upcountry. Under drought conditions, customers are required to cut back water use, and the reservoirs quickly run dry.

Maui is served by five major water supply systems: Central Maui, Makawao, Kula, Hana, and Lahaina; and 15 individual sub-systems. The Iao Aquifer in the West Maui Mountains is the water source for Kihei-Makena and other areas. Unlike Kihei-Makena, Upcountry's water supply is from surface sources along the north and east side of the island that feed into the Makawao and Kula systems. Makawao and Pukalani receive their water from the Makawao system. Surface water is treated at the Kamole Weir Water Treatment Plant located near Halliimaile, and pumped up to the two communities. This system has no reservoir. The Kula system operates as two separate systems (Upper and Lower), with each having its own separate surface water intakes, treatment facility, and distribution system (lines running along the upper portion of Haleakala Highway for the Upper system and lines running along Kula Highway for the Lower system). However, water can be pumped up (lower to upper) or gravity fed (upper to lower) between the two systems if required. Also, during droughts, water is sometimes pumped to the Kula systems from the Makawao system, and customers are required to reduce water use. The Maui BWS has recently constructed two 190,000 m<sup>3</sup> (50 million gallon) reservoirs in the Upper Kula System, but there are no other immediate plans for a new reservoir in this system.

The Maui BWS uses the Community Plans in planning new water systems and/or increasing the capacity of existing systems. The Maui BWS is planning improvements

to the Makawao system in response to the Makawao-Pukalani-Kula Community Plan (July 1996), and has approved private development plans to drill a well in Haiku to free water in the Makawao system for the Kulamalu development located south of Pukalani. Recent and planned projects for the Upper and Lower Kula systems are intended to improve service to current customers so that during drought conditions the Maui BWS does not have to implement water use restrictions as they have done many times in the past (telephone conversation with Maui BWS, May 5, 1998).

Providing more water to the Kula systems to support unplanned development in Upcountry, particularly Kula, is unlikely mainly because the system relies on surface water. Surface water resources are vulnerable to drought conditions, whereas groundwater resources provide a sustainable yield even during a year or two of limited rainfall. According to the Maui BWS, the high cost and substantial risk of developing alternative sources of water (i.e., wells) has stopped many development proposals in Upcountry. The Kulamalu developer is able to assume the high cost and risk of drilling a well in Haiku because of the size and scale of the development (telephone conversation with Maui BWS, May 5, 1998). Therefore, water supply limitation is likely to remain the constraint to development in Upcountry in the future, despite the efforts of the Maui BWS to improve its Upcountry systems and despite the construction of the Kihei-Upcountry Maui Highway.

Since the Maui BWS is planning to accommodate development in Pukalani (Makawao system), the U1 alternatives could facilitate Pukalani's growth westward (makai) toward the highway. This growth inducement would be partially consistent with the Makawao-Pukalani-Kula Community Plan because there are parcels on the west (makai) side of Pukalani designated for residential growth (see Figure 4-2). The U1 alternatives could facilitate development beyond Pukalani's urban growth boundary if the landowner, Alexander and Baldwin (A&B), chooses to develop its land west (makai) of Pukalani. Similarly, the U1 alternatives may induce development in Halliimaile beyond what is designated in the Makawao-Pukalani-Kula Community Plan (see Figure 4-2).

The U2-A and U2-B alignments may have very little influence in the area south (mauka) of Pukalani. The area south (mauka) of Pukalani is planned to be used for Kulamalu, and its developer will be making substantial improvements to the water supply infrastructure. Since parcels for this project already have State urban classification, the County has approved zoning and Community Plan amendments supporting the project (Maui News, December 2, 1997). With water availability not being a constraint, Kulamalu would be developed with or without Kihei-Upcountry Maui Highway. However, the U2-A and U2-B alternatives, unlike the U1 or U3 alternatives, would support this development by providing additional transportation infrastructure to the site (i.e., Kulamalu residents would not have to use Haleakala or Kula Highways to travel to Kihei). In particular, the U2-B alignment was suggested by the Kulamalu developer, and therefore would be more supportive of the development than the U2-A alignment. The U2-A and U2-B alignment may facilitate in-fill growth along Pukalani's southern (makai) side. According to the Community Plan, some of Pukalani's growth is directed toward this area (see Figure 4-2).

Segment U3 is located approximately 5 km (3 miles) south (mauka) of Upcountry's "urban" areas of Pukalani and Makawao, in an area where the Community Plan

designates very little additional growth. The developments that are planned include small scale commercial land uses in Waiakoa and rural residences. These uses, particularly the residences, are not dependent on the highway because of Kula's attractiveness as a residential area. However, these developments will have to receive other governmental approvals (e.g., zoning, subdivision, etc.) and obtain water meters. The latter could be difficult (see above). In summary, U3 would facilitate planned growth but not induce unplanned growth.

#### 4.4 Displacements and Relocations

Depending on the alternative, Kihei-Upcountry Maui Highway would require right-of-way from the land owners identified below (the properties' existing uses are provided in parentheses):

- Alexander & Baldwin (Hawaiian Commercial and Sugar Company (HC&S)); sugarcane cultivation (U1, U2-A and U2-B alternatives);
- County of Maui (Kula Agricultural Park); leased diversified agriculture (U3 alternatives);
- Dowling Company; vacant, but future Kulamalu development (U2-A and U2-B alternatives);
- Haleakala Ranch; pasture land and pineapple cultivation (all alternatives);
- Kaonoulu Ranch; pasture land (K1 and K2 alternatives)
- Matama Mohala Corp.; vacant, but future urban uses (U2-A and U2-B alternatives)
- Maui Land & Pineapple Company; pineapple cultivation (U2-A, U2-B and U3 alternatives)
- Von Tempisky Trust; pasture land (U3 alternative);
- Others (see Table 2-1 for a list of land owners); vacant, future urban uses (U2-A alternatives).

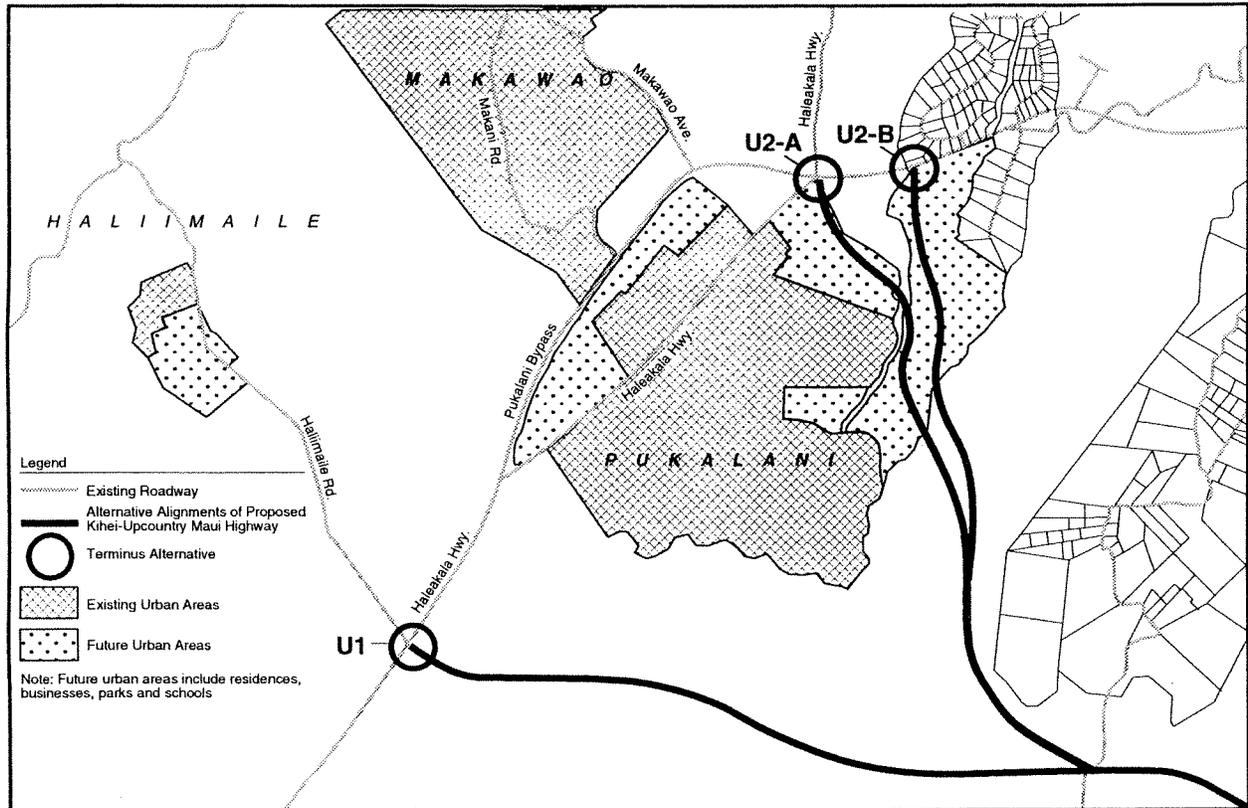

While mitigation measures to lessen the adverse impact on agricultural and ranching activities would be provided (see Section 6.1), none of these land owners or operators would be relocated due to right-of-way requirements. All of the enterprises listed above could continue operations at their present locations after acquisition of roadway right-of-way.

No alternative would require the displacement of any residence.

#### 4.5 Travel Patterns and Highway Safety

##### Traffic Diversion

All alternatives would cause major changes to existing traffic patterns in the project area. All would divert most, if not all, trips between Kihei-Makana and Upcountry onto the new highway and off of Haleakala Highway, Hana Highway, Dairy Road, and Mokuilele Highway, the existing Kihei to Upcountry route. If a K1 alternative is selected, some of the travel demand between Upcountry and West Maui would also be diverted

Existing and Future Urban Areas in Pukalani-Makawao  
 KIHAI-UPCOUNTRY MAUI HIGHWAY  
 Community Impact Assessment  
 FIGURE 4-2

onto the new highway. Kihei-Upcountry trip lengths could be cut by half, depending on the alternative, and the origin and destination. However, the K1 alternatives would increase traffic volumes on Pilihi Highway, north of the K1 terminus, and North Kihei Road, as traffic is diverted off the above roadways and Kihelani Highway (part of the existing Upcountry-West Maui route). The traffic diversion impacts on Pilihi Highway and North Kihei Road would not be substantial under the K2 alternatives.

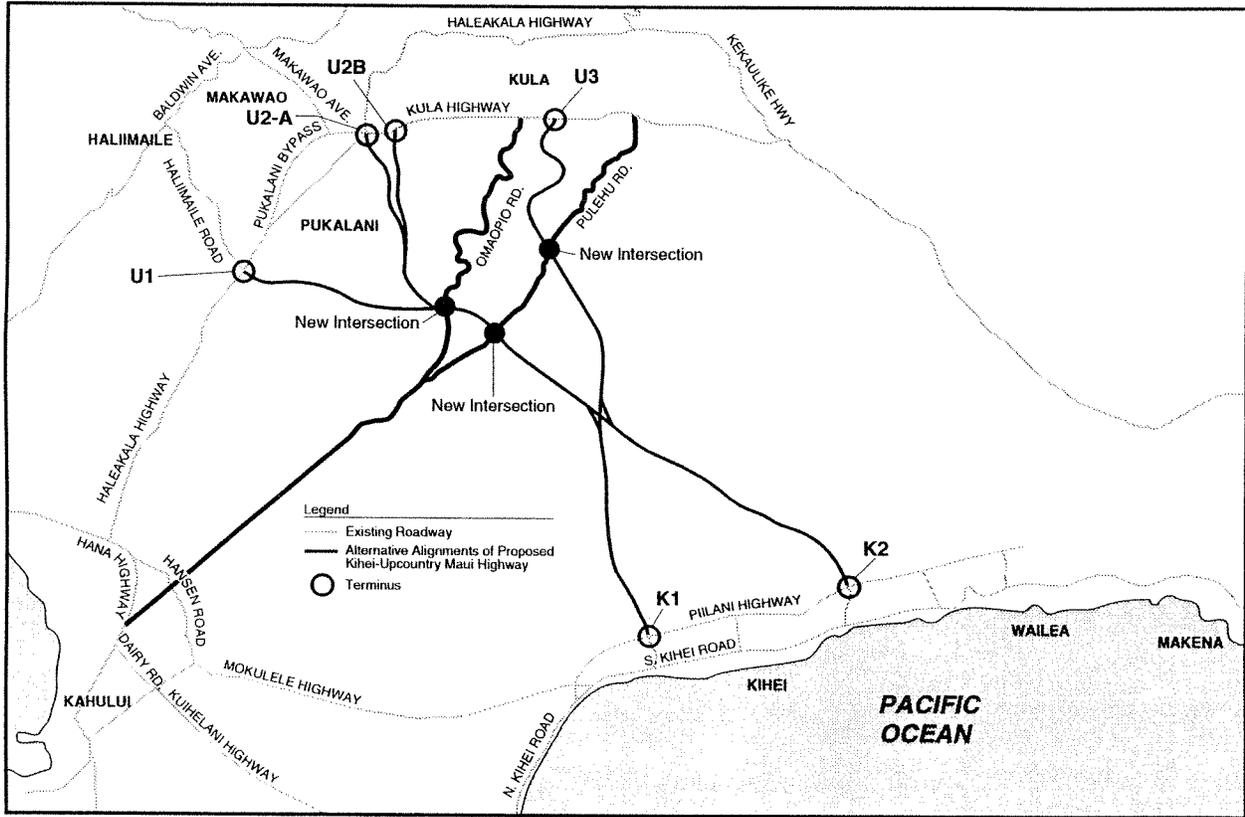

**Agricultural Movements**

Omaoipio and Pulehu Roads (see Figure 4-3) are County facilities used by Kula farmers to cultivate their fields (e.g., moving equipment from field to field) and transport agricultural products to Kahului Harbor. Although these roads are narrow and winding, they are used by some motorists as an alternative to Haleakala Highway to travel to Kahului or other parts of Maui. It has been reported that motorists often speed on these roadways. One "key informant" stated that some motorists use the even more narrow Pilihi Road, a local access road approximately 1.4 km (0.85 miles) long that is parallel to and off of Omaoipio Road, because it is straighter, allowing motorists to speed even faster. The use of these roads as a through route has adversely affected nearby and adjacent farmers and residents by interfering with farm equipment movements, increasing traffic noise and compromising traffic safety through excessive speeds on inappropriate roadways. Motor vehicle accident data from the Maui Police Department shows a high number of vehicle accidents on these roads. For example, in 1996, there were 34 vehicle accidents on Omaoipio Road. As a comparison, Haleakala Highway from the "Five Trees" intersection to Hana Highway, a roadway that has many times the traffic volumes as Omaoipio Road, had only nine vehicle accidents in the same year.

The U1, U2-A and U2-B alternatives would intersect both Omaoipio and Pulehu Roads (see Figure 4-3), and would cause an increase in the use of these agricultural roads as "short-cuts." The traffic on these roads would be higher under the U1 alternatives because the U1 terminus is farther from Kula than the U2-A or U2-B terminus. By increasing the use of Omaoipio and Pulehu Roads as through routes, greater impacts than at present from the inappropriate use of these roads would be expected. These impacts include interference with farm equipment movements, increased traffic noise and lower traffic safety through excessive speeds on inappropriate roadways. However, the County is planning to improve Omaoipio and Pulehu Roads.

In addition, the U1 or U2-A/U2-B crossings would have a slight adverse effect on farm product transportation from Kula to Kahului because delivery trucks would cross the new highway. However, the highway would enhance product transportation to Kihei-Makena.

The U3 alternatives would only intersect Pulehu Road (see Figure 4-3). Since the U3 terminus is a short distance away from the Pulehu Road/Kula Highway intersection, the traffic diversion onto Pulehu Road would be minimal.

**Impacts to Omaoipio and Pulehu Roads**  
**KIHEI-UPCOUNTRY MAUI HIGHWAY**  
 Community Impact Assessment  
 FIGURE 4-3

Residential Areas

U3 alternatives may encourage travelers to and from the Haleakala summit to use local residential roads between Kula Highway and Haleakala Highway. The preferred route for this trip is for motorists to stay on Kula and Haleakala Highways. Some visitors who are unfamiliar with the Upcountry roads may choose to use the local east-west (maukamaka) roads between Kula and Haleakala Highways because they may appear to be "short-cuts" to the summit. Increasing traffic volumes on local residential roads would adversely affect the adjacent neighborhoods through increased traffic noise (including travel to the summit early in the morning to watch the sunrise), and the increased potential for accidents on roadways not designed for heavy volumes.

King Kekaulike High School

"Key informants" have reported that students of the new King Kekaulike High School located on the southeastern corner of the Pukalani Bypass/Haleakala Highway/Kula Highway "Five Trees" intersection walk along Kula Highway, which has no sidewalks. They also report that students walk on Haleakala Highway in Pukalani, again because there are no sidewalks. The "key informants" were also worried that student "inexperienced" drivers would have difficulty driving to and from the school if an alternative is selected that is near the school because of the high traffic volumes associated with the highway, such as travel demand to and from the summit and the more populous communities of Pukalani and Makawao.

The location of the U2-A terminus at the "Five Trees" intersection would facilitate access to King Kekaulike High School. This alternative would have minimal effects to the school's main entrance, which is located approximately 300 m (1000 ft) south of the intersection on Kula Highway, because much of the high traffic volumes associated with the highway would use Haleakala Highway. Some of this traffic would, however, pass in front of the school's second back entrance/exit on Haleakala Highway. Under any of the U2-B alternatives, the majority of traffic would pass in front of the main entrance/exit, and therefore may make it more difficult for "inexperienced" drivers to enter or exit the school.

Bicycling Impacts

Bicycle tours are a popular tourist activity on Maui. Tours normally start from the summit of Haleakala, run through Crater Road, Haleakala Highway and Baldwin Avenue, and end in Paia. Although Kihei-Upcountry Maui Highway was not identified in Bike Plan Hawaii (April 1994) as a potential bikeway, the Kihei-Makena region would be a natural area to end some of the Haleakala bike tours. The proposed roadway would have sufficient room for bicyclists riding single file because bike lanes would be provided at urban roadway sections and adequate shoulders would be provided at rural roadway sections. Bike tour operators would be less likely to modify their routes if U1 or U3 is selected because of their distance from the "Five Trees" intersection.

Highway Safety

Engineering design standards for a rural, limited access arterial roadway, as specified by the American Association of State Highway and Transportation Officials (AASHTO), were used as a total flaw criterion in selecting alternatives for the project. Therefore, all the alternatives would provide a safe transportation facility. Regardless of the alternative selected, the Kihei and Upcountry termini would be signalized. However, since the U1, U2-A and U2-B alternatives could divert traffic onto Omaoipo and Pulehu Roads, and because these roadways are not designed to accommodate high volumes of traffic, accidents could increase on these two roadways.

**4.6 Community Facilities, Services and Parks**

None of the alternatives would directly affect (through right-of-way impacts) existing public facilities and services, parks or recreational facilities. However, access to these facilities and services would be enhanced by any of the alignment alternatives because of the decreased travel time between Kihei and Upcountry.

**4.7 Crime**

Table 4-1 exhibits the crime rates of the communities in the study area for selected offenses for the years 1993 to 1996. The table indicates that for property crimes, such as burglary and theft, the Kihei to Makena communities have crime rates two to four times the rate of Upcountry communities. The crime rate differences for other offenses, such as criminal property damage, are not as great or the Upcountry communities have higher rates than the Kihei-Makena communities. The information presented in this table supports views expressed by "key informants" from Kihei who identified crime as a social problem affecting their community, and views expressed by Upcountry "key informants" that that crime is not a problem.

Scoping activities and interviews conducted for this study indicated a strong belief among some Upcountry residents that Kihei-Upcountry Maui Highway would increase the crime rate in Upcountry because criminals based in Kihei would have more convenient access to Upcountry. Makawao and Kula police officers interviewed for this study could not speculate on whether the highway would increase the crime rate in Upcountry, although both officers agreed that the proposed highway would facilitate better police response through additional highway infrastructure.

**Table 4-1  
Crime Rate of Selected Offenses Per 10,000 Residents**

Offense/Location	Year			
	1993	1994	1995	1996
<b>Burglary</b>

**5. POTENTIAL ECONOMIC IMPACTS**

This chapter analyzes potential economic impacts of the alternatives for the Kihei-Upcountry Highway project. The following economic impacts of the proposed project are discussed:

- effects of the project on local tax revenues, public expenditures, and employment opportunities;
- impacts on the existing highway-related businesses and the economic vitality of established business districts; and
- impacts on the local or regional economy.

**5.1 Tax Revenues and Employment**

Property values could increase over the long term for lands adjacent to the highway, particularly at the termini, if they could be developed (i.e., proper zoning and water availability), resulting in increased property tax revenues for Maui County. None of the alignment alternatives would decrease property values in adjacent parcels. These parcels would more likely be affected by current land use and economic development trends.

Because of right-of-way requirements, property taxes that would be collected by Maui County would decrease by \$13,000 to \$17,000 per year (1997 dollars) for the four alternatives that have Upcountry termini at U1 and U3. The four alternatives with the U2-A and U2-B termini would produce property tax decreases of approximately \$44,000 to \$46,000 per year (1997 dollars). This higher impact is attributable to the conversion of vacant land designated urban to roadway right-of-way. The U1 and U3 alternatives would convert almost exclusively lands designated agricultural, which have much lower property values.

The proposed project would infuse up to \$66 million (depending on the alternative) in federal funds for construction into the local economy, which would increase short-term employment and the purchase of local goods and services. The potential for additional long-term employment opportunities depends on how well the proposed project facilitates employee-producing land uses in areas approved by the County. For example, the U2-A and U2-B alternatives would support current land use plans for parcels near the mauka terminus of these alignments (Kulamalu), including business development. Although the Kulamalu development would occur with or without the either U2-A or U2-B alternative being selected, both alternatives would directly and indirectly support this area as a business district, leading to increased long-term employment opportunities. The Kulamalu developer formally suggested the U2-B alignment, and has developed a master plan with the U2-B alignment. A U2-A alignment may cause the developer to modify the Kulamalu master plan.

## 5.2 Impacts on Highway-Related Businesses and Business Districts

Existing commercial districts in Upcountry are located in Pukalani and Makawao (see Section 2.2). Kihai's commercial districts are along South Kihai Road and at a parcel in North Kihai, west (mauka) of Piliani Highway. Regardless of the alternative chosen, the proposed highway is not expected to adversely affect these districts because the roadway would not function as a commercial district bypass, except for Kahului. In contrast, Pukalani Bypass adversely affected certain Pukalani businesses. The proposed highway would not function in such a manner. Pukalani Bypass' impacts to Makawao was less profound. A Makawao business owner stated that Makawao caters to very few drive-by visitors because of its location away from the main traffic route. Most business patrons intend to visit Makawao for its shops and restaurants.

Although the proposed project would enable many motorists to bypass Kahului, economic impacts to Kahului businesses would be minimal. Residents would continue to travel to Kahului regardless of the proposed project because of Kahului's attractiveness as the island's principal commercial center (Kaahumanu Shopping Center, K-Mart, Costco, Eagle Hardware, etc.).

## 5.3 Impacts on Regional and/or Local Economy

The proposed project would infuse up to \$82 million (up to \$66 million in federal funds) into the local economy, providing job opportunities and the purchase of goods and other services needed to complete the project. In that respect, the proposed project, regardless of the alternative, would have a positive impact on the local economy. Further, if Segments U1, U2-A or U2-B is selected, this would probably facilitate expansion of Pukalani in the direction of the roadway, providing further benefits to the local economy through construction job creation, purchases of goods and services, and possible long-term employment opportunities.

All the build alternatives would enhance access to tourist destinations in Upcountry and Haleakala National Park, and therefore would have a positive effect on this industry. The proposed project may facilitate economic activities catering to visitors.

Impacts on agricultural activities are discussed in Section 4.2.

The proposed project would support Maui's efforts to develop high technology industry. The roadway would provide increased synergism between Science City on the summit of Haleakala Crater and the R&T Park in Kihai. Currently, Science City receives technical support from defense contractors occupying space in the R&T Park.

## 6. MITIGATION MEASURES

The following are suggested measures to mitigate or minimize adverse impacts described in previous sections.

### 6.1 Agriculture and Ranching

Isolated or divided fields require mitigation measures to maintain their productivity. These measures should include haul road crossings (the U1 alternative should include two undercrossings), and the modification and reconstruction of existing irrigation and drainage systems. Access provisions for farm equipment to reach the isolated fields should be made. If U2-A or U2-B alternative is selected, Hamakua and Reservoir 40 Ditches should be protected and remain operative during and following construction.

If a U3 alternative is selected, SDOT should purchase any unworkable remnant ML&P land based on guidelines of the Uniform Relocation Assistance and Real Property Acquisition Policies Act. Also, if a U3 alternative is selected, SDOT should work with Maui County to modify the Kula Agricultural Park.

Stock-proof fencing should be erected along both sides of the highway where there is cattle grazing. These fences may be constructed of hog wire with barb wire along the top and bottom of the fence. Provisions should be made at various bridge crossings so that cattle could be herded from one pasture to another without disrupting traffic. If a U3 alternative is selected, the nearby cattle corral should be relocated based on guidelines of the Uniform Relocation Assistance and Real Property Acquisition Policies Act.

### 6.2 Land Use Impacts

Mitigation should not be required because the proposed project is not anticipated to cause unplanned development. However, it is nevertheless recommended that the SDOT deny access to the new highway from parcels other than those with proposed development that is approved by Maui County and is consistent with appropriate State and County land use objectives and guidelines. If DHHL requests access to the proposed highway for their Ulupalakua area homesteads, the SDOT should consider granting such a request in order to relieve increasing traffic volumes on Kula Highway from this development.

### 6.3 Traffic Patterns and Safety

Under a U1, U2-A or U2-B alternative, at least one of the intersections of the proposed highway with Omaoio and Pulehu Roads should be signalized to facilitate crossing by heavy trucks. If possible, the timing algorithm of this signal(s) can be set to discourage motorists from using Omaoio and Pulehu Roads as a "short-cut." This, of course,

would be an inconvenience for Kula farmers who previously had an uninterrupted route to Hana Highway.

If a U3 alternative is selected, signage should be provided to direct motorists to the proper route to the Haleakala summit.

Regardless of the alternative selected, the SDOT should consider constructing sidewalks along both sides of Kula Highway from the "Five Trees" intersection to at least the school. Since it is expected that development would occur on the south (mauka) side of Pukalani, sidewalks should also be appropriate on the east (makai) side of Kula Highway.

## APPENDICES

### Appendix A Interview Questions

1. How long have you lived in [location]?
2. How would you define your neighborhood? What makes it a "neighborhood"?
3. How old is your neighborhood?
4. How well do your neighbors know one another?
5. Would you say there is a sense of neighborhood? If so, in what way?
6. What kind of issues or problems has your neighborhood experienced in the last few years?
7. How were these issues or problems resolved?
8. [If interviewee is part of community association] What kinds of issues does your community association get involved with?
9. Is there something about [location] that you wish to stay the same?
10. What would you like to change?
11. What are the threats to the things you value about this place, if anything?
12. How have things changed in [location] in the last five years?  
ten years?  
twenty years?
13. What do you think [location] will be like in 20 years?
14. What kind of future would you like for [location]?
15. What are some of the obstacles to this future?
16. What are some of the opportunities or what can be done for this future to come true?
17. How do you feel about this project?
18. What kinds of impacts do you expect to your neighborhood from this project?  
to [location]?  
to the island?
19. Would a certain alternative make a difference?
20. How can the negative impacts be prevented or minimized?
21. How will [location] benefit from this project? How about the island? Neighborhood?

Cultural Surveys Hawaii, Inc.  
June 1999

**ABSTRACT**

An archaeological reconnaissance survey of six proposed alternate routes for the Kihei to Kula road corridor was conducted by Cultural Surveys Hawaii, Inc. from 18 February through 6 March 1997. Subsequent to the original reconnaissance survey additional alternatives, U2A and U2B were also subjected to reconnaissance survey. The alternate corridors are four hundred feet wide and over 121,176 linear feet (1112.7 acres). The alternate routes under study are located in the Makawao and Wailuku Districts of Maui island on the western slopes of Haleakala. They extend from Kailua at about 2300 ft. (700 m.) above mean sea level (amsl) at the north, through thirteen ahupua'a, to Kama'ole at about 100 ft. (30 m.) amsl in the south.

The reconnaissance survey included field work to assess archaeological sites, archival research of historical documents and maps, and research of previous archaeological studies. The fieldwork was conducted by three archaeologists walking each 400 foot wide corridor along a staked center line.

A total of 25 historic properties, or sites, were recorded. Twenty of these are new sites, designated State Sites #50-50-10-4760 through #50-50-10-4779. Previously recorded sites are the Kaliainui petroglyph site #50-50-10-1061; Kaluapulani Gulch petroglyphs, site #50-50-10-1062; Kaluapulani Gulch Petroglyphs (Canoes etc.) #50-50-10-4178; an historic cattle wall #50-50-10-4180; and two pineapple plantation clearing mounds, #50-50-10-4181. The new site types included enclosures, walls, mound and cairns, midden and lithic scatter, modified outcrop, road, ditch, overhang shelters and petroglyph sites. The primary functions of a majority of the sites found were agricultural and ranching (animal closures), although there were 4 recurrent habitation sites, 1 permanent habitation site, symbolic function for petroglyphs, and military function for a complex of enclosures.

In the U2A corridor historic properties, or sites, were found in two localities along Alternate U2A. The first, in Kaluapulani gulch, are two friezes of petroglyphs on the east side of the corridor. A search of the land to the west of the corridor revealed no historic properties there, thus, an option is to adjust the corridor to the west to avoid the archaeological sites.

Another site was found in Kaliainui gulch on the west side of the corridor. This site is a small shelter-cave. If the corridor will impact the site mitigation measures could be to realign the corridor to the east where no sites were found, or to retrieve the potential data from the site by archaeological excavation. No other sites were found in Alternate U2A.

If segment U2A is selected for the final road corridor an archaeological inventory survey is recommended to mitigate impacts to the historic properties in the vicinity of the corridor.

The western portion of Alternate U2B corridor, from the north edge of Kaliainui gulch westward to its terminus, was reconnoitered during the present survey work.

No historic properties, or sites, were found in the surveyed section of the corridor. However, U2B passes directly through site 50-50-10-4181 on the east side of Pu'u o Welii. It

consisted of four features including two agricultural clearing mounds and two stone alignments. Testing conducted at the stone alignments yielded historic artifacts associated with pineapple agriculture and the site is considered "no longer significant" (Wulzen 1996: ii). This previous work did not consider Pu'u o Weli, in the U2B corridor, as an historic property.

The eastern section of U2B, from Kaliainu'i gulch to the Kula Highway was previously subjected to an archaeological survey in 1996. (This portion of the route was not re-surveyed in the current work). The 1996 survey recorded one historic property, or site, in the area that is the U2B corridor. The site - 50-50-10-4181 - was tested by archaeological excavation during that survey and found to be a modern site associated with pineapple cultivation. Based on the testing the site is considered to be no longer significant and no further archaeological work is recommended for the site.

Near its *mauka* terminus Alternate U2B cuts into the west and north sides of the cinder cone Pu'u o Weli, which historically has been quarried for its cinder. This *pu'u* was not treated as an historic property in the previous archaeological study, but is potentially significant from an historic perspective in the context of the petroglyphs surrounding it, and as an early quarry associated with development in Kula.

Construction of Alternate U2B also has potential to indirectly impact the friezes of petroglyphs in Kaluapulani gulch - site 50-50-10-1062. They will require protective measures against short and long term negative impact. If segment U2B is selected for the final road corridor an archaeological inventory survey is recommended to mitigate impacts to the historic properties in the vicinity of the corridor.

On the west and southwest slope of Haleakalā, previous archaeological researchers report a pattern of at least four zones: 1) coastal, 2) intermediate or barren; 3) upland habitation and agriculture; and 4) forest zone, inland and coastal settlement and agriculture with little evidence of occupation between these extremes. The corridors under study extend from the upland (*mauka*) zone to the coastal (*makai*) zone. The present findings within the road corridors support this predicted settlement pattern.

Land Commission claims and awards (LCAs) of the Mahele and Kuleana Acts reflect some aspects of traditional life and new agricultural trends associated with the growth of an international trade. The locations of LCAs on the western flank of Haleakalā also support the predicted pattern of habitation and agriculture in the upland and coastal regions and an absence of these activities in the intermediate zone.

National Register of Historic Places significance criterion D is assigned to sites State sites #50-50-10-4750; -4760; -4761; -4763; -4780; -4763 through -4778 because the sites may be likely to yield information important to history and prehistory of Hawaii. An inventory level archaeological survey is recommended for mitigation of adverse impact to these sites, followed by data recovery of specific sites.

Sites Sites #50-50-10-1061, #50-50-10-4178, #50-50-10-4762, and #50-50-10-4764 are

significant under National Register criteria D and C because they are, respectively, likely to yield information important to history and prehistory, are considered excellent site types. Site #50-50-10-4762 is also significant under Hawaii Historic Preservation draft rules criterion E because it is "culturally significant". Recommendations for these sites call for an inventory level archaeological survey and preservation of these site areas. Mitigation of impact for these sites may necessitate realignment of portions of some of the Alternates to avoid the sites.

## I. INTRODUCTION

An archaeological reconnaissance survey of eight alternate routes for a proposed Kihei to Kula road corridor was conducted by Cultural Surveys Hawaii, Inc. from 18 February through 6 March 1997 for Parsons Brinkerhoff. The routes under study are located in the Makawao and Wailuku Districts of Maui island on the western slopes of Haleakalā.

Subsequent surveys were conducted for the new U2A and Alternate U2B alignments as a result of the finding of historic properties in the previously surveyed U2 corridor (Folk and Hammatt, eds. 1997).

Historic properties were found in Kaluapulani gulch (also shown on some maps as Haakakai gulch), and in Kaliainui gulch in the new U2A corridor. However, minor realignment of the corridor a few hundred feet to the west (downslope) will avoid these cultural resources in Kaluapulani and minor realignment to the east (up slope) will avoid the cultural resources in Kaliainui. No historic properties were found in the other segments of the U2A corridor.

### Project Area Description

The proposed Kihei to Kula road corridors selected for study extend from Pi'ilani Highway in the south at about 100 ft. (30 m.) amsl north to Kula Highway at about 2300 ft. (700 m.) amsl. The corridors cross thirteen *ahupua'a* (Figures 1-3) from north to south, Kailua, Keahua, A'apueo, Kaliainui, Oma'opio, Pūlehunui, Kealahou 3 & 4, Waiaikoa, Ka'ono'ulu, Kōheo 1 & 2, Waiohuli, Kōokea, and Kama'ole.

The eight alternate route segments are based on four upcountry termini designated U1, U2A, U2B, and U3 and two Kihei termini designated K1 and K2; these designations are used to identify the route segments in this report. U1 intersects Haleakalā Highway, U2A & U2B and U3 intersect the Kula highway. K1 and K2 intersect Pi'ilani Highway.

A segment common to alternatives U1 and U2 and is designated U1/U2 (Figure 3). Each alternate corridor is four hundred feet wide and combined, total approximately 121,176 linear feet (1112.7 acres). The eight alternates are summarized as follows:

1. Alternate U1 is about 18000 ft. long. Beginning at Haleakalā Highway at the intersection Hali'imaile Road, the route proceeds south through cultivated fields of sugarcane, crosses Kaliainui gulch, Oma'opio Road and Pūlehu gulch to intersect alternates U1/U2 and U2 in old cane fields converted to pasture north of Pūlehu Road at about 1000 feet above sea level.
2. Alternate U2, also about 18000 ft. long, extends from the Kula Highway at Kaluapulani Gulch west (*maka'i*) through former pineapple fields - now used for pasture - passing south of Pu'u O Wehi - an historically quarried cinder cone - to Kaliainui Gulch. It continues west on the south side of Kaliainui Gulch through

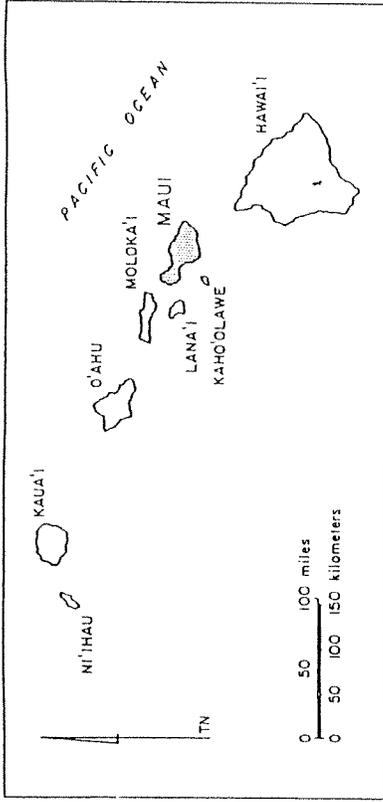

Figure 1 State of Hawaii

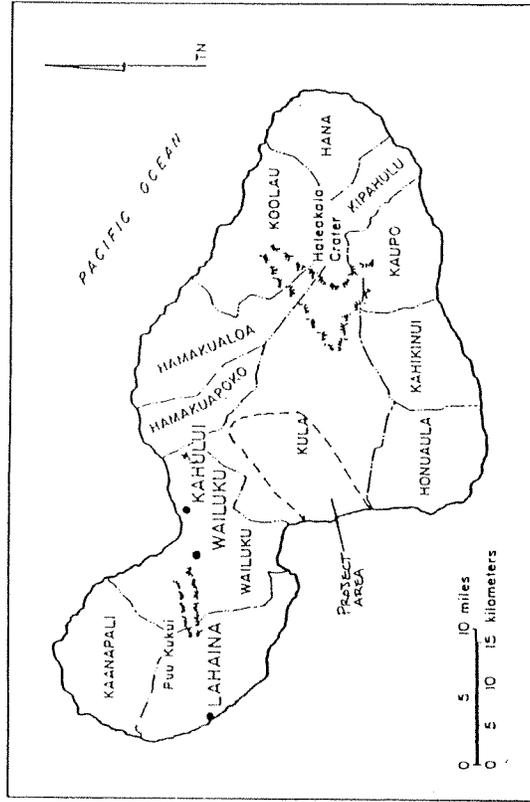

Figure 2 General Location Map, Hawaii Island

3. fields cultivated in pineapple, and then fields of sugarcane. In the sugarcane Alternate U2 turns south to parallel Alternate U1 crossing Oma`opio Road and Pūlehu Gulch, joining Alternate U1 and U1/U2 in the old sugarcane fields north of Pūlehu Road.
4. Alternate U1/U2 - a segment shared by Alternates U1 and U2 - is approximately 13000 feet long and extends from the intersection of U1 and U2 north of Pūlehu Road to the intersection of U3, K1 and K2 at about 750 feet above sea level. It begins in old cane field converted to pasture, proceeding south-southwest across Pūlehu Road, through cultivated pineapple fields, across Kolaloa Gulch at about 1000 ft. elevation, to and across Waiakoa Gulch at about 800 ft. to meet with the other alternates.
5. U3 begins at the Kula Highway at Pūlehu Gulch and proceeds west for over 25000 feet through cultivated pineapple fields, pasture, and truck farm lands. At 1600 ft. elevation the route crosses Pūlehu Road into more pineapple fields, then crosses Kolaloa Gulch, and Waiakoa Gulch at 1100 ft. elevation as it proceeds to the intersection of K1, K2, and U1/U2.
6. K1 is about 18000 ft. long and proceeds from Pī ilani Highway at Ka`ono`ulu St. east through ranch pasture land between Waiakoa and Kūlanihāko`i gulches, intersecting Alternates K2, U1/U2 and U3 at 750 ft. above sea level.
7. K2 extends northeastward for approximately 23000 feet, from Pī ilani Highway at its intersection with the newly built collector road (Road F per the Kihei Traffic Master Plan), through ranch pasture land. K2 crosses Waipūlani Gulch at about 500 feet above sea level and two branches of Kūlanihāko`i Gulch at about 650 ft. elevation, and joins with the other alternates near the 750 ft. contour.
7. The proposed U2A Alternative is approximately 9,000 ft. long and extends west, southwest from the intersection of Kula and Haleakala Highway to a point O1 on the U2 Alignment.
8. The U2B Alignment, approximately 8,000 ft. long and extends west, southwest from Kula Highway opposite - from the cane fields at Oma`opio Road east (*mauka*) through the pineapple fields south of Pūkalani town to the Kula Highway at the new King Kekaulike High School - impacted historic properties in a secondary, tributary branch of Kaluapūlani gulch, in Kaliahinui gulch, and on the ridge land south of Kaliahinui gulch.

As a result of the findings of historic properties in Alternate U2 two new *mauka* alignments - Alternate U2A and Alternate U2B - were proposed and surveyed during September 1997.

Project area map based on USGS 7.5 minute across topographical maps of the Hauka, Kilaheua, and Po'u O Kahi quadrangles, showing the corridor Alternates (the study area), and approximate site locations.

### Scope of Work

This scope of work is in response to the information delivered to Cultural Surveys Hawaii, Inc. (CSH) on Jan. 12, 1996, including agreements concluded during the Jan. 31, 1996 meeting at Parsons Brinkerhoff. The scope incorporates an Oct. 30, 1995 memorandum from Don Hibbard DLNR/SHPD on a review of an Environmental Impact Statement Notice for the Kihnei to Kula Highway.

Based on these documents two phases of work will be undertaken:

Phase I: Conduct background research on 6 corridor alternatives (2 added later) providing an overview in addition to walking of each of the staked corridors to locate sites and define site limits. During this phase, fieldwork would be carried out and fatal flaws, if they occur in any of the three corridors, would be identified.

Phase II: archaeological inventory survey of the single chosen alternative involving complete documentation of all archaeological resources within the chosen corridor. DLNR has requested to review both Phase I and II reports as well as the scope.

A scope of work for each phase is presented below.

#### Phase I: Assessment and Field Survey of 8 Alternatives

1. Historical background including archaeological and archival information dealing with past land use and history. This will also involve a search of land commission award records and historic maps. Aerial photographs will be studied to find any archaeological sites that may be visible. Ms. Sara Collins and other knowledgeable individuals will be consulted about items of archaeological and historical interest. The purpose of this background research will be to document settlement patterns for the areas covered by the alternatives. Not only will high density, medium density, and low density areas be defined by number of archaeological sites, but also DLNR has requested that the specific kinds of sites be included in this settlement study such as: habitation, agriculture, burials, and religious sites.
2. Interviews with knowledgeable *kama'aina* are planned especially Hawaiians, who could shed light on the settlement pattern as well as help identify traditional cultural places and archaeological sites. This task has been deferred until the Phase II, final road corridor is selected and will be conducted as part of the inventory survey.
3. Fieldwork will be conducted to confirm the predictions for site location as determined by historic documentation, examination of aerial photographs and. Fieldwork will involve helicopter reconnaissance followed by survey of the staked corridors. CSH would request stakes be placed at not more than 200' intervals and preferably at 100' intervals. The survey area for each

corridor will be 400' wide. The length of the survey area is estimated to be from 22 to 25 miles long. Although each site located will not be recorded in detail at this time, the types of features will be noted and the general boundaries of the site complexes will be recorded and initial assessments of the significance of these sites will be made.

4. Preparation of Phase I report. This report will summarize all the background information collected and the results of the fieldwork to evaluate the relative archaeological constraints involved in each of the alternatives. This evaluation will be in the context of the settlement pattern predictions for the area covered by the three corridors and will include maps showing site density and types of sites for each area. Each alternative will be ranked according to the relative impact on archaeological resources. The archaeological site areas will be located on an overall map of each corridor in relation to centerline stakes, and each area will be assessed on a preliminary basis for value and possible mitigative measures. This report will clearly identify if archaeological constraints will be difficult or impossible to overcome.

#### Phase II: Archaeological Inventory Survey of a Single Selected Corridor

The single corridor selected from the 8 alternatives of Phase I will be subject to a complete inventory survey with 100% ground coverage of the corridor and detailed description and mapping of each site.

The following Scope of Work is standard for satisfying the State and County requirements for an inventory survey level of investigation:

1. A complete ground survey of the entire project area for the purpose of site inventory. All sites will be located, described, and mapped with evaluation of function, interrelationships, and significance. Documentation will include photographs and scale drawings of selected sites and complexes. All sites will be assigned State site numbers.
2. Limited subsurface testing to determine location, boundaries, depth and quantity of cultural materials within archaeological sites and to obtain datable samples for chronological information for sites in the immediate area, if such data is not available from previous studies.
3. Research on historic and archaeological background, including a search of historic maps, written records, Land Commission awards, and Native Testimony. Research will focus on the specific area with general background on the *ahupua'a* and district and will emphasize settlement patterns.
4. Preparation of a survey report which will include the following:

- a. A topographic map of the survey area showing all archaeological sites and site areas;
- b. Description of all archaeological sites with selected photographs, scale drawings, and discussions of function;
- c. Historical and archaeological background sections summarizing prehistoric and historic land use as they relate to the archaeological features;
- d. A summary of site categories and their significance in an archaeological and historic context;
- e. Recommendations based on all information generated which will specify what steps should be taken to mitigate impact of development on archaeological resources, such as data recovery (excavation) and preservation of specific areas. Recommendations will be developed in consultation with the landowner and State and County agencies.

#### Survey Methodology

The center lines of the eight corridor segments comprising the alternate routes were located by licensed land surveyor. These center lines were marked in the field - normally at two hundred foot intervals - by wooden hubs and numbered wooden stakes with pink flagging tape at each point. The center line stake markers were used as guides for the survey and to locate sites by bearings and distances.

The archaeological reconnaissance survey was conducted on foot by three archaeologists. Each of the six segments of the proposed alignments were completely covered in the survey. The corridors surveyed were four hundred feet wide; two hundred feet on either side of the center line. The two hundred foot corridor half-width was used as the width for each sweep of the archaeological survey. Thus the archaeologists were spaced at intervals of approximately sixth-seven feet (20.4 meters) apart, with each archaeologist covering a distance of no more than thirty five feet (10.7 meters) to either side of his survey line. Where tall grasses grew the interval between archaeologists was reduced to provide complete coverage.

At the U2A crossing of Kaliainui gulch the survey area was expanded four hundred outside the corridor to the west, or *maikai*, side of the centerline. This was done to evaluate the potential impact to historic properties if the corridor were realigned to the west, because of the proximity of historic properties to the east.

The survey of Alternate U2A in Kaliainui was coordinated with another survey - of Alternate U2B - because of the steep valley walls in these sections of the gulch. The result was that the land from the west edge of the U2A corridor to the east side of the U2B

corridor was entirely surveyed within the gulch.

Vegetation was a factor in the survey, where it hampered visibility, the speed of the survey was reduced to provide more adequate coverage. The vegetation in the project area consisted of open savannah of *kiawe* trees and Pangola-like pasture grasses. At higher elevations the savannah closed in to open *kiawe* forest and the understory included dense growths of *panini* cactus. The *kiawe* did not present difficulties for the survey activity in the savannah or open forest, but recent rains produced a substantial growth of the grass understory. The grasses were consistently one to two feet high in the savannah and three, or rarely, four feet high in the open forest. Although difficult to see with sixty percent to one hundred percent high grass coverage, it was possible to view the archaeological features when they were present. The *panini* was difficult to navigate around and through, but the ground beneath it was clear of other vegetation.

All sites were located on the 1 in. = 3000 ft., 5-foot contour map by means of hand held tape and compass relative to the centerline stakes. They were briefly described and preliminary assessments of type, function, significance and future treatment were made. Selective photography was also used to complement survey documentation. The sites were flagged with yellow barricade tape and given temporary CSH site numbers were inscribed on the flagging. In the Kihei section of the K2-U1 corridor, some sites comprised a grouping, or complex, and the barricade tape flags were placed to mark the bounds of the site grouping within the road corridor. In other instances where a site had fewer features, each feature of the site was also flagged and assigned a letter suffix to the temporary site number. methods

## II. NATURAL HISTORY

### Geology

The *ahupua'a* of Kailua, Keāhuna, 'A'apueo, Kalialinui, Ōma'opio, Pūlehu Nui, Kealahou 3 & 4, Waiakea, Ka'ono'oulu, Kōheo 1 & 2, Waiohuli, Kēōkea, and Kama'ōle are all located on the western slope of Haleakalā. Haleakalā is composed of lava flows known as the Honomanū Volcanic Series of the Tertiary system. These ancient lavas have been mostly covered by later flows and are exposed in only a few localities, along the north and northeast shore sea cliffs and in Ke'anae Valley (Macdonald, *et al.* 1983:388).

In the project area, the Honomanū Series lavas are covered by the Kula Volcanic Series of the Pleistocene epoch. Lavas of the Kula Series consist mostly of *aa*; eruptions were explosive to the extent that many large cinder cones were formed and beds of ash are common. These cones are present mostly on the summit and northern slopes of the mountain but also occur on the western slope in vicinity of the project area. The Kula flows are relatively thick, averaging from twenty feet thick near the summit of Haleakalā to fifty feet thick at the coast. More recent rocks of the Hāna Volcanic Series mantle the Kula Series at the east and southwest ends of Haleakalā, but do not extend into the study area (*op. cit.*:388,390). The western edge of the study parcel (in the vicinity of Pīlani Highway) is characterized by a thin band of sedimentary rock consisting of a recent, younger alluvium. The Kihei coastline is comprised of an older sediment consisting of the lithified dunes of the Pleistocene epoch (*op. cit.*:388).

### Geography

#### Kula District:

The western slopes of Haleakalā receive a relatively small amount of rain annually, the recorded mean annual rainfall at the mountain's summit is 1000 mm, which decreases to 400 mm. at 1000 ft. above mean sea level (amsl). The majority of the project area receives between 400 mm. (sea level to 1000 ft. amsl) and 500 mm. (1000 to 2000 ft. amsl) of rainfall annually. The *mauka* portion of the parcel (2000 to 2300 ft. amsl) receives between 500 mm. and 750 mm. per year (Giambelluca *et al.* 1986:112). Mean monthly rainfall records show the heaviest rainfall to occur between November and March, ranging from 50-100 mm. (from approximately 300 ft. to 2000 ft. amsl), with the months of April to October averaging between 5-25 mm. During the driest month, June, the area receives 5-10 mm. (*op. cit.*:113-124).

Air temperatures in the upper elevations are cool; Kula San station, located at 3004 ft. amsl, records a maximum annual mean ranging from 69° to 75°F and a minimum annual mean from 50° to 58°F. The station has recorded a record low of 40°F in December and a record high of 90°F in June (Armstrong 1973:58).

#### Upland Zone

Soils in the *mauka* portions of the project area (the low uplands) consist primarily of the Keāhuna-Keāhuna-Molokai association, consisting of "moderately deep and deep, nearly level to moderately steep, well-drained soils that have a moderately fine textured subsoil" (Foote *et al.* 1972: General Soil Map, Maui Island). These soils range from sea level to 1500 ft. amsl and have a temperature between 73° and 75°F (*op. cit.*:8). A small area, where Pūlehu Gulch meets Kula Highway, has soils of the Puu Pa-Kula-Pane association. This soil association consists of "deep, gently sloping to steep, well-drained soils that have a medium-textured or moderately fine textured subsoil or underlying material, on intermediate and high uplands." (Foote *et al.* 1972: General Soil Map, Maui Island. These soils range from 1000 to 6000 ft. amsl and have a temperature between 55° and 69° F (*op. cit.*:9).

Vegetation consists of *kiawe* and lowland shrubs below 1000 ft. amsl, including *koa haole*, *finger grass*, and *pili grass*; and *lantana-koa haole* shrubs between 1000 and 3000 ft. amsl, including *kū*, *panini*, *itima*, and *Natal reedtop grass* (Armstrong 1973:64). Wildlife consists mostly of upland game birds (Foote *et al.*:8).

Handy and Handy (1972:55) describe the Kula region as sloping land covered with old, red soil in which sweet potato (*uala*), sugar cane, and pineapple grow well. The word *kula* is traditionally used to refer to dry land versus wet, taro land. Handy and Handy refer to fields of *pili grass* in Kula, traditionally used for roof thatching. The authors state that "before cultivation took over the area, the carpeting grass was interspersed with vines (such as the *kaali*, morning-glory) and many shrubs, all of which found practical uses by the immigrant folk. There were also a few stunted trees." (*Ibid.*) Handy and Handy also indicate that in the uplands of Kula grew flowering plants (including native ginger), medicinal herbs, thick shrubs, and many different trees whose wood was used for many purposes.

#### Coastal Kihei Region:

The Kihei area receives less than 400 mm. of rainfall annually (ranging from 5 mm. to 50 mm. monthly), making it the minimum rainfall area on Maui (Giambelluca *et al.* 1986:14). Most of the rain in this area comes during winter storms. Giambelluca *et al.* indicate that "the Kihei minimum is part of a broad area of low rainfall covering the saddle of the island and extending along the leeward coast from Makena to Ka'anapali. The aridity of this region results from the rain-shadow effects of the island's two large volcanoes" (*op. cit.*:16). Typically, Kihei is sunny and dry with an average temperature of 77°F with occasional variations ranging from the low 60s to the high 80s (CSH 1991:24).

#### Intermediate Zone

Soils in the area immediately *mauka* of the Kihei coastal beach zone are of the Pūlehu-Ewa-Jaucus association. These are "deep, nearly level to moderately sloping, well-drained and excessively drained soils that have a moderately fine textured to coarse-textured

subsoil or underlying material; on alluvial fans and in basins." (Foote *et al.* 1972: General Soil Map, Maui Island). These soils develop between sea level and 600 ft. amsl and have a temperature of 75 F (*op. cit.*:8).

Vegetation consists of *kiawe* and lowland shrubs below 1000 ft. amsl, including *koa haole*, finger grass, and *pili* grass (Armstrong 1973:64). Wildlife consists of native water birds and upland game birds (Foote *et al.* 1972:8). During the field survey, a population of wild deer was observed in the *maka* portion of the study parcel.

### III. HISTORIC BACKGROUND

#### Historic Setting

The project area lies primarily in what is referred to as the "barren zone" of the Makawao and Wailuku Districts, the area located between the narrow coastal zone and the upland habitation and agricultural zone which begins at 2000 ft. amsl (Cordy 1977:4). The eastern portion of the present study area extends into the inland zone. According to Cordy the barren zone was probably most utilized in the late pre-contact era as a route between the inhabited coastal and inland areas with corresponding intermittent habitation (*op. cit.*:12). Fredericksen and Fredericksen (1995:2) state that the upper area was probably used intermittently for its resources (*e.g.* *koa* and possibly sandalwood trees) and possibly for dryland agriculture towards the end of the pre-contact period. Sources indicate that upper Kula (old district), even with its arid climate, has continuously been a place of agricultural production, particularly of dryland *uala* or sweet potato. In their studies of Ōma'opio, (Donham 1992:4) and Waiohuli and Keōkea (Kolb *et al.* 1997) the authors discuss the presence of *heiau* and the subsequent inference that a large permanent population must have been present, as well as noting the presence of habitation and agriculture in the uplands (2000 to 2800 ft. amsl) of Keōkea and Waiohuli (south Kula) (Kolb *et al.* 1997). Wong-Smith (Brown and Haun 1989:C-2&3) also notes several *heiau* located in the uplands of Keōkea, Waiohuli, and Kailua and overlooking Mā'alaea Bay. Dryland agriculture in Kula would extend from pre-contact times to the 19th century and on into the present, amidst the influx of other land uses such as ranching, pineapple and sugar cane cultivation, and residential development.

#### Mythological and Traditional Accounts

Mythology regarding this region of the Makawao (Kula) and Wailuku Districts is relatively scarce. Legends of Maui the demi-god often encompass the entire island (or large portions) and include Haleakala, but rarely do they focus on the area inclusive of the study parcel. However sayings regarding the Makawao and Wailuku Districts do exist, as well as accounts of the pre- and post-contact activities of the chiefs. The literal translations of relevant land division names are presented below, along with selected historical and legendary sayings regarding Kula, Makawao and Wailuku, and traditional accounts regarding Wailuku, Kula, Pu'unene, Kama'ole, and Kihei.

Literal translations of several of the land areas and divisions relevant to the project area are listed below. Unless otherwise noted, the translations are taken from Pukui, *et al.* (1974).

Makawao (district):	"forest beginning" (or "Watchful eyes of Wa-o" (timeless or eternity)-Wong Smith in Donham 1990b:B-1)
Kula (district):	"plain"
Kihei:	"cape, cloak"
Kama'ole:	"childless" (or "barren"-Fredericksen, <i>et al.</i> 1994:3)
Keōkea:	"the white sand"

Waiohuli:  
 Kōheo:  
 Ka'ono'ulu:  
 'Alae:  
 Waiakoa:  
 Kealahou:  
 Pūlehu Nui:  
 Oma'opio:  
 Kaliahinui:  
 Maka'eha:  
 'A'apueo:  
 Pukalani:

"water of change"  
 "to show off or to twirl"  
 "the desire [for] breadfruit"  
 "mudhen"  
 "water [used] by warrior"  
 "the new pathway"  
 "large Pūlehu [broiled]"  
 possibly "whistling thrush"  
 meaning uncertain  
 "sore eye"  
 "owl call" (Wulzen, *et al.*, 1996:B-6)  
 "heavenly gate" or may take its origin from Pū'u-ka-lani "hill of the heavens"  
 "the mound"  
 "two seas (probably currents)"  
 "water of destruction"  
 "goose hill"

Pukui (1983) notes several sayings regarding Kula. These sayings range from the historical, legendary, and environmental to those of both ridicule and admiration. The following two sayings refer to historical and legendary events in Kula.

"*Ai pua a a Kukeawe. The pork-eating of Kukeawe*" refers to "a person who is not satisfied with the number of his own pigs and so robs his neighbors of theirs." (*op. cit.*:#88) This saying stems from the early historical account (c.1785) of a petty chief under Kahekili named Kukeawe, whose story (as told by Kamakau).

"*O ka wai kau no ia o Ke'anae; o ka 'ūlei ho'ouali 'uuala ia o Kula. It is the pool on the height of Ke'anae; it is the 'ūlei digging ditch for the potato [patch] of Kula.*" (*op. cit.*:#2447) This saying relates the story of a man from Kula and a woman from Ke'anae, both of great beauty, who in their mutual attraction boasted of their own physical perfection. The woman referred "to her body as the pool on the heights of Ke'anae...he looked down at himself and boasted of his manhood as the digging stick of Kula." The man's chosen metaphor implies not only the greatness of his ego and/or "manhood", but the importance of agriculture/sweet potato production in Kula.

Some sayings note environmental characteristics of Kula, using their imagery to describe other aspects of life.

"*Moe kokolo ka uahi o Kula, he Hau. The smoke of Kula traveled low and swift, borne by the Hau wind.* Said of one who is swift in movement. Also, in love and war much depends on swiftness and subtlety." (*op. cit.*:#2170)  
 "*Kokolo ka uahi o Kula, he Ke'ānu. The smoke of Kula creeps along when the Ke'ānu breeze blows.* Where there is smoke there is fire." (*op. cit.*:#1824)

Pukui records three derisive sayings regarding Kula and one saying of praise which binge upon the inland location of the Kula community:

"*Kula unahi pikapika he'e. Kula people, scalers of the suckers on the tentacles of the octopus.* Said in fun of the people of Kula, Maui. A Kula chiefless who lived inland did not know what the suckers on an octopus were and tried to scale them as one scales fish." (*op. cit.*:#1911)

"*No Kula ia po'e ke hoe hewa nei. To Kula belong the people who are such poor paddlers.* Kula, Maui, people are ignorant. Also, never mind the talk of fools." (*op. cit.*:#2339)

"*O Kula i ka hoe hewa. Kula of the ignorant canoe-paddlers.* Said of Kula, Maui, whose people did not know how to paddle canoes because they were uplanders." (*op. cit.*:#2473)

"*Na heiki unene māmane o Kula. The lads of Kula, who tug and pull the māmane up by the roots.* An expression of admiration for the people of Kula, Maui, who accomplish whatever they set out to do." (*op. cit.*:#2238)

Pukui (1983) records several sayings about Makawao including these three, which describe the characteristics of the inhabitants and the environment:

"*E hui e mai 'oe i ke kaai e o Makawao! Try uprooting the koai e tree of Makawao!* I defy you to tackle a lad of Makawao! A boast from a native of Makawao, Maui." (*op. cit.*:#298)

"*Keiki holoholo kuaa o Makawao. The lad of Makawao who goes about in the rain.* Said of a native of that place who is not afraid of being wet." (*op. cit.*:#1705)

"*Ka ua 'ūkiu o Makawao. The 'ūkiu rain of Makawao.* Refers to Makawao, Maui." (*op. cit.*:#1602)

"*Ho'olale a ka ua 'ūkiu. A suggestion of the 'ūkiu rain.* Go ahead and do what was suggested. The 'ūkiu rain is cold enough to make one hurry and scurry." (*op. cit.*:#1092)

Pukui (1983) notes a few sayings regarding Wailuku, including the following which refers to one of many battles which occurred in the area:

"*Ke inu aku la paha a 'u 'Alapa i ka wai o Wailuku. My 'Alapa warriors must now be drinking the water of Wailuku.* Said when an expected success has turned into a failure. This was a remark made by Kalaniopu'u to his wife Kalola and son Kiwala'o, in the belief that his selected warriors, the 'Alapa, were winning in their battle against Kahekili. Instead they were utterly destroyed." (*op. cit.*:#1711)

Traditional accounts concerning Makawao and Wailuku seem to be limited to the pre- and post-contact activities of the chiefs. Compiled below are traditional accounts regarding Wailuku, Kula, Pu' unene, Kama'ole, and Kihei.

Kamakau (1961) provides references to the areas of Wailuku, Kula, and Kihei involving the ruling chiefs of Maui and Hawaii and their warfare during the 1730s:

When Ke-kau-like heard that the ruling chief of Hawaii [Alapa'i] was at Kohala on his way to war against Maui, he was afraid and fled to Wailuku in his double war canoe named Ke-aka-milo...and the fleet landed at Kapa'ahu at the pit of 'Ai-hako'ko' in Kula. Here on the shore the chiefs prepared a litter for Ke-kau-like and bore him upland to Haleki'i in Kukahua. There Ke-kau-like died...in the month of March, 1736. (*op. cit.*:69-70)

Alapa'i sailed from Kohala on Hawaii...But when he landed at Mokulau in Kaupo (Maui) and heard that Ke-kau-like was dying, he gave up all thought of war and wished only to meet Ke-kau-like and his (half) sister Ke-ku'i-ipo-iwa-nui...He landed at Kiheipukoa with all his chiefs and fighting men...While he was at Kihei, Alapa'i heard that the ruling chief of Oahu was making war upon Molokai. Most of the chiefs of Molokai...were of Hawaii...Alapa'i's sympathy was aroused, for these were his own brothers and children (relatives), and he made ready to go to their help on Molokai. (*op. cit.*:70)

Speakman (1984:14), in his narration of the power struggle between the sons of Ke-kau-like for succession to the Maui throne, describes battles which occurred in West Maui, and specifically Pu' unene:

For several years after Ke-kau-like's death, the war continued. A major battle took place at Honokawai in West Maui. The forces of Alapa'i and the young Maui heir [Kamehameha-nui] were badly mauled and withdrew. Another battle occurred in which the ruling chief of Oahu fought in alliance with Ka'uhi, the challenger. The hardest fighting happened at Pu' unene in the dry central plain of Maui. The slaughter was great on both sides, and a stalemate resulted in a peaceful settlement between the ruling chiefs.

Kamakau (1961:142) relates an account of a lesser chief of Maui during the 1780s, with references to Kula, Wailuku, and Kama'ole:

During this period there were disturbances among the country people, not only on Oahu but also on Maui. The trouble arose through one of the lesser chiefs (*kauhauai'i*) named Ku-keawe, a favorite (*atikane*) of Ka-hekili to whom Ka-hekili had given the privilege of letting his pigs run over the land of Kula and roasting them as he needed them. But he seized also the pigs belonging to the country people of Kula, Honua'ula, and Kahikini, as far as Kaupo, and went with a large party to rob them of their wealth even with

violence. This was the cause of the uprising of the country people called the "Battle of the pig-eating of Ku-keawe" (*Aipua'a-a-Ku-keawe*). When the plundering party reached Kaupo they were surprised by some fighting men of Kahikini, Honua'ula, Wailuku, and Waiehe'e...they climbed the mountain of Haleakala in order to descend to Kamaole in Kula...Here they were surrounded by Ka-wehena's men. Ku-keawe was killed, and his body stuck up like an image toward the sea of Palaua.

A second reference to Kama'ole, regarding the coastal place name Kaluaaihakoko, is recorded by Kamakau in an account of the ruling chief 'Umi (1961:230):

... 'Umi came from a humble family, yet when he became ruling chief the people bowed to him... But Kiha-Pi'ilani despised 'Aihako'ko' and Ku-malae, the children of his sister Pi'i-kea-a-Pi'ilani, because they were born to 'Umi. 'Aihako'ko' was brought to Maui, but Kiha treated him with contempt and killed his favorite *kahu*; and 'Aihako'ko' died of grief for him and was buried at Kapa'ahu where is the burial cave of 'Ai-hako'ko'. The young people are mistaken in giving the name Ka-lua-'Ai-hako'ko' to the coconut grove at Koa-kanu on the seacoast of Kama'ole in Kula...

Speakman (1984:70-74) provides an account of the experiences of the British Captain George Vancouver, who first visited Hawaii under Captain Cook and later captained his own voyages. Kihei was one of the locations visited by Vancouver during his explorations of Hawaii between 1793-1794. During these visits, the captain became closely connected with several high chiefs and kings, including Kamehameha (of Hawaii) and Ka-hekili (of Maui). Speakman (*op. cit.*:74) and Clark (1980:50) note the presence of a monument at Mai Poina 'Oe Ia'u Beach Park in Kihei commemorating Vancouver's on-shore expedition in 1792, when he first met Kahekili.

### Prehistoric Period

An abundance of *heiau* - 33 total recorded in the archaeological survey of Maui by Winslow Walker (1931) - are in the district of Makawao between roughly the 2000 ft. to 3000 ft. elevation contours. This provides an image of extensive agricultural fields across open land in prehistoric times, much as Kula appears today. Only two *heiau* are located on the coast at Kalepope, the others are all in the upland (Kolb *et al.* 1997:28). In their recent study in Waiohuli, selected portions of Keōkea and Kama'ole, Kolb *et al.* documented 1093 features making up 213 sites of mostly pre-historic agricultural and habitation sites with some ritual sites and historic agricultural sites.

### Early Historic Period

For elaboration on the following subjects of whaling, the Irish potato industry, the Chinese presence in Kula, ranching, and sugar cultivation the reader is referred to Helen Wong Smith's research as presented in Brown and Haun (1989: Appendix C) and Kolb *et al.* (1997). However, a general overview of these subjects is provided in the following sections (**Early Historic Period** through **Summary**) along with supplemental information not covered by Wong Smith.

During the early 1800s, the whaling industry was introduced in Hawaii. Although the whaling centered around Lahaina and mainly effected the Kula/Kihei area with its agricultural demands, Clark (1980:47) notes that "From the 1840s to the 1860s a small whaling station was maintained at Kalepolepo [Kihei]."

The introduction of whaling to the Maui community brought with it an increased demand (from the sailors) for the potato. As a result, after 1830 dryland agriculture in the old Kula District expanded to include the Irish potato. The California Gold Rush of 1849 intensified this demand as a California-Hawaii potato trade began to flourish. Kula became the area of highest potato production and came to be known as "the potato district" (the area between 2000 and 5000 ft. amsl). Potato production thrived in Kula from 1830-1850 until successful potato cultivation and production in California and Oregon resulted in a decline in the Hawaii trade. (Burgett and Spear 1995:6-7) Donham (1992:5) notes that the inundation of land clearing and cultivation associated with the Gold Rush resulted in "deforestation [which] adversely affect[ed] the amount of rainfall in the district, and periods of drought became more common."

Around 1849 John Halstead built The Koa House at Kalepopo in Kihei. The building, part store and part residence, thrived on the whaling industry and the resultant potato industry. The store also served as a gathering place for the whaling sailors. David Maio created a balance for this boisterous crowd by constructing a church at Kalepolepo sometime after 1843. During the Gold Rush years, the store became "an emporium for Irish potatoes." Halstead ran his store until 1876, closing shop when the potato industry diminished and moving to Ulupalakua. (Janion 1977:25-31)

The increase in agricultural production associated with the potato industry encouraged many Hawaiians to venture into cash-cropping (Speakman 1984:116) and attracted Chinese immigrants to Kula in the 1840s. During the subsequent 30 to 40 years the Chinese created a thriving community (Burgett and Spear 1995:7). According to Speakman (1984:140), even though the Kula land was hard, with scattered rains and common droughts, "the Chinese who lived and worked around Kōōkea enjoyed the healthiest climate to be found almost anywhere; they also enjoyed themselves and became good friends and neighbors of the Hawaiians living there."

During this time period sugar cultivation and ranching were established in the Kula region. Sugar was present prior to 1846, with six sugar producers operating on the slopes of Haleakalā (Wong-Smith in Brown and Haun 1989:C-7). As Wong Smith points out (*op. cit.*:C-6), ranching was present in the area prior to the 1840s. Cordy (in Fredericksen, *et al.* 1994:3) specifically mentions that the majority of Kama'ole *ahupua'a* at that time, as noted in Mahele awards, was government cattle range (with Irish potato on inland parcels).

#### Mid-1800s (Land Commission Awards)

#### Settlement Pattern in Kula as shown by LCAs

As background, it is important to know that Kula was famous for its *'uala* (sweet potato) "plantations" (Handy and Handy 1972:511). The combination of good soil developed in

volcanic ash, cool temperatures and frequent clouds to lower evapo-transpiration and bring moisture as fog drip, and rainfall distributed fairly evenly throughout the year would also have allowed for taro cultivation for subsistence by Hawaiians living in Kula on a permanent basis.

Informants for Handy and Handy (*Ibid.*) in the 1930s place a "considerable population" on the "lower westward slopes of Haleakala." This information is supported by the findings in Kōōkea and Waiohuli of numerous archaeological sites of prehistoric age (Brown and Haun 1989; Kolb *et al.* 1997). However, Jarves (in Kuykendall 1980:313) describes the Kula area in July 1846 in the midst of the cash cropping boon of Irish potatoes there.

"It ranges along the mountain (Haleakala) between 2000 and 5000 feet elevation, for the distance of 12 miles. The forest is but partially cleared, and the seed put into the rich virgin soil."

This would seem to suggest that prehistoric occupation in Kula was dispersed and with possibly *swidden* type agriculture practiced. Substantial forest clearing does not appear to have occurred until the mid-1800s for commercial agriculture, especially potatoes and sugar cultivation throughout most of Kula during the Mahele period. In Waiohuli and Kōōkea Kolb *et al.* noted that in this period the forest fringe began just above the Kula Highway at about 1,036 meter amsl (3,400 foot) elevation (Kolb *et al.* 1997:99).

Kolb *et al.* also noted that Mahele records showed "awards extending down to ca. the 700 meter (2,300 foot) elevation" in Waiohuli & Kōōkea but survey and testing showed the agricultural fields actually extended down to the 460 meter (1,500 foot) elevation (*Ibid.*). These areas were not planted in sugar cane or pineapple as have the areas farther north, and this study might indicate that the areas farther north also had more agricultural plots farther *ma'akai* than those noted in the Mahele records. Long-term commercial cultivation of sugar cane and pineapples in the more northerly *ahupua'a* would have destroyed surface evidence of such plots.

The following *ahupua'a* were examined for Land Commission claims: A'apueo, the four *ahupua'a* of 'Alae, Kaliahnuu (most commonly written as Kaliahnuu in the documents), Kama'ole, Kamehame Nui and Kamehame Iki), Ka'ono'ulu, the 4 *ahupua'a* of Kealahou, Kōōkea, Kōheo, Kukuiaeo (Kukuiaea), Makaanu, the ten *ahupua'a* of Ōma'opio, Pūlehu with Pūlehu Iki and Pūlehu Nui, Waiakoa, and Waiohuli. While in some cases the boundaries of the *ahupua'a* appear as straight lines across the map's surface, gullies (whenever present) appear to act as natural demarcation lines between *ahupua'a*.

It seems likely that 'Alae, Ōma'opio and Kealahou, which had multiple sections at the time of the *Māhele* and *kuleana* awards (*i.e.* 'Alae 1, 2, 3, 4) may have been single *ahupua'a* at some previous time, and subsequent division of these lands resulted from population expansion and/or expanded land use.

While traditionally we speak of the number of claims or awards in an *ahupua'a*, it seems to make less sense to do so in the Kula area than elsewhere since the claimants here did not

confine their claims to one *ahupua'a*. A large number of claimants request *apana* in two, three, or more *ahupua'a* as a general practice. Therefore, we have tried to look at the Land Commission claim data in a slightly different way. Within each *ahupua'a*, the *'ili* and number of *apana* or specific land pieces seem to better reflect the mosaic of resident population, "migrant farmers" who come from elsewhere on Maui to work in their fields, and the absentee landlords who had various crops (especially potatoes) raised for export. While the Native Register documents for Kula tend to omit the name of the *'ili* (smaller strips of land within the *ahupua'a* where the *apana* were claimed), the Foreign and Native Testimony documents generally name these. Claimants in the Register, and *konoiki* (land managers), *luna auhau* (tax assessors), and neighbors in the Testimony documents (except for the royal claims for entire *ahupua'a*), discuss either vaguely or specially the land use of each *apana* claimed. In a few instances there is a claim for land that is temporarily fallow, but rarely, if ever, in Kula does anyone ever mention waste land. There are several mentions of fields which are temporarily lying fallow.

We have devised a table (Appendix B) which gives by *ahupua'a* (column 1), the *'ili* within that *ahupua'a* (whether awarded) (column 2), the land use (column 3), the claimant's name (column 4), the claim number (column 5), the acreage and the *apana* awarded, or entire claim # not awarded (column 6), and the location of the Tax Map Key (TMK) number where found on the TMKs. This table is accompanied by a map (Figure 8, in the back pocket), compiled using the TMKs, showing the *ahupua'a* for Kula with the located *apana*. Boundaries between some *ahupua'a* are not absolutely clear on the TMK maps, particularly between Kamehameiki and Pūlehuiki. Here there are several claimants who tell of their land in one *ahupua'a*, while the award appears in the other.

Land use has been restricted to house lots, potato fields (both Irish and sweet having the same habitat) and *kalo* (refer to Figure 8 in the report back cover) for the reconnaissance survey since the located claims are not within the road corridor alternatives, but rather are focused in the upland zone between the 2000 ft. (610 m.) and 4000 ft. (1219 m.) elevation, mainly along the old Kula Road. Claims extended down to the 2,300 ft. elevation in the south in Kama'ole and Kōōkea and to the 1,100 ft. elevation in the north in 'A'apueo and Makaeha.

In Kōōkea claim 6654, which is a wrong number and therefore not awarded, is among a number of house lots claimed but not awarded at the shore. Modern TMK maps do not show any of the awarded Land Commission claims along the shore. Kolb *et al.* have a map of the Kīhei coastline which shows these awards (Kolb *et al.* 1997:65).

Some *kulcana* were awarded although they were not claimed, some were exchanged for land in another *ahupua'a*, and traces of two *kulcana* were noted on the TMKs that were illegible Ōma'opio TMK 2-3-05, parcel 132 and Waiohuli TMK 2-2-05, parcel 34) and some numbers were transposed or misread so that 3759B appears as 8759B.

Including two claims (2383 for 'Alae and 3829 for Pūlehuiki) not claimed but awarded, there were at least 254 *apana* granted by the Land Commission in Kula to 187 claimants; this is approximately 40% of the 619 *apana* claimed for that district. This number includes

the royal awards of entire *ahupua'a* where no land use is given. Each claimant puts in a claim for an average of 3+ *apana* an average slightly higher than in most other places.

One map of a coastal area was located which shows coastal awards (in Kolb *et al.* 1997: 65) in Kalepolepo. Other coastal awards are not located. In Kula 69 house lots were claimed; many of these were in the coastal villages of Keawakapu, Laie, Kapukahawai, Wailuku and Kalepolepo. Only 15 of the 67 are awarded and 12 of the 15 can be seen on the Kolb *et al.* Map. Claims also list some potatoes plots and bananas claimed in conjunction with the house lots.

The rest of the Land Commission Awards (LCAs) in Kula occur in a narrow horizontal band along the old Kula road where there is sufficient natural rain for growing crops and where it is cool enough for tuber crops. There are number of house lots claimed in this area. Of the 24 "hooilo" (winter or permanent gardens) claimed in the Kaonoulu, Koheo, and Kamehame *ahupua'a*, 3 are awarded, of those 2 are shown on maps; these are in this Kula road upland zone.

The unawarded claims give a different picture of the land use than do the awarded claims, indicating many house lots at the shore, typical of other areas. It would also seem from the non-awarded claims that many residents had their coastal house lot and an upland house lot.

The Kula map drawn by Monsarrat and Dodge (1872-1879; Registered Map No. 913) shows only a few awarded claims, but some of these are different from those shown on the TMKs. What is evident on R.M. 913 is that some of the names of claimants appear with grant numbers, rather than Land Commission Awards. Helen Wong-Smith (in Dorham 1990b: B-4) notes that prior to the Mahele land in Makawao was offered for sale, fee-simple, to native Hawaiians. These parcels (numbering close to 100) ranged from 5 to 10 acres and were purchased for \$1.00 an acre, which may explain why many of the LCAs are not on the TMKs because the claimants had already opted for grant status.

A number of claimants use more than one number for the same claim. Kekahuna uses 4 different numbers, Hewahewa uses 3, Kaai uses 3, Kekua uses 3, and 16 others use 2 different numbers for their claims. This explains some instances where some claims are not awarded, as the same piece is awarded under another number. Some claimants are of high chiefly status, e.g. Keaweamahi, Keahokahole, and Namauu who claims a house lot in Waiohuli; and Naïhe with a house at Kama'ole; some are important personages such as Kaaawai, the land commissioner of Maui, and Hevahewa, who is awarded land on all islands and has a home in Kalepolepo; these persons appear to have claims in many places. There are, however, also claimants who appear to be commoners from elsewhere, Wailuku, Waikapu, Lahaina, who, along with the chiefs, are raising sweet potatoes and Irish potatoes for trade with the seagoing vessels or for the California Gold miners who had no time to raise food, or both.

The following table lists by *ahupua'a* the number of *apana* claimed and granted and the number of claimants.

Table 1: Land Commission Claims for Kula

Ahupua'a	# of claims	# of apana requested	granted	# of claimants, comments
'A'apueo	8	14	2	8
'Alae (various)	14	18	3	14
Kaliiahui	15	31	13	15
Kama'ole	49	90	26	14, some consolidated awards
Kahamehame	8	7	1	8, 5 claims on TMK map, some confusion with Pulehu Iki claims
Ka'ono'ulu	35	57	21	33
Kealahou (various)	22	43	19	19
Kōkeea	46	111	32	44
Kōheo	11	13	5	11
Kukuiaea/Kukuiāeo	1	1	1	1
Maka'eha	1	1	0	1
Ōma'opio 1-10	25	56	21	18
Pūlehu/Pūlehu Iki/ Pūlehu Nui	17	33	32	16, some consolidated awards; awarded not claimed
Waiakoa	17	44	33	16
Waiohūhi	41	100	30	40

The majority of claims consist of *apana* for kula, often specified as sweet potatoes or Irish (foreign, or small) potatoes, some dry *lo'i*, winter kula *makai*, as well as occasional bananas, and house lots. There are many claims for *moku mau'u* which the translator of the Native Register believes might be small arable pockets in stony soil. Mostly they are unspecified as to land use, although occasionally they say *moku mau'u* of sweet potatoes. Whether this means all *moku mau'u* were sweet potatoes is unknown.

The following land use profiles list, by *ahupua'a*, 1) the number of houses, 2) number of Irish potato patches (*mala*, *kihapai*, or *kula*), 3) number of sweet potato patches (*mala*, *mahina*, *moku mau'u*, *kula*), 4) the number of *kula* or *'i'i*, pastures, when no specified cultivar is named, 5) generic potato ground or patches or plots which probably can be considered as sweet potatoes, 6) generic plots such as *kihapai*, *moku mau'u*, or "claims," 7) number of *lo'i*, taro (*kalo*), and 8) other.

At 'A'apueo, Keohokalole claims and receives the *ahupua'a*. Awarded claims range from the minimum 6+ acres to Kekahuna's (9022) 22 acres of *kula*. The two claims not awarded are for *kula* or an unspecified "claim." Claimed are *apana* for 1 house lot, 6 Irish potato

patches, 6 sweet potato patches, 11 *kula'ili* or pastures, 1 "claim," and no taro or other items mentioned.

At 'Alae 1, 2, 3, & 4, Keohokalole is awarded 'Alae 3. There is 1 house lot, 2 plots of Irish potatoes, 2 of sweet potatoes, 6 *kula*, 1 generic potato ground, 19 generic "claims" or *moku mau'u*, and no taro or other items mentioned.

At Kaliiahui, Kamaikaaloa claims and receives the *ahupua'a* (claims #4460 and 7124) of 19,838 acres in claim 7124. There are claims for 4 house lots, 7 Irish potato patches or lands, 3 sweet potato patches, 20 *kula* (1 a winter *kula*), 3 unspecified "claims," etc., as well as 12 taro patches, and mention of wauke, a boggy place, and bananas.

At Kama'ole, the entire *ahupua'a* is not claimed. There are 3 claimants who receive close to or more than 50 acre *apana*, while most are from 1/2 acre to several acres. There are 17 house lots, 55 Irish potato patches or lands, 15 sweet potato lands, 23 *kula*, 25 generic potato lands, 27 generic *moku mau'u* or "claims," 5 *mio'o* of dry *kalo*, 1 *mio'o* sugar cane, 1 pig enclosure, and 2 *mala* of bananas.

At Kahamehame there is no house claim, there are 2 Irish potato patches, 0 sweet potato land, 3 *kula*, 0 generic potato lands, 9 generic lands or "claims," and no taro, but there is mention of 2 *pa'a*, 2 bogs, and a bracken place.

At Ka'ono'ulu, Hewahewa is awarded the *ahupua'a* of 5715 acres. Other *apana* awarded range in size from .22 acre to 28 acres. Claims are for 2 house lots, 22 Irish potato patches or land, 0 sweet potato claims, 46 *kula* which include winter *kula*, 1 generic potato land, 67 *moku mau'u* or "claims," 18 taro patches, a stream bank, and a *kuapa* (or pond) is mentioned in claim No. 5407.

At Kealahou (1, 2, 3 & 4), Keohokalole is awarded Kealahou 3-4 (no acreage given). In Kealahou the next largest award is for Kekapai who receives 6 *apana* of 10.25 acres, plus other smaller parcels. Claims for *apana* include no house lots, 3 Irish potato lands, 4 sweet potato lands, 31 *kula* etc., no generic potato lands, 26 *moku mau'u* or other generic land, and no taro or other items mentioned.

At Kōkeea (5332 acres) awards granted range from .25 acres to 16+ acres. *Apana* are claimed for 22 house sites, 42 Irish potato patches, 33 sweet potato patches, 26 *kula* or pastures, 6 generic potato lands, 19+ generic lands, and 73 taro lands, with 5 banana patches, sugar cane and fishing rights mentioned (claim 6453).

At Kōheo, Keohokalole claims and gets the *ahupua'a*. The only other award is 14+ acres awarded to Kahinu for 4 *apana* of taro and Irish potatoes. Claims not awarded include no claims for house lots, 7 Irish potatoes lands, 0 sweet potato lands, 11 *kula* including 1 winter *kula*, 0 generic potato lands, and 3 *kalo* patches.

At Kukuiaea, Keohokalole receives the *ahupua'a* of 150+ acres. There are no other claimants and Keohokalole does not mention land use.

At Maka'eha, Kekahuna claims but does not get the *ahupua'a*. Donham (1990c:6) notes that Keohokaloie had been offered Makaeha but she transferred this to the government. This is also true for the *ahupua'a* of Kailua. There are no other claims in Maka'eha.

At Ōma'opio 1-10, there is 1 claim for a house site, 8 claims for Irish potatoes, 1 for sweet potatoes, 28 for *kula*, none for generic potato lands, 5 for generic land, 21 *lo'i*, sugarcane and 2 wauke patches. LCA 281B is awarded to Ali, a non-resident claiming Lahaina as his place of residence. He has 1052 $\frac{1}{2}$  acres. Nine awards are centrally located between the north Ōma'opio *ahupua'a* boundary (the high ground between Kaliahūi Gulch and Pūlehu Gulch) and the south Ōma'opio *ahupua'a* boundary which is the stream bed in Pūlehu Gulch.

We do not believe this narrow band of plots is typical of the prehistoric settlement pattern in Ōma'opio. The land form in the *ahupua'a* provides widespread areas of arable land. Prehistoric settlement including cultivated fields would have been dispersed across the whole landscape in the *ahupua'a* between 488 and 1219 m. amsl. The pattern we see reflected in the distribution of Land Commission Awards probably results from population decline and subsequent resettlement of the remaining farmers to land close to or adjacent to the major trails or roads such as Ōma'opio Road, Kimo Road and Lower Kula Road leading to the new population centers at Makawao-Pu'uokalani and Kahului.

At Pūlehu, Pūlehuiki and Pūlehuunui, Keaweamahi receives 1 *apana* of 16,678.78 acres. There are no claims for house lots, 11 patches of Irish potatoes, 25+ patches of sweet potatoes, 35 *kula*, no generic potatoes, 13 generic lands, no taro lands, and mention of pigs, a bog and 3 springs.

At Pūlehu, Kaili claims 7 *kula* but relinquishes them for 20 acres in Ōma'opio.

At Waiaikoa, there is 1 claim for a house lot, 7 for Irish potatoes, and 7 for sweet potatoes, 52 for *kula* or pastures, none for generic potatoes, 3 for generic lands, and 1 taro field.

At Waohuli, there are claims for 25 house lots, 35 Irish potato lands, 113 sweet potato lands, 74 *kula*, 30 generic potato lands, 4 generic lands, 24 taro fields, 16 banana patches, 2 sugar cane lands. There is mention of the government road.

It is interesting that very many if not all the land sections have place names of their own in addition to the *li* and *ahupua'a* names. We also note that many of the awards, in describing the bounds of their lands, use for reference the land of many other people who never received awards. *Pōalima* (land worked for a chief) and *āupuni* (government land) are also mentioned in describing claims to the Land Commission.

The majority of house lots claimed are in Keōkeke (22) and Waiohuli (25) although *kula* often had houses on them that were not claimed separately.

Winter *kula* is a term used only on Maui and in Kula; they are often indicated as being *maikai*. One gets the impression that there was great movement between lowland and

upland and between other *ahupua'a* elsewhere and Kula, particularly during this potato growing time. Another interesting fact coming from the Mahele accounts is the canoe landing at Lahaina for the Waikapu people who come to sell their potatoes (Creed 1993). A sizeable number of Waikapu claimants had potato patches in Kula.

Another great potato growing area, Paehu, is mentioned by surveyors and Mr. E. Baldwin in their notes (F.T. 91-95v16 and N.T. 91-95v16). They discuss the loss of potato lands there where people thought to consolidate their lands but could not afford them and so lost them altogether. This kind of documentation does not appear for our Kula district lands, although there is mention of consolidation of claims to get grants of larger lands. In Waiohuli many claimants do not receive their claims, a few because they have not been there long enough. This comment adds support to the argument that 1848 was near the height of the Irish potato growing phenomenon, especially for the market in California. In the Kula District it appears that higher status claimants, living elsewhere on other parts of Maui and even on other islands, came into Kula at this time to grow potatoes.

By 1880 the government survey of the Kula area (RM 913) shows very few Land Commission Awards and even shows those who received awards as having replaced the award with grants. Many homestead sections were opened up before 1880 and many new names appear on this map. By 1853 90 land grants were awarded in the Kula area.

Typical subsistence agriculture continued to be prominent in the southernmost *ahupua'a*, but there, as elsewhere in Kula, people from outside Kula are coming to Kula to raise potatoes for the foreign market.

#### Late 1800s

A note of interest regarding the Chinese presence in Kula is that Sun Yat-sen, father of the Chinese Revolution and founder of the Chinese Republic, frequented the area in the 1880s. His brother was a Kula rancher. Sun Yat-sen, an Iolani graduate who also attended medical school, was often asked medical advice while visiting Kula. "When word reached Kula that the 1912 revolution was a success, the town [celebrated]...Sun Yat-sen [was] a familiar and respected personality in Kula." (Speakman 1984:141-143)

By the 1880s lower Kula consisted primarily of pasture land for ranching (Wong Smith in Donham 1990b:B-6). Kennedy (1992:7) notes that at this point *kiaue* was imported to feed cattle and provide wood. Maps from late 1800s/early 1900s indicate that several ranching companies owned and operated land in Kula. The land of Kōōkea, particularly the lowland/coastal portion, was historically used for ranching activities by Haleakala Ranch Company (Donham 1990b:6).

Sugar companies began operating in the Makawao area in the late 1800s. In 1899 the Kīhei Plantation Company (KPC) was founded and began sugar operations in Kīhei and the plain above. This plantation was then absorbed by the Hawaiian Commercial and Sugar Company in 1908. The best KPC fields continued to be cultivated (some are still productive), while the remaining plantation lands became cattle pasture. (Cox 1976:14-15)

The Hawaiian Commercial Company was founded in 1878 by Claus Spreckels and in 1882 became the Hawaiian Commercial and Sugar Company (HC&SC), located in Pu'uhene. In 1899 the company was acquired by investors headed by J.B. Castle, with Alexander & Baldwin replacing the plantations agents. In 1948, HC&SC absorbed the nearby Maui Agricultural Company, a Paia plantation. (Conde and Best 1973:208-210,213)

#### Early 1900s To The Present

Twentieth century activities in Makawao and Wailuku include sugar and pineapple cultivation, military operations, agriculture, ranching, and residential and commercial land development. According to Fredericksen and Fredericksen (1993:6), Kula experienced a shift toward diversified agriculture and cattle raising during this time frame, with the area of O'ma opio undergoing "intensive residential land development." Kihei also became an area of extensive development.

In 1905 the Kula Pipeline was built during a harsh drought, expanding the water resources of the Kula area (Mark in Kennedy 1992:7).

Sugar production continued into the twentieth century, with Hawaiian Commercial and Sugar Company cultivating sugar in the Kihei and Wailuku area, particularly during the 1940s-1960s (Sinoto and Pantaleo 1992:5). HC&SC currently operates the cane fields which constitute the bulk of the study parcel.

Pineapple cultivation was introduced to Makawao in the early 1900s. The Maui Agricultural Company (M.A.Co.), primarily a sugar producer, began planting pineapple in its upland parcels. "Some of the M.A.Co. fields in the higher elevations were too far from the main line railroad and lacked a water supply for fluming and irrigation. In 1923 the plantation started planting pineapple on these lands...the C.P.C. [California Packing cannery] concern then built a large cannery...The M.A.Co. moved the cannery workers from Paia to Kahului." (Conde and Best 1973:233)

Maui Land and Pineapple Company also had its beginnings during this time period. According to Speakman (1984:130-131) the company started as Baldwin Packers which then became Maui Pineapple Company, owned by Alexander & Baldwin. The company developed over the 1950s and 1960s, becoming "the largest producer of pineapple on Maui." The Cameron family then took control and the company became Maui Land and Pineapple Company. McPhatter and Rosendahl (1996:3) note that Maui Land and Pineapple Company planted pineapple in 'A'apueo in 1979, in an area currently used for cattle pasture. During the 1970s, under the new ownership, the company began endeavors into residential land development, such as the condominiums at Kapalua. Maui Land and Pineapple Company continues to cultivate pineapple within the western reaches of the study parcel.

While World War I had little impact on Maui, World War II brought with it a significant military presence. Speakman (1984:166-176) provides a detailed review of the Marines on Maui, particularly Camp Maui in Kokomo and training maneuvers held on Kaho'olawe and

at Ma'alaea Bay, along its beach and in the *kiawe* groves to the east of the Bay. Allen (1971:230) notes that the Marines conducted amphibious landing training at Ma'alaea Bay. Allen (*Ibid.*) also gives an extensive account of the Navy presence on Maui, which included the Combat Demolition Training Station at Kama'ole and two naval air stations, one at Pu'uhene and the other at Kahului. The training station at Kama'ole was responsible for research work at Kihei as early as 1940. The Pu'uhene air station was established in 1939, making it the second oldest in Hawaii. During 1941 (especially after Pearl Harbor) the station expanded to cover much of the Pu'uhene plain and served as an important naval hub for training, plane maintenance, and medical care for the enlisted.

A recent article in *The Honolulu Advertiser* (Tanji 1997:A23&26) notes an on-going research project (conducted by the Maui Military Museum) which studies the Naval Air Station at Pu'uhene, with its corresponding air strip, and the plentiful historic military artifacts which they are unearthing in the area. Bartholomew and Bailey (1994:147) refer to the Army camps throughout Maui (including Kula) and two hospitals, one in Waikapu and one in the old Makawao School.

Burgett and Spear (1995:8) discuss the introduction of ranching ventures into the uplands of Kula in the early 1900s. TMK maps (sections 2-2 and 2-3) list the following landholders: Haleakala Ranch Co., Ulupalakua Ranch, Inc., Kaonoulu Ranch Co., Ltd., Maui Land and Pineapple Co., Ltd., the James Campbell Estate, the State of Hawaii, and Hawaiian Homes Lands. As discussed by Wong Smith (Brown and Haun 1989:C-7), agriculture and cattle raising would continue to be important activities in the Kula area. During the 1970s, Kula produced the majority of Hawaii's locally grown produce and livestock ranches comprised most of the remaining land use. At present, non-residential areas are still in use as centers of agricultural production, particularly in the "potato district" of Kula (Donham 1992:5). Haleakala, Ulupalakua and Kaonoulu Ranches are also still in operation.

Kihei underwent a rapid residential and commercial development beginning in the 1970s. Clark (1980:49) notes that the groundwork for this development was established in the late 1950s when investors began purchasing coastal property. However, the construction boom of high rise apartments, hotels, and condominiums and corresponding shopping centers, restaurants, and real estate offices didn't occur until the 1970s. Speakman (1984:188) notes that along with the condominiums and "classy" hotels (Maui's "hallmark") came the construction of millionaire homes in the dry hills overlooking Kihei and the view beyond of Kaho'olawe and Moloka'i. He comments on the congestion and overcrowding which resulted from this development (*op. cit.*:188-189): "It was partially blamed on the fact that Kihei was owned by many proprietors or speculators, each with individual plans uncoordinated with general planning, and partly on the failure of the County planners to hold the line against the runaway development. Kihei became the model for the wrong way to go about expansion." Piiilani Highway was constructed to ease the congested Kihei traffic which resulted from this development and expansion of the tourist industry.

#### One Informant Interview

On April 16, 1997 Mr. Thomas Devereux of Cultural Surveys Hawaii Inc. (CSH) met with

Mr. Douglas MacCluer, manager of Maui Land and Pineapple Co. MacCluer is an avid hunter and hiker who has been employed in the pineapple industry on Maui for over thirty years and is well acquainted with the project area. The objectives accomplished at this meeting with MacCluer were: (1) a review of the archaeological sites located during the survey by CSH crew members, (2) conducting a field inspection of the surveyed sites, (3) conducting a field inspection of other site locations known by Mr. MacCluer to contain archaeological sites in the vicinity of the road corridors.

All archaeological sites identified by Cultural Surveys Hawaii in the *mauka* portion of the project area were confirmed by Mr. MacCluer during the field inspection. The field inspection was conducted by vehicle and on foot in the *mauka* portions of the project area in the cultivated pineapple fields. Several other archaeological sites known to Mr. MacCluer were pointed out at this time along segments B and C but were determined by Cultural Surveys Hawaii staff to be located well outside the alignment boundaries. It was Mr. MacCluer's opinion that CSH had located, within the alignment corridors, all archaeological sites with which he was familiar.

### Summary

The project area is located primarily in the barren zone of the Makawao and Wailuku Districts, with the western boundary at the coast and the eastern boundary extending into the upland zone. The upland zone has served as an agricultural center since the pre-contact era; *uala*, or sweet potato, has traditionally been cultivated in Kula in elevations above 2000 ft. amsl. Corresponding with this agricultural activity was habitation in the uplands and in the coastal zone with transportation routes and intermittent habitation in the zone between the coast and the upland referred to as the intermediate or barren zone.

Mythology regarding this portion of Maui is relatively scarce and traditional accounts focus on political activities. Existing accounts describe the people of Kula, Makawao, and Wailuku (referring to the importance of agriculture in Kula) and record the struggles and activities of Maui and Hawaii chiefs in the 1700s, including Ke-kau-like, Alapa i, Ka-hekili, Ku-keawe, Umi, and also British Captain Vancouver.

During the early historical period Kula's agricultural role was expanded as the introduction of whaling and the California Gold Rush of 1849 initiated a demand for the Irish potato, which was cultivated in the uplands. The traditional *uala* planting grounds were now also used for the Irish potato, and the area became known as the "potato district." Immigrants from China came to Makawao during this time and created a thriving community in Kula. Cash croppers in the Kula Region had a readily accessible port at Kalepolepo where J. J. Halstead had his store and residences, referred to as the "Koa House." Sugar cultivation and ranching were also introduced in the region in the early 1800s.

Many of the Land Commission claims in the Kula area were not granted. It is believed that many people living and farming in this area tried to consolidate their land holdings into a single large piece; a study of the grants in this area may show this in detail.

The Māhele-era data indicates both coastal zone and upland zone had permanent habitation, though the awarded claims suggest fewer coastal house lots than in the upland zone. The exception is a cluster or village-type setting at the Kalepolepo fishpond(s). Agriculture is almost exclusively in the upland zone, though a few claims note "winter *kula* makai." Whether *makai* means at the shore has not been deduced from available sources

(e.g. TMK maps, or historic 19<sup>th</sup> and 29<sup>th</sup> century maps). The few "hoiolo" or winter *kula* that were awarded are in the upland zone along the Old Kula Road, approximately at the center of the district and were not noted as being "makai."

The *Māhele* and Grant data also indicates variations across the region in terms of number of claims and awards and the elevational ranges of the upland zone. At the southern end of the region, upland *kulaena* claims are at roughly the 2800 to 3000 ft. amsl range. Moving north the elevational range drops. In Omaoipo the range of the upland belt appears to be from ca 1200 to 2700 ft. amsl, in 'A'apueo from ca. 1100 to 4000 ft. amsl, at Pukalani, 1100 to 1700 ft. amsl. The ranges are based on available map locations for Land Commission awards and similar mid-1800's grant data.

There is virtually no specific land use data for the intermediate zone between the coastal and upland zones from the *Māhele* data, however there are references to trails with one of the most important accessing Kalepolepo, which was an early virtualizing trade post for pigs, cattle, sheep, perhaps taro from Waikapū, sugar, potatoes and undoubtedly water.

The late 1800s were marked by the continuation of ranching and sugar in Makawao. Lower Kula consisted primarily of pasture land by the end of the century. By the late 1800s, Hawaii Commercial and Sugar Company became a major presence in Makawao with its absorption of other neighboring operations. Also, Sun Yat-sen frequently visited Kula and its Chinese community during the 1880s.

During the twentieth century sugar, pineapple, diversified agriculture, and ranching activities would continue while military operations associated with World War II and residential and commercial development would be introduced. Hawaii Commercial and Sugar Company and Maui Land and Pineapple Company continued their operations in the area. The military established itself on Maui during WWII with a Marine camp in Kokomo, Naval Air Station at Pu unene, a Navy Combat Demolition Training Station at Kama'ole, Army camps and hospitals in Kula and Makawao area. Agriculture and ranching continued in the area, with Kula providing a major source of produce for Hawaii in the 1970s and ranches constituting much of the remaining land use. Kula continues to provide local produce, including vegetables and flowers. Haleakala, Ulupalakua, and Kaonoulu Ranches continue to operate at this time. Residential and commercial development was initiated in the 1950s, with a construction boom beginning in the 1970s. The focus of this development was Kihei, an area now known for its resorts and retail ventures. Pi'ilani Highway was constructed to ease the Kihei traffic which became congested as a result of this development and the expansion of the tourist industry on Maui.

#### IV. PREVIOUS ARCHAEOLOGICAL RESEARCH

Previous archaeological research in the Makawao District has been concentrated in the higher elevations (1000 ft. amsl and above) of upcountry Kula and the coastal Kihei region. Research relevant to the study parcel is discussed below in terms of these two regions. Table 3 lists State sites in the corridor areas and the sites in or near the road corridors are shown on Figure 3.

##### Kula Region

The earliest archaeological studies on Maui begin with descriptive lists of religious sites by Thomas Thrum (1906-1918) and John Stokes (n.d.) in the early 1900s and culminate with the first island wide site survey by Winslow Walker (1931). Throughout the Kula region of Maui from Olinda and Makawao to Kanaio beyond Ulupalakua, the sites recorded by Walker (all *heiau* - 33 total) are located in a continuous band between roughly 2000 ft. and 3000 ft. amsl.

From around 1930 to the 1970s only sporadic visits were made to Kula by archaeologists, primarily for the purpose of recording individual archaeological sites reported by local residents. In 1970 J. Halley Cox and Edward Stasack (1970) compiled a listing of identified petroglyph sites throughout Hawaii, including the Kula area. Two of these sites, MA-B22-2 (State site 50-50-10-1061, Kahaianui Gulch petroglyphs) and MA-B22-1 (identified as MA-B23-1 in Cox and Stasack; State site 50-50-10-1062, Kaluapulani Gulch petroglyphs), were relocated during the present project (designated CSH 1 and CSH 23, respectively).

Inez Ashdown (1899-1992) spent her lifetime collecting information about Maui. This information she collected was put together in the book *Ke Alaialoa o Maui* (1971). Regarding Kula (including the current project area and areas nearby), she notes that the largest fields of *ki'i* were at Nu'u, and the next largest could be found throughout Honua'ula, "particularly around the ancient temple of Lono in Oama'opio [sic]. In Kamehameiki area and on across into Ka-ono-ulu many petroglyphs are known and new ones can be found" (*op. cit.*:48). She also remarks that in the Keōkea and Waiakoa areas:

are many structures, fields of petroglyphs and temples around the two temples called Pa'u hu and Ka-imu-pe'e-lua. Also in this area the temples of Mahea and Ka-umu-o-pahu (or Ka-umu-o-pahu) may still remain, along with Po'o-na-hoe-hoe and Mana' the latter now part of a modern cemetery. At Pūlehu stood the temple of Ni-ni-ni-wai, and at Kama'ole the two on the Mao land, one named Waiuku because of the battle there and the destruction during the time when Ka-lani-ku-pule ousted a brother of Pai'ea Kamehameha (*op.cit.*: 57-58).

Three archaeological surveys conducted during the 1980s in the *ahupua'a* of Waiouhuli and Keōkea by Mary Riford (1987), Roderick Brown and Alan Haun (1989) and Kolk *et al.* (1997) have contributed the bulk of data on site patterning and land use prior to the 20th century in "up-country" Kula Maui. These studies, and a selection of others relevant to the

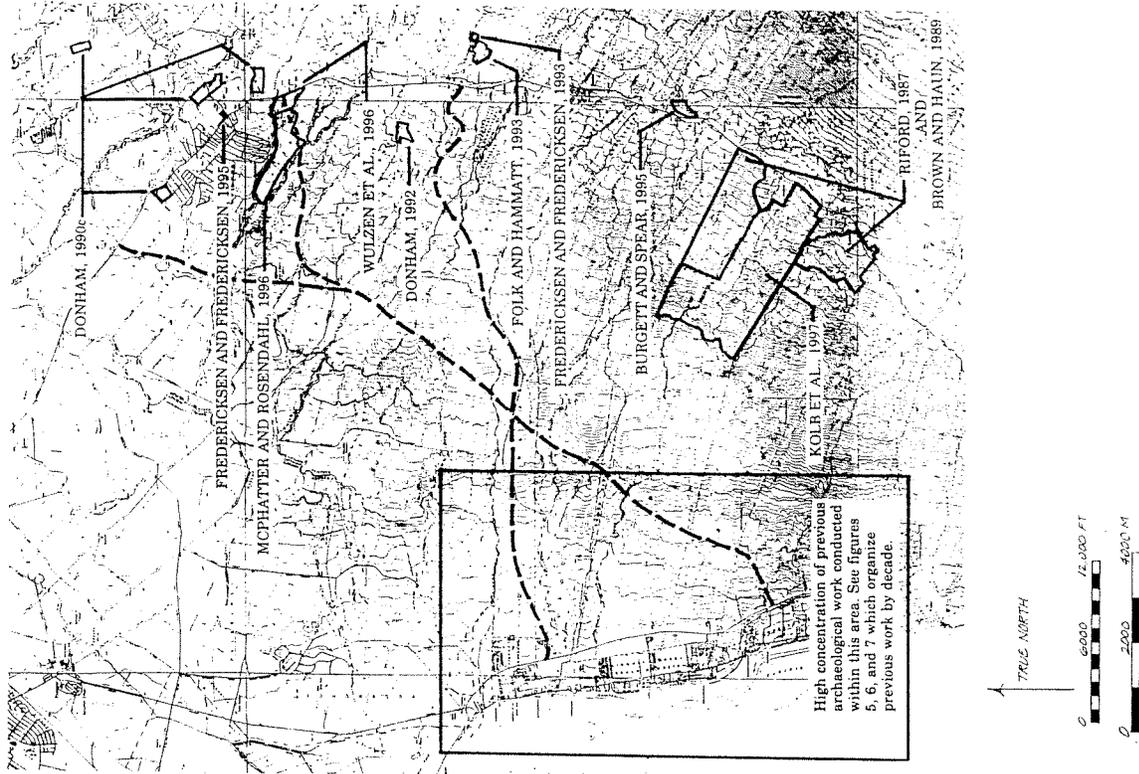

Figure 4 Previous archaeology conducted in upper portions of project area

upcountry Kula area, are summarized below (Figure 4).

Riford's (1987) monitoring and reconnaissance survey for the Waiohuli and Kōokea Subdivisions identified 113 sites with 252 features consisting of "agricultural terraces and mound features as well as a number of possible habitation- and religious-related stone, walled enclosures..." (*op. cit.*:55). Riford suggests that human occupation in the area extended from prehistoric times to the 1950s based on artifacts observed at the sites (*op. cit.*:56). This time frame is further documented by Brown and Haun (1989:18-21).

Brown and Haun (1989) conducted an inventory survey for the same study parcels in Waiohuli and Kōokea, covering 1,025 acres of uncultivated pasture land located between 1,800 ft. and 3,000 ft. amsl. Within the survey area 159 sites with 274 features were identified, including agricultural, residential, and ceremonial complexes. Fifty-three of the sites had been identified during the Bishop Museum (Riford 1987) survey.

Hammatt and Shideler (1990) conducted an inventory survey of a plot of land on the Kīhei coast at Wailuku. Kama'ole, just *makai* of the proposed K2 shoreline terminus. There were 8 sites; ranch walls, 3 fishing shrines and midden scatter, a C-shape and an undetermined remnant.

In general Brown and Haun (1989:27) found that the Kōokea division was intensively exploited in a variety of ways for at least two-thirds of the entirety of Hawaiian prehistory. "They suggest similar land use and chronology but lesser density in the Waiohuli area, probably due to a greater amount of recent land clearing activities. Sixteen radiocarbon dates provided overlapping ranges from A.D. 1270 through A.D. 1955. One sample, with the earliest date, yielded three possible ranges between A.D. 680 and A.D. 1157. (*op. cit.*:19,20)

In January 1993 (Folk and Hammatt 1993), Cultural Surveys Hawaii conducted an inventory level survey of approximately 25 acres on the southern edge of Oma opio *ahupua'a*. This survey resulted in the relocation of several previously recorded sites, which in relation to the current study parcel are located east of terminus U3, between Kula Highway and Halekalā Highway. These sites, already documented by Griffin and Donham, included a large enclosure (site 50-50-11-1349) and the Upper Pūlehu Gulch Petroglyphs (site 50-50-11-1268). Additional archaeological features consisting of a stacked boulder alignment and few low mounds were also located and collectively assigned site number 50-50-11-3121. Charcoal analysis of site 50-50-11-1349 suggests the site dates to be possibly as early as the 15th century A.D.

In 1995, Burgett and Spear (1995) of Scientific Consultant Services, Inc. conducted an inventory survey of a 22.5 acre parcel located in Ka'ono'ulu *ahupua'a*, Makawao District (to the south of the southeastern portion of the current study parcel). A total of six sites comprised of 29 features were identified during the survey. The identified features included the following formal types: terrace, wall, enclosure, cistern, mound, building and platform. It was determined that all sites are post-contact in age and associated with agriculture and habitation activities.

In February 1996 McPhatter and Rosendahl (1996) conducted an archaeological

reconnaissance survey of a 250-acre parcel located in the land of 'A'apueo, Makawao District (TMK: 2-3-08: Por-5). Most of the project area consists primarily of former pineapple lands between Kaluapulani and Kaliahinui Gulches. This survey resulted in the identification of two sites: (1) a site assigned the temporary number 1707-1 and described as a sailing canoe petroglyph, and (2) temporary site number 1717-2 described as a wall. In addition to these sites several land clearing piles associated with historic pineapple cultivation were also reported but were not assigned site numbers. It was determined that further data collection activities should take place at the wall site 1707-2, and that the petroglyph site 1707-1 be preserved with interpretive development.

Then in March 1996 Wulzen, *et al.* (1996) conducted an inventory survey of a 44-acre parcel that is the *maka* portion of McPhatter and Rosendahl's February 1996 project area. The 44-acre parcel is also described by Wulzen as part of the 305-acre Pukalani Terrace Subdivision Unit III located in the land of 'A'apueo, Makawao District (TMK: 2-3-08: Por-5). Wulzen's project area contained three previously recorded sites: (1) the Kaliahinui petroglyph site 50-50-10-1061, (2) 50-50-10-4179, the "sailing canoe petroglyph site" recorded as temporary site number 1707-1 by McPhatter and Rosendahl (1996); the description of this site was upgraded to multiple petroglyphs, and (3) 50-50-10-4178, the wall recorded as temporary site number 1707-2 by McPhatter and Rosendahl (1996). One new site (Site 50-50-10-4181) was identified during Wulzen's survey; it consisted of four features including two agricultural clearing mounds and two stone alignments. Testing conducted at the stone alignments yielded historic artifacts associated with pineapple agriculture. The Kaluapulani petroglyph site 50-50-10-1062, originally described as being only on the north side of Kaluapulani gulch, was relocated by Wulzen although his project area boundary is on the south side of that gulch. They reported their concurrence with the original recorded data on the site, except they found the petroglyphs to extend farther *makai* than originally described.

Other research in the upcountry Kula area includes Donham (1990c); 1992), Fredericksen and Fredericksen (1993; 1995) and Kolb *et al.* (1997).

In the study of Hawaiian Homeland parcels in Waiohuli and Kōokea, excavation data indicates that initial permanent habitation and land clearing for agricultural pursuits began ca. A.D. 1200 to 1400 (Kolb *et al.* 1997:300-304). The sequence of agricultural and habitation intensification was suggested by radiocarbon and pollen analysis and includes the A.D. 1200 to 1400 initial land clearing of forest, becoming mixed shrubs and grass lands by A.D. 1400-1500, with a corresponding "boom of habitations" and by the 1600s to 1700s the forests disappear and are replaced by expansive agricultural fields and continued increase in habitations. The increase of the 1600s to 1700s includes expansion into less favorable terrain both *makai* and *maka* of the prime upland zone lands (*Ibid.*). The research also indicated, as it has elsewhere in Hawaii, that there was a "rapid depopulation and change" by the mid-1800s (*Ibid.*)

### Coastal Kihei Region

Numerous archaeological surveys were conducted along the south coast of the Makawao District, particularly in the Kihei, Wailua, and Mākena area and the from Kama'ole to Waiakoa as a result of the 1970s resort development.

From 1969 to 1971, Kirch (1971) conducted a survey and subsequent excavations at Palaea, south of K1 and K2 termini at Pi'ilani Highway. Through his analysis of coastal sites 50-50-10-1028 and 50-50-10-1029, Kirch concluded that settlement patterns in this area were characterized by transient coastal habitation involving the use of ocean resources with permanent settlements and agricultural activities in the upland region. (Donham 1990b: 4)

Donham (1990), in a report on Phase II of the Pi'ilani Residential Community in Kōōkea lists numerous reconnaissance and testing projects conducted in the Wailua and Mākena area from the early 1970s to the late 1980s. These studies, as stated by Donham, include: Barrere 1974, Clark 1974, Clegghorn 1974 and 1975, Barrere 1975, Hommon 1975, Cordy 1978, Haun 1978, Sinoto 1978, Jourdane and Sinoto 1979, Bordner 1980, Schilt and Dohyans 1980, Bordner and Cox 1982, Walker, Rosendahl and Haun 1985, Dicks and Haun 1987, Dohyans 1988, Haun 1988, and Shapiro and Haun 1988. According to Donham, the findings from the Jourdane and Sinoto 1979 and Schilt and Dohyans 1980 studies also support Kirch's hypotheses regarding settlement and subsistence patterns involving the inland and coastal regions of Makawao.

Several projects were also conducted *makai* of the current project area in the coastal region of Kihei extending from Kama'ole *ahupua'a* in the south to Waiakoa *ahupua'a* in the north (Figures 5, 6, and 7). These projects provide useful information about the coastal area of Kihei and settlement patterns relating to the inland zone, as discussed by Kirch (1971). However, since these studies reiterate already mentioned information and are located outside of our current study parcel, they will not be discussed here. For the reader's reference, these projects include (but are not limited to) a flora and fauna survey by Austin, Smith & Assoc. Inc. in 1974 and the following archaeological studies: Cox 1976, Hirota 1979, Hommon 1981, Keau 1981, Miura 1982, Neller 1982, Mayberry and Haun 1988, Hammatt and Shideier 1989, Hammatt and Shideier 1990, Donham 1990(a&b), Hurst 1991, Kennedy 1991, Hammatt and Shideier 1992, Kennedy 1992, Sinoto and Pantaleo 1992, Fredericksen *et al.* 1993, and Fredericksen *et al.* 1994.

### Predictive Model

Based on background studies the project area, consisting of the corridors from *Makai* termini K1 and K2 to *mauka* termini, U1, U2A, U2B and U3 - is situated within the traditional Hawaiian District of Kula, which has been characterized as having a zonal settlement pattern based on elevation and terrain type. The zones include coastal, intermediate, upland, and forest. The bulk of the project area is within the intermediate zone. The *makai* termini are just inland of the coastal zone and the *mauka* termini U2A, U2B and U3 are in the upland zone. The *mauka* terminus of U1 is at approximately 900 ft. amsl. within the upper limits of the intermediate zone.

The settlement pattern model suggests a low site density for the intermediate zone with like site types to include: trails, markers, agricultural features, temporary habitation, and petroglyphs in gulches. The pattern suggests a higher site density in the vicinity of the *mauka* termini as they are within the upland zone. Based on historic background data site types could include: permanent habitations, large ceremonial structures, evidence of extensive dryland agriculture, burials and petroglyphs. Research, however, indicates that historic commercial agriculture of pineapple and sugar cane, has extensively altered the landscape.

Modern mechanized commercial agriculture has altered the landscape to such a degree that few, if any, sites are anticipated in existing or fallow fields. Based on the above data, it is presumed that sites will exist within non-commercial agricultural terrain such as gulches and gulches or where no commercial agriculture occurred. Based on existing maps, commercial agricultural fields are located above the 750-1000 ft. amsl range.

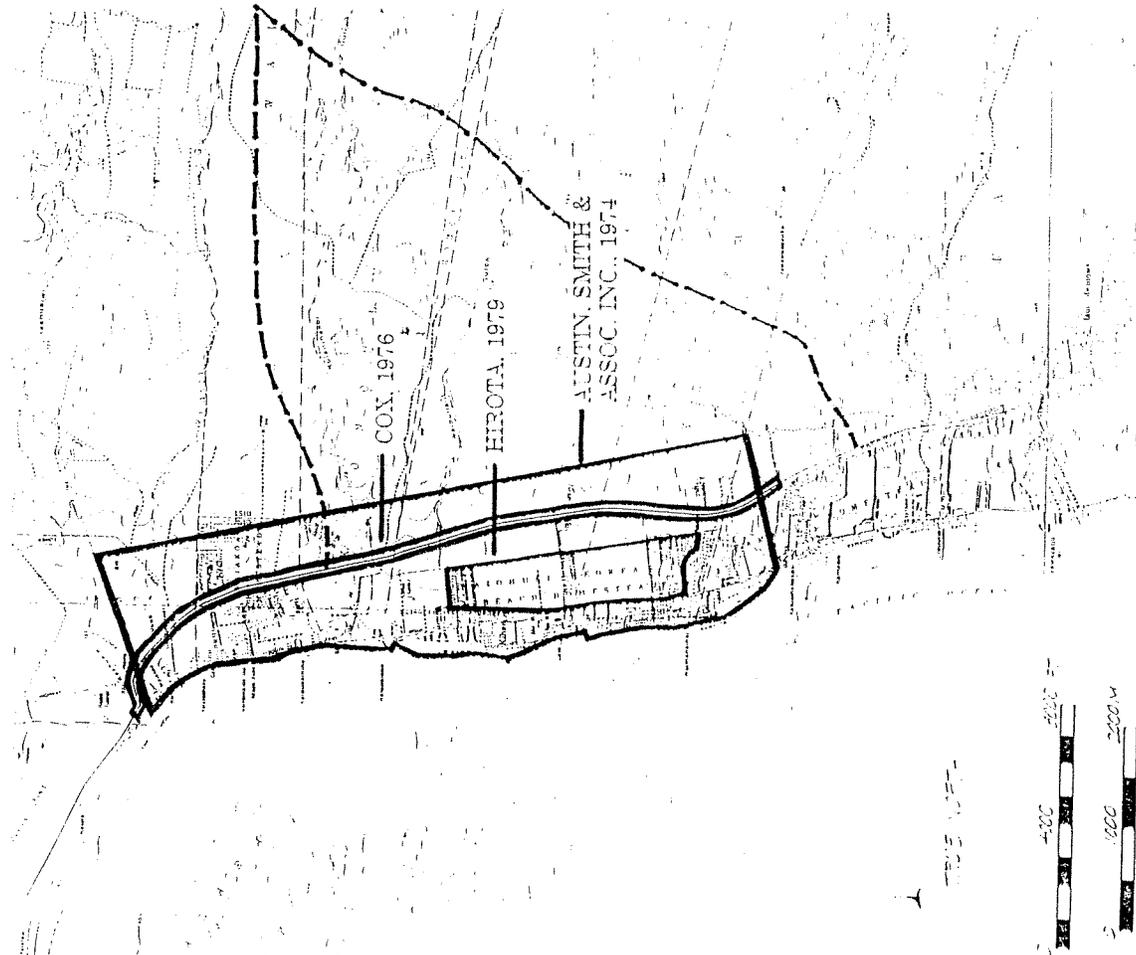

Figure 5 Previous archaeology conducted *maka*i of the project area during the 1970s

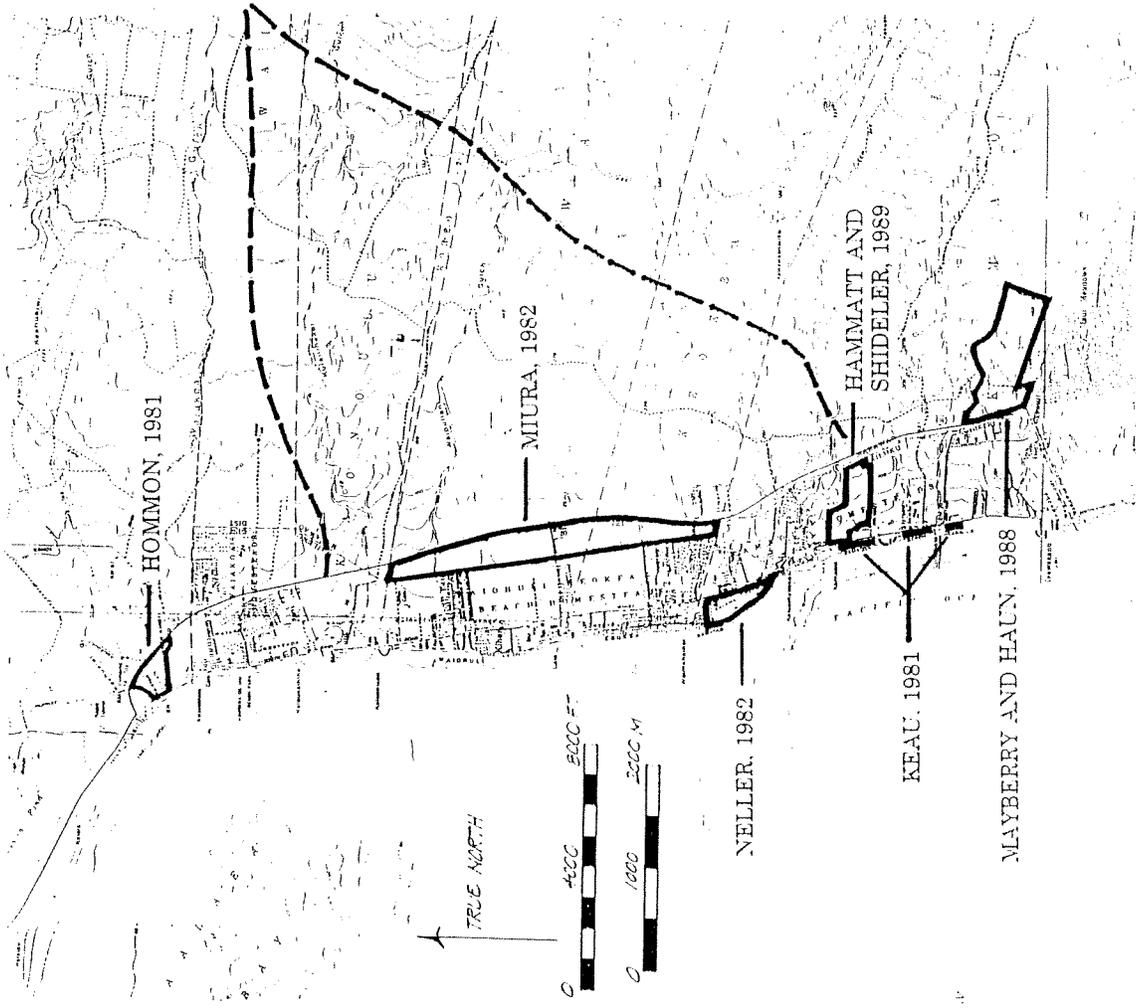

Figure 6 Previous archaeology conducted *maka*i of the project area during the 1980s

## V. SURVEY RESULTS

Twenty-five localities where historic properties, or sites, are present were identified during the archaeological reconnaissance survey (Table 2). In accord with the scope of work (see page 4) the survey was conducted at a reconnaissance level of site recording not that of an inventory survey. The types of features were noted, the general boundaries of the sites were recorded, and initial assessments of site significance were made based only on the reconnaissance data. Site function and significance will be refined or re-defined during the inventory survey level of work to follow in Phase II. State Inventory of Historic Places (SIHP) numbers are usually assigned during inventory survey. However, the State Historic Preservation Officer (SHPO) has requested that SIHP numbers be assigned here. SIHP numbers are, therefore, assigned to the features identified in the reconnaissance survey. This is potentially problematic because the age and function of some sites are difficult to determine without inventory survey level field testing. Some of the SIHP numbers may need to be retracted based on subsequent inventory survey findings.

### A. Site Descriptions

State Site #:	50-50-10-1061, Kaliaiinui petroglyphs	CSH #1
Site Type:	Petroglyphs/overhang shelter	
Function:	Symbolic/habitation, recurrent	
Corridor:	Alternate U2	
Features (#):	2	

Description: The Kaliaiinui petroglyphs were first recorded by the Bishop Museum as site MA-B22-2, and later, assigned State Inventory of Historic Places number 50-50-10-1061. The site is comprised of extensive arrays of petroglyphs on both the north and south walls of Kaliaiinui gulch, and a cliff-overhang shelter located on the north wall beneath the petroglyphs. The land survey centerline stake number 1581 is in the gulch bottom in the vicinity of the petroglyphs. Vegetation at the site consists of various exotic grasses, lantana, a few relict *vitivaili* trees.

Feature A is a cluster of 7-10 pecked petroglyph figures located on a single 3.5 m. (11.5 ft.) wide by 3 m. (9.8 ft.) tall rock panel located at the bottom of the south side of the gulch, 23 m. (75.4 ft.) southwest of stake -1581. Petroglyph figures at Feature A range in size and consist of several anthropomorphic figures, circles, and an image which could be interpreted as avian. No midden or artifacts were observed. There are no sediment deposits associated with this petroglyph cluster.

Feature B consists of a cliff overhang shelter and several rock faces containing 50+ pecked and incised petroglyph figures. Feature B is located 52 m. (171 ft.) west of stake -1581 and 30 m. (100 ft.) *makai* of Feature A along the bottom of the north side of the gulch.

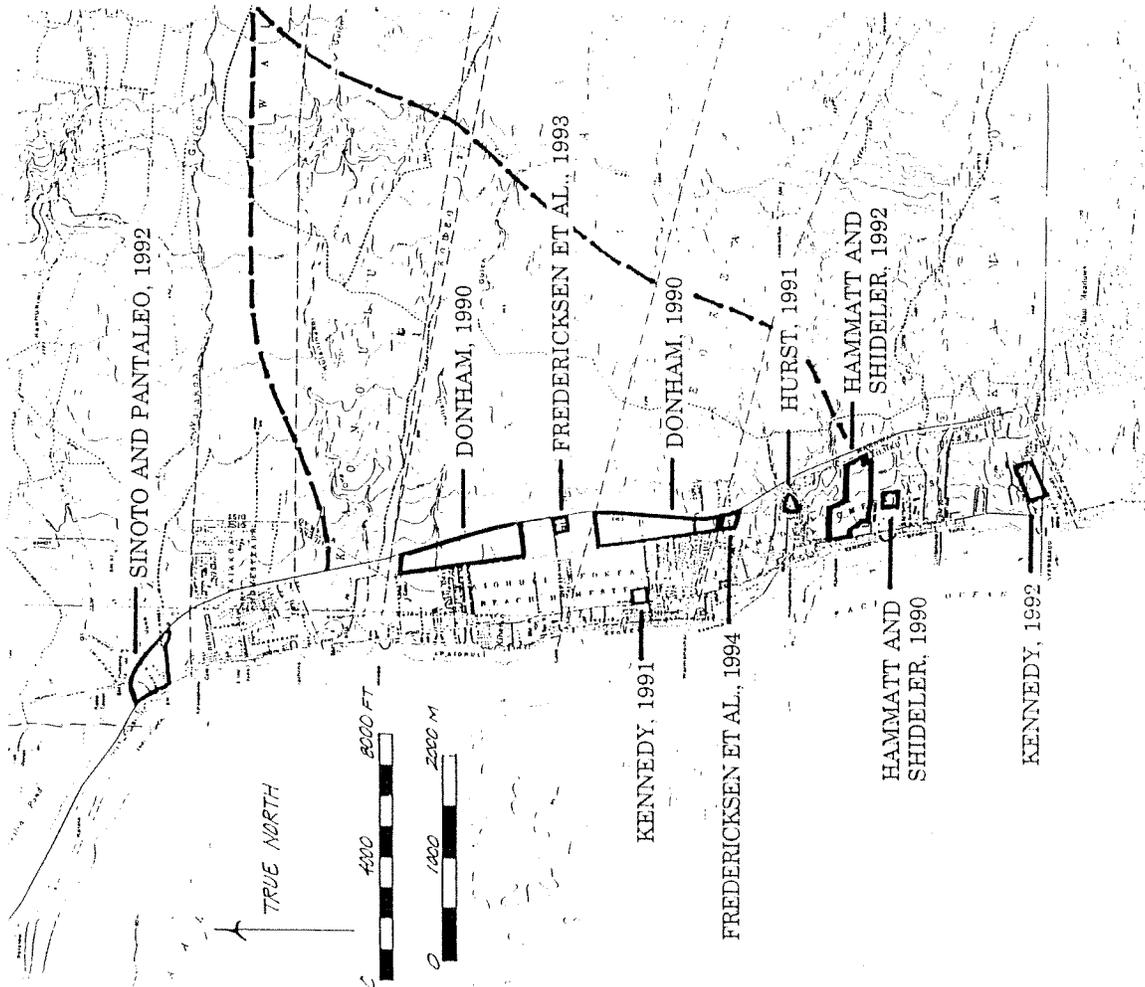

Figure 7 Previous archaeology conducted *makai* of the project area during the 1990s

Table 2: Sites Located During Reconnaissance Survey

*SIHP #	Alignment Section	Location	Description	Comments
#50-50-10-1061	U2	North and south sides of Kaliainui Gulch, stake # 1581	overhang shelter and petroglyph friezes	2 features; 60+ petroglyph figures, previously recorded as State site 50-50-10-1061
#50-50-10-1062	U2B	Kaluapulani Gulch	petroglyph (50+) freize, fire pit & wall	+/- 15 figures, including canoes; previously recorded State site 50-50-10-1062
#50-50-10-4178	U2	South fork of Kaluapulani Gulch, stake #-1592	Petroglyphs	
#50-50-10-4180	U2A	near Puu O Weli	Wall	identified by Wulzen (1996), related to pineapple cultivation cattle control
#50-50-10-4181	U2B	North face of Kaliainui Gulch, <i>mauka</i> of 50-50-10-1061	Complex of two agricultural clearing mounds; two stone alignments	Agriculture
#50-50-10-4760	U2	30 m. southeast of stake #-1578	Modified outcrop	Cattle trail bisects site
#50-50-10-4761	U2	At stake #-1582	Oval enclosure	Recurrent habitation
#50-50-10-4762	U2	<i>Mauka</i> of stake #-1582	Square enclosure	Permanent habitation

39

#50-50-10-4763	U3	Southern side of stake #-723 along ridge	Wall	Cattle wall
#50-50-10-4764	U3	North side of Pūlehu Gulch at stake #-578	Cliff overhang shelter with petroglyphs	15 pecked and incised figures
#50-50-10-4765	U1/U2	65 m. northwest of stake #-1189	Mounds, road berm, and irrigation ditch	3 features; ditch, clearing mounds, and berm segment
#50-50-10-4766	K2	Between stake #-907 and 911 both <i>mauka</i> and <i>makai</i> of centerline	Area of sites	+/- 30 associated features (enclosures, alignments, and mounds)
#50-50-10-4767	K2	On centerline between stake #-913 and -915	Circular enclosure	Agriculture
#50-50-10-4768	K2	On centerline between stake #-916 & -920	Wall	- Cattle wall?
#50-50-10-4769	K2	45 m. east of stake #-920	Wall and cairn	2 features; wall and <i>ahu</i>
#50-50-10-4770	K2	At stake #-923	Enclosure and cairn	2 features; enclosure and <i>ahu</i>
#50-50-10-4771	K2	300 m. <i>mauka</i> of Ke Ali'i Alanui Road & Pi'ilani Highway	Mound	clearing mound?
#50-50-10-4772	K2	Between stake #-928 & -929 along centerline	Boundary Wall	Site extends across entire corridor width

40

The overhang shelter measures 13.7 m. (45 ft.) wide, 3.1 m. (10.2 ft.) deep, with a maximum entrance height of 3.2 m. (10.5 ft.) tall. The petroglyph figures associated with the overhang shelter are found scattered above and inside the entrance area of the shelter. Petroglyph figures at the feature consist of partial and complete, incised and pecked stick and triangular human figures, 4 incised and pecked canoes, dog, bird, and several other incomplete shapes. Cultural material observed at the feature consisted of an egg-shaped coral manuport (worked). The floor of the shelter exhibits a sediment layer. Cultural material may be present in the sediments.

State Site #: 50-50-10-1062 CSH #101 & #102  
 Site Type: Petroglyph friezes, fire pit and stone wall  
 Function: Symbolic/habitation, recurrent  
 Corridor: Alternate U2A  
 Features (#): 50+

Description: Two petroglyph friezes. The first one is over one hundred feet long. It may be considered a discontinuous extension of SIHP 50-50-10-1062 - the Kaluapulani petroglyphs. This 100 foot long frieze is located on the north side of Kaluapulani gulch (Figure 3 and 4) west of the previously recorded friezes. There are a minimum of 23 petroglyphs in this section. (The boundaries of the site as recorded in the SIHP will need to be amended.) The petroglyphs are on the vertical face of an aa flow exposed by the stream cut. The lava flow is nearly horizontal and is near the top of the gulch wall. The road corridor centerline stake #314 is situated at the edge of the gulch on the north side, directly above the *maka*i end of the bedrock exposure.

The columnar or block, jointed lava of the aa flow exposure creates an overhang shelter area near the center of the frieze. Beneath the overhang is the remains of a small fire of grass and twigs about 20 centimeters in diameter. The remains of the fire was photographed, but was not otherwise disturbed (see Photographic Appendix).

Below the petroglyph frieze, the ground consists of a talus deposit sloping steeply down to the riverbed and is covered by tall grass, but otherwise open to full sun. At the bottom of the talus slope a discontinuous stacked stone wall is present along the edge of the riverbed. The wall is probably an old cattle fence, and thus, unrelated to the petroglyphs. The bedrock exposure on the north side of the gulch is bounded on each end by a single *Wiitooiti* tree and there are others on the opposite side of the gulch. A major electrical power line runs in the gulch bottom and power pole (PP) #186 is located in the riverbed directly below the site.

Another frieze of petroglyphs was discovered in the road corridor on the south wall of Kaluapulani gulch, about 100 feet *mauka* of an unnumbered, corridor centerline stake. The stake is at the south edge of the gulch, and is about 85 feet north of centerline stake #317, thus, its number should be #316.15 (stake #316 + 15 feet)(see Figure 3). (Stake numbers on the Alternate U2A corridor increase from north to south.). This frieze of petroglyphs, like the other on the north side of the gulch, is located on a vertical exposure of blocky, jointed

#50-50-10-4773	K1 & K2	5 m. east of stake #390; Both sides of centerline between stake #1118 & 1120	Complex of 2 Enclosures and 7 Enclosures	contain live small arms ammunition
#50-50-10-4174	U3	Bisects numbered stake #545 along northern side of Waiakoa Gulch	Wall	Cattle
#50-50-10-4775	U3	On southern edge of Kolaloa Gulch between stake #567 & 568	Wall	Cattle
#50-50-10-4776	K1	East side of Kulanihakoi Gulch between stake #3000 & -3001	Midden and lithic scatter, and mound	Previous test units observed in surrounding area (association undetermined)
#50-50-10-4777	U1	East edge of Kalialinui Gulch	Wall	Cattle; above power line at bottom of gulch
#50-50-10-4778	U1/U2	south edge of Waiakoa gulch at stake #1135	Enclosure	Undetermined
#50-50-10-4779	U2A	in Kalialinui gulch	Shelter Cave	recurrent habitation

\* State Inventory of Historic Places

lava of an aa flow. There are a minimum of twenty-six pecked and incised anthropomorphic figures of stick and triangular types in this frieze. The exposed bedrock is approximately 150 to 200 ft. in length and ranges in height from 10 to 30 ft., forming a semi-circular niche in the south ridge of the gulch. At the back of the niche is a dry waterfall course roughly 8 ft. wide and 30 ft. high. All the petroglyphs in this frieze are situated on the rock faces which are *mauka* of the waterfall at the back of the niche. None were observed *makai* of the waterfall although the lava exposure continues there. A re-alignment of a short section of this corridor 400 feet to *makai* in Kaluapulani gulch would not impact other historical properties and would avoid the two new friezes of 50-50-10-1062.

At the base of the waterfall are plunge pools indicating a significant volume of water when there is a flow. The waterfall forms the confluence of the primary stream in Kaluapulani gulch and this secondary unnamed tributary stream draining Pu'uoweli and the ridge to the south.

Large trees (of unknown classification) of perhaps 60 feet in height provide the niche with cool shade. Christmasberry trees and exotic grasses were also present. One plant observed in the sparse understory may be Mamake.

CSH #23

State Site #: 50-50-10-4178  
 Site Type: Petroglyphs  
 Function: Symbolic  
 Corridor: Alternate U2  
 Features (#): 1

Description: #50-50-10-4178 comprises 15+/- petroglyphs located on the north side of the south fork of Kaluapulani Gulch. Previously recorded as Bishop Museum site MA-B23-1 (Cox and Stasack 1988:92) the SHP site number is 50-50-10-1062. The petroglyphs consist of anthropomorphic figures and images that could be interpreted as canoe. They are located on the vertical basalt faces of an aa lava flow exposed in the north wall of the gulch covering an area 5 m. (16.4 ft.) long and 3 m. (9.8 ft.) high. Vegetation at the site consists of exotic shrubs and grasses. No associated features or cultural material was observed in the area.

CSH #5

State Site #: 50-50-10-4180  
 Site Type: Enclosure  
 Function: Animal control  
 Corridor: Alternate U2  
 Features (#): 1

Description: Site 50-50-10-4180 (also known as site 1707-2 (McPhatter and Rosendahl 1996) is a wall of small basalt boulders located on the steep, rocky, northern face of Kaliahinui Gulch, *mauka* of the Kaliahinui Petroglyphs (#50-50-10-1062)CSH 1). A segment of the wall about 12 m. (39.4 ft.) long, with a maximum height of 1 m. (3.3 ft.) and

maximum width of 2.5 m. (8.2 ft.), was observed in the U2 corridor. The wall extends between two vertical rock faces of the gulch. The site is in poor condition with substantial collapsing toward the gulch bottom. No cultural material was observed and it is unlikely that sediments in the vicinity of the wall would yield important information relative to its age or function. It is probable that the wall was used recently for control of grazing animals - to keep them in the gulch and out of the pineapple fields. Some rocks on this north edge of Kaliahinui gulch may also have been raked from the pineapple fields and dumped over the edge of the gulch. Vegetation at the site on the gulch slope consists of exotic shrubs and grasses.

Wulzen site

State Site #: 50-50-10-4181  
 Site Type: Rock walls and rock piles  
 Function: Historic agriculture  
 Corridor: U2B  
 Features (#): 4

Description: The site is described in Wulzen *et al.*, 1996:6-9 as consisting of: (1) two "alignments forming terraces in a small swale between former pineapple fields" (features A and B) and, (2) two "land-clearing piles of rock, associated with pineapple cultivation," (features C and D). Features A and B were tested by archaeological excavation, the results of which indicated a recent age (mid-twentieth century) for the site.

CSH #2

State Site #: 50-50-10-4760  
 Site Type: Modified Outcrop  
 Function: Undetermined  
 Corridor: Alternate U2  
 Features (#): 1

Description: State site #50-50-10-4760 is a modified outcrop located on the west side of gently sloping bedrock approximately 30 m. (98 ft.) southeast of stake number -1578. The modified area is constructed of small to medium boulders and measures 4 m. (13.1 ft.) in length with a maximum height of 1.4 m. (4.6 ft.). The modified section has an uneven bedrock and cobble surface and is not well faced. A 1 1/2 inch water pipe and a cattle trail run along the top of the modified outcrop, and blocks of cement are east of the outcrop along the waterline. Immediately around the site is close cropped pasture with water trough and jeep road. *Wiluili* trees are present at the site, and *panini* cactus is also present east of site #50-50-10-4760 in the adjacent property - separated by a fence line - where sites 50-50-10-4761 and 50-50-10-4762 are located. No cultural middens were observed at the site. Based on the observations a cultural deposit exists within the overhang shelter.

CSH #3

State Site #: 50-50-10-4761  
 Site Type: Enclosure

fields and paddock. If the wall has always functioned as part of the enclosure it may be related to cattle ranching. The wall then could date to the nineteenth century when ranching was even more widespread than today. Vegetation at the site consists of *panini*, lantana, and exotic shrubs and grasses. The wall is in good condition. No cultural material was observed. Sediments are gravelly, the terrace may be an old gravel bar of the stream.

State Site #: 50-50-10-4764 CSH #7  
 Site Type: Petroglyphs and overhang shelter  
 Function: Symbolic/habitat, recurrent  
 Corridor: Alternate U3  
 Features (#): 2

Description: 50-50-10-4764 consists of several rock faces containing a minimum of fifteen pecked and incised petroglyph figures and a cliff-overhang shelter. Located on the north wall of Pūlehu Gulch just *makai* of center line stake number 578 and about halfway between the top and bottom of the gulch, the bedrock exposure comprising the site is the dense center of a nearly horizontal aa lava flow. The overhang shelter is beneath the flow's dense layer and measures 6.5 m. (21.3 ft.) wide and 3.5 m. (11.5 ft.) deep, with a maximum height at the entrance of 1.7 m. (5.6 ft.). The petroglyph figures associated with the overhang shelter are found scattered above and inside the entrance area of the shelter. Petroglyph figures at the site consist of partial and complete, incised and pecked, stick and triangular anthropomorphic figures, animal forms that appear dog, bird, or fish-like, and several other nondescript shapes. Vegetation at the site consists of *koa hiale* and various exotic grasses of up to eight feet in height. The site is in excellent condition. Cultural material observed at the feature consists of a large, cobble-sized, basalt core and several large wood pieces. Sediments are present in the shelter and may contain cultural deposits.

State Site #: 50-50-10-4765 CSH #8  
 Site Type: Mounds, road berm and irrigation ditch  
 Function: Agriculture (Sugarcane cultivation)  
 Corridor: Alternate U1/U2  
 Features (#): 3

Description: State site 50-50-10-4765 consists of features derived from sugarcane cultivation on this parcel of land between Pūlehu Road and Ōma'opio Road, which has since been converted to pasture. Feature A is a historic irrigation ditch, Feature B consists of several agricultural clearing mounds, and Feature C is a small road segment. These features are located in gently sloping pasture land approximately 65 m. (213 ft.) northwest of center line stake number 1189. Vegetation in this section of the corridor consists of *panini* cactus, few monkeypod trees, *koa hiale*, and exotic grasses grazed short which allowed for an un-obscured view of the ground.

Feature A is an agricultural irrigation ditch. It passes through the Alternate U1/U2 corridor from *mauka* to *makai* where it is primarily earthen in construction. Beyond the corridor boundaries there are remnants of mortar and small basalt boulders used in the ditch's construction. Although it is in disuse the ditch was traced to a small reservoir that is now part of a newer, active ditch system *makai* of the U1/U2 road corridor, at the edge of

Function: Habitation, recurrent  
 Corridor: Alternate U2  
 Features (#): 1

Description: State site #50-50-10-4761 is an enclosure located near centerline stake 1582 on a gentle aa slope, surrounded by *panini* cactus, tall pasture grass and *ekoa* trees that are probably a decade or more old. The enclosure, roughly oval in shape and approximately 20 m.<sup>2</sup> (14.8 ft.) E-W by 4.5 m. (14.8 ft.) N-S, is constructed of small basalt boulders stacked 0.3 to 0.6 m. high. The structure is in fair condition with some collapsing of the walls in the site interior. No cultural material was observed at the site, but the grass cover suggests sediments suitable for cultural material. Downslope to the east is State site #50-50-10-4762 and to the west is State site #50-50-10-4760 over the fence line in the adjacent pasture.

State Site #: 50-50-10-4762 CSH #4  
 Site Type: Enclosure  
 Function: Habitation, permanent  
 Corridor: Alternate U2  
 Features (#): 1

Description: State site #50-50-10-4762 is an enclosure located near centerline stake 1582 on a gentle aa slope surrounded by *panini* cactus, tall pasture grass and *ekoa* trees that are probably a decade or more old. The enclosure is roughly square in shape, approximately 20 m.<sup>2</sup> (5 m. x 4 m. or 16.4 ft. by 13.1 ft.) EW/NS, and constructed of small angular basalt boulders stacked 0.5 to 0.8 m. high. An apparent entrance is located in the center of the west side of the enclosure. Site -4762 is in good condition. No cultural material was observed at the site, but a cultural deposit is anticipated. The tall grass suggests that deep sediments may be present which may contain cultural material. Site -4761 is located up-slope to the west and beyond -4761 is site -4760, across the fence line in the adjoining pasture.

State Site #: 50-50-10-4763 CSH #6  
 Site Type: Enclosure  
 Function: Animal control  
 Corridor: Alternate U3  
 Features (#): 1

Description: State site #50-50-10-4763 is a cattle paddock with 3 sides being barbed wire fencing and the northern side is dry masonry, stacked, basalt boulder wall. The wall is oriented *mauka/makai* along the ridge line on the south edge of Pūlehu gulch near center line stake number 723 approximately one thousand feet *makai* of the Kula Highway. The wall is 0.7 m. (2.3 ft.) wide and ranges in height from 0.7 to 1.6 m. (2.3 to 5.3 ft.) with a total length of 55 m. (180.4 ft.). The other three sides of the paddock are constructed of barbed fence wire strung between wooden posts with the south fence separating the pine

fields cultivated in sugarcane. Feature A has a maximum width of 2.3 m. (7.5 ft.) and maximum depth of 1.3 m. (4.3 ft.). The ditch is certainly part of an older irrigation system for sugarcane cultivation.

Feature B includes nine agricultural clearing mounds distributed along a shallow gully crossing the UI/U2 corridor just north of the 50-50-10-4765 feature A ditch. The mounds vary in size from a few meters in diameter, to 10 to 15 m. (32 to 49 ft.) long by 10 m. (32 ft.) wide and 2 to 5 m. (6.5 to 16.4 ft.) high. They consist of small to large boulders pushed up into piles on the high points of the ground along the gully and elsewhere leaving the low ground relatively free of stones. No cultural material was observed. There were no sediments observed in these boulder piles.

Feature C is a short (7.5 m. or 24.6 ft.) segment of road, or bridge-like berm, that extends across the shallow gully north of feature A and surrounded by five of the mounds of feature B. The berm is constructed of small basalt boulders which are exposed as a facing on the west, or *makai*, side of the berm. The berm is approximately 3 m. (9.8 ft.) wide 1.3 m. (4.3 ft.) high at the midpoint, or highest point. The feature is in good condition. No cultural material was observed. There is some sedimentary material trapped among the boulders. However, any material in these sediments will likely be historic in age or out of context if of prehistoric age. Construction detail of the road berm is intact.

State Site #: 50-50-10-4766 CSH #9  
 Site Type: Complex of C-shapes, enclosures, mounds, alignments  
 Function: Agriculture/habitation, temporary  
 Corridor: Alternate K2  
 Features (#): +/-30

Description: State site #50-50-10-4766 is a complex of +/-30 archaeological features that probably functioned as agricultural and habitation sites. The features include multiple C-shaped (2-3 m. diameter) and rectangular enclosures (approximately 3 features with 2-4 m. interior width), alignments, and mounds constructed of small basalt boulders. They are distributed along the top of a low, *mauka/makai*, or east-west oriented ridge line between centerline stakes 907 to 911. Multiple features are located on both sides of the stated center line. At the time of the survey the grass ground cover was dense and about two feet high precluding an accurate count of the features. The sites are in fair condition in land used as pasture for cattle for many years. No cultural material was observed in the sites probably because of the dense grass. The ground within the site cluster is very old aa lava. This normally produces a substantial surface sediment layer. The thick growth of grass also indicates a good soil layer where archaeological deposits may be present. The predominant tree is *kiawe*, however, *koa haole*, and occasionally *wiliwili* are also present.

State Site #: 50-50-10-4767 CSH #10  
 Site Type: Enclosure  
 Function: Agriculture  
 Corridor: Alternate K2  
 Features (#): 1

Description: State site #50-50-10-4767, a small, roughly circular enclosure approximately 3 m. (9.8 ft.) in diameter located on the north bank of a ravine between centerline stakes 912 and 913, is constructed of small boulders stacked 1 to 3 courses high for a maximum height of 0.5 m. (1.6 ft.). *Kiawe* and uncropped pasture grass predominate with sparse *koa haole*, and occasional *wiliwili*. The site is in fair condition; no cultural material was observed. The site is believed to be part of a large agricultural complex, extending east and north of this single enclosure. Other features may be beyond the project area boundaries to the west also, probably joining with the features of site 50-50-10-4766. These other sites were not investigated because they are outside the project area. Sediments are almost surely present on this old aa lava surface, but are obscured by the grass cover. Archaeological materials may be buried in the sediments.

State Site #: 50-50-10-4768 CSH #11  
 Site Type: Wall  
 Function: Animal control  
 Corridor: Alternate K2  
 Features (#): 1

Description: State site #50-50-10-4768 is a meandering wall segment. The wall is located on the road centerline between centerline stakes 916 and 919. It is built along the perimeter of a natural depression in the terrain; the area may have served as a corral or pen to include or exclude animals. The wall is constructed of small to medium boulders in combination with sections of natural bedrock and is approximately 150 m. (500 ft.) long and 0.3 to 0.6 m. (1 to 2 ft.) wide, with a maximum height of approximately 1.3 m. (4.3 ft.). The depression is predominantly grass filled; surrounding areas are savannah of *kiawe* and unidentified pasture grasses. The wall is in fair condition. No cultural material was observed. There may be sufficient sediment associated with the foundation of the wall in some places to establish a date of construction.

State Site #: 50-50-10-4769 CSH #12  
 Site Type: Wall and cairn  
 Function: Animal control/Boundary marker  
 Corridor: Alternate K2  
 Features (#): 2

Description: State site #50-50-10-4769 consists of a wall segment (feature A) and an *ahu* (feature B). These features are located approximately 45 m. (150 ft.) east of centerline stake 920 on the bank of a steep aa flow. Vegetation at the site consists of *wiliwili*, *kiawe*, and various grasses.

Feature A is a wall segment constructed of small boulders stacked 1-4 courses high. The wall segment is approximately 0.5 m. (1.6 ft.) wide, with a maximum height of 1.2 m. (3.9 ft.). The total length of the wall feature is not known because it extends beyond the four hundred foot wide survey corridor. The feature is in fair condition. No cultural

material was observed, however, there may be archaeological material associated with the wall foundation to establish a date of construction.

Feature B is an *ahu* feature constructed of small boulders stacked 3-4 courses high. The *ahu* is approximately 0.9 m. (3 ft.) wide and 0.7 m. (2.3 ft.) tall. The feature is in fair condition. No cultural material was observed, however, there may be archaeological material associated with the *ahu* foundation to establish a date of construction.

State Site #: 50-50-10-4770 CSH #13  
Site Type: Enclosure and cairn  
Function: Habitation, temporary/trail or boundary marker  
Corridor: Alternate K2  
Features (#): 2

Description: State site #50-50-10-4770 consists of an enclosure (feature A) and an *ahu* (feature B) located at centerline stake 923 on an aa lava flow at the edge of a *kipuka*. The savannah persists on the aa and in the *kipuka*.

Feature A is a roughly circular enclosure located in gently sloping aa. It is constructed of small boulders stacked 1 to 3 courses high for a wall construction height of 0.5 m. (1.6 ft.) and an average diameter 4.5 m. (about 15 ft.). The feature is in poor condition. No cultural material was observed, however, there may be archaeological material associated with the wall foundation to establish a date of construction. The absence of other features in the vicinity of this structure detracts from the possibility the feature is related to agriculture. The presence of the nearby *ahu*, which may be a trail marker, could be used to argue for the site being a temporary habitation site. Test excavations during the inventory survey could aid in the interpretation of the site by determining if archaeological deposits are present. If present the deposits could provide material to further assess site function, and for age determination.

Feature B is an *ahu* feature constructed of small boulders stacked 3 to 4 courses high with a maximum height of 0.6 m. (2 ft.) and width of 2 m. (6.6 ft.). The feature is in fair condition. No cultural material was observed and it is unlikely that there is archaeological material associated with the wall foundation that would be useful in establishing a date of construction.

State Site #: 50-50-10-4771 CSH #14  
Site Type: Mound  
Function: Undetermined  
Corridor: Alternate K2  
Features (#): 1

Description: State site #50-50-10-4771 is a mound located about 300 m. (980 ft.) *mauka* of Piliame Highway at Ke Alii Alanui Road, in the midst of an area of recent, heavy

bulldozing. It appears the bulldozer operator recognized and purposefully avoided the site while clearing the surrounding area. The bulldozing has obliterated the former landscape and other features, if present, around the mound. Thus, the context and estimated age of the mound is indeterminate. The bulldozed ground surface was inspected for archaeological remains of disturbed deposits, but no cultural material was seen. The mound is constructed of small boulders stacked 3 to 5 courses high measuring 0.9 m. (3 ft.) wide with a maximum height of 0.7 m. (2.3 ft.). The site is in fair condition. No cultural material was observed. If this corridor is selected the mound should be excavated to test for archaeological material.

State Site #: 50-50-10-4772 CSH #15  
Site Type: Wall  
Function: Ahupua'a boundary  
Corridor: Alternate K2  
Features (#): 1

Description: State site #50-50-10-4772 is a dry masonry stone wall, running generally *mauka/maikai*, located between centerline stakes 928 and 929, along the boundary of two lava flows of different ages. The wall is constructed of small and few medium boulders and cobbles stacked 5 to 7 courses high. Areas of barbed wire fencing were also observed along some sections of the wall which is 0.5 to 0.7 m. (1.6 to 2.3 ft.) wide and 1.4 to 1.7 m. (4.6 to 5.6 ft.) high. The total length of the wall was undetermined in the survey. It extends across the 400 ft. wide project area corridor and beyond its limits both to the east and the west. The wall is shown on the USGS topographic map as the boundary between Kama'ole and Ke'okea *ahupua'a*. This could be used to argue the wall probably dates to the late nineteenth century. The savannah persists on either side of the wall in spite of the difference in age of the lava flows on either side, and *panini* cactus makes an appearance at this elevation. The site is in excellent condition and appears to still be in use as a fence. No cultural material was observed. The sediments associated with the wall foundation could provide archaeological material for dating the structure especially if earlier wall structures are buried beneath the present one.

State Site #: 50-50-10-4773 CSH #16 & #17  
Site Type: Enclosures, square (2), Enclosures, U-shaped (7)  
Function: Temporary military command post and rifle positions  
Corridor: Alternate K1  
Features (#): 9

Description: State site #50-50-10-4773 consists of two complexes of enclosures. The first two enclosures are roughly square, located adjacent to a jeep road, and 5 m. (16.4 ft.) east of centerline stake 390. The enclosures are similar in size, being approximately 2.5 m. (8.2 ft.) square, and are constructed of small boulders stacked 1 to 4 courses high with a maximum height of 0.5 m. (1.6 ft.). *Kiawe* trees are growing in the sites, and the surrounding area is open savannah with *kiawe* trees and *kiu* being common. The

enclosures of the site are in fair condition. Historic cultural material observed at the site consisted of live, small arms ammunition and other assorted metal fragments including shrapnel and communications wire. These features are in an area with widespread bulldozing and abundant remains of military activities related to personnel training. These activities probably took place during WWII based on the abundance of .30 cal. ammunition and Springfield ammo clips, but no written evidence of this was found. No pre-contact or other early historic cultural material was observed. No other cultural material was predominantly decomposed bedrock, or C-horizon sediments. Test excavations during inventory survey of the route will show if these features were present prior to the twentieth century.

The second set of 7 U-shaped enclosures consists of a minimum of seven U-shape enclosures located between centerline stakes 1118 and 1120 in level, soil-covered terrain in open savannah. Signs of bulldozing are present in the area. The enclosures are uniform in construction style and size, measuring approximately 2 m. (6.6 ft.) in length and 1.5 m. wide, and constructed of small boulders stacked 1 to 3 courses high. A few are nearly circular, but also have the opening on one side. Small depressions are found in the interior of each of the U-shaped features. Historic cultural material observed within the interior of the enclosures and in the general site area include live, small arms ammunition, spent shell casings, tin food containers, shrapnel and other assorted metal fragments. These features are in an area with widespread bulldozing and abundant remains of military activities related to personnel training. These activities probably took place during WWII based on the abundance of .30 cal. ammunition, but no written evidence of this was found. No pre-contact or other early historic cultural material was observed. There are sediments within these features, however, the evidence of bulldozing suggests cultural deposits are unlikely.

State Site #: 50-50-10-4774  
Site Type: Wall  
Function: Animal control  
Corridor: Alternate U3  
Features (#): 1

Description: State site 50-50-10-4774 is a dry masonry wall crossing the road corridor diagonally at centerline stake 545. The wall extends along the slope contour (generally north-south) on the north side of Waiakoa gulch. This section of wall appears to be still in use as new barbed wire fencing is used as patch material where short sections of the wall have collapsed. The wall is constructed of small boulders stacked 3 to 6 courses high to a maximum of 1.3 (4.3 ft.) to 1.6 m. (5.3 ft.), with a maximum width of 0.8 m. (2.6 ft.). The cooler temperatures at the higher elevation of this site has created a nearly closed canopy forest of *koaue* with large stands of *panini* and at the time of the survey the uncropped grass was about three feet high. The site is in good condition. No archaeological middens were observed. However, there may be archaeological material associated with the wall foundation that would be useful to establish a date of construction.

51

State Site #: 50-50-10-4775  
Site Type: Wall  
Function: Animal control  
Corridor: Alternate U3  
Features (#): 1

Description: State site #50-50-10-4775 is a dry masonry wall within Kalaialoa gulch on the southern edge of the streambed between the corridor centerline stakes 567 and 568. The wall is constructed of small to medium boulders and incorporates sections of natural bedrock where the bedrock presents a wall-like drop that restricts cattle from passing. Constructed portions of the wall are generally 1 m. (3.3 ft.) high and 0.8 m. (2.6 ft.) wide. The barrier to animal crossing can be considerably higher where the bedrock is exposed and where gulch walls are vertical. The wall is still in use as a fence, evidenced by patches of new barbed wire in the wall where collapsing has occurred recently. The *koaue* forest is semi-closed on the land south of Kalaialoa gulch with an understory of pasture grasses. On the north side of the gulch the ridge is cultivated in pineapple. The wall is in good condition. No archaeological middens were observed. However, there may be archaeological material associated with the wall foundation that would be useful to establish a date of construction.

State Site #: 50-50-10-4776  
Site Type: Midden and lithic scatter/ mound  
Function: Habitation, recurrent/agriculture  
Corridor: Alternate KI  
Features (#): 1

Description: State site #50-50-10-4776 is a surface scatter of marine shell midden, coral, and lithic tools and detritus including a hammer-stone. A low mound of cobbles and small boulders is also included within the bounds of the site. The site is located between centerline stakes 3000 and 3001 along the east side of Kulanihako'i Gulch at Pihani Highway. The area in which the mound, scattered cultural middens, and artifacts were observed measures approximately 37 m. (about 120 ft.) in diameter. A previously dug pit within the mound at the site appears to be one meter square, as would be expected for archaeological test excavation units. This probability is augmented by the presence, nearby the mound, of two back-dirt piles from the mound excavation - one of sifted dirt and the other of neatly stacked rocks. Nevertheless, a search of previous archaeological studies conducted in the area and consultation with the Department of Land and Natural Resources, Historic Preservation Division staff did not determine the origin of the excavations. Intact archaeological deposits at the site appear unlikely. Deflation of a former soil deposit may have created the site as we see it today, or the site may have originally been only a surface scatter. Flora at the site is consistent with most of the low land survey area - open savannah, the predominant tree is *koaue*.

52

CSH #19

CSH #20

State Site #: 50-50-10-4777 CSH #21  
 Site Type: Wall  
 Function: Animal control/Field boundary  
 Corridor: Alternate U1  
 Features (#): 1

Description: State site #50-50-10-4777 is a wall located along the top edge of the north side of Kaliahinui Gulch where it intersects the U1 corridor *makai* of Pukalani town. The constructed portions of the wall are discontinuous sections connecting exposures of blocky, vertical bedrock. A typical wall section has a height of over 1 m. (between 3 and 4 ft.) and is constructed of small to medium, slab-shaped boulders and cobbles. Wood fence posts and wire fencing are currently being used to repair collapsed sections of the wall indicating its former use as a fence. The gulch is surrounded by cultivated sugarcane, but within the gulch there are various exotic grasses used for pasture and relict *kukui* and *wilituli* persist. No other cultural material was observed. However, there may be archaeological material associated with the wall foundation that could be useful to establish a date of construction.

State Site #: 50-50-10-4778 CSH #22  
 Site Type: Enclosure, L-shaped  
 Function: Habitation, temporary  
 Corridor: Alternate U1/U2  
 Features (#): 1

Description: State site #50-50-10-4778 is a L-shaped enclosure located upon a flat soil surface on the southern edge of Waiahoa Gulch at centerline stake 1135. The L-shaped enclosure measures 1.5 m. (4.9 ft.) east-west by 1.5 m. (4.9 ft.) north-south, and is constructed of small boulders stacked 1 to 3 courses high to a maximum height of 0.5 m. (1.6 ft.). The open savannah of *kiawe* trees and pasture grass at the site is consistent with the central project area as a whole. No cultural material was observed at the site. Grasses in the enclosure indicate some sediments there, but the site is in rocky terrain near the edge of the gulch which suggests these sediments are shallow.

State Site #: 50-50-10-4779 CSH #103  
 Site Type: Shelter-cave  
 Function: Habitation, temporary  
 Corridor: Alternate U2A  
 Features (#): 1

Description: State site #50-50-10-4779 consists of a shelter-cave located in Kaliahinui gulch (see Figure 2 and the Photographic Appendix). The shelter-cave is excavated into an aa clinker layer in the south wall of the gulch about 1.2 m. (4 ft.) above the gulch floor. The cave measures 2.1 m. (7 ft.) deep by 4 m. (13 ft.) long, with a ceiling height of 1.7 m. (5.5 ft.). Five boulders placed along the front edge of the cave floor are the only signs on the surface

of human use of the site. No midden or artifacts were observed, but the shelter floor appears to be a of loose sediment that may contain intact archaeological deposits.

## B. Summary of Results

Archaeological sites were recorded at twenty-five locations within the eight proposed alternate road segments during the reconnaissance survey. The sites fall into two general categories: 1) prehistoric sites including traditional sites in use in the early post-contact period, and 2) post-contact sites including historic and recent archaeological remains.

The prehistoric archaeological remains include simple shelter structures - which could have been used for temporary or recurrent shelter or sheltered planting areas - and three areas of extensive petroglyphs. The prehistoric habitation and agricultural sites occur in the *makai* and *mauka* extremes of the project area which were permanently occupied in prehistoric times. The petroglyphs occur only in the *mauka* sections of the corridors, in Kula.

The post-contact sites include: (1) stone walls for ranch fencing and corrals throughout the alternate corridors from Kihei to Kula, (2) irrigation ditches, rock-clearing mounds and a road berm for sugarcane cultivation occur at the edge of still active sugarcane fields at the edge of Kula, (3) and enclosures for military bivouac and troop maneuvers which occur in the middle section of the area of study.

The cave-shelter at the base of the south wall of Kaliahinui gulch - State Site 50-50-10-4779 - was probably used for temporary habitation, and it has potential to provide additional information on area history and prehistory. The site lies on, or very near, the west edge of corridor U2A where the corridor crosses Kaliahinui gulch. Its location could only be approximated because of the steep walls of the gulch. The site could be subjected to archaeological mitigation such as data recovery if necessary.

The sites will potentially be impacted because of their proximity to Alternate U2A, but they are present only in the two prominent gulches - Kahaupulani and Kaliahinui - and complete avoidance of the sites is possible by adjustment of the gulch crossing locations. There also are no historic properties in Alternate U2A westward from Kaliahinui to its intersection with Alternate U2B, nor to their combined *makai* termination point. Re-alignment of the U2A corridor to the east (*mauka*) within the limits of the reconnaissance as described here would not impact any historic properties.

The present reconnaissance of the Alternate U2B corridor from the north edge of Kaliahinui gulch westward to its terminus in the cane fields of Oma opio, did not locate any historic properties. The corridor passes through primarily cultivated fields of pineapple on the ridges. It crosses Kaliahinui gulch about six hundred feet east, or *mauka*, of a shelter-cave (field # CSH 103) identified in another surveyed corridor Alternate U2A, and over one thousand feet west, or *makai*, of the well known Kaliahinui Petroglyphs - 50-50-10-1061. We found the Kaliahinui gulch walls to be nearly vertical from top to bottom in the vicinity

of the Alternate U2B and U2A crossings. Because of these conditions we inspected the entire section of the gulch from two hundred feet west, or *makai*, of corridor U2A (where State site 50-50-10-4779 is found) to two hundred feet east, or *mauka*, of corridor U2B. We climbed the talus on both sides of the gulch to inspect all of the accessible bedrock exposures. No historic properties were observed (other than 50-50-10-4779 on the west edge of U2A) in either corridor, or between them, within Kaliahului gulch.

At it's *mauka* end the proposed Alternate U2B road would entail cutting into the west and north sides of Pu'u O Weli, a cinder cone of Pleistocene age derived from the Kula volcanic series of Haleakali. Our present research has not revealed a legendary history for Pu'u O Weli, nevertheless, it must certainly have been a prominent feature on the Kula landscape in prehistoric times. Its literal meaning, "hill of fear" (Pukui *et al.*, 1974: 205), in the context of the petroglyphs to the north, west and south allows us to infer cultural significance. Furthermore, during the modern development of Kula the Pu'u O Weli cinder cone was used as a borrow pit, or quarry. Depending on the age of the quarry and its role in the development of Kula, Maui's road systems, or other formative events, the use of Pu'u O Weli as a quarry should also establish the pu'u as an historic property.

Finally, the construction of Alternate U2B has the potential to indirectly impact the friezes of petroglyphs in Kaluapulani gulch. The frieze identified as field #50-50-10-1062 will require protective measures where the Alternate U2B road must cross the secondary stream west of Pu'u O Weli, along the south edge of Kaluapulani gulch. Further *mauka* on the north side of Pu'u O Weli the Kaluapulani petroglyphs, which are also known by the SIHP # 50-50-10-1062, will potentially be impacted by construction of the U2B road. The petroglyphs are reportedly all on the north wall of Kaluapulani gulch, but cutting and buttressing of the road could easily create a negative impact on these historic properties.

## VI. SIGNIFICANCE OF THE HISTORIC PROPERTIES

Historic properties, or sites, are normally evaluated for significance on a preliminary basis during an archaeological inventory survey, according to broad criteria established for the National and Hawaii State Registers of Historic Places. However, the scope of work for this study asked for significance evaluation of the sites during the reconnaissance survey of the alternate Kihei to Kula road corridor segments. Five criteria designations are used for site evaluation: the first four (A through D) are National Register criterion and the fifth (E) is unique to the Hawaii State Register. The meanings attached to the five criteria of significance are summarized as follows:

- Criterion A is used for a site that reflects major trends or events in the history of the state or nation.
- Criterion B is used for a site that is associated with the lives of persons significant in our past.
- Criterion C is used for a site that is an excellent example of a site type.
- Criterion D is used for a site that may be likely to yield information important in prehistory or history. And
- Criterion E is used for a site that has cultural significance, such as religious structures (shrines, *heiau*), or human burial locations.

The significance criteria assigned to each site is presented in Table 3, and is provided here in text.

All twenty-five sites identified during the reconnaissance survey are significant historic properties based on their potential to contain subsurface cultural deposits, and to provide comparative data on site architecture relative to site function and site distribution to settlement pattern.

Six sites meet multiple significance criteria: (1) State sites 50-50-50-1061, 50-50-10-1062, 50-50-10-4178 and 50-50-10-4764 are considered significant under Criterion C, D, and E, because they are likely to yield information important in history and prehistory, they represent excellent examples of site types, and the sites have cultural significance because of the presence of the petroglyphs. (2) State sites 50-50-10-4762 and 50-50-10-4779 are considered significant under Criterion C and D because the sites are likely to yield information important in history and prehistory and it is an excellent example of the site type (enclosure and shelter cave). The shelter-cave may yield varying types of scientific data which may include some or all of the following categories: a) subsurface cultural deposits; b) site architecture and function analysis; and c) site distribution and settlement patterns of inland land use.

The nineteen remaining sites are considered likely to yield information important to

Table 3: Significance of Sites Located During Reconnaissance Survey

Site #	Location	Site Type	Function	Probable Age	Significance/ Criteria
#50-50-10-1061	North and south sides of Kalialinui Gulch, stake # 1581	Complex of Petroglyphs/overhang shelter	Recurrent habitation/ Petroglyphs	P	C,D,E
#50-50-10-1062	U2B stake #1581 & 85 ft/ north of stake #317 (316.15)	Kaluapulani Gulch petroglyphs	Symbolic	P	C,D,E
#50-50-10-4178	north side of the south fork of Kaluapulani Gulch	Petroglyphs (canoe)	Symbolic	P	C,D,E
#50-50-10-4180	North face of Kalialinui Gulch, mauka of 50-50-10-1061	Historic Wall	Animal control	H	D
#50-50-10-4181	in swale between 2 pineapple fields	Complex of two mounds, two alignments	Agriculture (pineapple cultivation)	H	D
#50-50-10-4760	30 m. southeast of stake #-1578	Modified Outcrop	Undetermined	P	D
#50-50-10-4761	At stake #-1582	Enclosure	Recurrent habitation	P	D
#50-50-10-4762	Mauka of stake #-1582	Enclosure	Permanent habitation	P	C,D
#50-50-10-4763	Southern side of stake #-723 along ridge	Wall (enclosure segment)	Animal control	H	D

prehistory and history (Criterion D)

The preferred route to minimize impact to the archaeological sites is K1-Segment C to approximately the 750 ft. amsl, where Segment D veers to the NE crossing Pulehu Road (P1) to Omaopio Road (O1), and then goes to the U1 terminus.

There is potential that Pu'uoweli will be recognized later as an historic site. Should this occur Alternate U2B would pose an impact to Pu'uoweli, and any realignment of the mauka portion of the corridor to the south side of the pu'u would impact other archaeological sites in the vicinity. The potential of Pu'uoweli to be recognized as an historic property in the course of planning the final Kiheti to Kula road corridor necessitates anticipating what significance criteria it would be assessed as follows:

(1) In the context of Hawaiian history the site would probably be assigned criterion "E" for its inferred association with the friezes of the Kaluapulani Petroglyphs 50-50-10-1062, that of 50-50-10-4179 south of Pu'uoweli, and CSH 101 and CSH 102 west of Pu'uoweli. These sites are significant under Criteria C, D, and E, of the National and State Historic Registers.

(2) In the context of the quarry being recognized as having historic significance Pu'u O Welu would probably be assigned criterion A for its part in Maui's growth. Evidence of the quarrying activity is still extant in the remains of the cinder pu'u, and comparison of this and other contemporary cinder quarries on Maui could qualify Pu'uoweli as a good example of the cinder quarry site-type. This could translate into assigning it significance criterion C also.

Recognition of Pu'u O Welu as an historic property would not be easily mitigated because Alternate U2B is designed to cut into the north side of the pu'u which would significantly alter its present condition.

Site #	Location	Site Type	Function	Probable Age	Significance/ Criteria
#50-50-10-4764	North side of Pūlehu Gulch at stake #-578	Shelter/ Petroglyphs	Recurrent habitation/ symbolic	P	C,D,E
#50-50-10-4765	65 m. northwest of stake #-1189	Complex of mounds, road berm, and irrigation ditch	Agriculture	H	D
#50-50-10-4766	Between stake #-907 and 911 both <i>mauka</i> and <i>makai</i> of centerline	Complex of enclosures, alignments, mounds, C-shapes & enclosures	Agriculture/ habitation, temporary	P	D
#50-50-10-4767	On centerline between stake #-913 & -915	Enclosure, circular	Agriculture	P	D
#50-50-10-4768	On centerline between stake #-916 & -920	Wall	Animal control	H	D
#50-50-10-4769	45 m. east of stake #-920	Complex of wall & cairn	Animal control /Boundary marker	P	D

60

## VII. CONCLUSIONS AND RECOMMENDED TREATMENT

### Conclusions

This report is meant to aid in planning the proposed Kihei to Kula Upcountry Highway. The report is not meant to satisfy County, State or Federal standards for an archaeological inventory survey of the proposed highway.

There are twenty-five archaeological sites within the Alternate roadway alignments. All of the identified sites are evaluated as significant archaeological resources (refer to Table 3). These sites and associated features are present throughout all the proposed alignments and complete avoidance of them by road alignments is not possible (refer to Figure 3).

Traditional and historical activities affecting the project area include the following instances. Kula, traditionally an agricultural area, provided a major source of produce for Hawaii in the 1970s; the area still produces vegetables and flowers for the Hawaiian market. Haleakala, Ulupalakua, and Kaonoulu Ranches continue to operate at this time. All of the proposed corridors pass through these ranch lands. Hawaii Commercial and Sugar Company and Maui Land and Pineapple Company, founded in the late 1800s and early 1900s, continue their operations within the study parcel. Military training use of specific lands within the project area is evidenced by live arms munitions present at and around sites 50-50-10-4773. The *makaai* Alternates K1 and K2 will tie into Puilihi Highway, originally constructed to ease the congested Kihei traffic.

### Recommended Treatment

Mitigation of impact to historic properties could be addressed by realignment of the Alternate route. If realignment to avoid sites in a particular area is not an option then mitigation at specific sites would be recommended on a preliminary basis as follows:

State sites 50-50-10-4180, -4760, -4761, -4763, and -4765 through -4778, significant under National Register of Historic Places criterion D because they are likely to yield information important to history and prehistory, should be recorded to archaeological inventory survey level followed by data recovery at each site.

State site 50-50-10-4762, significant under National Registers of Historic Places criteria C and D because they may be likely to yield information important to history and prehistory and are considered excellent site types, should be recorded to archaeological inventory survey level followed by preservation or data recovery.

State sites 50-50-10-1061, -1062, -4178, -4764 and -4779 are significant under National Register criteria C and D because they may be likely to yield information important to history and prehistory and are considered excellent site types, and under Hawaii Historic Preservation draft administrative rules criterion E because they are culturally significant. The historic properties should be recorded to archaeological inventory survey level and ultimately preserved. Mitigation to avoid adverse impact to these sites may entail realignment of the alternate to avoid the sites.

The military site's (50-50-10-4773) significance is limited to our knowledge of its

presence at this location which would be completed during archaeological inventory level survey. However, it would seem appropriate that an assessment of ordnance remaining and ordnance clearing be conducted.

If Alternate U2B is to be seriously considered for the final road corridor the Hawaii State Historic Preservation Officer (SHPO) should be asked for a decision on consigning Pu'uoweli to historic properties status. If such status is to be conferred required mitigation may involve abandonment of the *mauka* portion of Alternate U2B for another alternative.

## B. Summary of Results

The twenty-five archaeological sites recorded during the reconnaissance survey of the eight proposed alternate road segments fall into two general categories: 1) prehistoric sites including traditional sites in use in the early post-contact period, and 2) post-contact sites including historic and recent archaeological remains.

The prehistoric archaeological remains include simple shelter structures - which could have been used for temporary shelter or sheltered planting areas - and three areas of extensive petroglyphs. The prehistoric habitation and agricultural sites occur in the *makai* and *mauka* extremes of the project area which were permanently occupied in prehistoric times. The petroglyphs occur only in the *mauka* sections of the corridors, in Kula.

The post-contact sites include: (1) stone walls for ranch fencing and corrals throughout the alternate corridors from Kihei to Kula, (2) irrigation ditches, rock-clearing mounds and a road berm for sugarcane cultivation occur at the edge of still active sugarcane fields at the edge of Kula, (3) and enclosures for military bivouac and troop maneuvers which occur in the middle section of the area of study.

Part of State site 50-50-10-1062 is physically within the east, or *makai* side of corridor U2A, adjacent to centerline stake #314. The other part of -1062 is close to the corridor's eastern edge. Because of this we expanded the reconnaissance area in Kaluapulani gulch four hundred feet to the west of the center line. No archaeological sites were found in the expanded search area. Therefore, re-alignment of a short section of this corridor to *makai* in Kaluapulani gulch would not impact other historical properties and would avoid State site 50-50-10-1062.

The cave-shelter at the base of the south wall of Kaliahinui gulch - State site 50-50-10-4779 was probably used for temporary habitation, and it has potential to provide additional information on area history and prehistory. The site lies on, or very near, the west edge of corridor U2A where the corridor crosses Kaliahinui gulch. Its location could only be approximated because of the steep walls of the gulch. The site could be subjected to archaeological mitigation such as data recovery if necessary.

About four hundred feet east, or *mauka*, of the U2A corridor another four hundred foot wide alternate corridor - Alternate U2B - crosses Kaliahinui gulch. Thus, the limits of the two corridors U2A and U2B nearly overlap here. In the field we found the walls of Kaliahinui gulch to be nearly vertical from top to bottom in the vicinity of the two alternate crossings. Because of these conditions we inspected the entire section of the gulch from two hundred feet west, or *makai*, of corridor U2A (where State site 50-50-10-4779 is found) to two hundred feet east, or *mauka*, of corridor U2B. There are no historic properties other than this site in either corridor, or between them, within Kaliahinui gulch.

The sites will potentially be impacted because of their proximity to Alternate U2A, but they are present only in the two prominent gulches - Kaluapulani and Kaliahinui - and complete avoidance of the sites is possible by adjustment of the gulch crossing locations.

There also are no historic properties in Alternate U2A westward from Kaliahinui to its intersection with Alternate U2B, nor to their combined *makai* termination point. Re-alignment of the U2A corridor to the east (*mauka*) within the limits of the reconnaissance as described here would not impact any historic properties.

During the survey of the Alternate U2B corridor, from the north edge of Kaliahinui gulch westward to its terminus in the cane fields of Oma' opio, we did not locate any historic properties. The corridor passes through primarily cultivated fields of pineapple on the ridges. It crosses Kaliahinui gulch about six hundred feet east, or *mauka*, of a shelter-cave (field #State site 50-50-10-4779) identified previously in corridor Alternate U2A, and over one thousand feet west, or *makai*, of the well known Kaliahinui Petroglyphs - 50-50-10-1061.

At it's *mauka* end the proposed Alternate U2B road would entail cutting into the west and north sides of Pu'uoweli, a cinder cone of Pleistocene age derived from the Kula volcanic series of Haleakala. Our present research has not revealed a legendary history for Pu'uoweli, nevertheless, it must certainly have been a prominent feature on the Kula landscape in prehistoric times. Its literal meaning, "hill of fear" (Pukui *et al.* 1974: 205), in the context of the petroglyphs to the north, west and south allows us to infer cultural significance. Furthermore, during the modern development of Kula the Pu'uoweli cinder cone was used as a borrow pit, or quarry. Depending on the age of the quarry and its role in the development of Kula, Maui's road systems, or other formative events, the use of Pu'uoweli as a quarry should also establish the pu'u as an historic property.

Finally, the construction of Alternate U2B has the potential to indirectly impact the friezes of petroglyphs in Kaluapulani gulch. The frieze identified as State site 50-50-10-1062 in the Alternate U2A will require protective measures where the Alternate U2B road must cross the secondary stream west of Pu'uoweli along the south edge of Kaluapulani gulch. Further *mauka* on the north side of Pu'uoweli the Kaluapulani petroglyphs, which are also known by the SHPP # 50-50-10-1062, will potentially be impacted by construction of the U2B road. The petroglyphs are reportedly all on the north wall of Kaluapulani gulch, but cutting and buttressing of the road could easily create a negative impact on these historic properties.

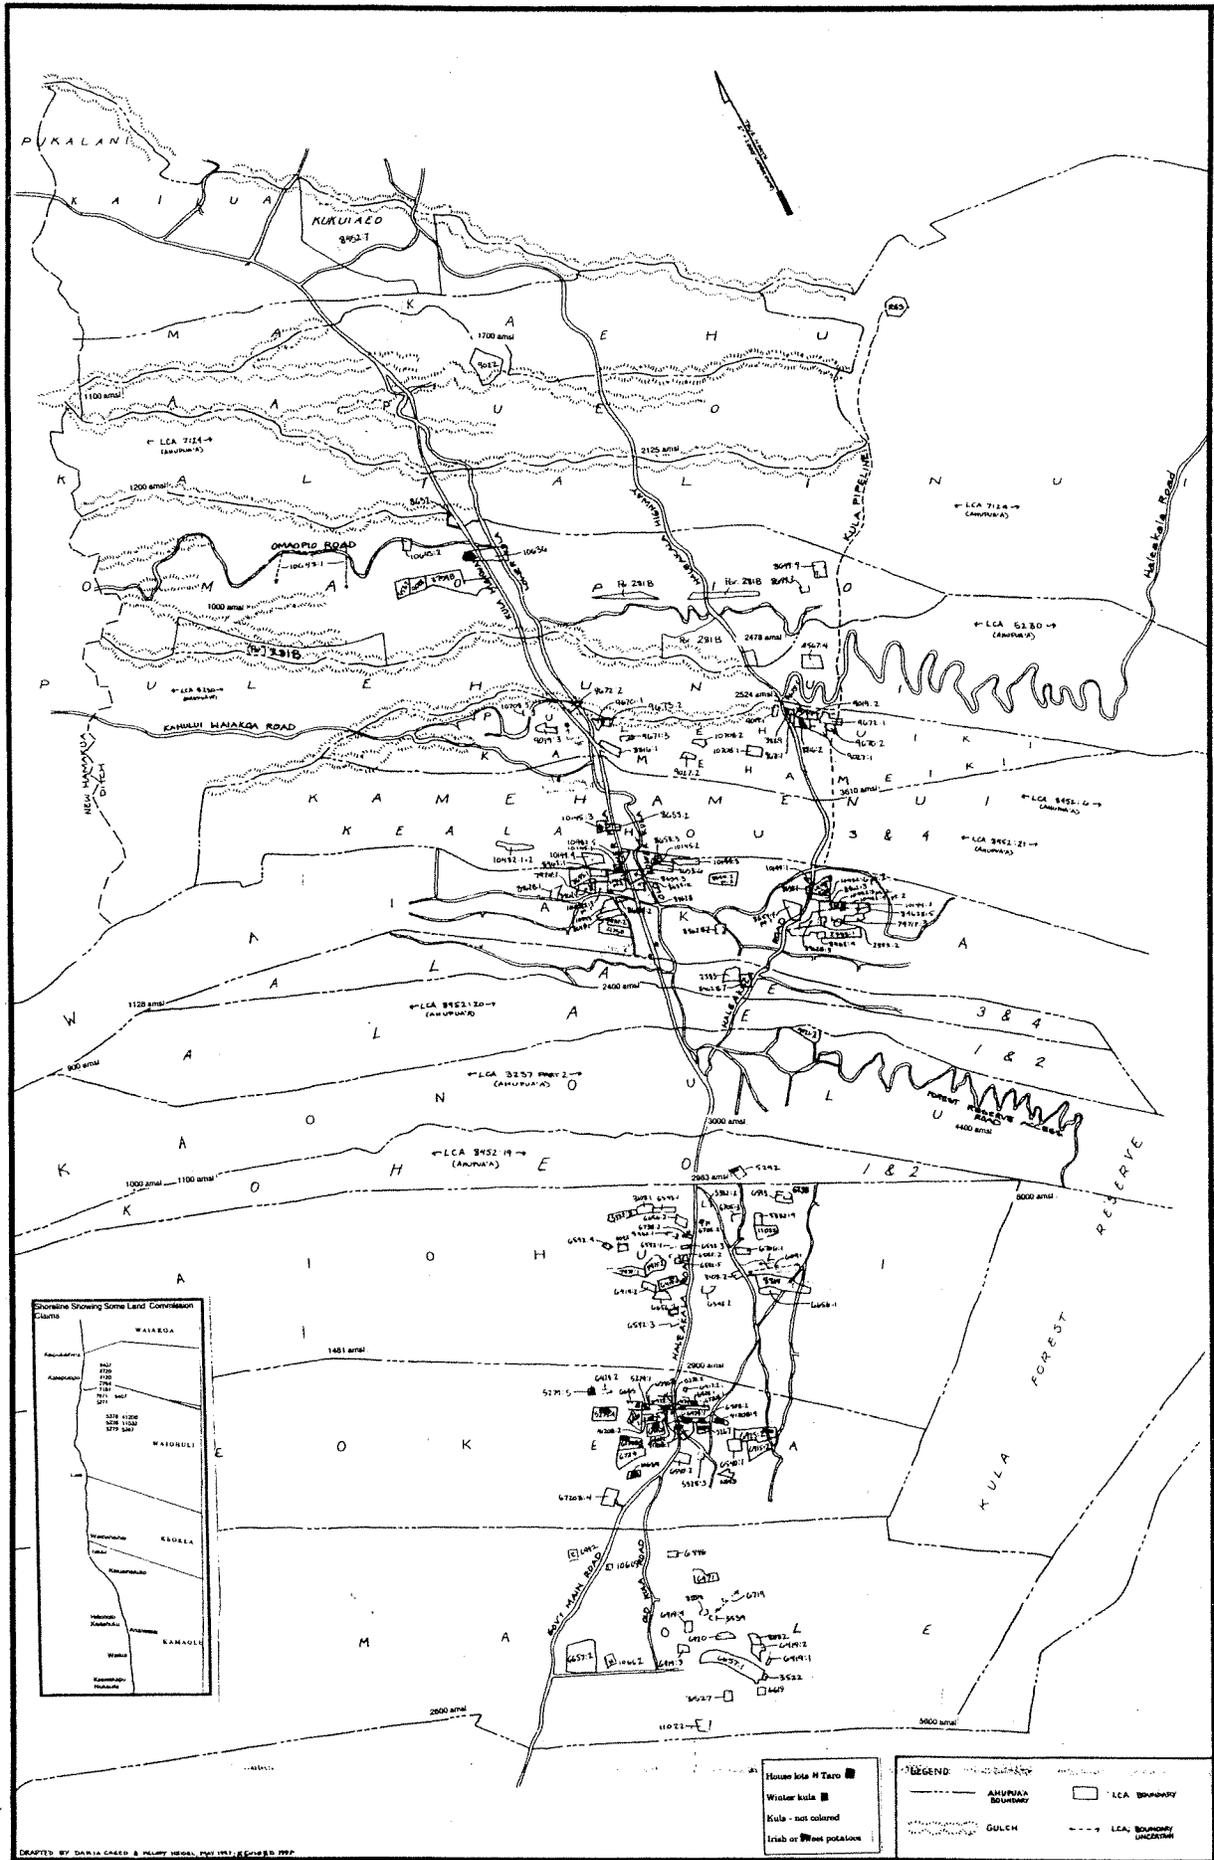

In summary, we once again note that the preferred route to minimize impact to the archaeological sites would be the K1-Segment C to approximately the 750 ft. amsl, where Segment D veers to the NE crossing Pulehu Road (P1) to Omaopio Road (O1), and then goes to the U1 terminus.

APPENDIX A: PHOTOGRAPHIC APPENDIX

The photographs selected for this appendix are representative of the site types present within the project area. For this reason, photographs of every site and/or feature are not included.

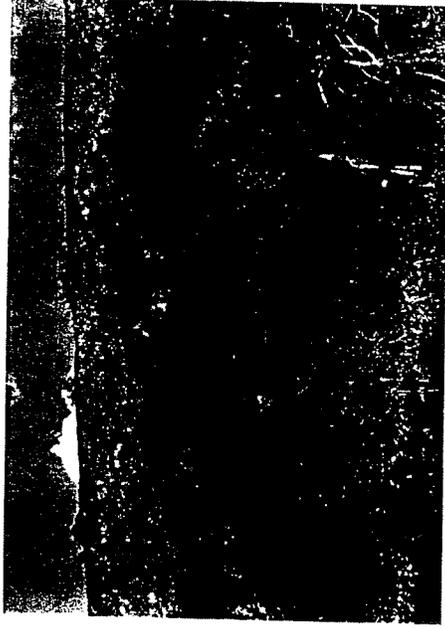

Figure 9  
Overview of cliff overhang shelter with petroglyphs, view to north, State site 50-50-10-1061

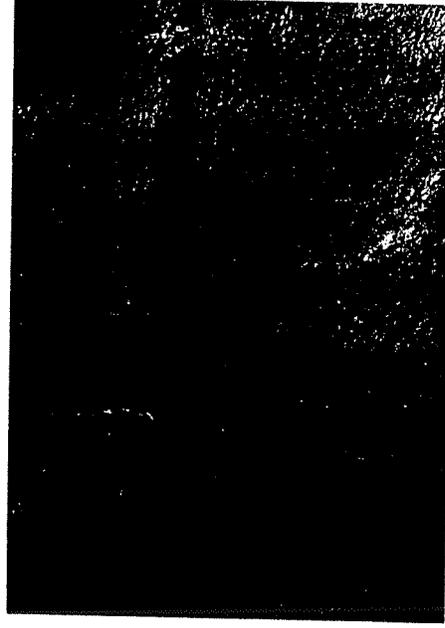

Figure 10  
Closeup of petroglyph: single human figure with spear, pecked on north face of overhang State site 50-50-10-1061

Figure 11 Modified outcrop, view to northeast, State site 50-50-10-4760

Figure 13 Enclosure, view to south, State site 50-50-10-4762

Figure 12 Enclosure, view to south, State site 50-50-10-4761

Figure 14 Terrace, view to east, State site 50-50-10-4180

Figure 17 Overhang wall showing numerous pecked human petroglyph figures, view to north, State site 50-50-10-4764

Figure 18 Man with dog petroglyph, pecked, view to northeast, State site 50-50-10-4764

Figure 15 Wall, view to east, State site 50-10-10-4763

Figure 16 Cliff overhang shelter with petroglyphs located on Pūlehu Gulch wall in upper left corner of photo, view to north, State site 50-50-10-4764

Figure 19  
Historic agricultural complex, showing berm segment with *panini*-covered clearing mound at left, view to southeast, State site 50-50-10-4765

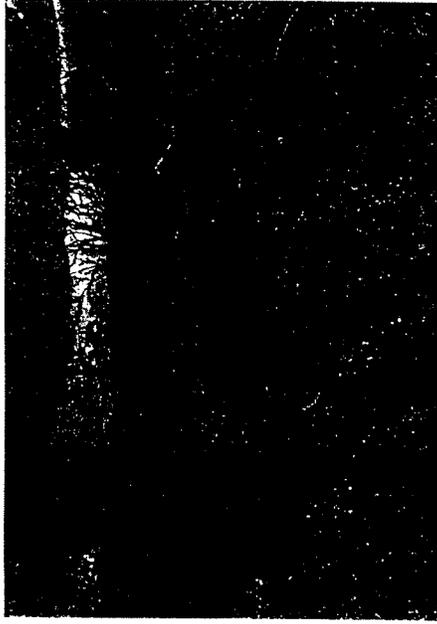

Figure 21  
Wall and *ahu*, view to west, State site 50-50-10-4769

Figure 20  
Historic agricultural complex, showing clearing mound, view to northwest, State site 50-50-10-4765

Figure 22  
*Ahu* and enclosure, view to west, State site 50-50-10-4770

Figure 23 Enclosure (square), view to east, State site 50-50-10-4773

Figure 25 Wall, on southern edge of Kolaloo Gulch, State site 50-50-10-4775

Figure 24 Wall, view to south, State site 50-50-10-4774

Figure 26 Midden and lithic scatter, view to southwest, State site 50-50-10-4776

Figure 29 L-shaped enclosure, view to east, State site 50-50-10-4778

Figure 30 Petroglyph site, north wall of south fork of Kaluapulani Gulch, view northwest, State site 50-50-10-4178

Figure 27 Midden and lithic scatter, view to northeast, State site 50-50-10-4776

Figure 28 Wall, along eastern ridge of Kaliainui Gulch, view to north, State site 50-50-10-4777

Figure 31 Canoe (with sail) petroglyphs on wall panel, view north, State site 50-50-10-4178

Figure 32 View of the north wall of Kaluapulai gulch from the south side. The center of the photo is aligned with the centerline of Alternate U2A, State site State site 50-50-10-1062, first panel is on the north wall right of center line; State site State site 50-50-10-1062, second panel is out of the photo to the right.

Figure 33 Lava Bedrock exposure bearing the State site State site 50-50-10-1062, petroglyph frieze; the view is to mauka, or east.

Figure 34 Examples of the petroglyphs at State site 50-50-10-1062. The 35 mm camera lens cap is included to show scale.

Figure 35 Example of petroglyph groupings at State site 50-50-10-1062. Ruler used for scale is six inches long. Petroglyphs exhibit an unusual triangular pattern.

Figure 36 Example of another petroglyph grouping at State site 50-50-10-1062, note the canoe-like petroglyph at top center of photo.

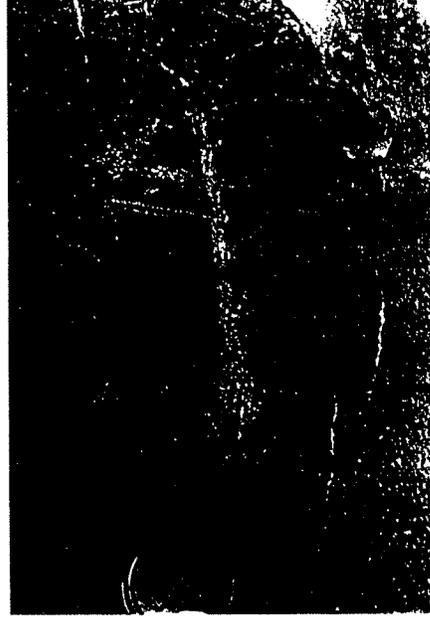

Figure 37 Close-up of canoe-like figure in petroglyph grouping shown in Figure 31.

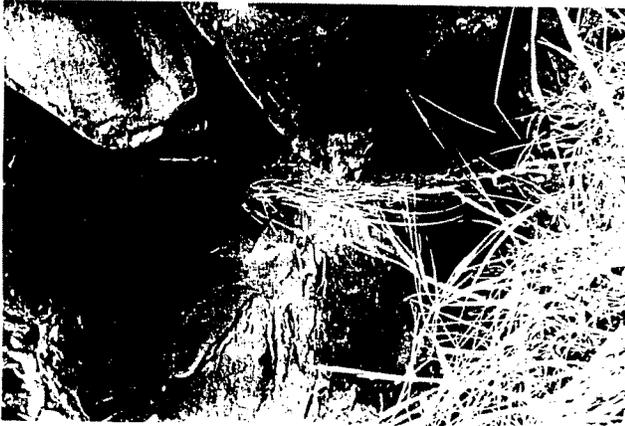

Figure 38 The overhang shelter at State site 50-50-10-1062, beneath the petroglyph frieze.

Figure 39 Remains of a small fire in the overhang shelter beneath the State site 50-50-10-1062 frieze.

Figure 40 The niche, or alcove, at State site 50-50-10-1062, second panel. The petroglyph frieze is to the upper left, the plunge pool at the upper center obscured by the understory. Possible *mamahe* plants are at the lower left backed by the large boulder.

Figure 41 Shelter-cave site State site 50-50-10-4779 in the south wall of Kaliialinui gulch. The front edge of the cave floor has five small boulders that level the floor of the shelter. View is to the west from near the streambed.

Figure 42 General view of the project area near 5 + 00, view to north, with pineapple plants visible in foreground

Figure 43 General view of the project area in the vicinity of 30 + 00, view to north

Figure 44 General view of State site # 50-50-10-2701, *heiau*, view to the east, showing structure surface

Figure 45 General view of State site # 50-50-10-2701, *heiau*, view to the northeast, showing SW *heiau* facing

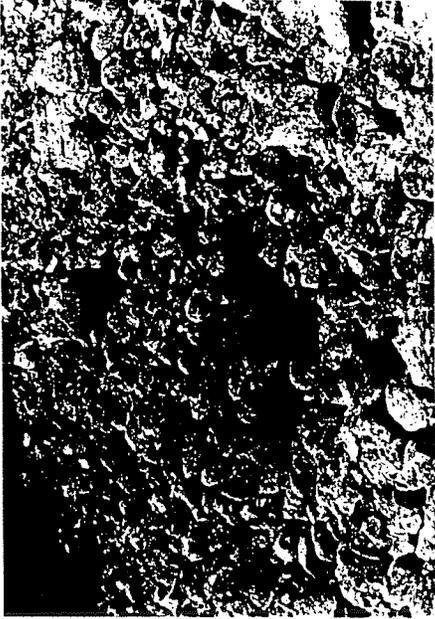

Figure 48 State site # 50-50-10-2701, *heiau*, view of a typical constructed pit in the structure surface at the northeast end.

Figure 49 Downslope view from State site # 50-50-10-2701, *heiau*, view to the southwest, showing the view plane from the structure

Figure 46 General view of State site # 50-50-10-2701, *heiau*, view to the northeast

Figure 47 View of State site # 50-50-10-2701, *heiau*, view to the southwest, showing the surface of the north end of the structure

**ABSTRACT**

An archaeological inventory survey with limited subsurface testing was conducted by Cultural Surveys Hawai'i (CSH), Inc. for the proposed Kihei-Upcountry Maui Highway on the island of Maui, TMK 2-05-001: por. 001, 002, 003, 009, 2-05-002: por. 001, 002, 005, 015, 016 and 3-09-001: por. 016. The road corridor extends 9.8 miles (15.8 kilometers) from the Haleakala Highway/Hailimaile Road Intersection, at approximately 850-foot elevation, to the intersection of Ka'ono'ulu Street and Piihimi Highway at approximately the 40-foot elevation. The study corridor is 300 ft (91.5 m) wide and encompasses approximately 360 acres. The proposed highway, which is on the western slopes of Haleakala, extends from Kailua *Ahupua'a* in the northeast through Keāhau, Kailiinui, Ōma'opu, Pūlehu nui, Waiahoa *Ahupua'a*, to Ka'ono'ulu *Ahupua'a* to the southeast. The study corridor was identified as the preferred alternative by the State of Hawai'i Department of Transportation among eight alternative alignments considered in the projects Draft Environmental Impact Statement. CSH conducted reconnaissance surveys of the eight alternative alignments.

The survey and testing were conducted between August 28, 2000 and October 3, 2000 by a crew that ranged from two to four archaeologists. A total of eleven days were spent in the field for a total of 36 person days. Crew members included Ka'ohulani McGuire, B.A., Mary Perzinski, B.A., Lokelani Aipa, B.A., Thomas Devereux, B.A., Tony Bush, B.Ed., and Ian Masterson with Brian Colin, B.A., acting as field director and Dr. Hal Hammatt as the principal investigator.

A total of 126 structural and nonstructural features were identified. The archaeological features were organized into seventeen distinct sites that were evaluated as significant in accordance with the criteria of the National and Hawai'i Register of Historic Places. These sites are associated with a variety of functions, including traditional Hawaiian temporary habitation (3742, 3743, 3745, 5032, 5033, 5034, and 5035), agriculture (3727 and 3728), symbolic art (petroglyphs)(5029 and 5031), historic agriculture (4765), animal husbandry (5030) and historic military training activities (4773, 4776 and 4778). Six of the sites, 3727, 3728, 3729, 3742, 3743, and 3745 were initially recorded by Xamanek Researches (Frederickson *et al.* 1994c). Three of the sites, 3742, 3743, and 3745 were surface scatters in which the majority of cultural material was collected (*Ibid.*). Limited subsurface testing was conducted at six sites (4773, 4776, 5032, 5033, 5034 and 5035) to determine the presence or absence of subsurface deposits.

The results of the inventory survey reflect the broad range of land use varying from traditional Hawaiian temporary habitation and petroglyphs, to historic military, ranching and agricultural activities. Temporary habitation sites were encountered between 45 to 460 ft. a.m.s.l. along the lower portion (see project area description) of the corridor above Kihei. A large historic military site was encountered in a cluster between 500 and 740 ft. a.m.s.l. also above Kihei. Petroglyphs were encountered in both Waiahoa and Kailiinui Gulches. Remnants of historic sugar cane cultivation were observed and recorded in the section of the corridor between Pūlehu and Ōma'opu Roads. Sections of cattle walls were encountered along the north side of Waiahoa Gulch.

Of the seventeen sites recorded, both petroglyph sites (5029 and 5031) are recommended for preservation, data recovery is recommended for three temporary

**ARCHAEOLOGICAL INVENTORY SURVEY  
OF THE PROPOSED KIHEI TO KULA ROAD CORRIDOR,  
KAILUA TO KA'ONO'ULU AHUPUA'A  
(TMK 2-05-001: por. 001, 002, 003, 009  
2-05-002: por. 001, 002, 005, 015, 016  
and 3-09-001: por. 016),

December 2000

habitation sites (5032, 5033, and 5035) and no further work is recommended for the military sites (4773, 4776 and 4778), the agricultural sites (3727, 3728, and 4765), the stone cairn marker (3729), the four temporary habitation surface scatters (3742, 3743, 3745 and 5034) and the cattle wall site (5030).

The two petroglyph sites (5029 and 5031), which are both recommended for preservation, are both located outside of corridor. Site 5029 is located on the north side of Kaliahuni Gulch approximately 200 ft to the east of the study corridor centerline. Site 5031 is located on the south side of Waiakoa Gulch approximately 200 ft to the west of the study corridor centerline. Site 5031 was originally located near the center of the study corridor (50 ft west of centerline) but the alignment was modified (moved 150 ft to the east at Waiakoa Gulch) to avoid any impact to the site.

## I. INTRODUCTION

At the request of Parsons, Brinkerhoff, Quade and Douglas Inc., Cultural Surveys Hawaii, Inc. conducted an archaeological inventory survey with limited subsurface testing for the proposed Kīhei-Uponcountry Maui Highway on the island of Maui, TMK 2-05-001: por. 001, 002, 003, 009, 2-05-002: por. 001, 002, 005, 015, 016 and 3-09-001: por. 016.

### Project Area Description

The proposed highway (Figure 1) extends 9.8 miles (15.8 kilometers) from the Haleakala Highway/Hālimāile Road intersection, at approximately 850-foot elevation, to the intersection of Ka'ono'u Street and Pi'ilani Highway at approximately the 40-foot elevation. The study corridor is 300 ft (91.5 m) wide, 150 ft on either side of a staked centerline corridor chosen based on previous research (Folk *et al.* 1997) and encompasses approximately 360 acres. The proposed highway, which is on the western slopes of Haleakala, extends from Kailua *Ahupua'a* in the northeast through Keāhua, Kāhālinui, Oma'opio, Pūlehu nui, Waiakea *Ahupua'a*, to Ka'ono'u *Ahupua'a* to the southeast. The route is divided into three segments, Segments A, D and E. The segment designations are carried over from the reconnaissance survey of the area in which six different segments were analyzed.

1. Segment A is approximately 20,800 ft long. It begins at Haleakala Highway at the intersection Hālimāile Road, at 850 ft. amsl and then proceeds south through cultivated fields of sugarcane, crosses Kāhālinui gulch, to Oma'opio Road. Segment A then continues south from Oma'opio Road across old cane lands that have been converted to pasture. It then crosses Pūlehu gulch to end at Pūlehu Road at approximately 1000 feet above sea level. Segment A crosses TMK 2-5-01:02, and .09 in addition to TMK 2-5-02:01, 02, 04, and 05. Segment A is owned by Alexander and Baldwin, Inc.
2. Segment D is approximately 10,000 ft long. It begins at Pūlehu Road and extends southwest across active pineapple fields and pastureland to its end at Waiakea Gulch at approximately 810 ft amsl. Segment D crosses TMK 2-5-01:03 which is owned by Haleakala Ranch Company and leased by Maui Land & Pineapple Company, Inc.
3. Segment E is approximately 20,600 ft long and extends in a westerly direction to the end of the corridor at the intersection of Pi'ilani Highway at Ka'ono'u Street at the approximate elevation of 40 ft. amsl. The segment traverses gently sloping pastureland. Segment E crosses TMK 2-2-02:016 owned by Haleakala Ranch and TMK 2-2-02:15 and 3-9-01:016 owned by Kaonoulu Ranch.

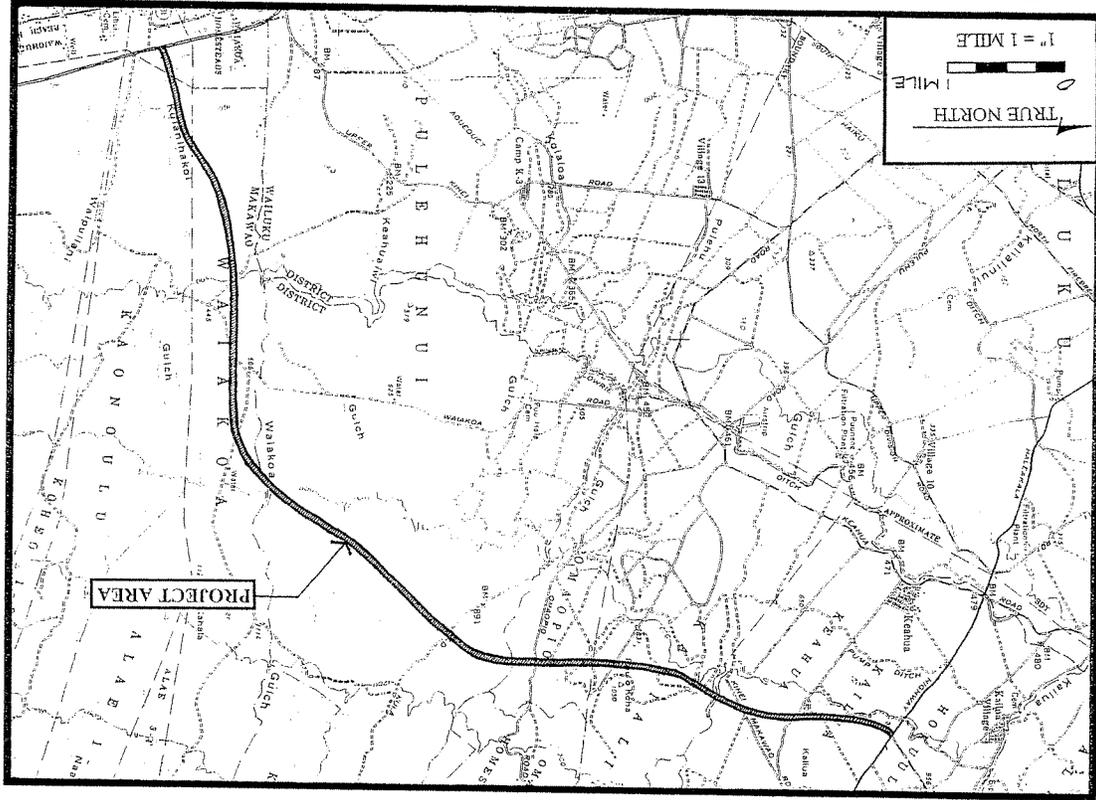

Figure 1  
Project area map based on USGS 7.5 minute series topographical maps of the Pi'ilani and Pūlehu quadrangles, displaying corridor.

The following Scope of Work is based on Title 13, subtitle 13, Chapter 276, Rules Governing Standards for Archaeological Inventory Survey and Report, was utilized for the present project.

1. A complete ground survey of the entire project area for the purpose of site inventory. All sites were located, described, and mapped with evaluation of function, interrelationships, and significance. Documentation included photographs and scale drawings of selected sites and complexes. All sites will be assigned State site numbers.
2. Limited subsurface testing to determine location, boundaries, depth and quantity of cultural materials within archaeological sites and to obtain datable samples for chronological information for sites in the immediate area, if such data is not available from previous studies.
3. Research on historic and archaeological background, included a search of historic maps, written records, Land Commission awards, and Native Testimony. Research focused on the specific area with general background on the *ahupua'a* and district and will emphasize settlement patterns.
4. Preparation of a survey report which includes the following:
  - a. A topographic map of the survey area showing all archaeological sites and site areas;
  - b. Description of all archaeological sites with selected photographs, scale drawings, and discussions of function;
  - c. Historical and archaeological background sections summarizing prehistoric and historic land use as they relate to the archaeological features;
  - d. A summary of site categories and their significance in an archaeological and historic context;
  - e. Recommendations based on all information generated which will specify what steps should be taken to mitigate impact of development on archaeological resources, such as data recovery (excavation) and preservation of specific areas. Recommendations will be developed in consultation with the landowner and State and County agencies.

## II. NATURAL HISTORY

### Geology

The project corridor traverses approximately 15.8 kilometers of the slightly dissected uplands in the traditional district of Kula on the western slope of Haleakala Volcano, Island of Maui. Haleakala is a shield volcano composed of pahoehoe and a flows and associated pyroclastic materials.

Terrain in the project area is associated with the Kula Volcanic Series of the Pleistocene epoch (Macdonald *et al.*, 1983). Lavas of the Kula Series consist mostly of a; eruptions were explosive to the extent that many large cinder cones were formed and beds of ash are common. These cones are present mostly on the summit and northern slopes of the mountain but also occur on the western slope. One such cone, Pu'u Kahala, lies approximately one kilometer south of the central portion of the project area.

Soils of the Keahua soil series (including Keahua silty clay, Keahua cobbly silty clay, and Keahua very stony silty clay loam) dominate the north half of the project corridor north of Kolaha Gulch. Soils of the Waiahoa soil series (including Waiakea very stony silty clay loam and Waiakea extremely stony clay loam) dominate the area south of Kolaha Gulch. All of these soils are well drained and developed in material weathered from basic igneous rock (Footte *et al.*) though the Waiahoa series differs in being influenced by volcanic ash.

### Geography

The western slopes of Haleakala are cut off from the northeast, tradewind pattern and typically receive scant rain owing to this rain shadow effect (Figure 2). The southern half of the project area receives approximately 400 mm. (15 inches) of rainfall annually with the northern end of the project area receiving approximately 800 mm (30 inches) (Giambelluca *et al.*, 1986:112). Mean monthly rainfall records show the heaviest rainfall to occur between November and March, ranging from 50-100 mm. (from approximately 300 ft. to 2000 ft. amsl), with the months of April to October averaging between 5-25 mm. During the driest month, June, the area receives 5-10 mm. (Giambelluca *et al.*, 1986:113-124). There are no perennial streams in *kula* district but flash floods of considerable volume periodically inundate the lowlands.

Typically, Kihei is sunny and dry with an average temperature of 77°F with occasional variations ranging from the low 60s to the high 80s.

Vegetation consists predominantly of *koa* and lowland shrubs and grasses, including *koa haole*, finger grass, *pili* grass, *lantana*, *kula*, *panini*, *ilima*, and *Natal reedtop* grass. Wildlife consists mostly of upland game birds (Footte *et al.*:8).

**Environmental Zones**

Based on archaeological and ethnographic studies in the Kula District three land use zones consisting of 1) coastal, 2) barren or transitional, and 3) inland have been postulated (Cordy 1977:3-5).

The coastal zone has been characterized as a quarter mile (400 m) wide band paralleling the shore. "The coastal zone is defined as the flat area near the sea with brackish marshlands at the mouth of gulches (behind the coastal dunes) and with associated raised dry areas." Cordy (2000:1) notes that this was a narrow zone along the shore with permanent habitations, *heiau*, some fishponds, fishing shrines and burials. Twelve of the seventeen *ahupua'a* of Kula District (not including the subdivisions, *i.e.* Oma'opio 1-10) appear to have never extended to the coast and had no coastal zone. Seven of the nine *ahupua'a* traversed by the project area (Kailua, Keāhua, Maka eha, 'A'apueo, Kalialinui, Oma'opio and Pūlehunui) have no coastal zone as they are cut off to the west (*maka*) by Waialuku District.

The intermediate or barren zone (Cordy 1977) prefers the latter designation as having greater meaning for social patterning) is the dry area of slopes back of the coast with less than 30 inches of annual rainfall. This zone of broad stoney grass land with gulches is about 16 kilometers (10 miles) wide in the southernmost *ahupua'a* of Kula District, and narrows down to 4 kilometers (2½ miles) wide in the north at Kailua. Cordy (2000:1-2) notes that this zone seemed to mainly have had trails and associated shelters leading to the uplands, but with some small dryland fields and associated field shelters near the shore. This zone is suggested (Cordy 2000:2) to have a very low density of sites. The entire present project area lies within this barren zone.

The inland or upland field zone is stipulated to begin 8-11 kilometers (5-7 miles) inland and "essentially is characterized by lush vegetation and the occurrence of agricultural fields" (Cordy 1977:3). The down-slope edge of the inland zone is suggested (Cordy 1977:5) to approximate the 30-inch rainfall isohyte which lies close to the alignment of Haleakala Highway and Kula Highway (see Figure 2). This is suggested to be the approximate lower limit for large scale aboriginal agriculture. Cordy (2000:2) notes that this zone had continuous dryland fields, permanent houses, some burials, *heiau* of small-moderate size, and petroglyphs in many gulches. Cordy notes that a major trail passed through these fields just seaward of today's Kula Highway and that this is a high density site zone.

Cordy (2000:2) posits the existence of two additional zones further up slope: a forest zone and a zone above the tree-line. He notes that the historic site patterns of the forest zone are poorly known but that site density is expected to be low. The above the tree-line zone is associated with quarries, trails and shelters. The approximate boundaries of these environmental zones are shown on Figure 3.

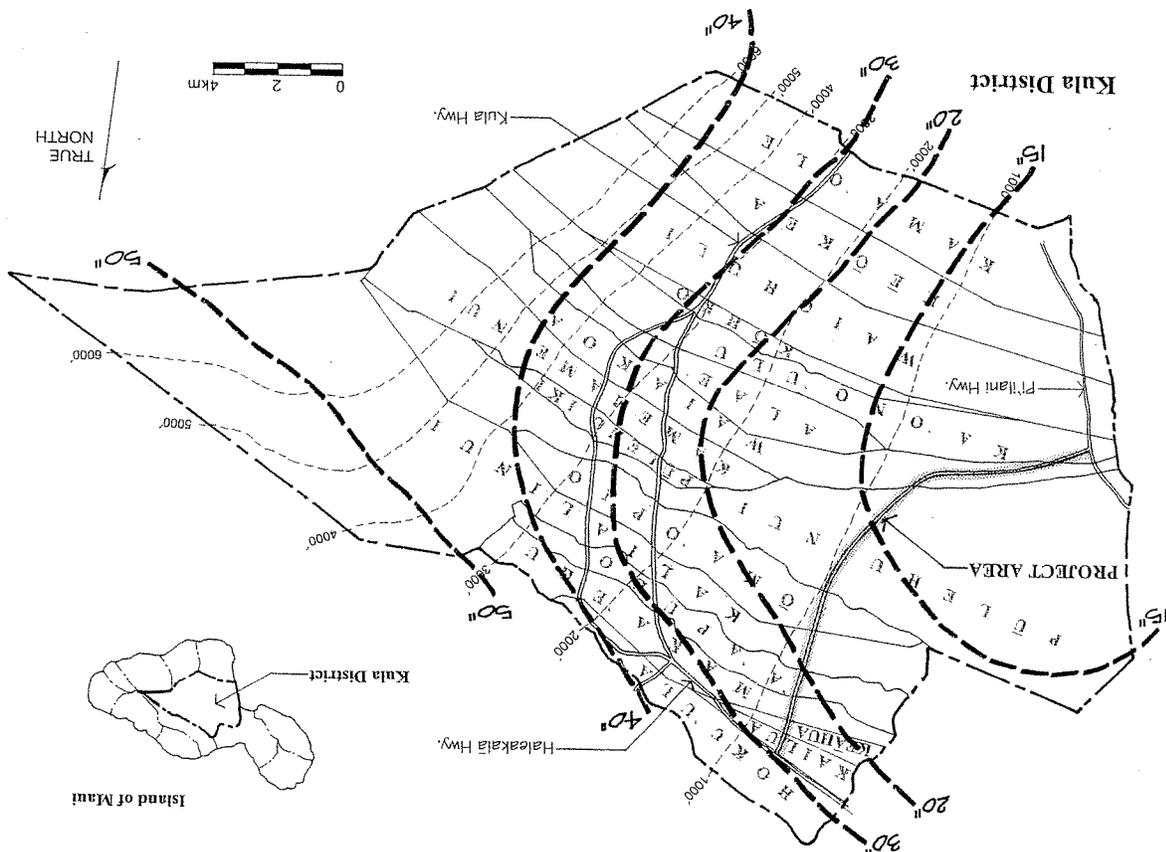

Figure 2 Rain Isohytes (in inches) in the Project Corridor and Kula Region

### III. HISTORIC BACKGROUND

The project area lies entirely in the intermediate or barren zone, referred to by Hawaiians as the "kūla or dryland plain zone", located between the narrow coastal zone and the "inland zone" which begins at approximately 2000 ft. amsl (Cordy 1977:4). Although the field work for this project developed no data pertinent to any other zones this historic background review seeks to develop data pertinent to other zones of Kula District to provide the basis for a settlement pattern model discussion and indicate the types of anticipated finds in the present project area.

#### A. Pre-Contact Period

Our knowledge of patterns of settlement in the pre-contact period comes from mythological and traditional accounts, archaeological studies, early explorer accounts and inferences drawn from patterns in the early historic period.

##### i. The Coastal Zone in the Pre-contact Period

Traditional accounts related to the upland district of Kula emphasize the lack of familiarity of the kula people with the sea. Perhaps most famous is the saying:

"Kula unahi pikapika he'e.  
"Kula people, scaters of the suckers on the tentacles of the octopus"  
(Pukui 1983:#1911)

This proverb was said in fun of the people of Kula, Maui. The tradition is that a Kula chiefess who lived inland did not know what the suckers on an octopus were and tried to scale them as one scales fish. That an adult Hawaiian would not be familiar with octopus would indeed be remarkable and the account suggests the remarkably terrestrial focus of the pre-contact Hawaiians of Kula District, Maui. Two other traditional sayings similarly deride the lack of maritime acumen of the Kula people.

"No Kula ia po'e ke hoe hewa nei.  
"To Kula belong the people who are such poor paddlers."  
(Pukui 1983:#2339)

and

"O Kula i ka hoe hewa.  
"Kula of the ignorant canoe-paddlers."  
(Pukui 1983:#2473)

Pukui offers an explanation: "Said of Kula, Maui, whose people did not know how to paddle canoes because they were uplanders." The Kula people were proverbial as uplanders.

The historical settlement survey by Kolb *et al.* (1997:29) discusses the distribution of notable archaeological sites (fish ponds and *heiau*) based on Winslow Walker's 1931 survey augmented by Kolb's 1991 research (Figure 4). The only "notable" sites discussed

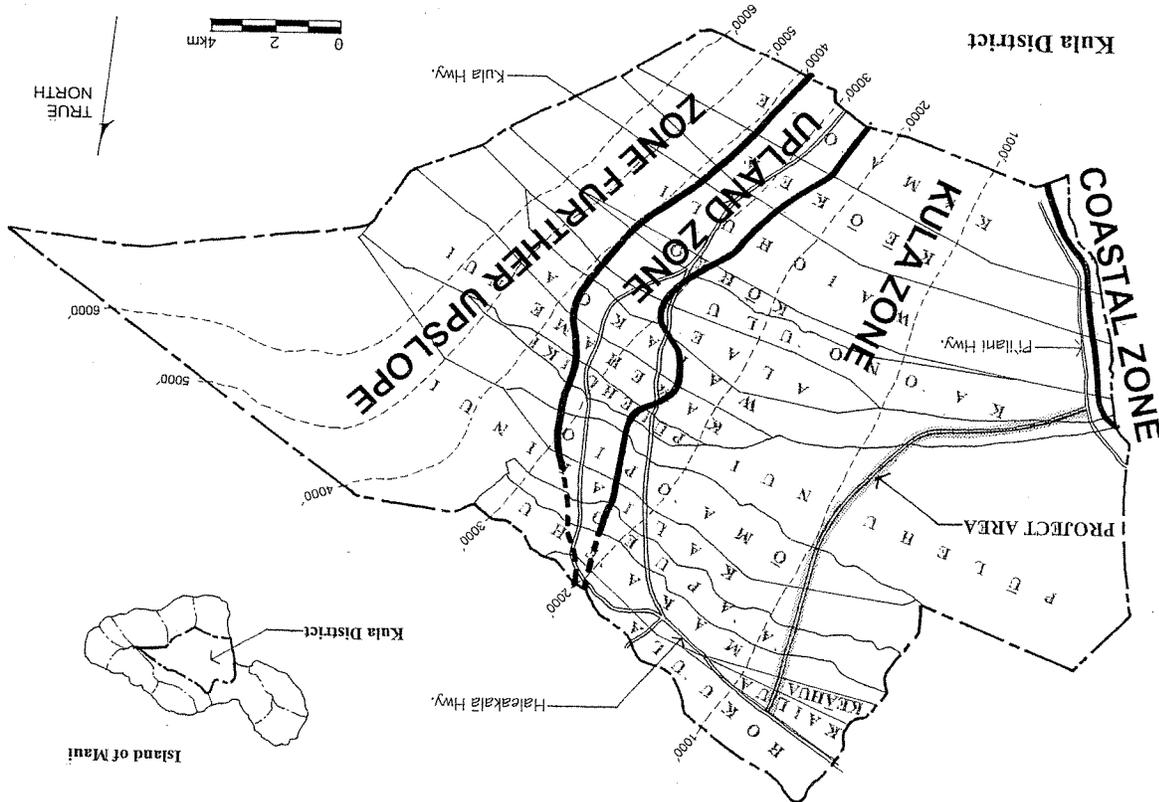

Figure 3  
Map of Kula District Showing Relationship of Project Area to Environmental Zones

along the coast are the fish pond and two associated *heiau* at Kalepolepo Settlement in coastal Waiohuli. *Ahupua'a*. This study notes "the surprising lack of coastal temples" and that in fact "these two coastal *heiau* represent only 7% of the districts total number of *heiau*" (Kolb *et al.* 1997:28). The authors of this settlement survey note the common assumption that typically *heiau* would be built in and around community settlements and that densely populated communities contain a large number of *heiau*. "If this model holds true for Kula, then a large number of upcountry *heiau* suggest that almost all settlement was concentrated there as well, rather than the coast." (Kolb *et al.* 1997:28) The authors of this settlement survey note that this pattern is anomalous not only for Hawai'i in general but is also atypical when compared to other leeward Maui Island districts such as Honua'ula and Kahikinui. Possible explanations suggested are "survey bias or early coastal development" or more likely the "extraordinary distance between habitable upcountry regions and the coast." (Kolb *et al.* 1997:30) Other prosaic explanations are the exceedingly low rainfall and paradoxically the propensity to flood. Coastal Kula receives less than 15" of rainfall a year and it is a long walk up to the 15" isohyete which lies above 1000' elevation (Figure 2). Hammatt and Shideler (2000:10-11) point out ten documented flooding events (due to tsunami, runoff inundation, and heavy surf) in the twentieth century and note that at a distance of 350 m from the coast in central Kihei the elevation is typically only 1.4 -2.3 m amsl. The "coastal zone" lies within the Kihei flood plain and is remarkably prone to severe backwater flooding. Another factor discouraging coastal settlement would be "blasts of the Kaumuku wind which sweep the place [Kalepolepo] at times like a localized tornado" (Wilcox 1921:65).

Clearly there was however a focus of habitation and activity at Kalepolepo in precontact times with its Kalepolepo Fishpond and two *heiau* (Kalaithi and Kealahipoo *Heiau*). Unfortunately, much of the archaeological record of coastal Kula district was removed by early resort development that took place before the implementation of the current historic preservation review process. As Kolb (*et al.* 1997:157) points out "the development proceeded without archeological work, and as a result little information is available, and many of the coastal Kula sites have been destroyed. Thus we know little yet about the coastal zone of Kula".

Recent work near David Malo's stone church just south of Kūlamihāko'i Road (Pepalis and Kolb, in press; McDermott *et al.* 2000) has added greatly to our knowledge of the early pre-contact period at Kihei. Carbon dating and associated pollen analysis indicate direct human modification of the Kihei coastal environment in the period between 650 and 1050 A.D. with evidence of landscape change from Dry-Mesic forest to an environment characterized by disturbance-loving species beginning in that period and complete by the time-frame of 1380-1450 (McDermott *et al.* 2000:64).

The cultural sequence in Kula posited in the Kolb *et al.* (1997:281) settlement survey concludes there was very low intensity use of the coast and uplands, largely focused on exploitation of natural resources, prior to A.D. 1200. This settlement survey suggests

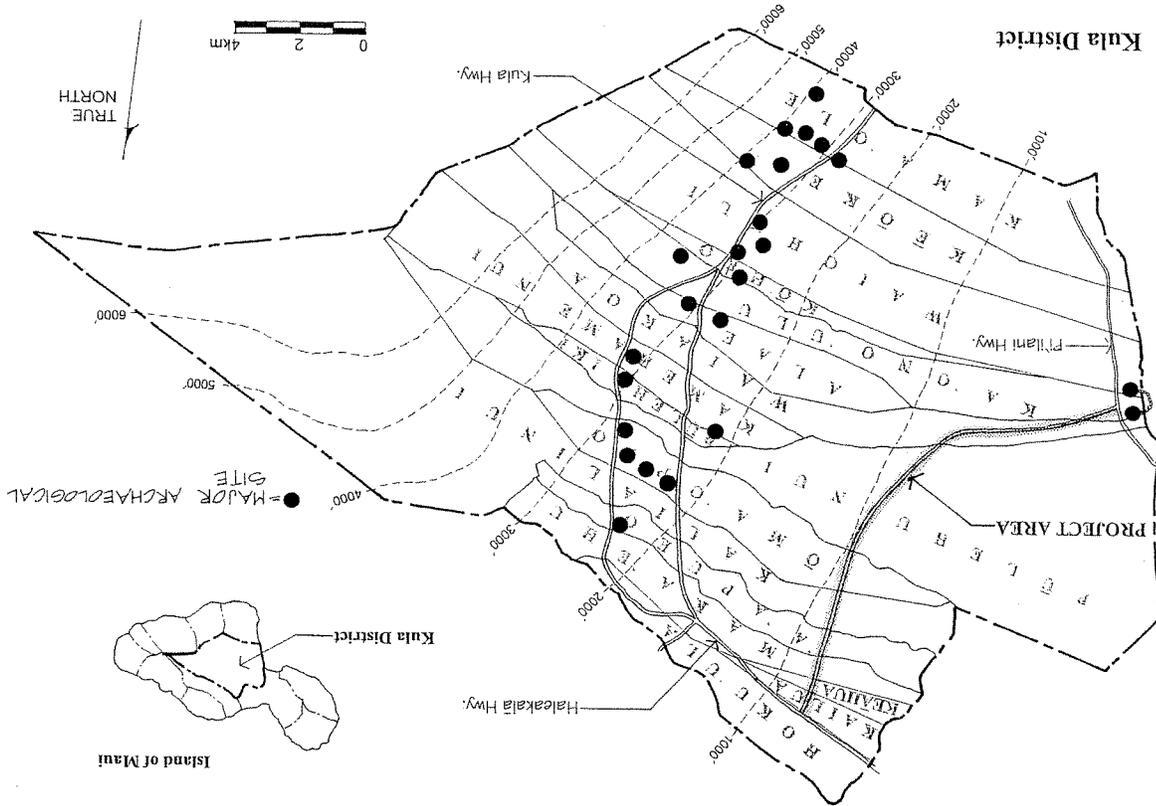

Figure 4 Map of Major Archaeological Sites in Kula District (Adapted from Kolb *et al.* 1997:29)

that initial permanent settlement of coastal Kula may have begun during A.D. 1200s-1400s and that "the presence of settlement both on the shore and in the uplands seems to mark the establishment of a dual settlement pattern (shore and uplands) from the very start of permanent occupation in Kula" (Kolb *et al.* 1997:281). The dating for the initial permanent settlement of coastal Kula appears to be a geographic extrapolation from two early dates from coastal sites in Honua'ula District (Kolb *et al.* 1997:189).

The few available radiocarbon dates from the general vicinity of the current project area are consistent in their rather broad, later prehistoric age determinations, most commonly post 1500 A.D. (Fredericksen and Fredericksen 1996b; Fredericksen 1994; Fredericksen *et al.* 1993). This fits with the model that the more intensive use of the Kihei shoreline was a later prehistoric development that corresponded with the expansion of upland permanent habitation, ceremonial constructions, and agricultural clearing after 1400-1500 A.D. (Kolb *et al.* 1997:281-282). The fishponds are traditionally thought to date to the late 1500s (Kolb *et al.* 1997:66).

The presence of three additional fishponds (Waiohuli kai, Kōokea kai and an unnamed pond) in the two kilometer long stretch south of Kalepolepo Fishpond testify to pre-contact activities along the Kula coast.

Even with the record of development and the potential for destruction of the archaeological record, it still seems inescapable that few areas in the Hawaiian Islands abutting sandy beaches have less in the way of Hawaiian cultural deposits than coastal Kula district. For example, as far as we can determine, the only account of any burials in coastal Kula (Waiakeo, Ka ono ulu, Waiohuli, Kōokea or Kama ole *Ahupua'a*) is Neller (1982a)'s account of burials reported (but not seen) at Kalamā Beach Park. This general lack of burial accounts is supportive of the general conclusion that habitation (and associated burial activities) in Kula district were overwhelmingly focused on the inland zone.

The general absence of coastal habitation was noted by George Vancouver while lying off the east side of Mā'alaea Bay in 1793 when he recorded: "A few habitations were promiscuously scattered near the water side."

#### ii. The Barren Zone in the Pre-contact Period

Most of the Kula District fits into the Hawaiian land category of "*kula*" defined as plain, field, dry grassland, or open country. In their place names study, Pukui *et al.* (1974:123) indicate the District name was derived from the land category.

According to Cordy this *kula* or "barren" zone was probably most utilized in the late pre-contact era as a route between the inhabited coastal and inland areas with corresponding intermittent habitation (Cordy 1977:12). Inventory surveys of portions of this intermediate zone have found remnants of dispersed, low-intensity, dryland agricultural features, such as mounds and alignments, as well as temporary habitations (Chaffee *et al.* 1997; Donham 1990; Miura 1982). Site densities are typically quite low within this barren zone with many dates of large parcels (Kennedy 1986c; Watanabe 1987; Hammatt and Shideler 2000b; Kikiloi *et al.* 2000) identifying no pre-contact sites at all.

The general absence of human endeavor on the vast barren zone slope was noted by George Vancouver while lying off the east side of Mā'alaea Bay in 1793 when he recorded: "The appearance of this side of Mowee was scarcely less forbidding than of its southern part...yet the soil had little appearance of fertility and no cultivation was to be seen...the inhabitants who came off to us, like those seen the day before, had little to dispose of."

#### iii. The Upland Field Zone in the Pre-contact Period

As the map of notable pre-contact archaeological sites (*heiau* and fishponds) of Kula District (Figure 4) clearly shows, these sites were overwhelmingly located between the 2000-foot and 4000-foot elevation contours. If, as seems likely, there is a rough correlation between *heiau* density and habitation density then "almost all settlement was concentrated there as well" (Kolb *et al.* 1997:28). The location of notable archaeological sites runs remarkably closely to the 30-inch isohyete (Figure 2) running along approximately the 3000-foot elevation in the southern half of Kula District (as far north as Pūlehu Iki *Ahupua'a*) and then dropping down to lower elevations further to the north. The distribution of notable archaeological sites would seem to suggest that prehistoric occupation in Kula was quite dispersed across this inland or upland field zone with perhaps slightly lower population densities in the northernmost *ahupua'a* (Kaupakalua, 'A'apueo, Maka'eha and Hōkū'ula *ahupua'a* appear to have only one *heiau* amongst them).

The settlement survey by Kolb *et al.* (1997: 281ff) concludes that prior to circa A.D. 1200 human activity in this zone was limited to intermittent exploitation of forest resources (particularly of birds). Settlement and farming are understood as beginning circa A.D. 1200-1400 and "the first large scale period of up-country permanent settlement occurred in the 1400s-1500s." Forest-clearing was increasing during this period as the dryland field systems expanded. The settlement survey concludes that:

In the A.D. 1600s, even more permanent habitations appear in the archaeological record along with more medium sized *heiau* and the larger garden enclosures. Grasslands with shrubs begin to dominate the area under agriculture, showing the expansion of lands under farming...no evidence of population decline or stabilization appears. (Kolb *et al.* 1997: 282)

Some traditional Hawaiian sayings probably dating to this late pre-contact period note environmental characteristics of Kula. The multiple references to smoke probably indicates the practice of burning the land before planting new sweet potato patches.

"*Moe hōkolo ka uahi o Kula, he Hau.*  
*The smoke of Kula traveled low and swift, borne by the Hau wind.*  
(Pukui. 1983:#2170)

"*Kokolo ka uahi o Kula, he Kēhau.*  
*The smoke of Kula creeps along when the Kēhau breeze blows.*  
(Pukui. 1983:#1824)

Another saying, relating a story of a man from Kula and a woman from Ke'anae, emphasizes the sense of identity of the man with the agriculture/sweet potato production of Kula.

"O ka wai kau no ia o Ke'anae; o ka 'ālei ho'owali 'uualā ia o Kula."

"It is the pool on the height of Ke'anae; it is the 'ālei digging stick for the potato [patch] of Kula."  
(Pukui, 1983:#2447)

Kula was traditionally famous for its 'uualā (sweet potato) "plantations" (Handy 1940:161; Handy and Handy 1972:131,276, 511; Kolb 1997: 25). The combination of good soil developed in volcanic ash, cool temperatures and frequent clouds to lower evapotranspiration and bring moisture as fog drip, and rainfall distributed fairly evenly throughout the year would also have allowed for taro cultivation.

Archaeological studies in this upland field zone (Riford 1987, Brown 1989, Moore and Kennedy 1995) indicate high site densities, and by logical extension high pre-contact population densities. In her study of Ōma'opio, Donham (1992:4) discusses the presence of *hetau* and the subsequent inference that a large permanent population must have been present, as well.

#### iv. Zones Further Upslope in the Pre-contact Period

Relatively little archaeological research has been undertaken on the Kula slope above 4,000-foot elevation. Work at higher elevations (P. Rosendahl 1975, M. Rosendahl 1978, Masterson *et al.* 1995) have identified primarily cave shelters, wall shelters, and carns. One of the main routes of access to Haleakalā Crater ascended through the *ahupua'a* of Pūlehu nui and Kaliainui of Kula District with a rest house located just north of Pu'u Kiohana (Sterling 1998:260). Kaliainui *Ahupua'a* extends into the crater. A number of burial places and *hetau* were associated with the summit region (Sterling 1998:264 ff).

The pre-contact utilization of one higher elevation resource, māmane wood, is suggested in one proverbial saying about the Kula people. Māmane was used for making the wooden digging sticks, the most important tool of potato farmers (Malo 1996:154).

"Na heiki uneune māmane o Kula.

The lads of Kula, who tug and pull the māmane up by the roots.

Pukui, 1983.:#2238

#### B. Early Historic Period

For elaboration on the subjects of whaling, the Irish potato industry, the Chinese presence in Kula, ranching, and sugar cultivation the reader is referred to Helen Wong Smith's research as presented in Brown and Haun (1989:Appendix C). A general overview of these subjects is provided in the following sections along with supplemental information not covered by Wong Smith.

#### i. The Coastal Zone in the Early Historic Period

In 1820, the whaling industry arrived and although the whaling centered around Lahaina, Clark (1980:47) notes that "From the 1840s to the 1860s a small whaling station was maintained at Kalepolepo [Kihei]." This station both serviced the international Pacific whaling fleets and supported a local "bay whaling" industry that lasted at least as late as the 1860s. Shore parties would go off in small boats to take humpback and sperm whales. The Hawaiian Kingdom licensed the Mā'alaea fishery at least as early as 1847 (Jones 1938:20). The fisheries expert Cobb (1902:513) relates that "According to several of the old inhabitants of Wailuku the natives used to kill whales in the bay quite often in the 'forties.'"

Around 1849 John Halstead built The Koa House at Kalepolepo in Kihei. The building, part store and part residence, thrived on the whaling industry and the resultant potato industry. The store also served as a gathering place for the whaling sailors. David Malo created a balance for this boisterous crowd by constructing a church at Kalepolepo sometime after 1843. During the Gold Rush years, the store became "an emporium for Irish potatoes."

Kuykendall (1938:313) notes that in the period from 1830 to 1854:

The commercial development during this period, by magnifying the importance of a few ports, gave momentum and direction to a townward drift of population; the population of the kingdom as a whole was steadily going down, but the population of Honolulu, Lahaina and Hilo was growing.

We believe that Kuykendall's observation was most likely the demographic pattern at the Kalepolepo entreat as well. The development of Kalepolepo as an entreat and a focus of Christian life in the 1840s and 1850s most likely increased the population in the immediate vicinity above the pre-contact population figures, contrary to the island-wide trend of depopulation. That the population and areal extent of the Kalepolepo community reached its zenith during the mid 1800's appears to be supported by the settlement study by Kolb *et al.* (1997:68):

The ancient village of Kalepolepo was relatively small, and was built around an economy primarily based upon the exploitation of ocean resources--primarily the excellent fishing grounds as well as three large fishponds. However, as the number of visiting ships increased, Kalepolepo soon became an important provisioning area. By 1850 we know that the economic opportunities were attracting a number of European entrepreneurs.

This study (Kolb *et al.* 1997:69) goes on to discuss how Kalepolepo, with Captain John Halstead's Koa House establishment, "became the hub of activity for all of Kula". Based on the available evidence it appears most likely that the settlement of Kalepolepo was greatest c. 1850.

ii. The Barren Zone in the Early Historic Period

Developments in the barren zone during the early historic period remain largely undocumented. Presumably the Kalepolepo Trail, which ran up the middle of Waiohuli *Ahupua'a*, would have been more heavily utilized and perhaps somewhat developed to provide the major artery between the upland field zone and the Kalepolepo entreat. Another major development was the establishing of ranching in the Kula region prior to the 1840s (Brown and Haun 1989:C-6). While the locus of early ranching endeavors is not well documented, the Kula grass lands would have been a natural focus. Cordy (in Federicksen, et al. 1994:3) notes that the majority of *Kama'ole Ahupua'a* at that time, as noted in Māhele awards, was government cattle range.

iii. The Upland Field Zone in the Early Historic Period

The whaling industry mainly effected the Kula/Kihei area with its agricultural demands. The introduction of whaling to the Maui community brought with it an increased demand (from the sailors) for the potato. As a result, after 1830 dryland agriculture in the upland field zone of Kula District expanded to include the Irish potato. The California Gold Rush of 1849 intensified this demand as a California-Hawai'i potato trade began to flourish. Kula became the area of highest potato production and came to be known as "the potato district" (the area between 2000 and 5000 ft. amsl).

Jarves (in Kuykendall 1980:313) describes the Kula area in July 1846 in the midst of the cash cropping boom of Irish potatoes there.

"It ranges along the mountain (Haleakala) between 2000 and 5000 feet elevation, for the distance of 12 miles. The forest is but partially cleared, and the seed put into the rich virgin soil."

Potato production thrived in Kula from 1830-1850 until successful potato cultivation and production in California and Oregon resulted in a decline in the Hawai'i trade (Burgett and Spear 1995:6-7). Donham (1992:5) notes that the inundation of land clearing and cultivation associated with the Gold Rush resulted in "deforestation [which] adversely affect[ed] the amount of rainfall in the district, and periods of drought became more common." Substantial forest clearing for commercial agriculture, especially potatoes and sugar cultivation, does not appear to have occurred until the mid-1800s.

While it lasted, the increase in agricultural production associated with the potato industry encouraged many Hawaiians to venture into cash-cropping (Speakman 1984:116) and attracted Chinese immigrants to Kula in the 1840s. During the subsequent 30 to 40 years the Chinese created a thriving community (Burgett and Spear 1995:7).

Sugar cultivation was present prior to 1846, with six sugar producers operating on the slopes of Haleakalā (Wong-Smith in Brown and Haun 1989:C-7). In or by the 1840s plantation camps, such as at Keihua, grew up, with small communities with churches, stores and homes (all which have since disappeared).

iv. Zones Further Upslope in the Early Historic Period

We really have no data on this subject. It seems not unlikely that the introduction of temperate cultigens ("Irish" potatoes and wheat) encouraged cultivation at higher elevations but this would really have been an inland extension of the traditional upland field zone.

C. Mid-1800s (Land Commission Claims / Awards)

According to Kame'eleihuwa (1992:52), Kekau'ōnohi had the District of Kula before the *Māhele*. In the Māhele land division of 1848 the "Crown" (Kauikeaouli Kamehameha III) kept certain lands including *Kōōkea Ahupua'a* and the 'ili of Keahou 1 & 2. The Kingdom retained as "Government lands" 'A'apueo, 'A'apueo 3, Hōku'ūla *Ahupua'a*, *Kama'ole Ahupua'a*, Kamehame 1 & 2, 'Oma'opio 6-11, Pulehu, and *Waiakoa Ahupua'a*. No particular pattern is suggested in these Crown and Government claims.

Certain *Ali'i* received very large parcels of Kula district lands. The high chiefs, Ane Keohokālole (also known as Keohokālole wahine, she was the great granddaughter of Keaweheulu and Kame'eiamoku, two of Kamehameha's four Kona "Uncles"), claims and gets the *ahupua'a* of 'A'apueo, Alae 3, Kamehame, Kealahou 3 & 4, Kōōhea, and Kukuinēa. The *Kaukau Ali'i*, Hapakuka Hewahewa, claimed and was awarded the entire *ahupua'a* of Ka'ono'ūlu, as 1 *āpana* of 5,715 Acs (LCA 3237). The little known "Ali" received Ōma'opio 1-4. Another important personage of the time Ka'awai, the land commissioner of Maui, received Alae 3 without a claim and three *āpana* in Waiakoa.

Seemingly a relatively large number of *ali'i* claimed Kula district lands but had their claims denied. Keohokālole wahine claimed but didn't receive Ōma'opio 5. *Kaukau ali'i*, Nāmau'u claims but doesn't get Waiohuli. Hewahewa claims but doesn't get Kōōhea. The *konohiki*, Kealoa, claims but gets neither Kama'ole or Keohe. Kalama, claims but doesn't get Kama'ole, Kōōkea and Waiohuli lands. Ka'aha claims but doesn't get Keohe or Waiohuli. Nahuia claims Kama'ole and Kōōkea but gets neither. Kamaikaaloa's claim is for the entire *ahupua'a* of Kaliainui. Kaawai is not awarded his claims in Ōma'opio and Kaliainui. Of the *ali'i*, only three, Kealoa, Kaaha and Hewahewa, claim house lots.

Of greater interest in reconstructing patterns of land use are the commoner *kūleana* claims. In the records of the Land Commission (1847-1851) there were 203 claims made for the District of Kula on Maui, and almost half of these are for parcels in more than one *ahupua'a*. The number of parcels claimed by each claimant range between one and 14. Claimants range from the *ali'i* to local residents and included in this range are many claimants from outside the Kula District, who are raising potato crops or have ranching pastures. An article in the Polynesian newspaper for November 24, 1849 noted: "Kula, however, is full of people. Strangers from Wailuku, Hamakua, and Lahaina are there preparing the ground and planting."

No *kuleana* land claims lie within any of the *ahupua'a* traversed by the project area within a distance of approximately one kilometer of the project area. There may have been *kuleana* claims in Wailuku District within a kilometer of the north end of the project. The closest *kuleana* land claims in Kula District were those at Kalepolepo Village (Figure 5) discussed below.

i. The Coastal Zone in the Mid 1800s Period

At Kalepolepo in Ka'ono'ulu there were numerous *kuleana* located just southeast of the Kalepolepo fishpond and approximately a kilometer southwest of the west end of the project corridor (Table 1, Figure 5).

There appear to be five awarded *kuleana* claims at Kalepolepo, three awarded under Ka'ono'ulu *Ahupua'a* (LCAs 4120b, 5228, and 5376) and two awarded under Keōkea *Ahupua'a* (LCAs 5279 and 7791). The rationale for the awards under Keōkea *Ahupua'a* is unclear as the nearest point of this *ahupua'a* is understood as lying approximately 3.3 kilometers to the south of Kalepolepo Village. Possibly this represents a pattern of migration to commercial centers discussed previously, with people from "rural" Keōkea claiming land near the Kalepolepo entrepot, but this is by no means certain. It appears that *Māhele* records (Table 1) report approximately a dozen *kuleana* at Kalepolepo (the majority unawarded). As is often the case, it is unclear whether all of the parcels (*āpana*) claimed are in the vicinity of the Kalepolepo settlement or not. Possibly the potato patches, taro lands, and pastures mentioned were all near the settlement. Wilcox (1921:67) describes Kalepolepo of the eighteen-fifties as a place where "Coconut trees and kou trees grew beside pools of clear water, along the banks of which grew the taro and the ape". Some of these claims, however, could have been quite distant.

Hapakuka Hewahewa (the *kahu* for the Maui lands of Kaheheimalie - one of Kamehameha's wives) claimed and was awarded the entire *ahupua'a* of Ka'ono'ulu, of 5,715 acres (LCA 3237). He claimed this land from the time of Kamehameha I in 1782 (well before the Kamehameha forces conquered the Island of Maui), through one of Kamehameha's wives who was from Maui. Hewahewa also claims the fish pond at Kalepolepo in another claim. His permanent place of residence was Kalepolepo.

We are unable to identify any *kuleana* claims awarded anywhere else in coastal Kula District beside Kalepolepo. *Māhele* records indicate a few (2-4) unawarded *kuleana* claims at "Late", which may be the Late at the coast where Waiohuli and Keokea *Ahupua'a* meet, but this is uncertain.

ii. The Barren Zone in the Mid 1800s Period

That no *kuleana* land claims are known to lie within any of the *ahupua'a* traversed by the project area within a distance of approximately one kilometer of the project area attests to just how barren the barren zone was in the mid 1800s.

Table 1: Kuleana Claims to the Land Commission in Kalepolepo Village and Vicinity

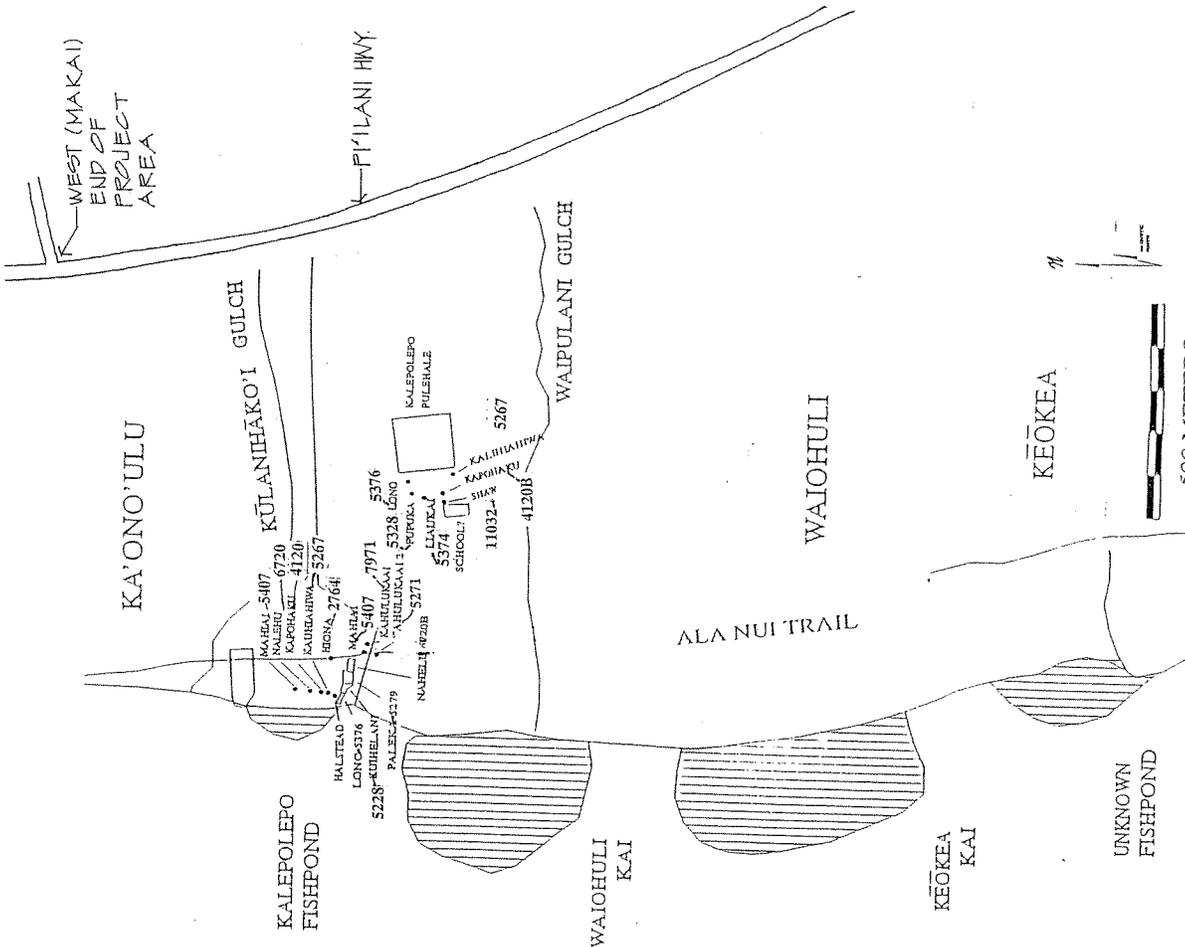

Figure 5 Map showing the location of *kuleana* land claims at Kalepolepo in Relation to the West End of the Project Area

It is certainly possible that some of the "pasture land" claims lay in the barren zone. Pasture lands are claimed 36 times throughout the District, but it is possible some might have been more generic *kula* or grassland claims, translated into pasture in English. Eight of these claims were in Pūlehu, one in Pūlehuiki, and five in Waiakoa. Except for Ah's pastures (LCA 281B), at circa 2,500-foot to 3,000-foot elevation in Ōma'opio, most of these pasture claims were not awarded and their location in terms of zone is uncertain. The location of the Ah pasture suggests that many or all of the "*kula*" or "pasture land" claims were in fact in the upland field zone.

The *kuleana* land claims in the upland field zone allow for an estimate of the width of the *kula* zone in the various *ahupua'a* of Kula District. The *kula* zone lies between the following approximate elevations at the time of the *Māhele* and *kuleana* claims (Table 2).

Table 2: Kula Zone Elevations of Kula District (from South to North)

Ahupua'a	Approx. Elevation (in Feet)	Approx. Distance from Coast to top of Kula Zone (Km)	Comments
Kama'ole	40' to 2,400'	8.1	
Keōkea	40' to 2600'	11.0	
Waiohuli	40' to 2800'	12.0	
Kōheo	40' to 3000'	13.4	<i>Ahupua'a</i> does not quite reach the coast
Ka'ono'ulu	40' to 2900'	13.7	
Alae	1000' to 3200'	15	Seaward end of <i>Ahupua'a</i> is at approx. 1000' elevation
Waiakoa	40' to 2700'	14	
Kamehame-nui	1800' to 2400'	16	Seaward end of <i>Ahupua'a</i> is at approx. 1800' elevation
Pūlehu iki	2400'	17	Seaward end of <i>Ahupua'a</i> is at approx. 1800' elevation
Pūlehu nui	450' to 2400' elevation	17	No coastal zone, cut off by Waialuku District
Ōma'opio	450' to 2000'	16	No coastal zone, cut off by Waialuku District

Ahupua'a	Approx. Elevation (in Feet)	Approx. Distance from Coast to top of Kula Zone (Km)	Comments
Kaliainui	450' to 2300	16	No coastal zone, cut off by Wailuku District
'A apueo	450' to 2200	16	No coastal zone, cut off by Wailuku District
Maka'eihu	450' - ?	17	No coastal zone, cut off by Wailuku District, no data is available on the upland field zone
Keāhua	450' to 1075'	-	Cut off by Wailuku District seaward and Kaliainui
Kailua	450' to 1075'	-	Cut off by Wailuku District seaward and Kaliainui
Hökū'ula	450' to ?	-	No coastal zone, cut off by Wailuku District, no data is available on the upland field zone

About the same time as the *Māhele* (late 1840s-early 1850s) land grants show foreigners coming into the District to establish ranches and plantations for sugar cane in this *kula* zone.

### iii. The Upland Field Zone in the Mid 1800s Period

"*Wao-kanaka*" is used by Malo to describe that area below the various forest and mountain ones: "Here grows the *amau* fern and here men cultivate the land" (Malo 1976:17). It is this band of *wao-kanaka* that is most particularly detailed in the land claims.

In the Kula area, unlike most other areas of the islands in general, claimants did not confine their claims to one *ahupua'a* or even one district. A large number of claimants request *āpana* in two, three, or more *ahupua'a* and the same claimant may also register several different claim numbers. We find "migrant farmers" who come from elsewhere on Maui (i.e. Lahaina or Waikapu or Wailuku) who either come occasionally to work in their fields, or are absentee landlords having others raise various crops (in particular Irish potatoes) for them. The booming victualing trade for whalers and the California gold fields may have significantly changed residential and agricultural patterns by the mid 1850s from what they had been in pre-contact times.

By the time of the *Māhele*, the major locus of settlement and food production was along the Government Main and the Old Kula roads. The vast majority of *kūleana* land claims (c. 1847-1853) in the Kula District are situated along the old Kula Road between 1200-foot elevation (in the north) and 3,800-foot elevation in the southern part of the district within a zone where there is sufficient natural rain and where it is cool enough for tuber crops. Of the land claims for the entire Kula District, by far, the greatest number are for plots of potatoes, both sweet and Irish (494 plots claimed). There are also claims for banana patches particularly in Waiohuli and Kōōkea *ahupua'a* at around the 3,000-foot elevation. Sugarcane is mentioned in one claim in Ōma'opio at about 2,600-foot elevation. There are only two claims for pig pens in the district and one is in Pūlehuki about 3,200-foot elevation. There are three mentions of *wauke*, one (unawarded) in Kaliainui, and two in Ōma'opio at about 3,000-foot elevation, with one of these latter being a *wauke* stream. Claims of "*kula*" lands in this upland zone included pastures while other "*kula*" lands in this upland field zone were used for dryland crops, such as bananas, some dryland taro, with occasional sugar cane patches, and grass lands. A few pig pens are also mentioned. In the southern area of Kōōkea, there were the claims for taro lands.

In the Kula District *kūleana* claims there is special kind of claim that is claimed no where else in the islands, "*ho'oi'o*" or "winter" *kula*. While the concept of "*ho'oi'o*" claims is not entirely clear it appears likely that these were typically lands which could be cropped in the wetter winter months but which did not support agriculture during the drier summer months. Twenty "*winter kula*" are claimed in Kula Maui: one in Kaliainui, two in Kamehame, three in Kealahou, three in Ōma'opio, three in Pūlehuki and eight in Ka ono'ulu. While many of these are unawarded claims and cannot be located on today's maps, many of the *ho'oi'o* claims that can be located appear to typically be on the downslope edge of the upland field zone, just seaward of present-day Kula highway. One claim (10480) specifies that this winter *kula* is "*makat*" but how far "seaward" this claim lay is unclear. Only two winter *kula* claims mention the types of crops grown there and these two specify Irish potatoes. Three of the claims for winter *kula* (Kaliainui, Kamehame I and II - at about 2,400-foot elevation) are, however, associated with a bog (*āzēle*) which calls into question the conception that these were exclusively rainy season plots.

Another unusual term, used in Kula District and a few other places on Maui, is "*moku mau'u*" (which the Archive's translator believed might be small pockets of plantings, probably of sweet potatoes) found throughout the upland field zone.

The Kula map drawn by Monsarrat and Dodge (1872-1879; Registered Map No. 913) (Figure 6) shows only some of the awarded claims, and some differ from numbers those shown on the TMs. What is evident on the Monsarrat and Dodge map is that some of the names of Land Commission claimants appear rather with grant numbers. Helen Wong-Smith (in Donham 1990b:B-4) notes that prior to the *Māhele*, land in Makawao was offered for sale, fee-simple, to native Hawaiians. These parcels (numbering close to 100) ranged from 5 to 10 acres and were purchased for \$1.00 an acre, and may explain why many *kūleana* are not shown on maps as the owners had already opted for grant status. Land Grants were also purchased by Hawaiians and appear to consolidate scattered holdings, and occur particularly in the upland cultivating area (See McGerty and Spear 2000).

Table 3: Upland Field Zone Elevations of *kuleana* claims in Kula District (from South to North)

Ahupua'a	Approx. Elevation (in Feet)	Comments
Kama'ole	2,400' - 3800'	38 claims with potato fields, 13 with houses, 4 with taro and 1 with bananas
Kēōkea	2600' - 3200'	29 claims with potato fields, 14 with houses, 24 with taro and 4 with bananas
Waiohuli	2600' - 3300	35 claims with potato fields, 23 with houses, 9 with taro and 12 with bananas
Kōheo	3000'	5 claims with potato fields, 1 with taro
Ka'ono'ulu	2900'	20 claims with potato fields, 1 with taro
Alae	3200'	1 claim with potato fields, 1 with a house
Waiakoa	2600' - 3800'	5 claims with potato fields, 1 with a house
Kealahou	2600-3000'	3 claims with potato fields
Kamehame	2400' - 3400'	2 claims with potato fields
Pūlehu	2400' - 3400'	7 claims with potato fields
Ōma'opio	2000' - 3800'	5 claims with potato fields, 2 with houses
Kaliainui	2300	7 claims with potato fields, 2 with houses, 1 with taro and 1 with bananas
'A'apueo	2200	2 claims with potato fields, 1 with a house
Maka'ehu	n.d.	No claims?
Keāhua	nd.	No claims?
Kailua	n.d.	No claims?
Hōkū'ula	n.d.	No claims?

The settlement pattern in the upland field zone indicated on the Monsarrat and Dodge map (Figure 6) and on Table 3 shows that this habitation/agricultural zone follows a relatively uniform contour as far as it can be documented. From Kama'ole in the south to Kaliainui in the north this zone typically begins on the downslope side between 2300 to 2600-foot elevation close to the 30" rain isohyete. There is really very little evidence for this zone further north but it appears to be descending in elevation - presumably following the same rain isohyete (see Figure 2). The Monsarrat and Dodge map (Figure 6) and Table 3, however, also show that this "zone" should not be construed as a uniform band of

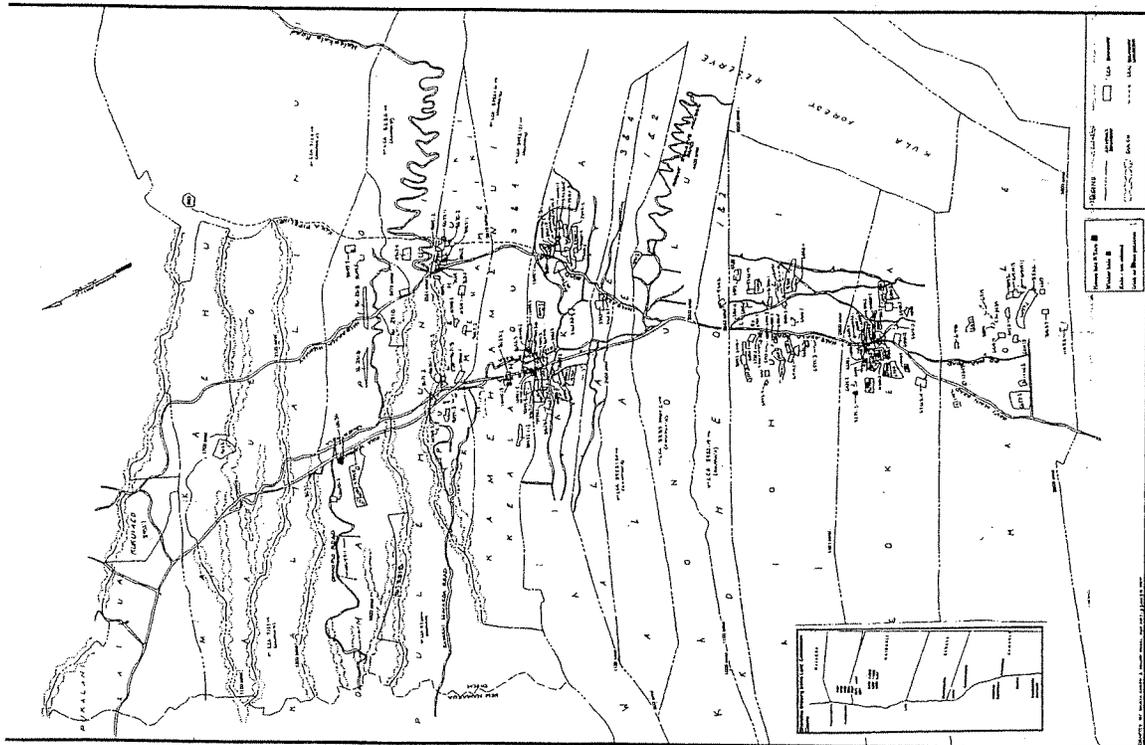

Figure 6 1880 Monsarrat & Dodge Map of Kula Upland Settlement Area, RM 913, Annotated to Show *Māhele* and *Kuleana* claims

habitation and agricultural activity across slope. The upland field zone of three *ahupua'a* (Kama'ole, Keōkea and Waiohuli) account for 50 house claims and 102 potato fields while the fourteen northern *ahupua'a* (Kōheo - Hōkū'ūla) collectively account for only seven house claims and fifty-seven potato field claims. This may in part reflect a random bias of the data, as there was clearly a good deal of activity in the upland field zone of Waiaikoa *Ahupua'a* (Figure 6) despite the few houses and potato fields specifically claimed there. It still appears, however, that the upland zone of the southern portion of Kula District supported a much higher density of habitation and agriculture than did the northern lands.

iv. Zones Further Upslope in the Mid 1800s Period

Traditional activities in zones further upslope probably decreased in the mid 1800s as a result of Hawaiian population decline. Cattle and goats probably made incursions in upper forests which had never been subjected to swidden agriculture resulting in the increased erosion noted below. The approximate limits of the "zones further upslope can be estimated by locating the upslope limit of *kuleana* claims and noting the upslope extent of the *ahupua'a* of Kula District (Table 4).

Table 4: Elevations of Zones Further Upslope in Kula District

Ahupua'a	Approx. Elevation (in Feet)	Comments
Kama'ole	3800' - 7000'	ends at Pu'u Keōkea
Keōkea	3200' - 7200'	Beheaded by Papa'anui
Waiohuli	3300' - 8800'	Ends at Kalepeamoā
Kōheo	3000' - 6000'	Pinched out by Ka'ono'ulu and Waiohuli
Ka'ono'ulu	2900' - 9000'	Beheaded by Papa'anui
Alae	3200' - 7400'	Pinched out by Ka'ono'ulu and Waiohuli
Waiaikoa	3800' - 10000'	To summit
Kealahou	3000' - 10000'	To summit
Kamehame	3400' - 9500'	To caldera
Pūlehu	3400' - 9500'	To caldera
Ōma'opio	3800' - 4600'?	Pinched out by Kaliahinui and Pūlehu
Kaliahinui	2300' - 7500'	To caldera
'A'apeo	2200' - 3200'	Beheaded by Kaliahinui, perhaps no zones further upslope

Ahupua'a	Approx. Elevation (in Feet)	Comments
Maka'eha	n.d. - 3200'	Beheaded by Kaliahinui, perhaps no zones further upslope
Keāhūa	nd. - 1500'	Pinched out by Hoku'ūla and Maka'eha, perhaps no zones further upslope
Kailua	n.d. - 1500'	Pinched out by Hoku'ūla and Maka'eha, perhaps no zones further upslope
Hōkū'ūla	n.d. - 2400'	Beheaded by Maka'eha, perhaps no zones further upslope

D. Late 1800s Period

i. The Coastal Zone in the Late 1800s Period

Coastal activity remained focused at Kalepolepo. Bay whaling was evidently still going strong in 1862 with O. J. Harris "meeting with such success that try-works were erected at his Kalepolepo Station." (Thrum 1913:56) Halstead ran his Koa House store at Kalepolepo until 1876, closing shop when the potato industry diminished and moving to 'Ulu'apalaka. (Janion 1977:25-31). Wilcox (1921:66) relates an account of acute environmental degradation in Kula circa the 1870s as follows:

In the [eighteen-] seventies and later, the Kula mountains had gradually become denuded of their forests, torrential winter rains were washing down earth from the uplands filling with silt the ponds at Kalepolepo." cattle trampling down the brush and grass of the nearby fields caused sand dunes to drift, filling up the Kalepolepo pond, and the daily breezes which once cooled the heated air had changed to a scorching daily simoon, sweeping clouds of dust and drifting sand over the partly abandoned site of the [Kalepolepo] village. In the seventies, ruins of grass huts partly covered by drifting sand, and a few weather beaten houses perched on the broad top of the old fishpond wall at the edge of the sea, with the Halstead house looming over them dim and shadowy in the daily swirl of dust and flying sand, impressed on the passerby that unlovely name bestowed on the village in song and story as a reproach - Kalepolepo, "the dirty place."

This was a far cry from the Kalepolepo of the eighteen-fifties in which "Coconut trees and kou trees grew beside pools of clear water, along the banks of which grew the taro and the ape."

The coastal portions of Kula, were used for ranching activities by Haleakalā Ranch Company in the late 1800s (Donham 1990b:6).

ii. The Barren Zone in the Late 1800s Period

By the 1880s the barren zone consisted primarily of pasture land for ranching (Wong Smith in Donham 1990b:B-6). The Land Grants show that Haleakalā Ranch Co. patented 2155 acres in Kula in 1891. Kennedy (1992:7) notes that at this point *kiaue* was imported to feed cattle and provide wood. Maps from late 1800s/early 1900s indicate that several ranching companies owned and operated land in the broad expanse of *kūia* land in the barren zone of Kula District.

iii. The Upland Field Zone in the Late 1800s Period

Wilcox (1921:66) relates that: "In the late [eighteen-] sixties the Irish potato trade had become unimportant and later ceased all together." The declining decades of the potato industry were somewhat off-set by wheat. Wilcox (1921:66) relates that: "during the wheat boom of the [eighteen-] fifties and early sixties when the upper Makawao country was cropped to wheat." In the later decades of the 1800s the upland field zone was used increasingly for ranching. E. D. Baldwin relates that in 1888 "There were none of the owners of Waiakoa *kūleanas* living above the Government Road and only a few *makai* of said road (Sterling 1998:252). A major reason for abandonment was that "Waiakoa had been over run with cattle for years."

iv. Zones Further Upslope in the Late 1800s Period

While the acute environmental degradation of the 1870s Wilcox related above probably affected all environmental zones, it may have been most severe on the native forest of the higher slopes. Cattle and goats probably continued to make incursions in upper forests which had never been subjected to swidden or commercial agriculture.

Sugar companies began operating in the Makawao area in the late 1800s. The Hawaiian Commercial Company was founded in 1878 by Claus Spreckels and in 1882 became the Hawaiian Commercial and Sugar Company (HC&SC), located in Pu'uene. In 1899 the company was acquired by investors headed by J.B. Castle, with Alexander & Baldwin replacing the plantations agents.

E. Early 1900s To The Present

i. The Coastal Zone in the Twentieth Century Period

The Kihei Plantation Company, located on the shores of Mā'ālaea Bay was chartered in 1899 by an illustrious group including B. F. Dillingham, H.P. Baldwin, L. A. Thurston, J. P. Cooke and M. P. Robinson. Following poor returns, the Kihei Plantation Company was absorbed or merged into the Hawaiian Commercial and Sugar Company in 1908 (Conde and Best 1873:250). It seems probable that the Kihei Plantation Company sugar lands were quite similar to the Kihei lands of the Hawaiian Commercial and Sugar Company shown on a map by H. I. Shoemaker dated 1910. This 1910 map indicates extensive sugar cane fields with some pastures lying seaward of the "Lowrie Ditch" at approximately 450-foot elevation. Some of these fields went virtually to the coast. The

best KPC fields continued to be cultivated (some are still productive), while the remaining plantation lands became cattle pasture. (Cox 1976:14-16) The upslope limit of these fields corresponds closely with the modern Wailuku/Makawao District boundary, or the seaward edge of Pūlehuunui, Omā opio, Kaliahinui, 'A'apueo, Maka'eha Keāhua, Kailua and Hōkū'ūia *Ahupua'a*. It appears that there was no commercial sugar cane cultivation near the project area at that time.

While World War I had little impact on Maui, World War II brought with it a significant military presence. Speakman (1984:166-176) provides a detailed review of the Marines on Maui including an account of training maneuvers held at Mā'ālaea Bay, along its beach and in the *liawe* groves to the east of the Bay. Allen (1971:230) notes that the Marines conducted amphibious landing training at Mā'ālaea Bay. Allen (*Ibid.*) also gives an extensive account of the Navy presence on Maui, which included a Combat Demolition Training Station at Kama'ole. The training station at Kama'ole was responsible for research work at Kihei as early as 1940.

Kihei underwent a rapid residential and commercial development beginning in the 1970s. Clark (1980:48) notes that the groundwork for this development was established in the late 1950s when investors began purchasing coastal property. However, the construction boom of high rise apartments, hotels, and condominiums and corresponding shopping centers, restaurants, and real estate offices didn't occur until the 1970s. Speakman (1984:188) notes that along with the condominiums and "classy" hotels (Maui's "hallmark") came congestion and overcrowding which resulted from this development. "It was partially blamed on the fact that Kihei was owned by many proprietors or speculators, each with individual plans uncoordinated with general planning, and partly on the failure of the County planners to hold the line against the runaway development. Kihei became the model for the wrong way to go about expansion." Pi'ilani Highway was constructed to ease the congested Kihei traffic which resulted from this development and expansion of the tourist industry.

ii. The Barren Zone in the Twentieth Century Period

In 1909 Henry P. Baldwin receives a grant for 873 acres (Grant 5167 seen on TMK: 2-5-01:2) in Omā opio and Pūlehu nui. With pineapple, sugar, and dairy in the area, "a sizeable plantation community developed at Keāhua, a few miles below Pukalani, complete with school post office, and churches, all of which has now disappeared and been replaced with sugar cane" (Bartholomew and Bailey 1994:121). Keāhua Camp lay approximately 4 kilometers west of the north end of the project area at the seaward edge of Kailua *Ahupua'a*. A 1949 map of Hawaiian Commercial and Sugar Company lands shows extensive fields extending up to the Hāmākua Ditch at approximately 1000-foot elevation extending across an expanse of Pūlehuunui, Omā opio, Kaliahinui, 'A'apueo, Maka'eha

Keāhua, Keolu and Hōkū'ula *Ahupua'a*. Thus it can be safely assumed that most of the sugar cane field infrastructure observed in the northern 60% of the project area dates between 1910 and 1949. HC&SC currently operates the cane fields which blanket the northern third of the study parcel (Figure 7).

Pineapple cultivation was introduced to Makawao in the early 1900s. The Maui Agricultural Company (M.A. Co.), primarily a sugar producer, began planting pineapple in its upland parcels. "Some of the M.A. Co. fields in the higher elevations were too far from the main line railroad and lacked a water supply for fluming and irrigation. In 1923 the plantation started planting pineapple on these lands...the C.P.C. [California Packing cannerly] concern then built a large cannery...The M.A. Co. move[d] the cannery workers from Paia to Kahului." (Condé and Best 1973:233)

Maui Land and Pineapple Company also had its beginnings during this time period. According to Speakman (1984:130-131) the company started as Baldwin Packers which then became Maui Pineapple Company, owned by Alexander & Baldwin. The company developed over the 1950s and 1960s, becoming "the largest producer of pineapple on Maui." The Cameron family then took control and the company became Maui Land and Pineapple Company. Maui Land and Pineapple Company continues to cultivate pineapple within the western reaches of the study parcel (Figure 7).

Burgett and Spear (1995:8) discuss the introduction of ranching ventures into the uplands of Kula in the early 1900s. Haleakalā Ranch and Ka'ono'ulu Ranch continue to run cattle over a huge expanse of the "barren zone" of Kula District.

Speakman (1984:188) notes that along with the Kihei construction boom in the late twentieth century came the construction of millionaire homes in the dry hills overlooking Kihei and the view beyond of Kaho'olawe and Molokai.

iii. The Upland Field Zone in the Twentieth Century Period

In 1905 the Kula Pipeline was built during a harsh drought, expanding the water resources of the Kula area (Mark in Kennedy 1992:7). Haleakalā Ranch and Ka'ono'ulu Ranch continue to run cattle over a huge expanse of the "upland field zone" of Kula District.

iv. Zones Further Upslope in the Twentieth Century Period

Haleakalā Ranch and Ka'ono'ulu Ranch continue to run cattle over a huge expanse of the "zones further upslope" of Kula District. During the 1970s, Kula produced the majority of Hawai'i's locally grown produce and livestock ranches comprised most of the remaining land use. At present, non-residential areas are still in use as centers of agricultural production.

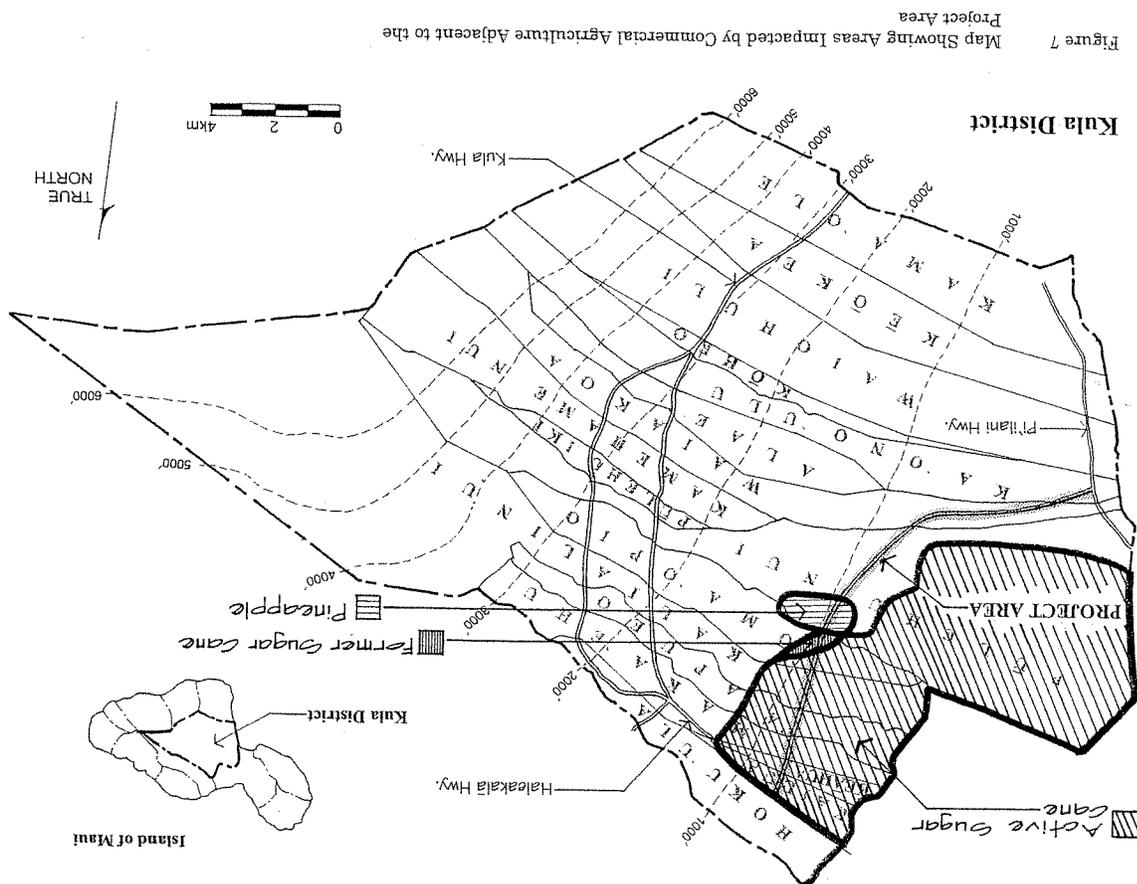

Figure 7 Map Showing Areas Impacted by Commercial Agriculture Adjacent to the Project Area

#### IV. SUMMARY AND PREDICTIVE MODEL

The project area appears to be located entirely in the *kula* (dryland plains) or "barren zone" of Kula District (see Figure 3). The vicinity of the upper roads on the slopes of Haleakalā, above this *kula* zone has served as an "upland field zone" or agricultural center since the pre-contact era. The *uata*, or sweet potato was traditionally cultivated in Kula in elevations above 2000 ft. a.m.s.l. in an upland field zone belt. Corresponding with this agricultural activity was relatively dense habitation in the uplands, particularly in the southern *ahupua'a* of Kama'ole, Kōkeā and Waiohuli. This upland field zone is poorly defined in its northern extent in land documents with no *kuleana* land claims for houses or agricultural fields awarded in the uplands of the northern *ahupua'a* of Maka'eha, Keāhua, Kailua, or Hōkū'ula (there is one claim 8452:7 for *kula* land in Kailua *Ahupua'a*). It appears that the upland field zone most likely approximated the 30-inch rainfall isohyete, dipping in elevation to the north (Figure 2), but this remains largely conjectural in north Kula District owing to the absence of land claims for houses or agricultural fields. The extensive historic disturbance in this area by commercial agriculture probably obliterated most traces of what few fields and homesteads there were here.

Cordy (2000:2) notes that the barren zone in which the project area lies seemed to mainly have had trails and associated shelters leading to the uplands, but with some small dryland fields and associated field shelters near the shore. This zone is suggested (Cordy 2000:2) to have a very low density of sites. It seems probable that the more populous southern *ahupua'a* of Kula District, which had a coastal zone (Kama'ole, Kōkeā, Waiohuli, Ka'ono'ulu, Waiakoa), had more activity in the barren zone. This greater activity would be due to the greater traffic between uplands and coast and also to small dryland fields associated with coastal settlement.

The prediction for the most likely area of pre-contact and early post-contact Hawaiian sites thus would focus on the southwestern third of the project area in Waiakoa and Ka'ono'ulu *ahupua'a*. It seems probable that trails from the uplands to the coast would have traversed these narrow *ahupua'a* (such as the Waiakoa Trail; see McGerty and Spear 2000:4f) and that associated temporary shelters, midden scatters etc. might be encountered. Another focus of pre-contact and early post-contact Hawaiian sites would be expected to be in the gulches. McGerty and Spear (2000:51) quote Charles Maxwell as asserting knowledge of petroglyphs in at least four gulches and of at least six burial caves in these gulches. The over-riding conclusion however is that the entire *kula* or barren zone in which the project entirely lies is an area in which low to very low site densities might be anticipated. This is supported by a recent study (McGerty and Spear 2000:55) "which did not identify any specific Traditional Cultural Properties within the project area".

The results of the present study suggest that the vast majority of Kula District land, including the Barren Zone and zones above the upland field zone, would be expected to have low densities (perhaps less than one site per ten acres on average) of pre-contact to mid 1800s sites. Areas with anticipated high site densities (averaging perhaps one or more sites per acre) would include the vicinity of Kalepolepo settlement and the upland field zone of Kama'ole, Kōkeā, Waiohuli, Ka'ono'ulu. Other portions of the coastal zone and the upland field zone might be anticipated to have moderate site densities (perhaps averaging 0.1 to 1 site per acre).

#### V. PREVIOUS ARCHAEOLOGICAL RESEARCH

Previous archaeological research in Kula District has predominantly been done at the elevations above 2,000 ft. a.m.s.l. -- upcountry Kula -- or in the coastal Kihei region. An overview of research relevant to the study parcel is presented in Table 5 and is discussed below.

Table 5. Previous Archaeology

Date	Author	<i>Ahupua'a</i>	Nature of Study	Findings
1909	T. Thrum	Island wide	<i>Heiau</i> study	1 <i>heiau</i> in Kailua <i>Ahupua'a</i>
1918	J. Stokes	Island wide	Reconnaissance, <i>Heiau</i> study	Documents a settlement and agricultural zone around 2,000' elevation
n. d.; c. 1909	W. Walker	Entire Island	Reconnaissance	three <i>heiau</i> in the <i>ahupua'a</i> of Waiohuli above 3,000' elevation
1931	J. Cox & E. Stasack	Archipelago Wide	Petroglyph study	Inventories petroglyphs
1970	I. Ashdown	Island Wide	Study of <i>Ke Ala'oa o Maui</i>	Collection of cultural information
1971	P. Kirch	Palaea	Survey & Excavations	Documents a coastal settlement and settlement patterns
1973	W. Kikuchi	State-wide fishpond survey	Fishpond survey	Notes 3 fishponds in the Kalepolepo area
1975	P. Rosendahl	Haleakalā Hwy.	Reconnaissance	Identified 7 sites
1976	D. Cox	Pūlehunui to Kama'ole	Surface Survey	Identified 6 sites
1977	R. Cordy	Pūlehunui to Paeahu	Reconnaissance	Identified 38 sites: 30 in Waiohuli, 0 in Kaonoulu and 8 in Kōkeā
1978	M. Rosendahl	Haleakalā	"Overview"	Located & reported sites
1978	A. Sinoto	Coastal Kama'ole	Reconnaissance	Recorded 6 sites including 4 probable habitation features

Date	Author	Ahupua'a	Nature of Study	Findings
1981	R. Hommon	Coastal Waiaikoa	Reconnaissance	No archaeological findings
1981 (a)	C. Keau	Coastal Kama'ole	Reconnaissance	No archaeological findings
1981 (b)	C. Keau	Coastal Kaonoulu	Reconnaissance	Notes historic features & significance of area
1982	M. Miura (R. Bordner & D. Cox)	Coastal Waiohuli & Kōkeā	Reconnaissance	Reports 9 sites
1982 (a)	E. Neller	Coastal Kama'ole	Reconnaissance	Relates report of "large number of burials"
1982 (b)	E. Neller	Coastal Kaonoulu	Reconnaissance	No archaeological findings but relates history on pond & graves
1986	W. Kam	Waiohuli & Kōkeā 2100' to 2700' elevation	Field Inspection	2 possible pre-contact house sites & walls
1986 a	J. Kennedy	Coastal Kōkeā	Reconnaissance	No archaeological features were located
1986 b	J. Kennedy	Coastal Waikapu	Reconnaissance	Notes mounds (discounted in 1988a)
1986 c	J. Kennedy	Coastal Waiohuli	Reconnaissance	No archaeological sites were found
1987	M. Riford	Uplands (1800' to 3000') of Waiohuli & Kōkeā	Monitoring & Reconnaissance Survey	Identified 113 sites mostly pre-contact
1987	F. Watanabe	Uplands (280' to 380') of Waiohuli	Reconnaissance	No archaeological sites were found
1988	A. Estioko-Griffin	Uplands (2680') of Kōkeā	Field Inspection	Notes human remains in a cave site
1988	A. Haun	Kama'ole	Reconnaissance	Identified 33 sites, mostly military, revisited by Mayberry & Haun 1988
1988 (a)	J. Kennedy	Coastal Waikapu	Testing & Monitoring	No archaeological findings

Date	Author	Ahupua'a	Nature of Study	Findings
1988 (b)	J. Kennedy	Coastal Kaonoulu	Reconnaissance	No archaeological findings
1988 (c)	J. Kennedy	Coastal Waiohuli	Reconnaissance	No archaeological Findings
1988 (d)	J. Kennedy	Coastal Waiohuli	Reconnaissance	No archaeological Findings
1988	J. Mayberry & A. Haun	Coastal Kama'ole	Reconnaissance	Identified 33 sites
1989	R. Brown	Upland (1800' to 3000') Kōkeā and Waiohuli	Inventory Survey	Identified 159 sites (part of this area was studied by Riford in 1987)
1989	R. Brown & A. Haun	Kōkeā and Waiohuli	Inventory Survey	A more detailed study of the same parcels described by Brown 1989
1989	T. Donham	Waiohuli	Inventory Survey	Identified 4 sites in a portion of the Miura 1982 study area and recommended data recovery
1989	W. Fredericksen <i>et al.</i>	Coastal Kama'ole	Inventory Survey	No archaeological findings
1989	H. Hammatt & D. Shideler	Coastal Kama'ole	Reconnaissance	Identified 8 sites
1989 (a)	J. Kennedy	Coastal Kama'ole	Survey	No archaeological findings judged significant
1989 (b)	J. Kennedy	Coastal Kama'ole	Reconnaissance	No archaeological findings
1989 (c)	J. Kennedy	Coastal Pūlehu	Inspection	No archaeological findings
1989 (d)	J. Kennedy	Coastal Waiohuli	Subsurface Testing	No archaeological findings
1989	H. Leidemann	Coastal Kama'ole	Reconnaissance	No archaeological findings, area extensively bulldozed
1989	A. Sinoto	Coastal Kama'ole	Surface Survey	Identified 8 sites

Date	Author	Ahupua'a	Nature of Study	Findings
1990 (a)	T. Donham	Coastal Waiohuli	Data Recovery	Site 2475 was excavated
1990 (b)	T. Donham	Coastal Kōōkea	Inventory survey	Part of Miura 1982 study area. 16 sites were identified
1990 (a)	W. Fredericksen & D. Fredericksen	Coastal Kōōkea	Monitoring	No archaeological findings
1990 (b)	W. Fredericksen & D. Fredericksen	Coastal Kōōkea	Survey & Monitoring	No archaeological findings
1990	W. Fredericksen <i>et al.</i>	Coastal Kama'ole	Inventory Survey	No archaeological findings
1990	H. Hammatt & D. Shideler	Coastal Kama'ole	Reconnaissance	No archaeological findings
1990 a	J. Kennedy	Coastal Waiahoa	Survey	No archaeological findings
1990 b	J. Kennedy	Kama'ole, 300' elevation	Archaeological Inventory Survey	No archaeological findings
1990 (a)	A. Sinoto	Coastal Waiahoa	Survey & Testing	No archaeological findings (other than 2 pieces of midden)
1990 (b)	A. Sinoto	Coastal Kama'ole	Reconnaissance	No archaeological findings
1991	T. Donham	Upland (3200') Kaonoulu	Field Inspection	Study of the Wonderland Mushroom House (1933-1936) historic structures
1991 a	W. Fredericksen <i>et al.</i>	Coastal Kama'ole	Subsurface Inventory Survey	No significant archaeological findings (2 modern dog burials and a modern trash pit)

Date	Author	Ahupua'a	Nature of Study	Findings
1991 b	W. Fredericksen <i>et al.</i>	Coastal Kama'ole	Subsurface Inventory Survey	No significant archaeological findings (only modern trash)
1991	J. Kennedy	Coastal Kama'ole	Reconnaissance	No archaeological findings
1991	J. Kennedy & M. Breithaupt	Coastal Kōōkea	Inventory survey	No archaeological findings
1991	J. Pantaleo <i>et al.</i>	Coastal Kama'ole	Inventory Survey	Covered part of same area as Hammatt & Shideler 1989, 1991
1991	L. Hazuka & J. Pantaleo	Coastal Kama'ole	Surface Survey	No archaeological findings
1992	H. Hammatt & D. Shideler	Coastal Kama'ole	Survey & Testing of H. Hammatt & D. Shideler 1989 study area	Identified 2 probable <i>hoā</i> (fishing shrines) among 8 sites
1992	J. Kennedy	Coastal Kama'ole	Inventory survey	Identified 4 sites including a permanent pre-contact habitation/religious site
1992	J. Kennedy <i>et al.</i>	Coastal Kama'ole	Inventory survey with Subsurface Testing	Identified 4 sites all believed to be historic; two military and 2 ranching
1992	Sinoto & Pantaleo	Coastal Pālehunui	Inventory Survey	No archaeological findings other than a bridge foundation (site -3131)
1992	R. Spear	Coastal Kōōkea	Inventory Survey	No archaeological findings
1993	W. Folk and H. Hammatt	Ōma'opio, 2500 ft elevation	Inventory Survey	Three sites identified
1993	D. Fredericksen <i>et al.</i>	Coastal Waiohuli	Inventory Survey/Data Recovery	A rock shelter excavation yielded lithic artifacts, midden and a date of A.D. 1560 to 1800
1993	W. Fredericksen & D. Fredericksen	Ōma'opio	Inventory Survey	No sites identified

Date	Author	Ahupua'a	Nature of Study	Findings
1994	D. Frederickson <i>et al.</i>	Coastal Kama'ole	Inventory Survey	2 sites were identified including a midden scatter & a concrete slaughterhouse foundation
1994 <sup>a</sup>	E. Frederickson <i>et al.</i>	Kama'ole	Inventory Survey	Radiocarbon date reported as AD 1520 to 1570
1994 <sup>b</sup>	E. Frederickson <i>et al.</i>	Coastal Kama'ole	Subsurface Testing	Work at Site 50-50-10-2636
1994 <sup>c</sup>	E. Frederickson <i>et al.</i>	Kaonoulu, <i>mauka</i> of Pi'ilani Hwy.	Inventory Survey	21 sites were identified, some military and some pre-contact
1994	W. Frederickson <i>et al.</i>	Coastal Waiohuli	Inventory Survey	22 backhoe test trenches were excavated but there were no significant archaeological findings
1994	M. Kolb <i>et al.</i>	Upland Waiohuli and Ke'okea	Settlement Survey	Archaeological & historical settlement survey
1995	Burgett & Spear	Upland Kaonoulu (3100' elevation)	Archaeological Inventory Survey	6 post contact sites were identified
1995 <sup>a</sup>	E. Frederickson & D. Frederickson	Waiohuli	Inventory Survey	one rock shelter site was identified as a pre-contact temporary habitation site
1995 <sup>b</sup>	E. Frederickson & D. Frederickson	Waiohuli	Data Recovery	Four carbon dates were obtained suggesting late pre-contact use.
1995 <sup>a</sup>	D. Hibbard	Coastal Ke'okea	Environmental Assessment	Determined Phase III South Kihei Road Improvements project would have "no effect"
1995 <sup>b</sup>	D. Hibbard	Coastal Ke'okea	Historic Preservation Review	Determined Phase II South Kihei Road Improvements project would have "no effect"
1995	Masterson <i>et al.</i>	Kalepeamao at 9,250' elevation	Inventory Survey	Identified five sites

Date	Author	Ahupua'a	Nature of Study	Findings
1995	Moore and Kennedy	Upland Koheo and Kaonoulu (2600' elevation)	Archaeological Inventory Survey	8 sites were identified (3 historic ranching, 5 possibly pre-contact ag.
1996	E. Frederickson <i>et al.</i>	Upland Kaonoulu (3060' to 9700' elevation)	Archaeological Inventory Survey	4 sites were identified including 2 rock shelters and 2 historic sites
1996	B. McPhatter & P. Rosendahl	'A'apueo (Pukalani) 1600' elevation	Reconnaissance	Two sites were identified
1996	W. Wulzen <i>et al.</i>	'A'apueo (Pukalani) 1800' elevation	Archaeological Inventory Survey	5 Sites reported on
1997	Chaffee <i>et al.</i>	Waiohuli (120' elevation)	Archaeological Inventory Survey	3 sites were identified, all interpreted as agricultural
1997	Kolb <i>et al.</i>	Waiohuli & Ke'okea	Settlement Survey	Focuses on sites in Waiohuli & Ke'okea <i>maka'i</i> of Kula Hwy.
1998	C. Kawachi	15 kilometer corridor	Reconnaissance	Notes a large area of agricultural features
1999 (in press ?)	Pepalis, J. & Michael J. Kolb	Waiohuli	Archaeological Excavations	Found evidence of a stream-fed pond near Kalepolepo Church
1999	A. Dunn <i>et al.</i>	Waiohuli (2,700' elevation)	Data Recovery	11 sites were studied, 15 carbon samples were dated
1999	H. Hammatt and W. Folk	Kailua to Kama'ole	Reconnaissance	23 sites were identified
1999	Erik and Demaris Frederickson	Kama'ole (170' elevation)	Archaeological Inventory Survey	3 sites were identified including 5 small enclosures and a rock pile
1999	E. Gordon & J. Brent	Waiohuli (2800' elevation)	Archaeological Inventory Survey	3 sites were identified
2000 <sup>a</sup>	H. Hammatt & D. Shideler	Waiohuli	Assessment	No archaeological findings

Date	Author	Ahupua'a	Nature of Study	Findings
2000 b	H. Hammatt & D. Shideler	Kēōkea	Archaeological Inventory Survey	No archaeological findings
2000	S. Kikiloi <i>et al.</i>	Kēōkea	Archaeological Inventory Survey	No archaeological findings
2000	McDermott, Shideler, and Hammatt	Waiohuli, adjacent to the Kalepolepo Church	Additional Archaeological Inventory Survey (Backhoe Testing)	Document Site 50-50-09- 4981, former inland pond that contains evidence of early occupation at coastal Kīhei--approximately A. D. 600-900

#### General Kula District Research

The earliest archaeological studies on Maui begin with descriptive lists of religious sites by Thomas Thrum (1906-1918) and John Stokes (n.d.) in the early 1900s and culminate with the first island wide site survey by Winslow Walker (1931). Throughout the Kula region of Maui from Olinda and Makawao to Kanalo beyond Ulupalakua, the sites recorded by Walker (all *heiau* - 33 total) are located in a continuous band between roughly 2000 ft. and 3000 ft. amsl.

From around 1930 to the 1970s only sporadic visits were made to Kula by archaeologists, primarily for the purpose of recording individual archaeological sites reported by local residents.

Inez Ashdown (1899-1992) spent her lifetime collecting information about Maui. This information she collected was put together in the book *Ke Alaia o Maui* (1971). Regarding Kula (including the current project area and areas nearby), she notes that the largest fields of *ki'i* were at Nu'u, and the next largest could be found throughout Honua'ula, "particularly around the ancient temple of Lono in Oama'opio [sic]. In Kamehameiki area and on across into Ka-ono-ulu many petroglyphs are known and new ones can be found" (*op. cit.*:48). She also remarks that in the Kēōkea and Waiakeoa areas:

are many structures, fields of petroglyphs and temples around the two temples called Pa'u'hu and Ka-imu-pe'e-lua. Also in this area the temples of Mahea and Ka-umu-o-pahu (or Ka-unu-o-pahu) may still remain, along with Po'o-na-hoe-hoe and Mana' the latter now part of a modern cemetery. At Pūlehu stood the temple of Ni-ni-ni-wai, and at Kama'ole the two on the Mao land, one named Wailuku because of the battle there and the destruction during the time when Ka-lani-ku-pule ousted a brother of Pū'e'a Kamehameha (*op. cit.* 57-58).

W. Folk *et al.* (1998) located 23 sites during a reconnaissance survey of six different alternate routes for the Kīhei to Kula road corridor. The alternate corridors were four hundred feet wide. Sites encountered included petroglyphs, cattle walls, military features (C-shapes, enclosures, etc.), temporary habitation enclosures, a midden scatter and agricultural features. Two of the six alternatives were chosen as the final routes. The present study is an inventory of those two alternatives.

#### Coastal Kīhei Region (Figure 8)

Numerous archaeological surveys were conducted along the south coast of the Makawao District, particularly in the Kīhei, Wailea, and Mākena area and the from Kama'ole to Waiakeoa as a result of the 1970s resort development.

From 1969 to 1971, Kirch (1971) conducted a survey and subsequent excavations at Palauea, south of K1 and K2 termini at Pi'ilani Highway. Through his analysis of coastal sites 50-50-1028 and 50-50-1029, Kirch concluded that settlement patterns in this area were characterized by transient coastal habitation involving the use of ocean resources with permanent settlements and agricultural activities in the upland region. (Donham 1990b: 4)

Donham (1990), in a report on Phase II of the Pi'ilani Residential Community in Kēōkea lists numerous reconnaissance and testing projects conducted in the Wailea and Mākena area from the early 1970s to the late 1980s. These studies, as stated by Donham, include: Barreve 1974, Clark 1974, Cleghorn 1974 and 1975, Barrere 1975, Hommon 1975, Cordy 1978, Haun 1978, Sinoto 1978, Jourdane and Sinoto 1979, Bordner 1980, Schilt and Dobyms 1980, Bordner and Cox 1982, Walker, Rosendahl and Haun 1985, Dicks and Haun 1987, Dobyms 1988, Haun 1988, and Shapiro and Haun 1988. According to Donham, the findings from the Jourdane and Sinoto 1979 and Schilt and Dobyms 1980 studies also support Kirch's hypotheses regarding settlement and subsistence patterns involving the inland and coastal regions of Makawao.

Other projects were also conducted in the coastal region of Kīhei extending from Kama'ole *Ahupua'a* in the south to Waiakeoa *Ahupua'a* in the north (Figure 8). These projects provide useful information about the coastal area of Kīhei and settlement patterns relating to the inland zone, as discussed by Kirch (1971). However, since these studies relate to already mentioned information and are located outside of our current study parcel, they will not be discussed here. For the reader's reference, these projects include (but are not limited to) a flora and fauna survey by Austin, Smith & Assoc. Inc. in 1974 and the following archaeological studies: Cox 1976, Hirota 1979, Hommon 1981, Keau 1981, Miura 1982, Neller 1982, Mayberry and Haun 1988, Hammatt and Shideler 1989, Hammatt and Shideler 1990, Donham 1990(a&b), Hurst 1991, Kennedy 1991, Hammatt and Shideler 1992, Kennedy 1992, Sinoto and Pantaleo 1992, Fredericksen *et al.* 1993, and Fredericksen *et al.* 1994.

### Kula Zone (above Pi'ilani Highway at the coast)

In 1970 J. Halley Cox and Edward Stasack (1970) compiled a listing of identified petroglyph sites throughout Hawai'i, including the Kula area. Two of these sites, MA-B22-2 (State site 50-50-10-1061, Kaliainui Gulch petroglyphs) and MA-B22-1 (identified as MA-B23-1 in Cox and Stasack; State site 50-50-10-1062, Kaluapulani Gulch petroglyphs), were relocated during the present project (designated CSH 1 and CSH 23, respectively).

In January 1993 (Folk and Hammatt 1993), Cultural Surveys Hawai'i conducted an inventory level survey of approximately 25 acres on the southern edge of Oma'opio *Ahupua'a*. This survey resulted in the relocation of several previously recorded sites, which in relation to the current study parcel are located east of terminus U3, between Kula Highway and Haleakala Highway. These sites, already documented by Griffin and Donham, included a large enclosure (site 50-50-11-1349) and the Upper Pulehu Gulch Petroglyphs (site 50-50-11-1268). Additional archaeological features consisting of a stacked boulder alignment and few low mounds were also located and collectively assigned site number 50-50-11-3121. Charcoal analysis of site 50-50-11-1349 suggests the site dates to be possibly as early as the 15th century A.D.

Mayberry and Haun's study in Kama'ole (1988) identified 33 sites with formal features including C-, U- and L-shaped alignments or walls, enclosures, terraces, cairns, alignments, upright boulder, mounds and roadbeds and modified outcrops. They interpreted these to include military sites, temporary habitations, transportation, markers and agriculture. Which the majority of sites (20) interpreted as military-related remains.

E. Fredericksen *et al.* (1994) located 21 sites in Kaomoulu ranch land and these sites included a petroglyph (Site 3746), stone piles, cairn(s), enclosures, alignments for roadbed, walls, midden and lithic scatters. The stone piles are interpreted as possible clearing piles, possibly for agriculture, the cairns as markers, the enclosures as both a military and a pre-contact shelter, alignments for a military road, erosion walls from ranching period, and the midden and lithic scatters as possible sites of temporary habitations.

### Upper Settlement and Agricultural Zone

In 1995, Bargett and Spear (1995) of Scientific Consultant Services, Inc. conducted an inventory survey of a 22.5 acre parcel located in Ka'ono'ulu *Ahupua'a*, Makawao District. A total of six sites comprised of 29 features were identified during the survey. The identified features included the following formal types: terrace, wall, enclosure, cistern, mound, building and platform. It was determined that all sites are post-contact in age and associated with agriculture and habitation activities.

In February 1996 McPhatter and Rosendahl (1996) conducted an archaeological reconnaissance survey of a 250-acre parcel located in the land of 'A'apueo, Makawao District (TMK: 2-3-08: Por.5). Most of the project area consists primarily of former pineapple lands between Kaluapulani and Kaliainui Gulches. This survey resulted in the identification of two sites: (1) a site assigned the temporary number 1707-1 and described as a sailing canoe petroglyph, and (2) temporary site number 1717-2 described as a wall. In

addition to these sites several land clearing piles associated with historic pineapple cultivation were also reported but were not assigned site numbers. It was determined that further data collection activities should take place at the wall site 1707-2, and that the petroglyph site 1707-1 be preserved with interpretive development.

In March 1996 Wulzen, *et al.* (1996) conducted an inventory survey of a 44-acre parcel that is the *mauka* portion of McPhatter and Rosendahl's February 1996 project area. The 44-acre parcel is also described by Wulzen as part of the 305-acre Pukalani Terrace Subdivision Unit III located in the land of 'A'apueo, Makawao District (TMK: 2-3-08: Por.5). Wulzen's project area contained three previously recorded sites: (1) the Kaliainui petroglyph site 50-50-10-1061, (2) 50-50-10-4179 the "sailing canoe petroglyph site" recorded as temporary site number 1707-1 by McPhatter and Rosendahl (1996); the description of this site was upgraded to multiple petroglyphs, and (3) 50-50-10-4178, the wall recorded as temporary site number 1707-2 by McPhatter and Rosendahl (1996). One new site (Site 50-50-10-4181) was identified during Wulzen's survey; it consisted of four features including two agricultural clearing mounds and two stone alignments. Testing conducted at the stone alignments yielded historic artifacts associated with pineapple agriculture. The Kaluapulani petroglyph site 50-50-10-1062, originally described as being only on the north side of Kaluapulani gulch, was relocated by Wulzen although his project area boundary is on the south side of that gulch. They reported their concurrence with the original recorded data on the site, except they found the petroglyphs to extend further *maka'i* than originally described.

Other research in the upcountry Kula area includes Donham (1990(c); 1992), and Fredericksen and Fredericksen (1993; 1995).

Two archaeological surveys conducted during the 1980s in the *ahupua'a* of Waiohuli and Kōkeka by Mary Riford (1987) and Roderick Brown and Alan Haun (1989) have contributed the bulk of data on site patterning and land use prior to the 20th century in "up-country" Kula Maui. These studies, and a selection of others relevant to the upcountry Kula area, are summarized below.

Riford's (1987) monitoring and reconnaissance survey for the Waiohuli and Kōkeka Subdivisions identified 113 sites with 262 features consisting of "agricultural terraces and mound features as well as a number of possible habitation- and religious-related stone, walled enclosures..." (*op. cit.*:56). Riford suggests that human occupation in the area extended from prehistoric times to the 1950s based on artifacts observed at the sites (*op. cit.*:56). This time frame is further documented by Brown and Haun (1989:18-21).

Brown and Haun (1989) conducted an inventory survey for the same study parcels in Waiohuli and Kōkeka, covering 1,025 acres of uncultivated pasture land located between 1,800 ft. and 3,000 ft. amsl. Within the survey area 159 sites with 274 features were identified, including agricultural, residential, and ceremonial complexes. Fifty-three of the sites had been identified during the Bishop Museum (Riford 1987) survey.

In general Brown and Haun (1989:27) found that the Kōkeka division was intensively exploited in a variety of ways for at least two-thirds of the entirety of Hawaiian prehistory." They suggest similar land use and chronology but lesser density in the

Waiohuli area, probably due to a greater amount of recent land clearing activities. Sixteen radiocarbon dates provided overlapping ranges from A.D. 1270 through A.D. 1955. One sample, with the earliest date, yielded three possible ranges between A.D. 680 and A.D. 1157. (*op. cit.*:19,20)

In 1996 Xamanek Research located 4 sites of which two are in the Upper Settlement and Ag zone: a historic house platform with cistern and agricultural terracing at 3600 ft. a.m.s.l. and an historic habitation area between 3080 and 3200 ft. a.m.s.l. which the authors believe is probably associated with potato production during the Gold Rush.

In 1996 Farley Watanabe did an assessment followed up by Carol Kawachi's recordation of sites in the upper reaches of the Upper Settlement and Agricultural zone. Three Chinese corn-growing agricultural sites including a historic house foundation were recorded at the 4169 ft. Elevation. The recordation of sites was between the 3988 to 4214 a.m.s.l. Other retaining walls and an historic road were also noted.

"Watanabe's (1996) research suggest that the project area may have been in forest in pre-contact times and at the upper reaches of early post-contact cultivation" (Kawachi 1997:10).

Michael J. Kolb, editor, *et al.* (2000), has provided an extensive historical and archaeological background for the Kula District in Waiohuli and Kōkeā. They identified 1093 features of which 52% were interpreted as having an agricultural function. The features included terraces, enclosures, mounds, walls, outcrops, alignments, and C-U, and L-shapes, platforms, garden enclosures, rock shelters, notched enclosures, overhangs, lava tubes, depressions, an 'auwai, a pavement and a road. Their 161 test pits determined agricultural, permanent and temporary habitations, ritual and burial functions.

#### Mountain and Forest Region including Kaliainui section of Haleakala

In 1975 Paul Rosendahl conducted an archaeological reconnaissance for the Haleakala road Realignment corridor in the National Park. He located 2 cave shelters, 6 walled shelters, 1 platform, and 3 cairns. In 1978 Margaret Rosendahl wrote an overview of National Park archeological resources including Emory's and others' works, although none of these resources appears in Kula, the types of sites she noted were caves, pits, walls, resting places with *ahu* or cairns, trail, platforms, terraces, a *hetau*, various shelters and enclosures and fireplaces.

In 1995 Ian Masterson, William Folk and Hallett Hammatt conducted an inventory survey of the summit in Papa 'anui Ahupua'a and found two walled shelters. Tina Bushnell and Hallett Hammatt (in progress) *An Archaeological Inventory Survey of 1.5 Acres of the University of Hawaii: Facility at Haleakala, Papa 'anui Ahupua'a, Makawao District, East Maui.* (TMK 2-2-07: 8) located two rock enclosures which are interpreted as trash burning pits and are associated with military use of Kolekole in the early 1940s and subsequent University of Hawaii's Research use. Another site was a terrace, an enclosure and a wall segment (Bushnell & Hammatt 2000:2). In 1996 Xamanek Research located 4 sites of which two are in the Mountain & forest zone of which 2 in the upper reaches of the Upper Settlement and Ag zone: the 2 rock shelters are found at the 6900 and 7400 ft. a.m.s.l.

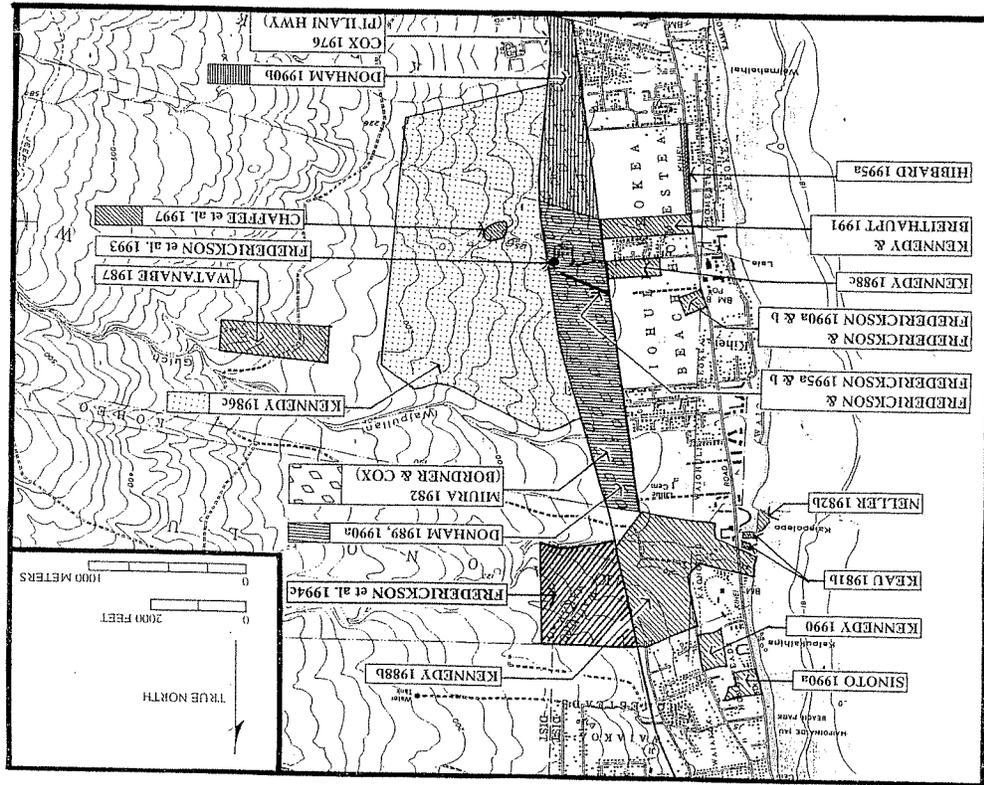

Figure 8 Previous archaeology conducted in the Kula Zone of the Kula District

## VI. SURVEY METHODOLOGY

The survey and testing were conducted between August 28, 2000 and October 3, 2000 by a crew that ranged from two to four archaeologists. A total of eleven days were spent in the field for a total of 36 person days. Crew members included Ka ohulani McGuire, B.A., Mary Perzinski, B.A., Lokelani Aipa, B.A., Thomas Devereux, B.A., Tony Bush, B.Ed., and Ian Masterson with Brian Colin, B.A., acting as field director and Dr. Hal Hammatt as the principal investigator.

Different survey methods were utilized during the course of the inventory survey. In the sections of the project that were active sugar cane fields the corridor was followed by two archaeologists in a vehicle. The active cane fields were not traversed by foot. The section of the corridor that traverses active pineapple fields was traversed by four archaeologists on foot following the existing pineapple roads. All clearing mounds in the pineapple fields along the corridor were inspected. All other areas of the project including the gulches, valleys and ravines within the active cane fields were swept by four archaeologists with the distance between members ranging from 1 to 15 meters. Generally the gulches, valleys and ravines within the project area were covered with team members being one to three meters apart due to the potential for petroglyphs within these areas. The rest of the project area corridor consisted of open savannah with scattered *kiawe*. The open savannah portions of the project were swept by four archaeologist with distances ranging from 5 to 15 meters between members covering 100% of the area. The centerline of the corridor was staked every 200 feet in all portions of the project area that were not in active agriculture. A 400 foot wide corridor, 200 feet on either side of the staked centerline was surveyed. Therefore the entire project area, with the exception of the areas in active sugar cane or pineapple cultivation, were covered 100% by pedestrian sweeps. Visibility was excellent at the time of the survey due to ongoing drought conditions.

All sites and features were plotted on a 1 inch = 500 ft project area map with 25 ft contours. All sites were located on the contour map by tape and compass measurements to at least two centerline stakes. A metal site tag was placed at each feature and labeled with the feature designation, state site number (when available, for new sites a temporary field number was assigned preceded by CSH(see Table 6).

Each site was described in detail and photographed. All of the sites were mapped to scale with the exception of State site -4773. State site -4773 is a large complex of simple military features that cover an approximate 6000 ft of section of the road corridor (see Survey Results section for complete details). Dr. Melissa Kirkendall SHPD/DLNR Maui Island archaeologist was informed of the extent and type of military features that were encountered within State site -4773. The SHPD/DLNR provided guidelines for the recording of the site. Based on the provided guidelines for site -4773, all features were plotted on the overall project map, all features were photographed, all features were described including type, size, the presence or absence of surface remains, and overall condition. A representative sample, 47 out of 102 features (46%), were mapped to scale. Mapped features represent the range of feature types in different states of preservation from a range of different elevations.

Each site and feature were recorded by formal site type using descriptive categories (i.e. mounds, C-shape enclosure, wall etc.) presented in the SURVEY RESULTS section of this report. Functional interpretation of sites were established on the basis of structural characteristics, spatial associations with other sites and in some cases, associated artifacts as well as external correlations with other archaeological studies and interpretations in the general region. Significance and recommended treatment of each site was determined on the basis of type, complexity, configuration, apparent function, probable age, and comparable characteristics to other sites in the region.

During the field work, an effort was made to consolidate related features into complexes. Feature associations were typically based on the following considerations; proximity, similarity in construction technique, similarity in states of preservation, functional interrelationships and similarity of artifactual materials observed on the surface.

Limited subsurface testing was conducted at six sites. A total of five 1.0 m by 50 cm test units were excavated at two sites (-4773 and -4776) and two traditional temporary habitation sites (-5033 and -5034). One 50 by 50 cm unit was excavated at another temporary habitation site (-5032). The features were tested using controlled excavation. Excavations were extended well into sterile soil layers with contents sifted through 1/8-inch mesh screens. One profile was prepared for each excavation. In addition three shovel test probes were conducted at two sites (-4773 and -5035) to determine the presence or absence of subsurface deposits. Results of the subsurface testing are presented in the EXCAVATION RESULTS section of this report. All excavations were back-filled and structures reconstructed.

Subsequent to the field work all sites were given SIHP (State Inventory of Historic Properties) site numbers. As a result of the inventory survey, seventeen sites were identified on the property (Table 6 and Figure 9).

Table 6: Archaeological Inventory Survey: Summary of Sites

State Site # 50-50-10-	Feature/ CSH #	Site Type	Function	Distance/ orientation to center line(CL)	Age	Significance	Recommendation

## VII. SITE DESCRIPTIONS

State Site #: 50-50-10-3727  
 Site Type: Series of Mounds  
 Site Function: Agriculture  
 Features: 3

**Description:** State site 50-50-10-3727 is comprised of three irregular shaped mounds (designated features A-C) (Figure 10) with a previously excavated 1.0 m by 0.5 m test unit. The site was initially documented by Xamaneck Researches (Fredericksen, et. al. 1994c:61). The site is located approximately 50 ft to the south of the study corridor centerline. The mounds are roughly in a straight line which is oriented at roughly 225°T.

**Feature A** the northernmost mound was partially excavated during the 1994 Xamaneck study. A 1 m by 50 cm test unit was excavated into the northern portion of the mound. Feature A presently measures 1.5 m in diameter. It is constructed of a rough stacking of basalt cobbles to medium boulders with a maximum height of 35 cm in the center of the structure. There is a small mound located approximately 1.2 m to the east of the northern mound is a small mound, approximately 70 cm in diameter, which appears to be the byproduct of the excavation.

**Feature B**, located in the center of Feature A and Feature C, is constructed in a similar style to Feature A. Feature B is located approximately 2.5 m from the Feature A. The mound measures 1.9 m NE/SW by 1.1 m NW/SE. The maximum height of the mound, near its center, is 50 cm.

**Feature C**, the southern most mound, is located approximately 1.0 m from the southern end of Feature B. It is irregular in shape and is also constructed of stacked basalt cobbles to medium boulders. Heights of the mound range from 20-50 cm. A few fragments of cowrie shell were observed just to the south of Feature C. The site was relocated.

State Site #: 50-50-10-3728  
 Site Type: Mound  
 Function: Agriculture  
 Features (#): 1

**Description:** State site 50-50-10-3728 was initially recorded by Xamaneck Researches in 1994 (*Ibid.*:62). The site consisted of an isolated stone mound. During Xamaneck's recording a 1.0 m<sup>2</sup> test unit was excavated through the mound dismantling the majority of the structure. No cultural material was observed at the site. The site was relocated 150 ft to the south of the study corridor centerline.

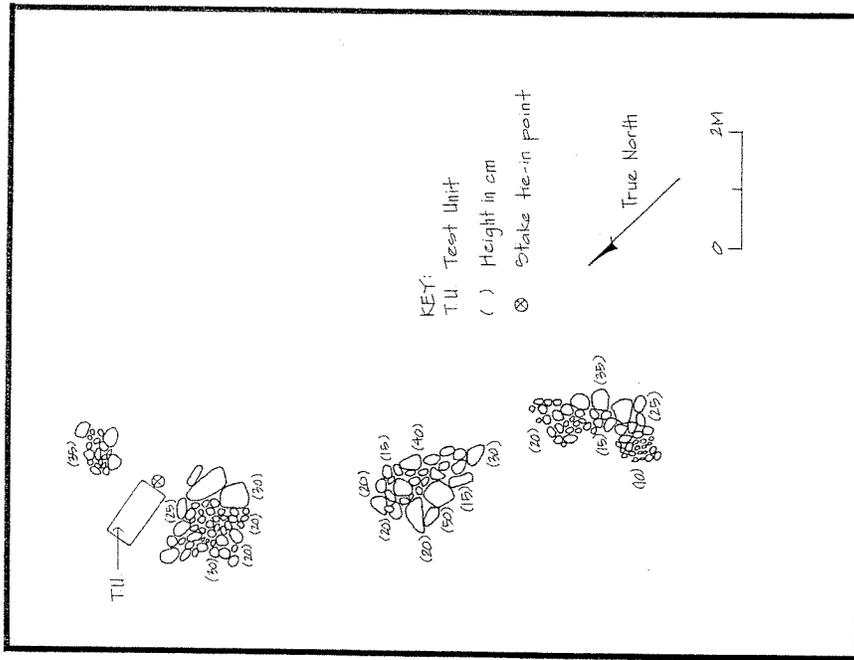

Figure 10 State site 50-50-10-3727: Series of Mounds, Plan View

**State Site #:** 50-50-10-3729  
**Site Type:** Mound  
**Function:** Agriculture  
**Features (#):** 1

**Description:** State site 50-50-10-3729 was initially recorded by Xamanek Researches in 1994 (Ibid.:62). The site was a mound. During Xamanek's recording a 1.0 m by 50 cm test unit was excavated through the mound dismantling the majority of the structure. No cultural material was observed at the site. The site was relocated 165 ft south of the study corridor centerline.

**State Site #:** 50-50-10-3742  
**Site Type:** Surface Scatter  
**Function:** Temporary Habitation  
**Features (#):** 1

**Description:** State site 50-50-10-3742 was initially recorded by Xamanek Researches in 1994(Ibid.:69). The site was a very sparse surface scatter consisting of only a few marine shell fragments, a basalt flake, waterworn stones and coral fragments. During Xamanek's recording a surface collection was conducted, collecting all of the cultural material at the site with the exception of the marine shell midden. The site was located on the study corridor centerline. The site area was relocated and the marine shell midden was observed.

**State Site #:** 50-50-10-3743  
**Site Type:** Surface Scatter  
**Function:** Temporary Habitation  
**Features (#):** 1

**Description:** State site 50-50-10-3743 was initially recorded by Xamanek Researches in 1994(Ibid.:69-70). The site was a very sparse surface scatter consisting of approximately 25 pieces of marine shell, two basalt flakes, two basalt cores, waterworn stones and coral fragments. During Xamanek's recording a surface collection was conducted, collecting all of the cultural material at the site with the exception of the marine shell midden. The site was located 200 ft south of the study corridor centerline. The site area was relocated and the marine shell midden was observed.

**State Site #:** 50-50-10-3745  
**Site Type:** Surface Scatter  
**Function:** Temporary Habitation  
**Features (#):** 1

**Description:** State site 50-50-10-3745 was initially recorded by Xamanek Researches in 1994(Ibid.:70-71). The site was a very sparse surface scatter consisting of approximately six pieces of marine shell, three basalt flakes, a basalt core, a waterworn stone and coral fragments. During Xamanek's recording, a surface collection was conducted, collecting all of

53

the cultural material at the site with the exception of the marine shell midden. The site was located 130 ft south of the study corridor centerline. The site area was relocated and the marine shell midden was observed.

**State Site #:** 50-50-10-4765 (CSH #8)  
**Site Type:** Mounds and Irrigation Ditches  
**Function:** Agriculture  
**Features (#):** 7

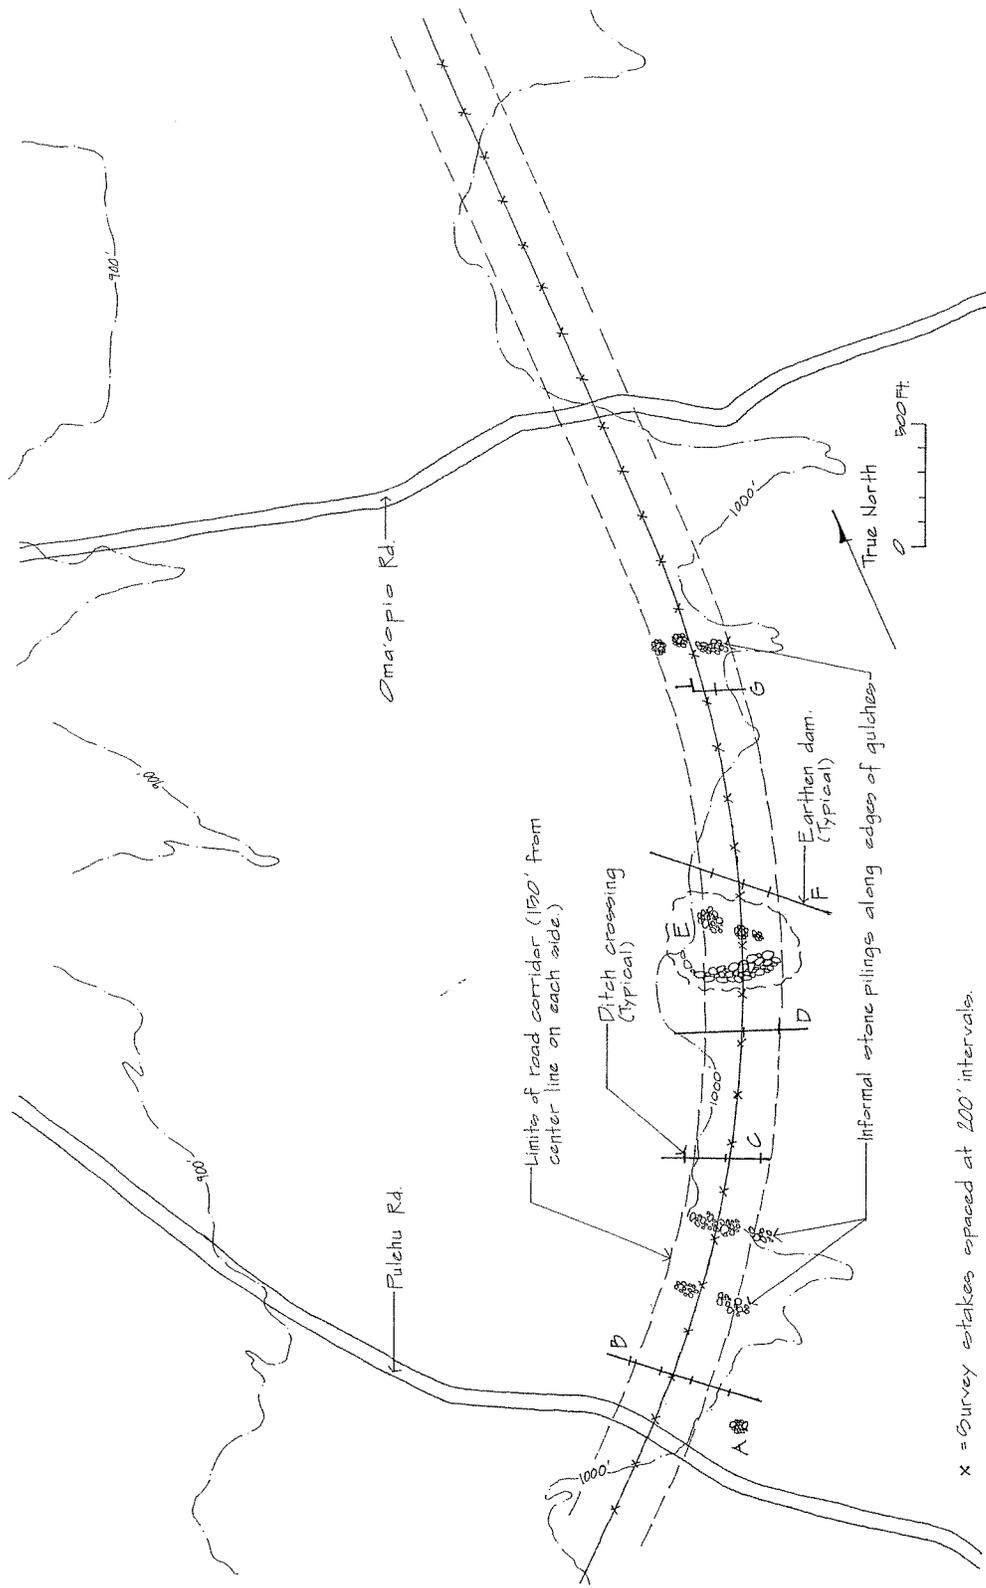

**Description:** State site 50-50-10-4765 is a complex of features that are all related to sugarcane cultivation on the parcel of land between Pulehu Road and Oma'opio Road (see Figure 11). The study corridor traverses this site. The area is currently utilized as a cattle pasture. Feature A is a single agricultural clearing mound, Features B, C, D, F and G are historic irrigation ditches, and Feature E consists of a series of agricultural clearing mounds covering a large area. These features are located on gently sloping pasture land. Vegetation in this section of the corridor consists of a few monkeypod trees, *panini* cactus, *kiawe*, and *koa hooie*; groundcover consists of low grass. In addition to the seven features detailed below, remnants of other smaller less formal cross slope earthen ditches, also associated with sugarcane irrigation systems, were also observed within this area

**Feature A** is a historic agricultural clearing mound located just off Pulehu Road approximately 300 feet from the corridor centerline. The mound is constructed of stacked and piled boulders and cobbles. Some sections are neatly stacked, while others are piled with less organization. Moss is visible on most of the rocks. Feature A has a maximum height of 2.9 m, a maximum length of 8.65 m N/S and a maximum width of 7.8 m E/W. No cultural material was observed at the feature.

**Feature B** is a historic irrigation ditch, currently not in operation, which is primarily earthen in construction. It passes through the corridor from east to west, perpendicular to the road alignment. Four small bridges cross the ditch within the corridor. The bridges are constructed of lumber, concrete and set stone. Some of the lumber elements have been damaged or destroyed by fire. The ditch portion of Feature B has a maximum width of 3.6 m and a maximum depth of 0.7 m. The bridges of Feature B average 1.85 m wide and 0.7 m high. The irrigation ditch runs under the bridge through a rectangular opening that measures 0.65 m wide by 0.4 m high. Feature B is in poor condition; it is clearly part of an old irrigation system for sugarcane cultivation.

**Feature C** is a historic irrigation ditch, currently not in operation which is primarily earthen in construction. It passes through the corridor from east to west, perpendicular to the road alignment. Three small bridges cross the ditch within the corridor. The bridges are constructed of lumber, cement and set stone. Some of the lumber elements have been damaged or destroyed by fire. Feature C bridges are similar to those in Feature B, with the added feature of an adjacent side-chute, constructed of cement and set stones. The side-chute is at a right angle to the bridge, allowing for lateral ditch flow. The ditch portion of Feature C has a maximum width of 2.1 m and a maximum depth of 0.85 m. The bridges of Feature C average 2.1 m wide and 0.85 m high. The ditch runs under the bridge through a rectangular opening that measures 0.6 m wide by 0.56 m high. The side-chute wall is 0.95 m

54

x = Survey stakes spaced at 200' intervals.

Figure 11 State site 50-50-10-4765: Plan View

wide and 0.7 m high, with a circular opening approximately 0.4 m. in diameter. Feature C is in poor condition; it is clearly part of an old irrigation system for sugarcane cultivation.

**Feature D** is a historic irrigation ditch, currently not in operation, which is primarily earthen in construction. It passes through the corridor from east to west, perpendicular to the road alignment. Three small bridges cross the ditch within the corridor. The bridges are constructed of lumber, concrete and set stone. Most of the lumber in the bridge sampled for measurement had been destroyed by fire. Feature D bridges are similar to those in Feature C due to the presence of a side-chute. The side-chute is at a right angle to the bridge, allowing for lateral ditch flow. Feature D ditch has a maximum width of 1.4 m and a maximum depth of 0.65 m. Feature D bridges average 1.85 m wide and 0.8 m high. The ditch flowed through a rectangular opening beneath the bridge which measures 0.6 m wide. The side-chute wall is 0.95 m wide and 0.7 m high, with a circular opening approximately 0.4 m in diameter. Feature D is in poor condition; it is clearly part of an old irrigation system for sugarcane cultivation.

**Feature E** includes a number of historic agricultural clearing mounds distributed across a large, sloping area approximately midway between Pulehu Road and Oma'opio Road. The mounds range in form from circular/elliptical to long and linear. Construction also varies from stacked to piled, and size of basalt materials range from very large boulders to cobbles. Mechanical scarring and lichens are evident on many of the stones. A small, discrete mound was measured and tagged. The sample measures 2.5 m E/W by 2.7 m N/S and 1 m high. All of the constituents of Feature E are associated with clearing activities for sugarcane cultivation.

**Feature F** is a historic irrigation ditch, primarily earthen in construction. Feature F passes through the corridor from east to west, perpendicular to the road alignment. Three small bridges cross the ditch within the corridor. The bridges are constructed of lumber, concrete and set stone. Some of the lumber elements have been damaged or destroyed by fire. Bridges are similar to those in Feature C and D (Feature F also has a side-chute). The side-chute is at a right angle to the bridge, allowing for lateral ditch flow. The ditch has a maximum width of 1.97 m and a maximum depth of 0.65 m. Feature F bridges average 2.1 m wide and 0.95 m high. The irrigation ditch flowed through a rectangular opening beneath the bridge that measures 0.55 m wide by 0.6 m high. The side-chute wall is 0.95 m wide and 0.7 m high, with a circular opening approximately 0.4 m in diameter. Feature F is in poor condition; it is clearly part of an old irrigation system for sugarcane cultivation.

**Feature G** is a historic irrigation ditch, primarily earthen in construction. It passes through the corridor from east to west, perpendicular to the road alignment. Three small bridges cross the ditch within the corridor. The bridges are constructed of lumber, concrete and set stone. Some of the lumber elements have been damaged or destroyed by fire. Feature G is similar to Feature C with an adjacent side-chute. The side-chute is at a right angle to the bridge, allowing for lateral ditch flow. The ditch has a maximum width of 1.56 m and a maximum depth of 0.35 m. The bridges average 2.1 m wide and 0.85 m high. The ditch formerly flowed through a rectangular opening beneath the bridge that measured 0.6 m wide by 0.56 m high. The side-chute wall is 0.95 m wide and 0.7 m high, with a circular opening approximately 0.4 m in diameter. Feature G is in poor condition; it is clearly part of an old irrigation system for sugarcane cultivation.

State Site #: 50-50-10-4773 (CSH # 16 & # 17)  
Site Type: Complex of enclosures, alignments and foxholes  
Function: Military training  
Features (#): 102

**Description:** State Site 50-50-10-4773 consisted of 102 features, all composed of cobbles to large boulders that are typical and plentiful in the area (Figures 12-19). Of these features, there were 28 C-shapes, 17 U-shapes, 22 square enclosures, 5 circular/oval enclosures, 12 rectangular enclosures, 9 alignments/walls, 4 L-shapes, 1 remnant, and 4 sets of foxholes. The study corridor traverses this site.

A total of 28 C-shaped rock structures were encountered with the most were in fair to poor condition, with several being collapsed to almost indefinable remnants. Most consisted of a single alignment of cobbles to medium size boulders, though stacking to 2 to 3 courses high was observed in approximately thirteen structures (46% of C-shapes). Angles of the actual "C" shape ranged from very wide to an almost U-shape, with corners typically being rounded. Over 1/3 of the C-shapes had an slightly excavated interior similar to the foxhole construction. This excavation typically did not extend deeper than 30 cmbs. Construction style was generally similar in all cases. One C-shape was built against an existing kiawe tree, demonstrating the relatively recent age of construction.

The 17 U-shaped structures were also generally in fair to poor condition with a number being almost undefinable. The majority were constructed of a single alignment of cobble to medium boulders with stacking only occurring in six examples of U-shapes (35%) None of the U-shapes exhibited an excavated interior.

The 22 square enclosures, 5 circular/oval enclosures, and 12 rectangular enclosures are similar in all ways except for their actual shape. Most are composed of small to medium boulder alignments. Six of the square/rectangular enclosures exhibit an excavated interior, no deeper than 30 cmbs. Most features are deteriorating, with gaps in the wall.

The nine alignment/walls within the site complex are consistent in construction style with all the other features types previously described: less than 15 boulders long (1-3 m long, 0.8 m wide) and the walls being no more than three courses in construction.

The 4 L-shaped stone structures are also consistent with typical construction style of the features in this area, with alignment segments ranging from 0.7-3.5 m in length. L-shape Feature CA exhibits some portions of 2 course stacking and Feature AC exhibits a partial excavated interior. Both other L-shapes are formed by a single alignments.

The remnant was most likely a rectangular enclosure that has been severely altered by the placement of a waterline through the center of the feature. The stones from the feature appear to have been re-utilized to create a support for the waterline. The center of the remnant is partially excavated to a depth of 20 cmbs.

The four series of fox hole-type features, which have no associated rock structures consist of excavated hole in the terrain that average 20 to 30 cmbs. It is possible that the fox holes may be the product of explosions from military activity rather than human excavation.

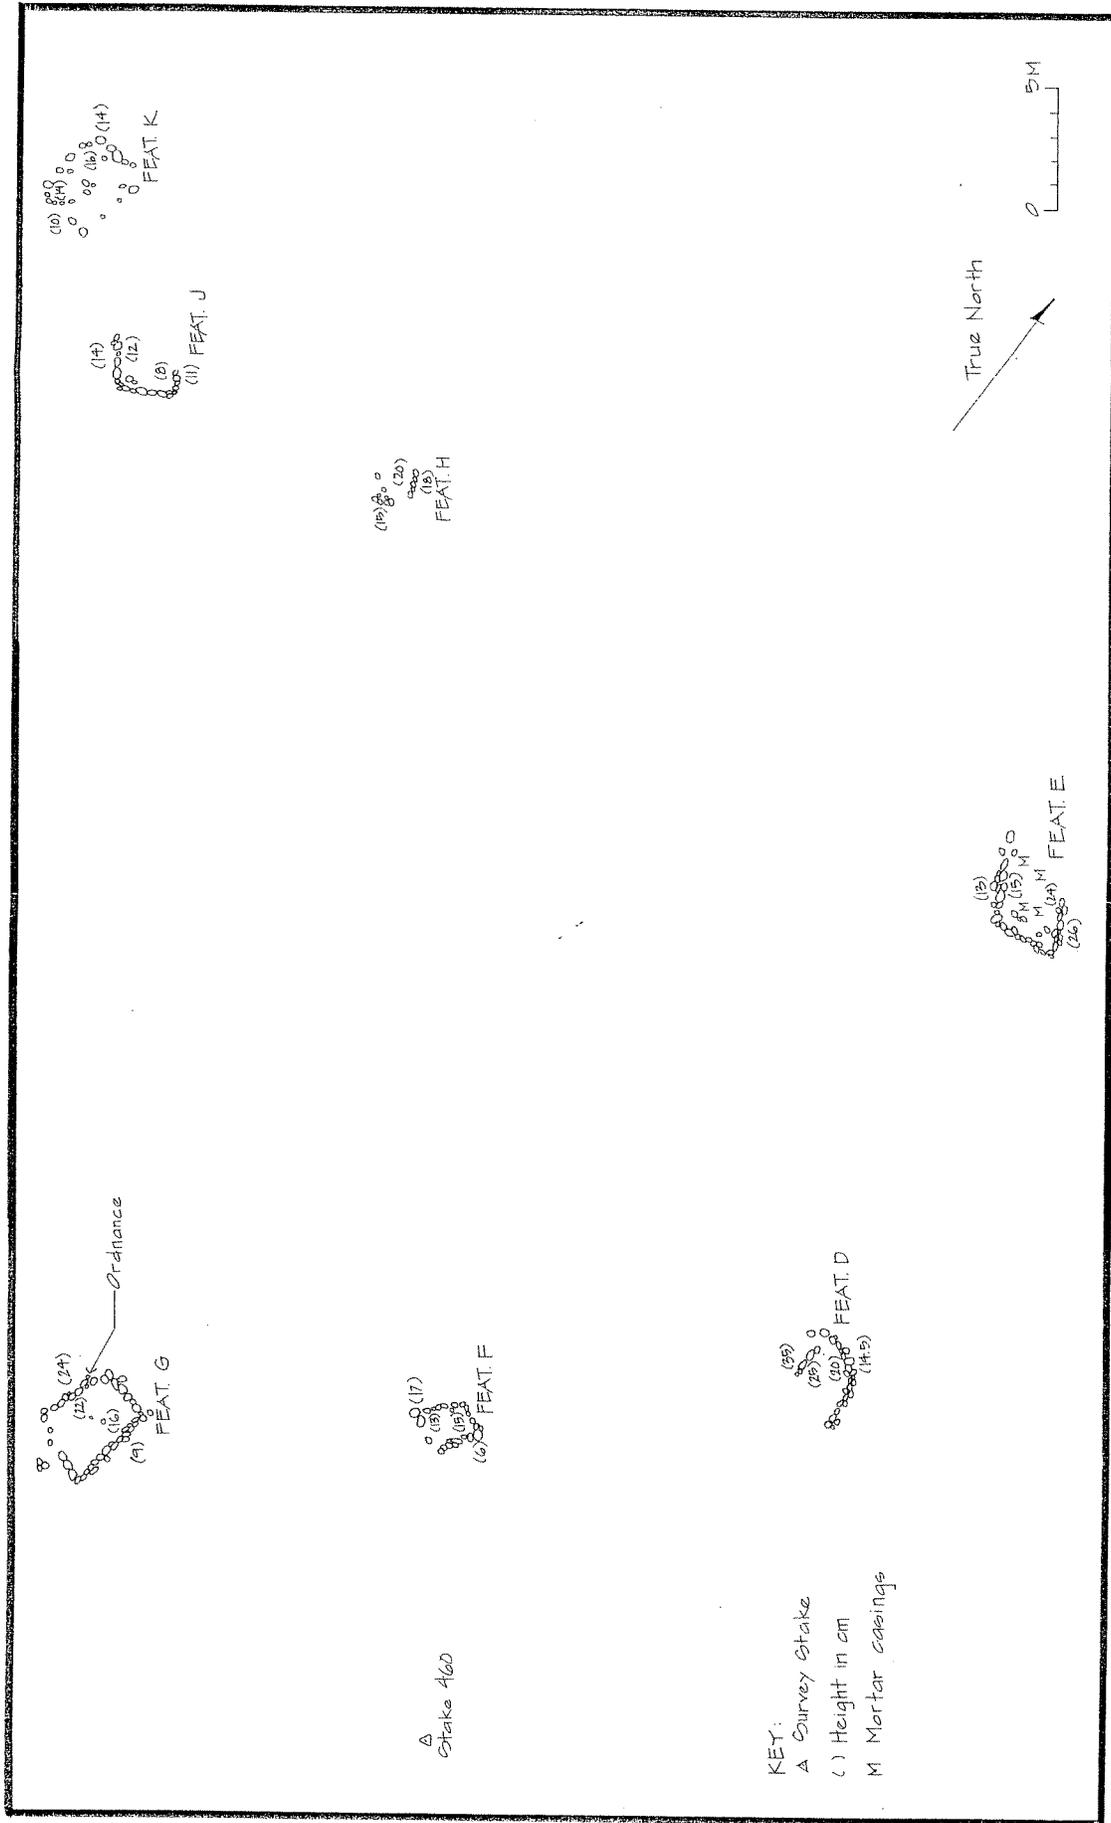

Figure 13 State site 50-50-10-4773: Features D, E, F, G, H, J, and K Plan View

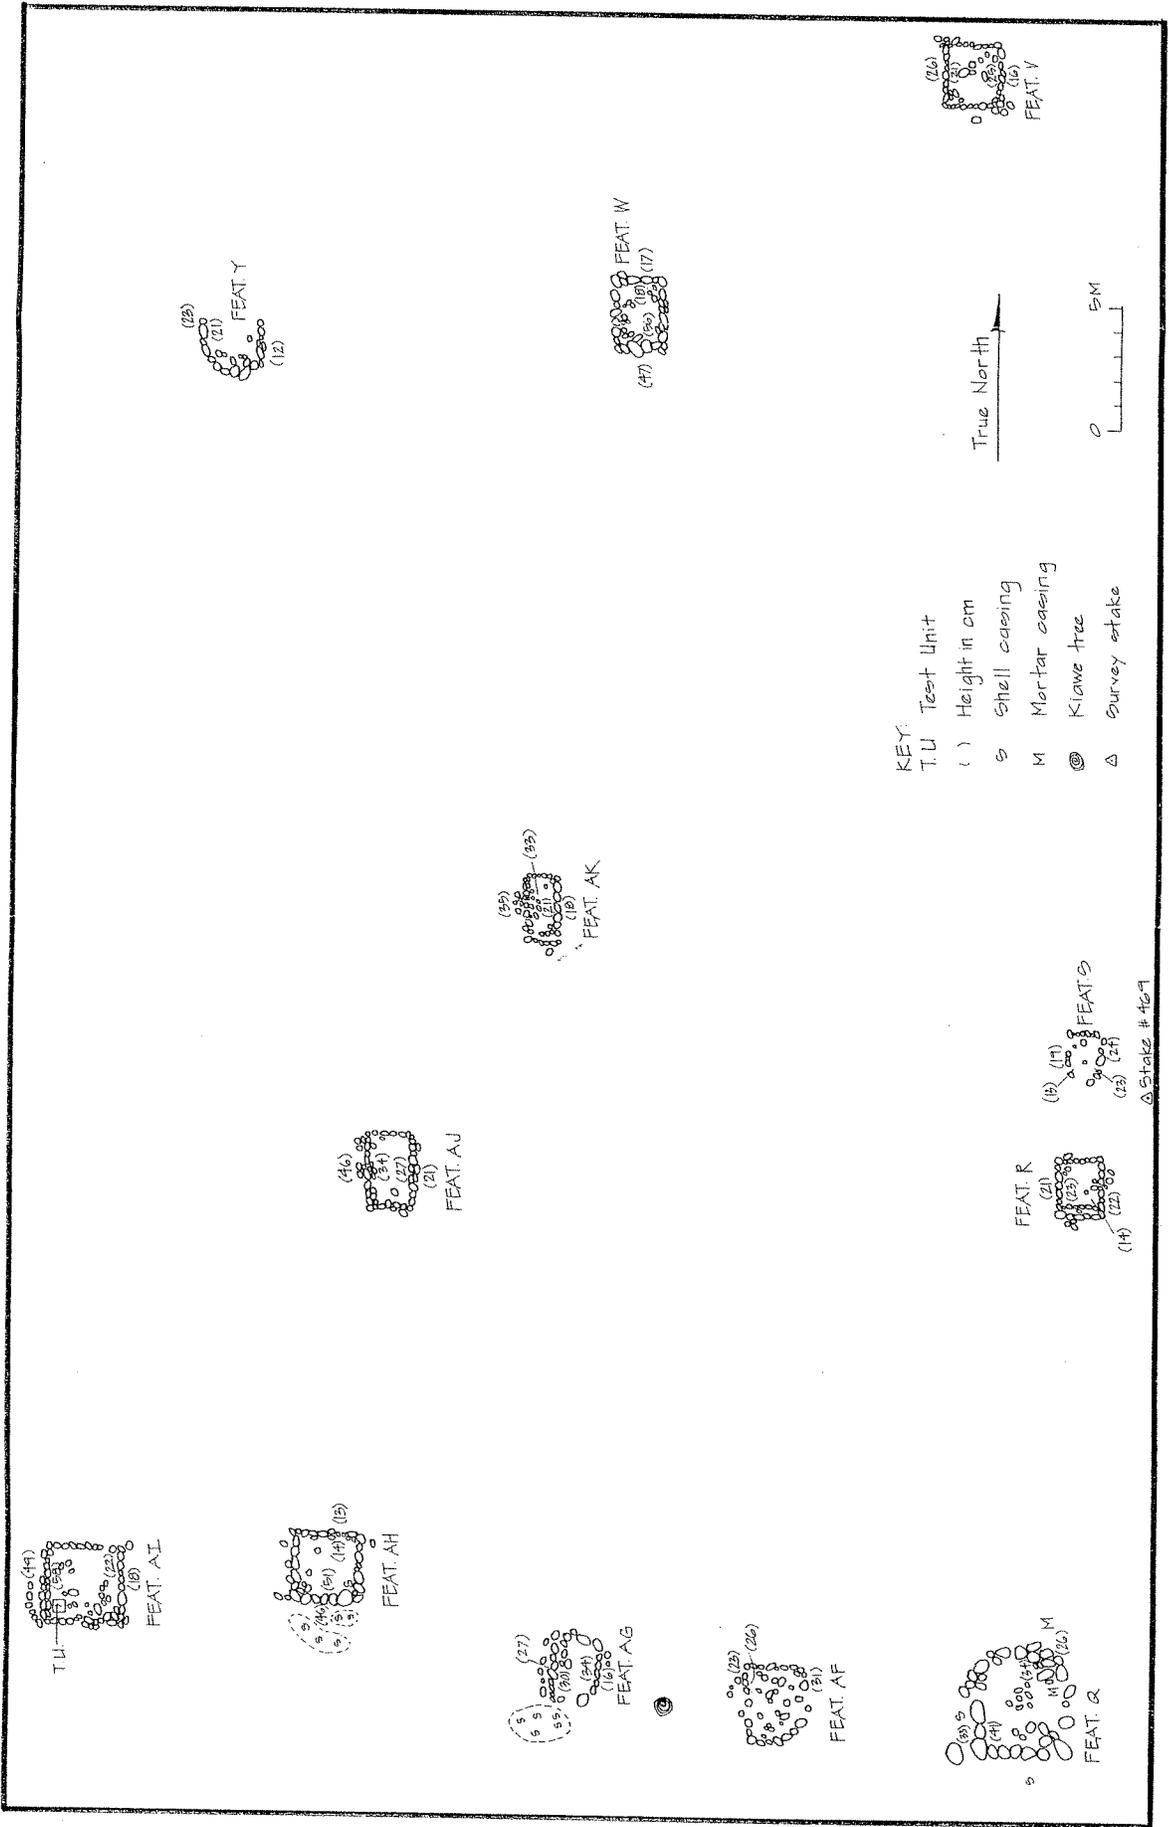

Figure 14 State site 50-50-10-4773: Features Q, R, S, V, W, Y, AF, AG, AH and AI, Plan View

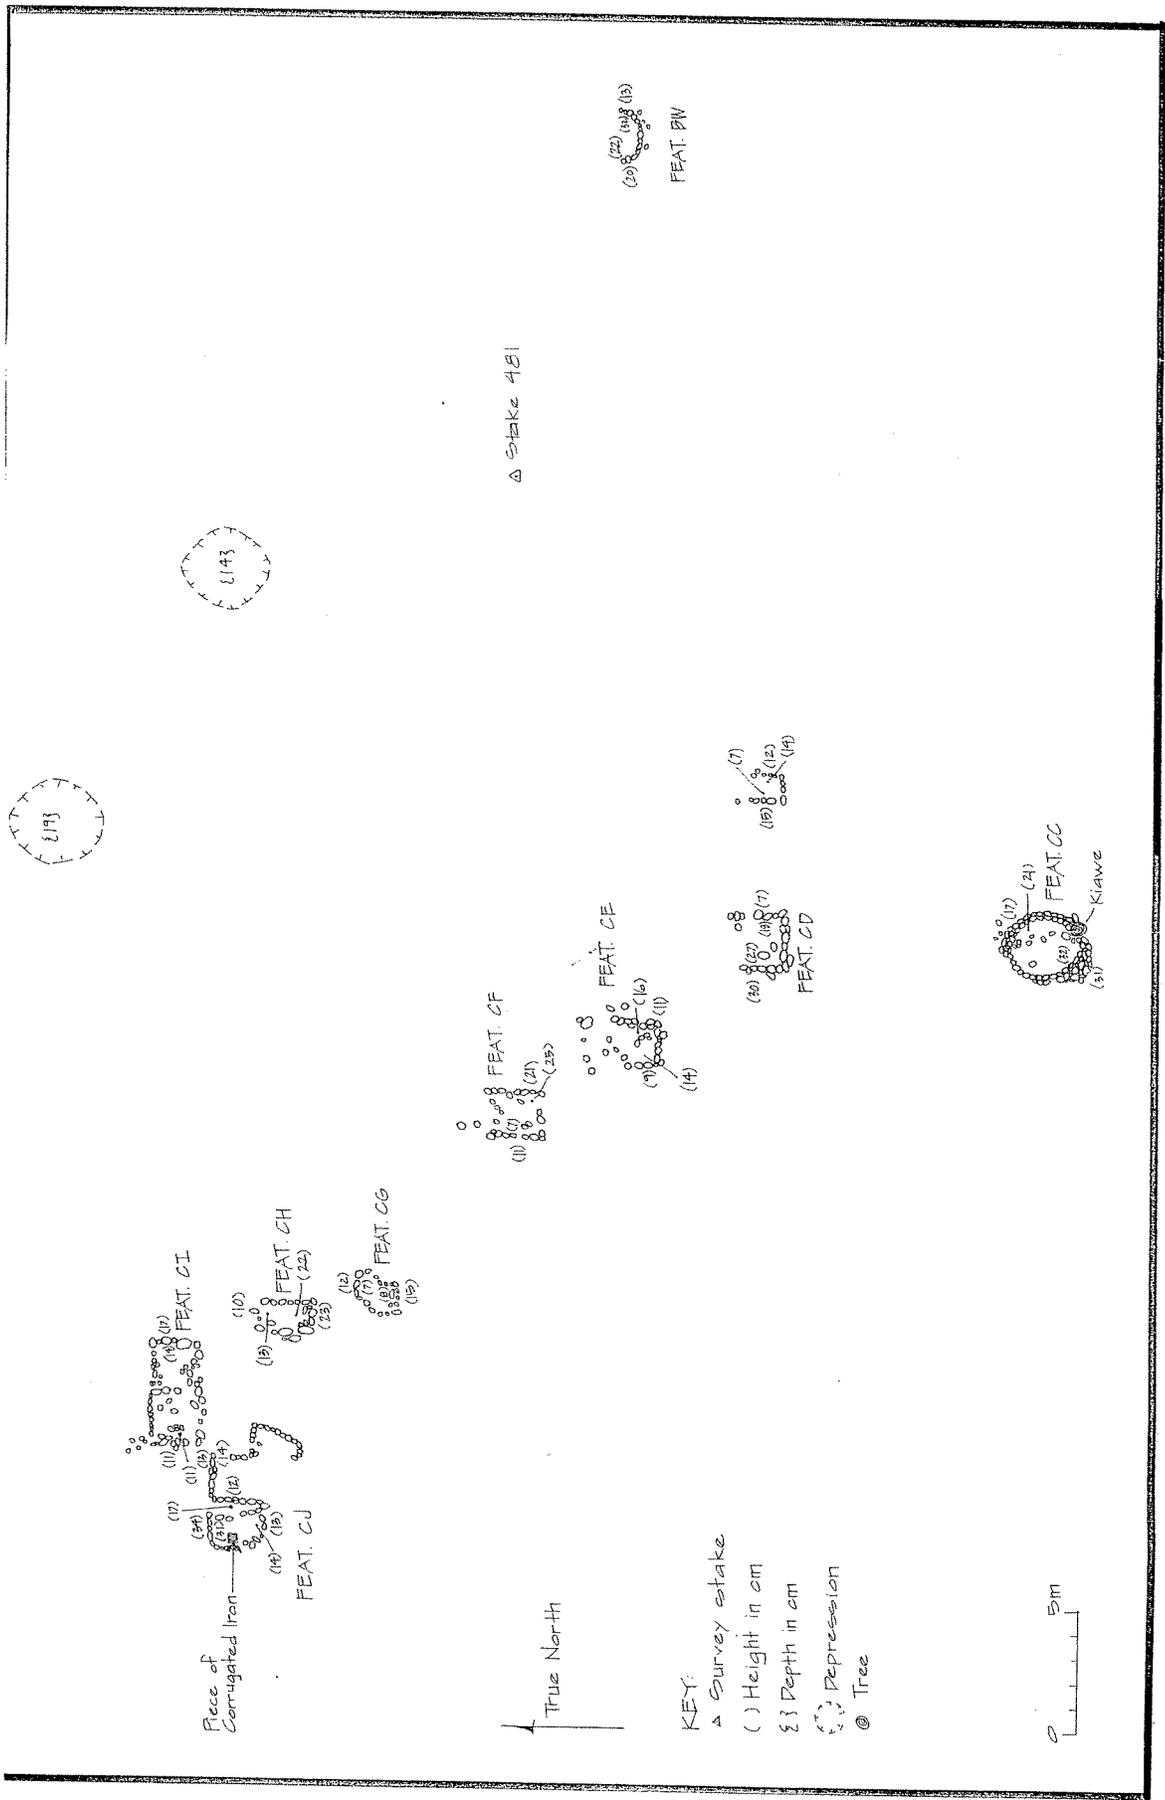

Figure 18 State site 50-50-10-4773, Features BW, CC, CD, CE, CF, CG, CH, CI and CJ, Plan View

Military debris was observed throughout the entire site area and was common at most features. Ordnance encountered included a variety of small arms ammunition including spent cartridges from 30 cal., 50 cal., and 20 mm ammunition. Springfield ammo clips were observed scatter throughout the area. In addition a number of casings for 60 mm mortars were observed scattered through the site area. A single shell casing for a 75 mm Howitzer was also observed within the site area. An illumination rounds were also observed. In addition to ordnance assorted metal fragments and communications wire were observed throughout the site area. The site area contains evidence of widespread bulldozing. No other cultural material was observed within the site area.

Two 50 cm by 1.0 m test units were excavated at Features U and CS to determine the presence or absence of subsurface cultural material. In addition, shovel test probes were conducted at Features AI and AW to determine the presence or absence of cultural material. All excavations, test units and test probes, were completely sterile of cultural material.

The table below lists each feature, its type, individual measurements, description, and condition, and whether the feature was mapped or not:

Table 7: State Site 50-50-10-4773 Feature list

Feature	Type	Measurements	Condition	Map	Description and materials
A	C-shape; collapsed	2.4 m E/W 2.8 m N/S	Poor		1 mortar casing
B	Alignment; collapsed	2.5 m E/W 0.8 m wide	Poor		14-stone alignment; 2 sections with 2 course stacking
C	C-shape	2.0 m E/W 2.2 m N/S	Poor		Opening to west; 3 mortar casings
D	C-shape	4.0 m E/W 2.6 m N/S	Fair	x	Opening to southwest; east and north sections 2 course stacking
E	C-shape	3.5 m E/W 3.4 m N/S	Fair	x	Opening to west; square corners; composed of medium sized boulders
F	U-shape	2.9 m E/W 2.6 m N/S	Fair	x	Opening to west; square corners; some 2 course stacking
G	U-shape	2.9 m E/W 2.8 m N/S	Fair	x	Opening to west; square corners; 1 artillery dummy round and 1 mortar casing
H	U-shape; collapsed	2.3 m E/W 2.35 m N/S	Poor	x	Opening to northwest; several collapsed sections
I	U-shape; partial	2.85 m E/W 2.55 m N/S	Fair		Opening to northwest, southeast section is stacked 2 courses
J	U-shape	2.1 m E/W 1.65 m N/S	Fair/poor	x	Opening to north; square corners; construction not complete

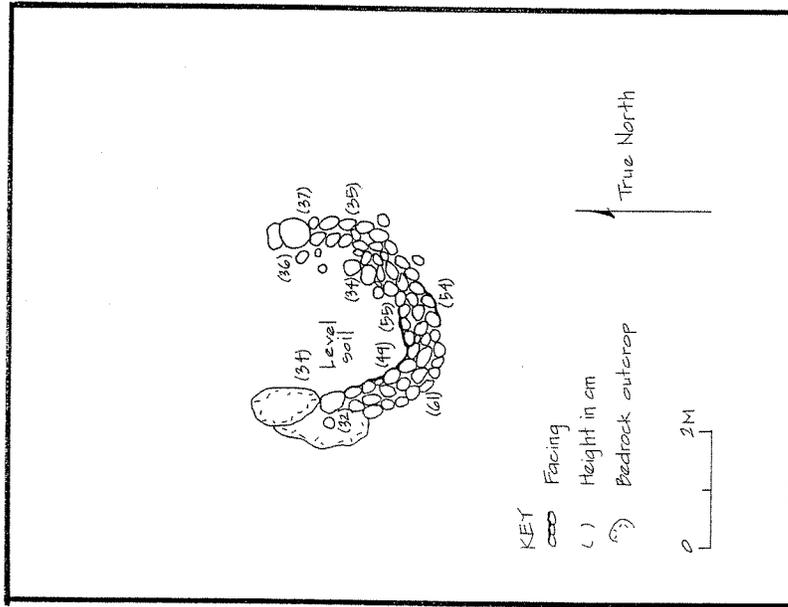

Figure 19 State site 50-50-10-4773: Features CU, Plan View

K	U-shape; collapsed enclosure	3.2 m E/W 2.65 m N/S	Very poor	x	Opening to east; very poor alignment; construction not complete
L	Square enclosure	2.7 m E/W 2.5 m N/S	Fair		Composed of medium boulders; metal fragments present; numerous features in vicinity of this feature but just outside the project corridor;
M	U-shape	2.3 m E/W 2.6 m N/S	Fair		Opening to south (toward existing road); impacted by existing road improvements
N	Square enclosure	3.1 m E/W 3.3 m N/S	Fair		Composed of medium to large boulders; 2 course stacking on south side; near existing road
O	Circular enclosure	3.3 m E/W 3.5 m N/S	Fair		Alternating alignment to 2 course stacking; near existing road
P	U-shape	2.2 m E/W 2.5 m N/S 0.35 m average height	Fair		Opening to north; up to 3 course stacking in some sections
Q	Circular enclosure	3.25 m E/W 3.9 m N/S 10-40 cm high	Fair	x	Alignment composed of medium boulders; 4 mortar casings and several bullet casings present
R	Rectangular enclosure	1.9 m E/W 2.6 m N/S 10-40 cm high	Fair	x	Alignment composed of small boulders; square corners
S	U-shape	1.6 m E/W 2.2 m N/S 5-25 cm high	Poor	x	Opening to south; incomplete construction
T	Square enclosure	2.9 m E/W 2.95 m N/S 10-40 cm high	Fair/ Good	x	Single to 3- course (south side) stacking
U	Square enclosure	2.9 m NE/SW 2.7 m NW/SE 10-30 cm high	Fair	x	Single course alignment; small gaps at northwest section
V	Square enclosure	2.5 m E/W 2.8 m N/S 10-25 cm high	Fair	x	Single course small boulder alignment
W	Square enclosure	2.1 m E/W 2.5 m N/S 5-40 cm high	Fair	x	Medium boulder to cobble alignment; previously 2-3 courses but now mostly collapsed

X	Foxhole and associated rock alignment	1.8 m E/W 2.2 m N/S Foxhole 10 cm deep. Alignment 1.2 m long 0-30 cm high	Poor		Excavated soil interior; edges now slumped, possibly from erosion; 7 small boulder alignment along south edge
Y	C-shape	2.5 m E/W 2.3 m N/S 15-40 cm high	Fair/ Good	x	Opening to north; ranging from alignment to 2 course stacking (north side)
Z	Square enclosure	2.6 m E/W 2.6 m N/S 15-40 cm high	Fair/ Good	x	Small boulder to cobble alignment; ranging from 1 to 2 course stacking
AA	Square enclosure	3.1 m NE/SW 2.6 m NW/SE 15-47 cm high	Fair/ Good	x	Small boulder to cobble alignment; ranging from 1 to 3 course stacking; partially excavated interior; metal fragments and ammo clips present
AB	Square enclosure	2.7 m NE/SW 3.0 m NW/SE 10-47 cm high	Poor/ Incomplete	x	Small boulder to cobble alignment; north section incomplete; south section 2 course stacking; east and west sections 1 course stacking; built on a slope in the terrain
AC	L-shape/ Right Angle	2.5 m NE/SW 3.5 m NW/SE	Poor	x	NE/SW alignment composed of 5 small boulders; NW/SE alignment composed of cobbles; interior section is partially excavated
AD	Square enclosure	3.15 m NE/SW 3.3 m NW/SE 15-40 cm high	Fair/ Poor/ Incomplete	x	Small boulder to cobble alignment; incomplete construction; interior partially excavated
AE	Square enclosure	3.1 m E/W 3.2 m N/S 10-50 cm	Fair/ Good	x	Small boulder to cobble alignments; south side 3 courses high; interior excavated to 30cms; 1 modern brown beer bottle within enclosure
AF	Square enclosure; collapsed	2.7 m E/W 3.25 m N/S 10-45 cm high	Poor	x	Composed of small boulders; soil pushed up into south side during existing road construction; several waterworn boulders present
AG	Oval enclosure	2.1 m E/W 2.7 m N/S 10-35 cm high	Poor	x	Small to medium boulder alignment; rations can lids

AH	Square enclosure	2.8 m E/W 2.7 m N/S 7-55 cm high	Good	x	Southern section composed of medium boulders with some 2 course stacking, other sections lower; northern section also contains some 2 course stacking; numerous bullet casings scattered throughout site area
AI	Square enclosure	3.2 m E/W 3.3 m N/S 10-55 cm high	Good	x	East and west sections 2 courses high small boulders; north and south sections cobbles to small boulders; interior excavated to 20 cmbs; bullet casings, tin cans, communications wire present at site area; 6 small boulder c-shape alignment between AH and AI
AJ	Rectangular enclosure	1.8 m E/W 3.0 m N/S 7-35 cm high	Good	x	Small boulder to cobble alignment with some 2 course stacking; ammo clips near feature
AK	Square enclosure	2.8 m E/W 3.2 m N/S 5-35 cm high	Good	x	Small boulder alignment with some 2 course stacking
AL	U-shape	3.1 m E/W 3.5 m N/S 10-55 cm high	Fair/ Good	x	Opening to north; southwest section 3 course stacking; east side now only a remnant; large gap in south side; bullet shell casings present
AM	Military remnant	3.45 m E/W 4.0 m N/S 5-40 cm high	Poor	x	No sides intact; existing modern water pipe cuts through the middle of the site, utilizing feature rocks to prop pipe up off ground surface; interior excavation to 20 cmbs; metal fragments present
AN	Square enclosure	3.1 m E/W 3.4 m N/S 18-42 cm high	Good	x	Small to medium boulder alignments with some 2 course stacking; just off existing road
AO	C-shape	2.1 m E/W 1.8 m N/S 5-35 cm high	Good	x	Opening to north; square corners; small boulder alignments
AP	C-shape	2.3 m E/W 1.8 m N/S 10-25 cm high	Fair/ Poor	x	Opening to north; small boulder alignment; interior excavated 10 cmbs; ammo clips present
AQ	Rectangular enclosure	3.55 m E/W 2.4 m N/S 10-40 cm high	Fair/ Good	x	2 course stacking on north, east, and west sides; south side impacted by existing road; cannister bomb (?) observed at center of structure; bullet casings present
AR	Alignment	1.8 m long 20 cm high	Fair		Seven stone alignment, bullet casings present

AS	Rectangular enclosure	3.8 m E/W 2.8 m N/S 10-50 cm high	Fair/ Poor	x	Small boulder to cobble alignments; interior excavation to 15 cmbs; bullet casings and ammo clips present
AT	C-shape	2.1 m E/W 2.0 m N/S 10-35 cm high	Poor	x	Opening to north; 12 small boulders total; interior excavated to 10 cmbs; bullet casings and metal fragments present
AU	C-shape; collapsed	2.5 m E/W 1.5 m N/S 5-25 cm high	Very poor	x	North section impacted by erosion
AV	C-shape	2.0 m E/W 1.4 m N/S 5-30 cm high	Good	x	Structure generally 2 course stacking of small boulders; bullet casings present
AW	C-shape; collapsed	2.5 m E/W 2.15 m N/S 10-35 cm high	Poor	x	Opening to north; terrain sloping to north; small boulder alignment
AX	Rectangular enclosure	2.4 m E/W 3.0 m N/S 15-30 cm high	Fair/ Poor		Small boulder alignment; gaps in south and west sections
AY	C-shape	1.5 m E/W 2.0 m N/S 10-40 cm high	Fair		Center section (south) 2 course stacking w/ longer west wall (1.5 m) and shorter east wall (30 cm); ammo clips present
AZ	U-shape	2.2 m E/W 1.95 m N/S 10-30 cm high	Fair		Opening to north; Small boulder alignment; 50 caliber casings present
BA	U-shape	2.2 m E/W 2.2 m N/S 7-35 cm high	Fair/ Good		Small boulder alignment with some 2 course stacking; ammo clips present
BB	C-shape	2.4 m E/W 2.0 m N/S	Fair		Opening to north
BC	C-shape	2.3 m E/W 2.0 m N/S	Fair		Bullet casings present
BD	C-shape and associated collapsed wall	2.0 m E/W 1.9 m N/S	Poor		Opening to north; structure composed of 12 small boulders only
BE	4 Foxholes	see map	Poor	x	see map
BF	Alignment	2.5 m long (E/W)	Fair		Composed of 12 small boulders only
BG	Alignment	2.0 m long (E/W)	Fair		Small boulder to cobble alignment
BH	Alignment	3.0 m long (E/W)	Fair		Small boulder alignment

BI	Alignment	2.3 m long (E/W)	Fair	Small boulder to cobbles alignment; metal fragments present
BJ	Square enclosure	2.7 m E/W 3.2 m N/S	Fair	Some gaps/collapse in walls
BK	Alignment	2.4 m long (E/W)	Poor	Medium to small boulders alignment
BL	C-shape	2.4 m E/W 1.3 m N/S 30 cm high	Fair	Opening to south; shallow angle; some two course stacking
BM	U-shape	2.2 m E/W 1.4 m N/S	Fair	Small boulder alignment
BN	C-shape	2.1 m N/S	Fair	Opening to north; small boulder alignment; "1943" 75 mm Howitzer casing in interior
BO	C-shape	2.0 m E/W 2.4 m N/S 30 cm high	Good	Opening to north; small boulder to cobble alignment
BP	Rectangular enclosure	1.4 m E/W 2.2 m N/S	Fair/ Poor	Incomplete alignments
BQ	Rectangular enclosure	1.4 m E/W 2.4 m N/S	Fair	Small boulder alignments
BR	Rectangular enclosure	1.6 m E/W 2.6 m N/S	Fair/ Poor	Small boulder alignments; most of east and west sides missing; interior excavated less than 10 cm
BS	L-shape	2.4 m E/W 2.0 m N/S	Poor	Very rough small boulder alignments
BT	3 alignments	1) 2.4 m E/W 2) 2.1 m E/W 3) 1.0 m E/W	Poor	Alignments consist of medium to small boulders
BU	Square enclosure	2.1 m E/W 2.0 m N/S	Poor	Rough small boulder to cobble alignment
BV	Square enclosure	2.2 m E/W 2.3 m N/S	Good	Small boulder to cobble alignments
BW	C-shape	3.2 m E/W 1.0 m N/S	Poor	Opening to north; shallow angle of "C"; erosion evident
BX	Rectangular enclosure	1.4 m E/W 2.4 m N/S	Fair/ Good	Small boulder to cobble alignment
BY	Square enclosure	1.4 m E/W 1.2 m N/S	Poor	Small boulder to cobble alignment

BZ	Square enclosure	1.6 m E/W 2.6 m N/S	Fair/ Poor	Interior excavated less than 10 cm
CA	L-shape		Fair/ Poor	Small boulder to cobble alignment with some 2 course stacking
CB	U-shape	0.8 m E/W 1.4 m N/S	Good	Very narrow alignment
CC	Circular enclosure	see map	Fair	Small boulder to cobble alignment with some 2 course stacking and piling
CD	C-shape	2.1 m E/W 1.2 m N/S	Fair	Opening to north; Small boulder to cobble alignment with some 2 course stacking
CE	U-shape	see map	Fair	Opening to north; Small boulder to cobble alignment
CF	Square enclosure; remnant	see map	Poor	Small boulder to cobble rough alignment with gaps / collapses
CG	Rectangular enclosure; remnant	see map	Poor	Small boulder to cobble rough alignment with gaps / collapses
CH	Rectangular enclosure; remnant	see map	Poor	Small boulder to cobble rough alignment with gaps / collapses
CI	Circular enclosure; very remnant	see map	Poor	See map
CJ	Rectangular enclosure	see map	Fair/ Good	Small boulder to cobble alignment with gaps / collapses in south section; communications wire present
CK	C-shape	1.2 m E/W 2.6 m N/S	Fair/ Poor	Opening to west; Small boulder to cobble alignment with some 2 course stacking
CL	L-shape	0.7 m E/W 1.3 m N/S	Fair/ Poor	Small boulder to cobble rough alignment
CM	C-shape	1.2 m E/W 2.2 m N/S	Poor	Small boulder to cobble rough alignment some stacked and piled two course areas
CN	C-shape w/foxtail	2.2 m E/W 2.8 m N/S	Good	Opening to west; One course alignment on north, east, and south sides; well excavated interior; 4+ c-ration cans in structure interior

CO	Foxhole	2.1 m E/W 2.4 m N/S	Poor	Small boulder alignment; possible bomb crater; otherwise, excavated interior; 4 other similar features nearby
CP	C-shape w/ foxhole	2.4 m E/W 1.7 m N/S	Fair/Poor	Small boulder to cobble alignment with some 2 course stacking on the east side; interior excavated less than 10 cmbs
CQ	C-shape	1.6 m E/W 3.2 m N/S	Fair/ Good	Opening to west; Small boulder to cobble alignment with some 2 course stacking
CR	Foxhole	1.1 m E/W 1.4 m N/S	Fair	Small boulder to cobble alignment with some 2 course stacking along east side
CS	C-shape	2.0 m E/W 3.2 m N/S	Fair	Opening to west; abutting kiawe tree to south; collapsed sections appear to have once been 2 courses high
CT	C-shape	2.2 m E/W 1.2 m N/S	Fair	Opening to south; Small boulder to cobble alignment with some rough 2 course stacking; 2 ammo clips present
CU	U-shape	see map	Good	see map
CV	C-shape	2.5 m E/W 1.2 m N/S	Fair	Opening to north; just off existing road; small boulder alignment with some 2 course stacking
CW	U-shape	1.4 m E/W 2.2 m N/S	Fair/good	Possible utilization of existing bulldozer push or vice versa; large flat stones in structure; unique to this area
CX	2 alignments and 1 rock wall		Fair	Very simple construction

State Site #: 50-50-10-4776

Site Type: Circular Enclosure

Site Function: Military

Features: 1

Description: State site 50-50-10-4776 is a oval enclosure (see Figure 20). The enclosure measures 1.8 m N/S by 2.3 E/W with the enclosure wall averaging 0.25 m in width. The site is constructed of basalt cobbles to medium boulders with heights ranging from 15-30 cm. Construction ranges from a single coarse alignment to two-course stacking on the western section of the site. The site is partially constructed on exposed bedrock outcrop and partially on soil. The soil at the interior of the site is slightly higher than on the outside of the site, possibly due to erosion. The site is located approximately 50 ft to the north of the study corridor centerline.

A 1 m x 50 cm test unit was excavated at the eastern interior section of the site, partially dissecting the enclosure wall (see Testing Results section for complete results).

73

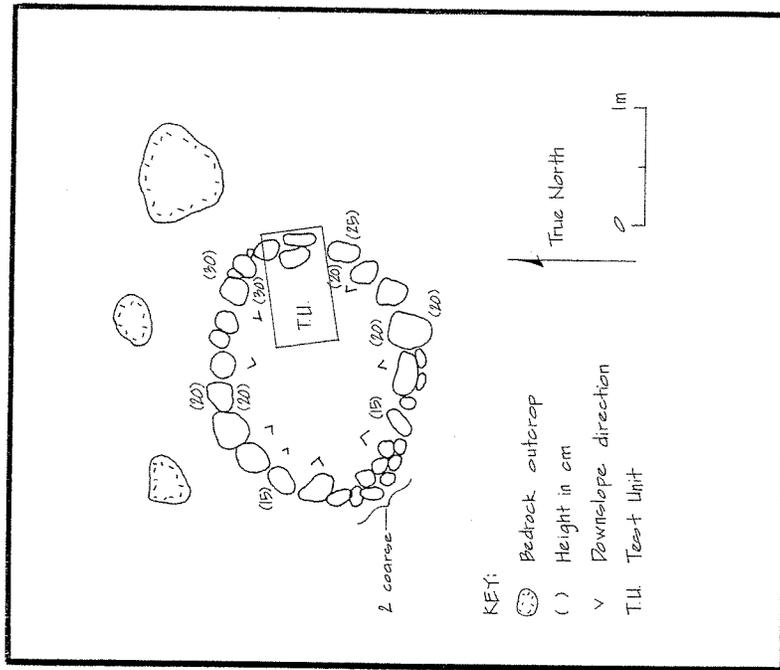

Figure 20 State site 50-50-10-4776: Plan View displaying test unit location

74

State Site #: 50-50-10-4778 CSH Site #: 22  
 Site Type: L-shape enclosure  
 Site Function: Military  
 Features: 1

**Description:** State site 50-50-10-4778 is a roughly constructed L-shaped enclosure situated on the southern edge of Waiakoa Gulch (Figure 21). The L-shaped enclosure measures 2.8 m E/W by 2.3 m N/S and is constructed of small to medium boulders stacked 1 to 3 courses high to a maximum height of 0.65 m. The site is open to the south and southwest. The interior of the enclosure appears to be shallow soil over bedrock. No cultural material was observed at the site. The site is located approximately 75 ft to the east of the study corridor centerline.

State Site #: 50-50-10-5029 CSH Site #: 1001  
 Site Type: Petroglyphs  
 Site Function: Symbolic  
 Features: 1

**Description:** State site 50-50-10-5029 is comprised of three historic petroglyphs on two panels located on the northern cliff of Kaiainui Gulch approximately 200 ft north of centerline (Figures 22 and 23), outside the study corridor. The petroglyphs consist of three words in block lettering, all capitals with pronounced serifs. The words have been pecked and abraded into the vertical fine grain basalt cliff face near the top of the north side of the gulch approximately 6.1 m below the top of the cliff face. A narrow ledge trail allows access to this portion of the cliff. All petroglyphs are faint and in fair condition. Lichen growing on the gulch face obscures the petroglyphs. The petroglyphs appear to spell KUAANA, MILMILI(A?), and MEHAME. The word KUAANA measures 83 cm long and 5 cm high, except the "K" which is 7 cm tall. The word MILMILI measures 40 cm long and 5 cm tall, with an "A" at the end that has been scratched in, as opposed to pecking. The word MEHAME measures 40 cm long and 10-11 cm tall. All words appear to have had the outline of each letter pecked, then the interior was pecked and abraded to fill it in. Sections of the word MEHAME are very faded, especially the "E"s.

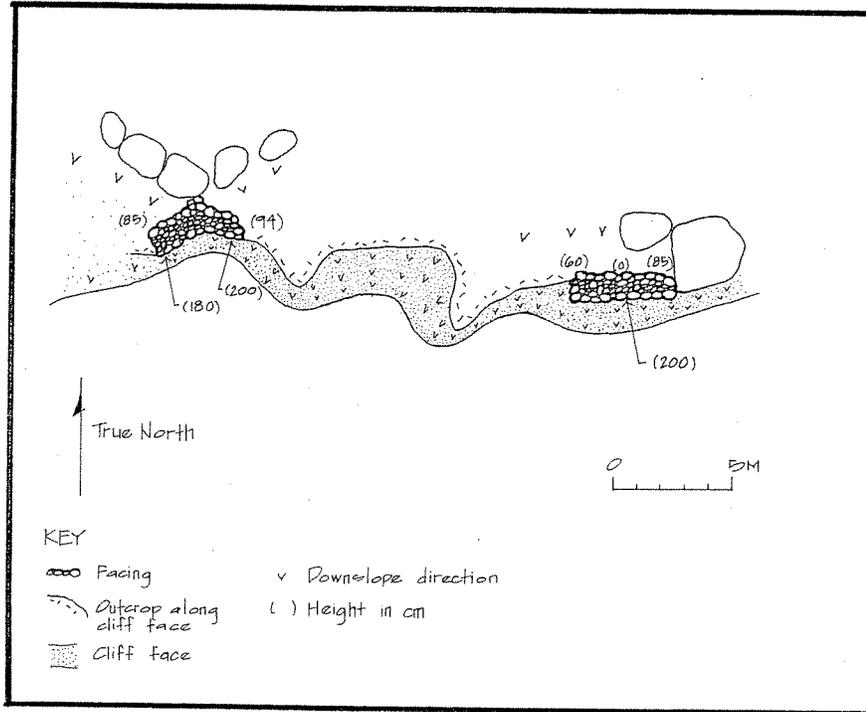

Figure 24 State site 50-50-10-5030: Plan View

80

State Site #: 50-50-10-5030  
 Site Type: Historic Wall  
 Site Function: Cattle barrier  
 Features: 2 within corridor  
 CSH Site #: 1002

**Description:** State site 50-50-10-5030 consists of a series of short wall segments constructed along the northern edge of Waiahoa Gulch (see Figure 24). The wall segments are constructed at strategic points along the cliff effectively preventing cattle from either exiting or entering the gulch. Wall segments were observed along the north side of the gulch both to the east and the west of the present road corridor. Two of the wall segments are located within the project area corridor and have been designated features A and B (see Figure 24). A total of six more segments were observed to the west of the corridor along the gulch and a total of three segments were observed to the east of the corridor along the gulch. Only the portions of the site within the corridor were recorded. Surrounding terrain outside of the gulch consists of gently sloping grassland with scattered basalt boulders and cobbles. Vegetation consists of *koaue*, several monkeypod trees, *pauiui* cactus, *koa haole*, and grass.

**Feature A** is a wall segment which measures 4.5 m E/W by 0.7 m wide, with a maximum height of 0.85 m, and a minimum height 0.1 m at the western end. The wall is constructed of small to medium basalt boulders, stacked 4 - 5 courses high. The wall appears core filled. Feature A is in good condition.

**Feature B** is another short wall segment measures 3.7 m E/W by 0.7 m wide. Feature B wall heights range from 0.85 - 0.9 m on the south side, and 1.8 - 2.0 m on the north side. Feature B is constructed of small to medium basalt boulders, stacked 4 - 5 courses high on the exterior face. The wall is core-filled with cobbles.

State Site #: 50-50-10-5031  
 Site Type: Petroglyphs  
 Site Function: Symbolic  
 Features: 3  
 CSH Site #: 1003

**Description:** State site 50-50-10-5031 consists of two petroglyph panels located on the southern side cliff face of Waiahoa Gulch. The first panel contained two petroglyphs (Figures 25 and 26) and the second panel contained a single petroglyph (Figures 25 and 27). All three petroglyphs are of anthropomorphic figures. The petroglyphs were originally located 50 ft to the west of the corridor centerline, but the corridor was redesigned (150 ft to the east) to place the site 200 ft from the corridor centerline. The corridor was redesigned to avoid any impact to the site.

Panel #1 consists of two anthropomorphic figures, possibly male. The figures have been pecked into the surface. The first figure, designated Figure 1, measures roughly 16 cm tall and 9 cm wide. Figure 1 has a triangular shaped torso. Additional pecking is visible just above the figures' head. Figure 2 is a pecked stick figure, possibly male measuring roughly 14 cm tall by 9 cm wide. Both figures are very faint.

79

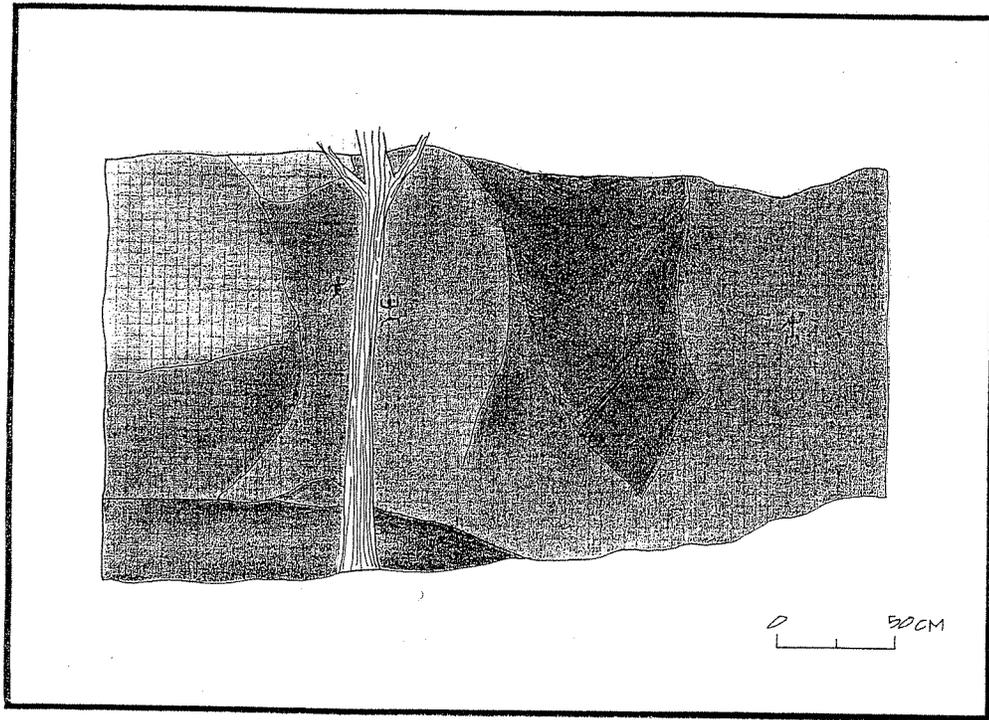

Figure 25 State site 50-50-10-5031: Petroglyphs, Plan View

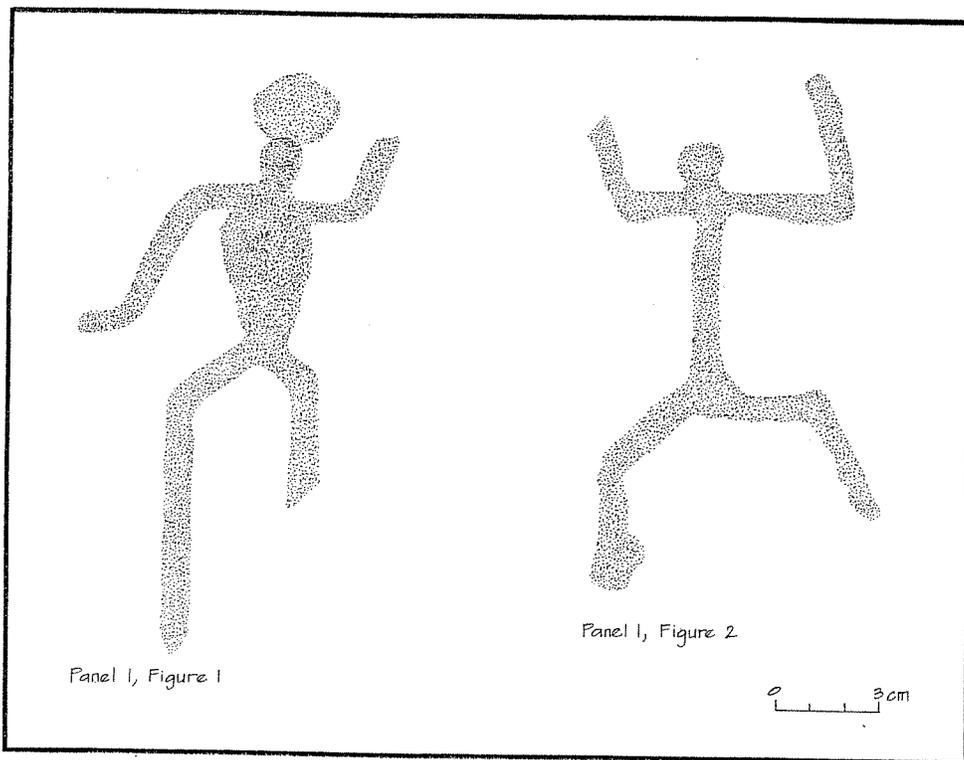

Figure 26 State site 50-50-10-5031: Petroglyphs, Panel 1

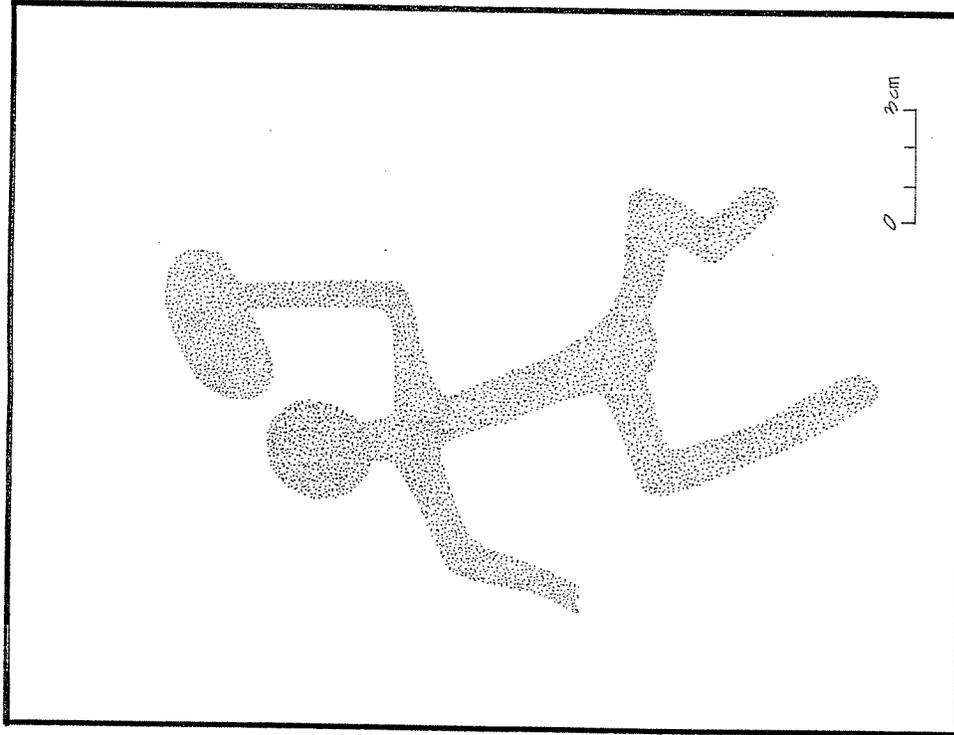

Figure 27 State site 50-50-10-5031: Petroglyphs, Panel 2

Panel #2, located 1.8 m west of Panel #1, consists of a single anthropomorphic stick figure, possibly male, holding something (club, paddle?) in the left hand. The right hand tip has definite claw-like points (fingers?). The basic figure is approximately 18 cm tall and 8 cm wide; it is located 2.5 m up the cliff face from the gulch floor. The figure was made by pecking rather than with an incising style. Additional pecking is visible connecting to the right hand of the figure, suggesting the figure is holding something. It is very faint, almost impossible to see when sunlight is directly shining on it. It appears to be very old and worn.

No other cultural material was observed in the vicinity (*i.e.* midden, artifacts). Vegetation consists of *kiaue* brush along the sides of the gulch, sporadic grass, and sparse *koa haole*. No water was observed in the gulch during the time of the survey.

State Site #: 50-50-10-5032 CSH Site #: 1004  
 Site Type: Alignments  
 Site Function: Temporary Habitation  
 Features: 1

**Description:** State site 50-50-10-5032 consists of a series of alignments (see Figure 28). The alignments are constructed of single rows of small basalt boulders, which are set into the soil in a row. The longest section, which is discontinuous and L-shaped, measures 25 m N/S by 4 m E/W. Extending from the midpoint of the E/W section is a second, smaller L-shaped alignment that measures 3 m N/S by 1.7 m E/W. There is another small L-shaped alignment that begins 4 m to the east of the north end of the largest alignment. The alignment generally parallels the larger alignment. The surrounding terrain is gently sloping pasture land. The site is located approximately 190 ft to the north of the study corridor centerline. Vegetation consists of *lili*, *kiaue* and *koa haole*; groundcover consists of sparse grass. Cultural materials observed at the site consist of a single fragment of cowry shell (*Cypraea* sp.), a basalt sinker stone and a basalt adze preform fragment. The sinker was collected for further analysis.

A 50 x 50 cm test unit was excavated in the south corner of the enclosure (see Testing Results section for complete details). No cultural material was encountered during the excavation.

State Site #: 50-50-10-5033 CSH Site #: 1005  
 Site Type: Rectangular enclosure  
 Site Function: Temporary Habitation  
 Features: 1

**Description:** State site 50-50-10-5033 is a roughly rectangular enclosure (Figure 29). It is constructed of basalt stones, cobble- to small boulder-sized, stacked one to three courses high, with a maximum height of 55 cm on the south wall. The site is located approximately 150 ft to the north of the study corridor centerline. Vegetation near the site consists of

*kiawe*, *hala*, and various sparse grasses. The enclosure appears to be constructed directly upon Stratum I soil. The interior of the enclosure is soil-filled and is slightly higher than the ground surface at the exterior of the enclosure. The north side and portions of the east and west sides appear to be core-filled. The south and east sides of the structure have gaps in their construction.

Two sections appear to be more recent modifications. The southwest corner section of the structure appears to be a newer stacking of small basalt boulders constructed on top of the existing older core-filled western wall section. This modification, similar to the military features construction style possibly functioned as a wind break. The site tag has been placed within this newer construction. The southeast corner section is also created with a different construction style of stacked small basalt boulders and cobbles constructed alongside the existing southern wall. The stone stacking seems to delineate a hole, 15 cm deep, in its center, which appears to have functioned as a fire pit. No cultural material was observed on the surface at the site.

An additional alignment of small basalt boulders is located to the southwest of the site, constructed parallel to the south wall section of the enclosure. The alignment is composed of 6 boulders. This may have been the former southwestern edge of the site, from which material was removed to create the more recently modified sections of the site.

A 1 m x 50 cm test excavation unit was excavated in the northwest corner of the site, just inside the west wall and just north of the newer constructed mound. A total of 29.8 g of marine shell midden and a 146.7 g piece of coral were collected from the excavation (see Testing Results Section of complete details).

State Site #: 50-50-10-5034 CSH Site #: 1019  
 Site Type: Square Enclosure  
 Site Function: Temporary Habitation  
 Features: 1

**Description:** State site 50-50-10-5034 is a square enclosure situated on relatively level pasture land (Figure 30). The site is located approximately 75 ft to the south of the study corridor centerline. Vegetation consists of *hala*, *kiawe* and *koa haole*, and sparse grasses. The enclosure measures 2.7 m N/S x 2.4 m E/W, with alignment heights ranging from 0.05 - 0.35 m. The enclosure is constructed of small to medium basalt boulders set into the soil with some segments stacked up to 3 courses high. The interior of the enclosure is level soil. The entire enclosure, including the interior, is constructed on a raised soil base, about 0.5 m higher than the surrounding ground surface. The northwest half of the site has been damaged by bulldozing. No cultural material was observed.

A 1.0 m by 50 cm test unit was excavated in the interior of the enclosure to determine the presence or absence of subsurface cultural materials (see Testing Results section for complete details).

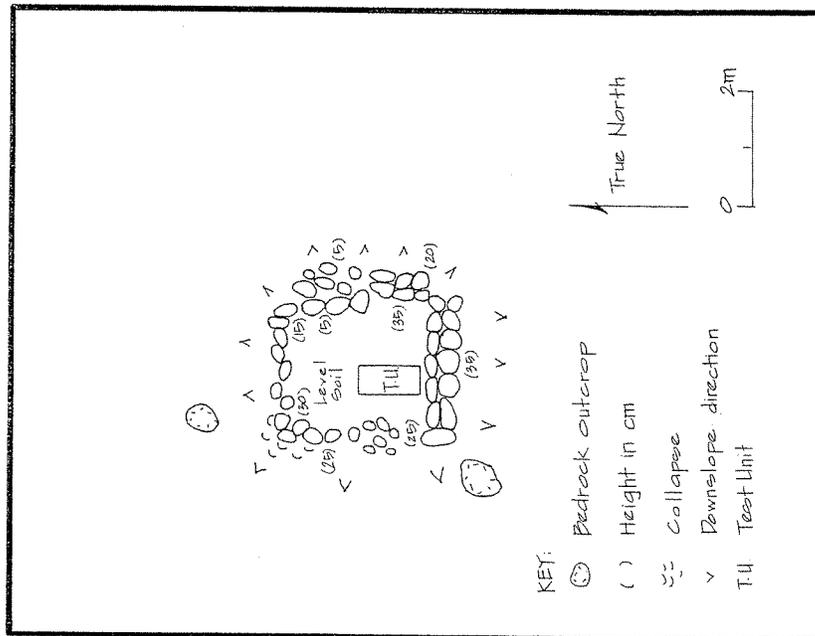

Figure 30 State site 50-50-10-5034: Plan View displaying test unit location

State Site #: 50-50-10-5035 CSH Site #: 1020  
 Site Type: C-shaped Enclosure  
 Site Function: Temporary Habitation  
 Features: 1

**Description:** State site 50-50-10-5035 consists of a large C-shaped enclosure and associated mound at its southeast end (Figure 31). The surrounding terrain is gently sloping pasture land. The site is located approximately 50 ft to the north of the study corridor centerline. Vegetation consists of *kia*, *kiaoe*, and *koa kaole* and various sparse grasses. The enclosure is constructed of stacked basalt boulders, 1 to 3 courses high (15-62 cm high), constructed directly on bedrock outcrop. The interior of the structure is completely soil-covered with some exposed bedrock and a few scattered cobbles. Three *kiaue* trees are growing just inside the enclosure. The north end of the C-shape is in good condition; the eastern and western sides are more weathered and collapsed. The adjacent mound consists of piled basalt cobbles to small boulders, 1 - 3 courses high, measuring 1.9 m N/S x 1.2 m E/W. The mound is collapsed on the south side.

A shovel test probe was excavated in the northwest interior of the structure (see Testing Results section for complete details). No cultural material was observed.

**A. Testing Results Section**

Limited subsurface testing was conducted at six sites. A total of five 1.0 m by 50 cm test units were excavated at two military sites (4773 and 4776) and two traditional temporary habitation sites (5033 and 5034). One 50 by 50 cm unit was excavated at another temporary habitation site (5032). In addition three shovel test probes were conducted at two sites (4773 and 5035) to determine the presence or absence of subsurface deposits.

A 1 m x 50 cm test units were excavated site 4773 Features U (Square Enclosure) and Feature CS (C-Shaped Enclosure). A 1 m x 50 cm test unit was also excavated at two of the temporary habitation sites 5032 (Square Enclosure) and 5033 (Rectangular Enclosure). The last 1 m x 50 cm test unit was excavated at a military site 4776 (Oval enclosure). In addition, shovel test probes were excavated at SS# 50-50-10-4773 Features A1 and AW, 5032, and 5035 to determine presence or absence of subsurface cultural material.

The features were tested using controlled excavation. Excavations were extended well into sterile soil layers. One profile was prepared for each excavation. All excavated materials were screened through 1/8-inch wire mesh and cultural material recovered from the excavations were measured and analyzed. Each test unit was backfilled and the sites were reconstructed as close as possible to their original form.

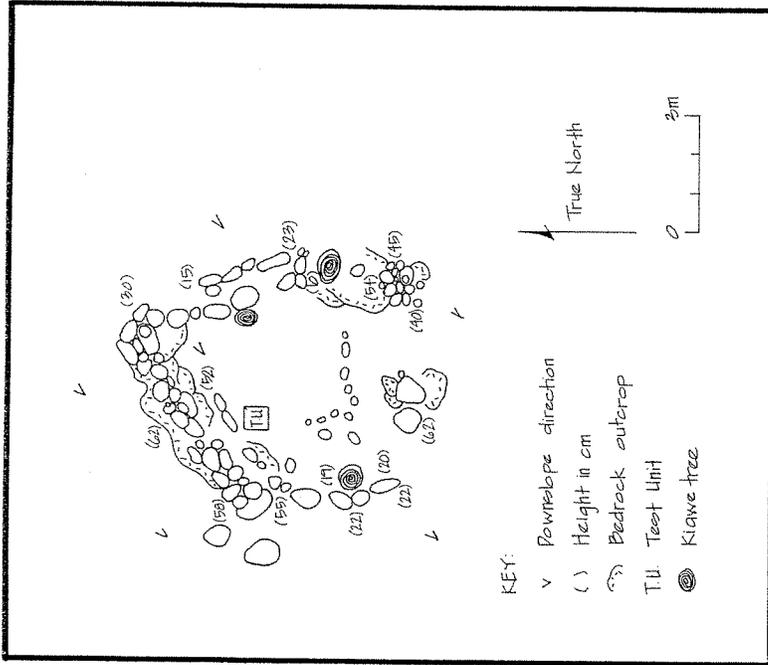

Figure 31 State site 50-50-10-5035: Plan View displaying location of test probe

### Test Excavation Unit Descriptions

#### State Site # 50-50-10-4773 Feature U

A 1 m x 50 cm test unit was excavated in the northern interior of Feature U, a historic military square enclosure. A single stratigraphic layer was observed, very compact, fine grain, yellowish red (5YR 5/6) clay silt (Figure 32). The unit was excavated to a depth of approximately 60 cmbs. The top 20-25 cmbs contained approximately 20% root/rootlet inclusions and a basalt cobble concentration of approximately 50%. The cobble concentration increased with depth to a maximum of approximately 80% cobble inclusion at 25 cmbs that was the base of excavation. The base of the unit contained decomposing bedrock. No cultural material was encountered during excavation. A profile was drawn of the north face. Photos were taken pre- and post-excavation.

#### SS# 50-50-10-4773 Feature AI

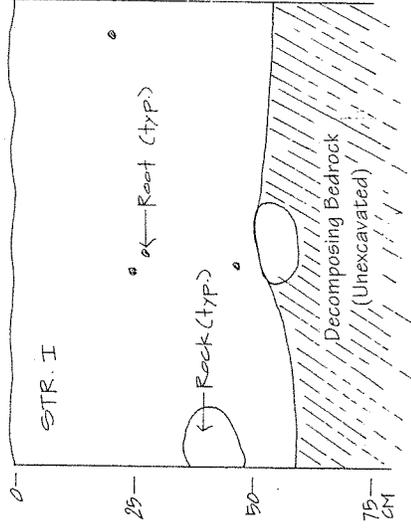

A shovel test probe was excavated in the center of military Feature AI to aid in determining the presence or absence of subsurface cultural material. The probe was approximately 60 cm N/S x 40 cm E/W. The probe was excavated to a maximum depth of 46 cmbs. One stratigraphic layer was encountered, a very compact 5YR 5/6 yellowish red silt, containing small cobbles and abundant roots and rootlets (Figure 33). No cultural material was noted during excavation. A profile was drawn of the northeast face of the probe. Photos were taken pre- and post-excavation.

#### SS# 50-50-10-4773 Feature AW

A shovel test probe was excavated in the southwest corner of military Feature AW to aid in determining the presence or absence of subsurface cultural material. The probe measured approximately 60 cm N/S x 42 cm E/W (at the surface) and was excavated to a maximum depth of 48 cmbs at which point bedrock outcrop was exposed throughout the majority of the base of the probe (Figure 34). Two strata were encountered: the O-horizon, which included the first 2-4 cm at the surface, a 5YR 4/4 reddish brown silt, and Stratum I to the base of excavation, a very compact 5YR 5/6 yellowish red silt, which contained small cobbles and decomposing bedrock and abundant roots and rootlets. No cultural material was encountered during the excavation. A profile was drawn of the southwest face. Photos were taken of the pit, pre- and post-excavation.

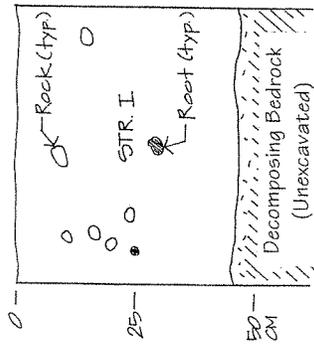

#### State Site # 50-50-10-4773 Feature CS

A 1 m x 50 cm test unit was excavated in the northern interior of Feature CS, a historic military C-shaped enclosure. A single stratigraphic layer was encountered that consisted of a very compact, fine grain, yellowish red (5YR 4/6) clay silt (Figure 35). The unit was excavated to a maximum depth of 70 cm. At approximately 25 cmbs the cobble content increased to 80%. The root content throughout the excavation was extremely high. Bedrock outcrop was encountered at the base of excavation. No cultural material was encountered during the excavation. A profile was drawn of the eastern face. Photos were taken pre- and post-excavation.

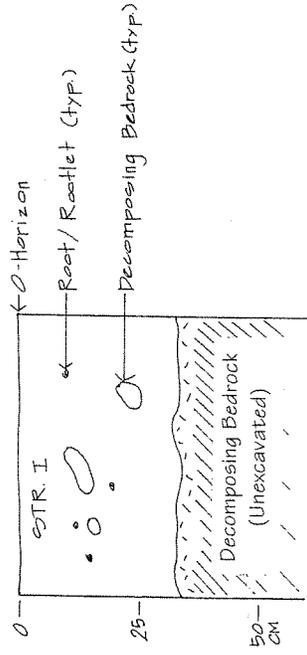

Stratum I: (0-BOE) Very compact, fine grain, yellowish red (5YR 5/6) clay silt

Figure 32 State site 50-50-10-4773: Feature U, Post excavation profile displaying test unit, view to north

Stratum I: (0-BOE) Very compact 5YR 5/6 yellowish red silt, containing small cobbles and abundant roots and rootlets.

O-horizon: (0-2 cmts) 5YR 4/4 reddish brown silt  
 Stratum I: (2-BOE) Very compact 5YR 5/6 yellowish red silt which contained small cobbles and decomposing bedrock and abundant roots and rootlets.

Figure 33 State site 50-50-10-4773: Feature AI, Post excavation profile displaying test unit, view to northeast

Figure 34 State site 50-50-10-4773: Feature AW, Post excavation profile displaying test unit, view to southwest

State Site 50-50-10-4776

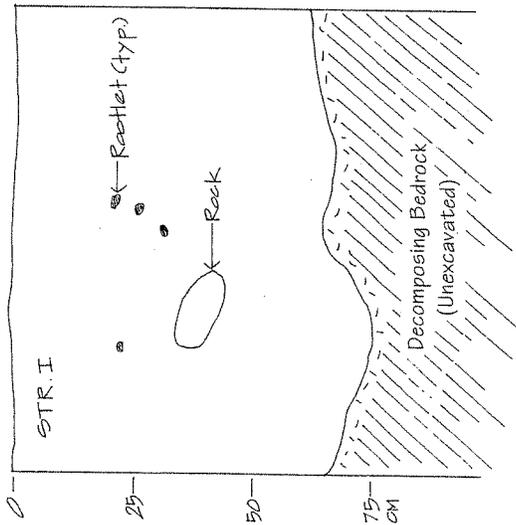

A 1 m x 50 cm test unit was excavated bisecting the eastern wall and extending into the eastern interior of the enclosure (Figure 36). The excavation was terminated at a maximum depth of 28 cmbs. A small pocket of a very dark brown (10YR 2/2) silt was observed in the northwest corner of the unit extending a maximum of 2 cmbs. No cultural material was observed in this darker stained surface pocket. Besides the pocket only a single stratigraphic layer was encountered throughout the rest of the excavation. No cultural material was encountered during the excavation of this unit. A profile was drawn of the south face. Photos were taken pre- and post-excavation.

State Site #50-50-10-5032

A 50 x 50 cm test unit was excavated at Site 5032. The unit had a maximum depth of 41 cmbs. A single stratigraphic layer (Stratum I) was encountered, a 5YR 4/6 yellowish red silt (Figure 37). Stratum I contained decomposing bedrock and abundant roots and rootlets. No cultural material was encountered during the excavation. A profile was drawn of the south face. Photos of the unit were taken pre- and post-excavation.

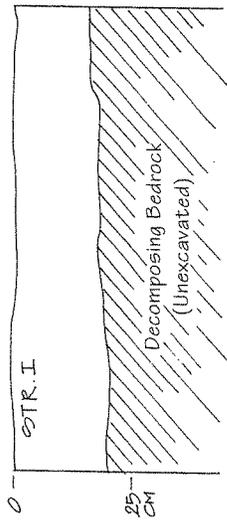

State Site #50-50-10-5033

A 1 m x 50 cm test unit was excavated in the interior of Site # 5033, a rectangular temporary habitation enclosure. Three stratigraphic layers were encountered (Figure 38). Stratum I, consisted of a very compact, fine grain, yellowish red 5YR 5/6 clay silt. Stratum I contained no cultural material. Stratum II contained a high concentration of roots and rootlets. Stratum II consisted of a compact very fine grain dark reddish brown (5YR 3/2) silt which contained cultural material. Cultural material encountered consisted of 3.2 g of *Conus* sp., 12.4 g of *Cypraea caputserpentis*, 0.1 g of *Merita picea*, 1 g of *Isozomon* sp., 3.1 g of unidentified marine shell and a 146.7 g piece of coral. All cultural material encountered appeared very weathered and brittle. Stratum II was encountered between 18-25 cmbs. with both boundaries, with Stratum I and Stratum III, were gradual and wavy. Stratum III was encountered at approximately 25 cmbs and it extended to the base of excavation at 60 cmbs. Stratum III consisted of very compact fine grained yellowish red (5YR 4/6) silt which contained no cultural material. The cobble concentration increased throughout Stratum III so that at the base of excavation the cobble concentration increased approximately 80%. The base of excavation unit was at depth of 60 cmbs. A profile was drawn of the southern face. Photos were taken pre- and post-excavation.

**Stratum I: (0-BOE)** Very compact, fine grain, yellowish red (5YR 4/6) clay silt.

Figure 35 State site 50-50-10-4773: Feature CS. Post excavation profile displaying test unit, view to east

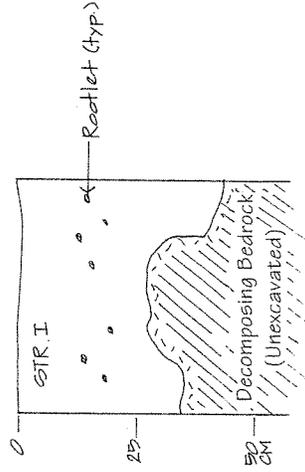

**Stratum I: (0-BOE)**

Very compact, fine grain 5YR 4/6 yellowish red silt with decomposing bedrock and abundant roots and rootlets

**Pocket:**

A small pocket of a very dark brown (10YR 2/2) silt was observed in the northwest corner of the unit extending a maximum of 2 cmbs

**Stratum I:**

Very compact fine grain 5YR 4/6 yellowish red silt with decomposing bedrock and abundant roots and rootlets

Figure 36 State site 50-50-10-4776: Post excavation profile displaying test unit, view to south

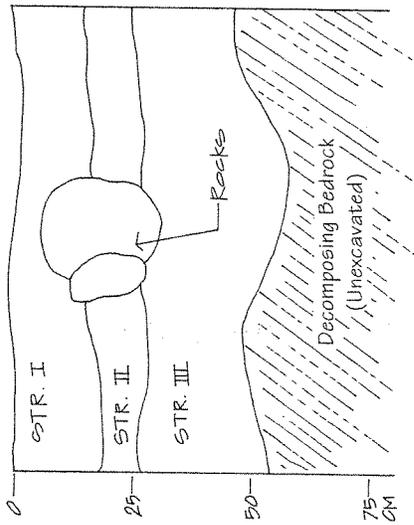

Figure 37 State site 50-50-10-5032: Post excavation profile displaying test unit, view to south

State Site #50-50-10-5034

A 1 m x 50 cm test unit was excavated in the interior of Site # 5034, a square temporary habitation enclosure. Three stratigraphic layers were encountered (Figure 39). Stratum I consisted of a very compact, fine grain, reddish brown 2.5YR 4/4 clay silt and contained no cultural material. Stratum I contained a high concentration of roots and rootlets. Stratum II consisted of a compact very fine grain brown (7.5YR 2/4) silt which contained cultural material. Cultural material encountered consisted of 0.5 g of unidentified marine shell. The marine shell encountered appeared very weathered and brittle. Stratum II was encountered between 29-42 cms. with both boundaries, with Stratum I and Stratum III, were diffuse and wavy. Stratum III was encountered at approximately 42 cms and it extended to the base of excavation at 51 cms. Stratum III consisted of very compact fine grained yellowish red (5YR 4/6) silt which contained no cultural material. The cobble concentration increased throughout Stratum III so that at the base of excavation the cobble concentration was approximately 80%. A profile was drawn of the northwestern face. Photos were taken pre- and post-excavation.

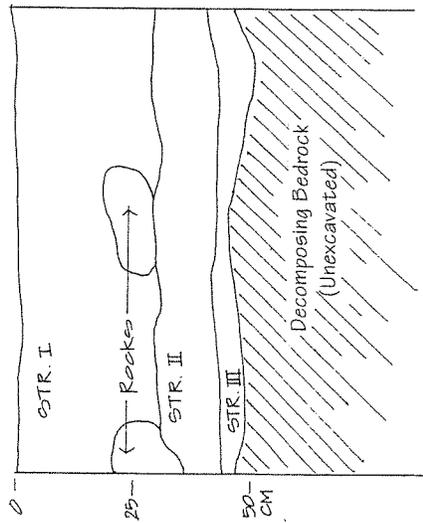

State Site# 50-50-10-5035

A shovel test probe was excavated within the interior of site 5035. The test probe was approximately 54 cm x 48 cm (at the surface), and was excavated to a maximum depth of approximately 29 cms. Two strata were encountered during excavation (Figure 40), Stratum I, a 2.5YR 4/4 to 4/6 reddish brown compact silt, and Stratum II, a 7.5YR 2/3 to 2/4 brown. Stratum II was only encountered in a small pocket in the northwest corner of the probe. Both strata contained plentiful roots and rootlets, and numerous basalt cobbles. Stratum II appeared similar to the weak cultural layers encountered at site 5033 and 5034, although no cultural material was encountered at site 5035. Decomposing bedrock was encountered at the base of excavation. A profile was drawn of the northwest face. Photos of the test pit were taken pre- and post-excavation.

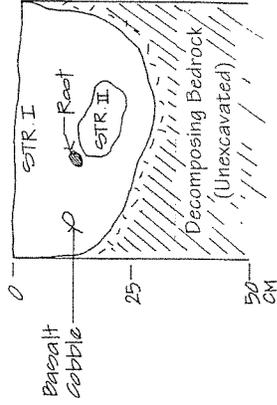

- Stratum I: (0-18)** Very compact, fine grain, yellowish red 5YR 5/6 clay silt with a high concentration of roots and rootlets.
- Stratum II: (18-25)** Compact very fine grain dark reddish brown (5YR 3/2) silt which contained cultural material.
- Stratum III: (25- BOE)** Very compact fine grained yellowish red (5YR 4/6) silt which contained no cultural material.

Figure 38 State site 50-50-10-5033: Post excavation profile displaying test unit, view to south

- Stratum I:** Very compact, fine grain, reddish brown 2.5YR 4/4 clay silt with a high concentration of roots and rootlets.
- Stratum II:** Compact very fine grain brown (7.5YR 2/4) silt which contained cultural material.
- Stratum III:** Very compact fine grained yellowish red (5YR 4/6) silt which contained no cultural material.

Figure 39 State site 50-50-10-5034: Post excavation profile displaying test unit, view to northwest

- Stratum I:** Compact 2.5YR 4/4 to 4/6 reddish brown clay silt
- Stratum II:** Compact 7.5YR 2/3 to 2/4 brown clay silt. Stratum II was only encountered in a small pocket in the northwest corner of the probe.

Figure 40 State site 50-50-10-5035: Post excavation profile displaying test unit, view to northwest

### VIII. SURVEY RESULTS

The study corridor is 300 ft wide, 150 ft on either side of centerline. An area 400 ft wide, 200 ft on either side of centerline, was surveyed to insure complete coverage of the study area. During the inventory survey a total of 126 structural and nonstructural features were identified within the study area. The archaeological features were organized into seventeen distinct sites. Of the seventeen sites encountered during the present study twelve are located within 150 ft of the corridor centerline. The other five sites (3729, 3743, 5029, 5031, and 5032) are located within 200 ft of the corridor centerline.

The seventeen sites are associated with a variety of functions, including traditional Hawaiian temporary habitation (3742, 3743, 3745, 5032, 5033, 5034, and 5035), agriculture (3727, 3728, and 4766), symbolic (petroglyph sites 5029 and 5031), animal husbandry (5030), a marker (3729) and historic military training activities (4773, 4776 and 4778).

A portion of the Kihei end of the corridor was subject to an inventory level survey by Xamanek Researches prior to the present study (Fredericksen et al 1994c). Six sites from the Fredericksen et al 1994c survey are located within our present project area, they are 3727, 3728, 3729, 3742, 3743, and 3745. Site type, function, age, significance and recommendations for the aforementioned six sites are taken directly from the Fredericksen et al 1994c report.

The results of the inventory survey reflect the broad range of land use varying from traditional Hawaiian temporary habitation and petroglyphs, to historic military, ranching and agricultural activities.

#### Traditional Hawaiian Sites

##### Temporary Habitation

Traditional temporary habitation sites were encountered from 45 to 460 ft a.m.s.l. portion of the corridor above Kihei within the *ahupua'a* of Waiakoa and Kaonoulu (Table 8). A total of six sites within the project area are interpreted as having functioned as temporary habitation sites. Sites types include surface scatters (3742, 3743, and 3745), three types of small enclosures (5033 (rectangular), 5034 (square), and 5035 (c-shape)) and finally a rather unique site that consists of a series of boulder alignments (5032). Generally we can place the temporary habitation sites into two broad categories: structural and non structural.

In general all of the non-structural temporary habitation sites (i.e. surface scatters of cultural material) were located between the elevations of 45 to 105 ft a.m.s.l., while all of the temporary habitation sites that contained structural elements (i.e. enclosure) were located at elevations between 205 to 460 ft a.m.s.l. Due to the fact that the majority of the cultural material from the three surface scatter sites (3742, 3743, and 3745) was collected during a previous inventory survey (Fredericksen et al. 1994c) it is difficult for us to re-evaluate those three sites based on the evidence observed in the field. Therefore sites 3742, 3743, and 3745 will not be discussed in detail here (see Fredericksen et al. 1994 for complete analysis).

Table 8: Comparisons of Temporary Habitation Sites

State Site #	Type	Sub-surface Deposits	Cultural material on surface	<i>Ahupua'a</i>	Const. Style	Elev. ft a.m.s.l
50-50-10-3742	Surface Scatter	No	Yes	Kaonoulu	NA	65
3743	Surface Scatter	No	Yes	Kaonoulu	NA	45
3745	Surface Scatter	No	Yes	Kaonoulu	NA	105
5032	Alignments	Possibly	Yes	Waiakoa	Alignm ent	360
5033	Rectangular Enclosure	Yes	No	Waiakoa	Core	460
5034	Square Enclosure	Yes	No	Waiakoa	Core	235
5035	C-shaped Enclosure	Possibly	No	Waiakoa	Indeter minate	205

Site 5032, a series of boulder alignments, was determined to be a temporary habitation site based on the presence of cultural material observed on the surface which is typically associated with pre-contact Hawaiian culture. Items observed on the surface included a basalt net sinker stone, a basalt adz preform or core and a single piece of marine shell midden. The construction style of the site, which is an alignment, is typical of the two military sites within the project rather than the other structural temporary habitation sites. The size of 5032 is unique when compared to the other temporary habitation sites or military sites in that it is considerably longer (the western alignment at the site is approximately 26.0 m in length). 5032 is located 190 ft to the north of the study area centerline at approximately 360 ft a.m.s.l within the *ahupua'a* of Waiakoa. A 50 by 50 cm test unit was excavated at the site. No cultural material was observed during the excavation and only a single stratigraphic layer was observed.

Site 5033 is a rectangular enclosure that appears to be a traditional Hawaiian temporary habitation site that was modified historically either by the military or by hunters (see Figure 29). The unmodified portions of the sites enclosure wall are collapsed but appear to have been core filled at one time. This contrasts with the construction style of the military features at site 4773, which were normally alignments or rough stacking lacking core filling. No cultural material was observed on the surface at site 5033. A 1.0 m

by 50 cm test unit was excavated at the site. Traditional marine shell midden was encountered from a weak cultural layer during the excavation. A total of 29.8 g of marine shell midden was collected from the excavation. The site is located 150 ft north of the study area centerline at approximately 460 ft a.m.s.l.

Site 5034 is a square enclosure located 75 ft south of the study area centerline at approximately 236 ft a.m.s.l. The site appears to have been impacted by bulldozer, which appears to have crossed the northwest corner of the site damaging both the west and north walls of the enclosure. A 1.0 m by 50 cm test unit was excavated at site 5034 to better ascertain function. A very sparse amount (0.5 g) of marine shell midden was encountered from a weak cultural layer during the excavation. The construction style of the site is similar to site 5033 in that the walls are severely collapsed but appear to have been core filled.

Site 5035 is a C-shaped enclosure located 50 ft north of the study area centerline at approximately 205 ft a.m.s.l. No cultural material was observed at the site. A shovel test probe was excavated at the site. No cultural material was encountered during the probe but a darker stained layer, similar to the weak cultural layers at Sites 5033 and 5034, was encountered.

Temporary habitation sites were expected in the project area along former trails from the uplands to the coast (such as the Waiakoa Trail; See McGerty and Spear 2000:44). No physical evidence of a former trail was observed in the project area but it is probable that a trail traversed the Kaonoulu and/or the Waiakoa portions of the project area.

#### Petroglyphs

Petroglyphs were encountered in both Kaliainui and Waiakoa Gulches (5029 and 5031). Site 5029 consists of a panel of three historic petroglyphs pecked into the northern cliff face of Kaliainui Gulch. State site 5031 consists of at least three traditional petroglyphs of anthropomorphic figures located on the southern side of Waiakoa Gulch. The petroglyphs are pecked into the cliff face. Kaliainui Gulch has previously identified petroglyph sites located at higher elevations. Both petroglyph sites are located 200 ft from the study area centerline, site 5029 is 200 ft to the east of centerline and site 5031 is 200 ft west of centerline. Site 5031 was originally located 50 ft west of centerline, but the corridor was adjusted 150 ft to the east to avoid any impact to site 5031.

#### Agriculture and Marker

Three sites from the Kihei end of the survey (i.e. Fredericksen *et al.* 1994c) are functionally associated with agriculture and a marker. All three sites consist of stone piles or stone cairns. All three sites are of an indeterminate age. Site 3728 and 3729 were almost completely excavated during the 1994 inventory survey (*Ibid.*) which makes re-evaluation difficult.

#### Historic Land Use

##### Military Sites

A large historic military site, State site 50-50-10-4773, was encountered between 500 and 740 ft. a.m.s.l. The corridor passes directly through the site. A total of 102 features were documented. Features were generally very simple boulder alignments of varying shapes including C-shape, U-shape, rectangular, square, oval and circular enclosures. In addition fox holes were encountered typically consisting of a hole excavated into the soil with a small stacking or alignment of boulders along one side. Two 1.0 m by 50 cm test units and two shovel test probes were excavated at four separate features from different areas of the site. None of the test probes or excavations at the site encountered any cultural material and only a single stratigraphic soil layer was encountered. The site extends well outside of both the east and west sides of the corridor. The overall extent of the site was not determined.

Site 4776 is a small oval enclosure located 50 ft north of the study area centerline at approximately 65 ft a.m.s.l. The feature is isolated with no other features of similar type within the area. A 1.0 m by 50 cm test unit was excavated at the site. A single stratigraphic layer was observed. No cultural material was observed at the site either on the surface or from the test excavation. The site is interpreted as a military site based on the construction style, size, location and lack of traditional cultural materials. It must be noted that there is a considerable evidence of bulldozing in the area of site 4776 so it is possible that it was not an isolated site and that the surrounding sites or features have been destroyed.

Site 4778 is a small L-shaped enclosure situated 75 ft east of the study area centerline on the southern edge of Waiakoa Gulch. The feature is similar to 4776 in that it is isolated and there is no observable cultural material on the surface. There does not appear to be the potential for subsurface cultural deposits in the area. The wall of the enclosure appears to be constructed partially on exposed outcrop and partially on exposed C-horizon. The site is interpreted as a military site based on the construction style, size, location and lack of traditional cultural materials. No cultural material of any kind was observed in the area.

##### Historic Sugar Cane Agriculture

Remnants of historic sugar cane cultivation infrastructure were observed and recorded in the section of the corridor between Pūlehu and Oma Opio Roads (site 4766). The corridor passes directly through the site. Recorded features included five inactive irrigation ditches that cross the corridor perpendicularly. The ditches are earthen. Each ditch is crossed by two to three small bridges. The bridges are constructed of concrete and lumber and are in poor condition. Two of the recorded features consist of clearing mounds associated with historic sugar cane cultivation. In addition to the recorded features barely discernable cross slope earthen sugar cane irrigation ditches were also observed.

#### Cattle Walls

Sections of cattle walls were encountered along the north side of Waiakoa Gulch. Site 5030 documents the sections of cattle walls within the corridor. The cattle walls are short sections that prevent the cattle from either entering or exiting Waiakoa Gulch. The walls were encountered throughout the corridor along the north side of Waiakoa Gulch.

#### IX. SIGNIFICANCE OF THE HISTORIC PROPERTIES

A total of seventeen sites of archaeological significance are present in the project area (see Table 6). Sites were evaluated for significance according to the broad criteria established for the National and State Registers. The five criteria are:

- Criterion A Site reflects major trends or events in the history of the state or nation.
- Criterion B Site is associated with the lives of persons significant in our past.
- Criterion C Site is an excellent example of a site type.
- Criterion D Site may be likely to yield information important in prehistory or history.
- Criterion E Site that has cultural significance, such as religious structures (shrines, *heiau*) or human burial locations.

All seventeen sites recorded all are classified under significance criterion D. Two sites were also classified under significance criterion C.

Criterion D - "site may be likely to yield information important in prehistory and history" - is assigned to all of the sites. It is believed that these sites have yielded varying types of scientific data and contribute to some or all of the following analyses: (1) material culture; (2) site architecture and function; (3) chronology; and (4) settlement patterns. We believe that twelve of the seventeen sites lack any additional scientific data beyond what was acquired during the inventory survey (i.e. site configuration, description and plotted location).

Criterion C - "site is an excellent example of a site type" - is assigned to the two petroglyph sites (5029 and 5031). Sites 5029 and 5031 are considered excellent examples of smaller petroglyph sites in the lower *Kula* gulches.

#### X. RECOMMENDED TREATMENT

Of the seventeen sites recorded in the project area, it is recommended that three sites be subjected to a program of data recovery and two sites be preserved. The remaining twelve sites (3727, 3728, 3729, 3742, 3743, 4765, 4773, 4776, 4778, 5030 and 5034) in the project area are not recommended for further work. Based on documenting location, type, age and function sufficient data has been generated from the present inventory level survey that no further research appears warranted for the 12 sites.

The three sites (5032, 5033 and 5035) recommended for data recovery should be subjected to a program of additional data collection. All of the sites recommended for data recovery have been assigned a temporary habitation function. Data recovery at these sites will probably consist of further excavations in accordance with a data recovery plan, which will need to be approved by SHPD/DLNR.

The two petroglyph sites (5029 and 5031) are recommended for preservation. The specifics regarding preservation of the two sites will need to be addressed in a preservation plan.

**EXECUTIVE SUMMARY**

At the request of Parsons Brinckerhoff, Inc., Scientific Consultant Services (SCS) conducted a Traditional Cultural Impact Study to be included within an Environmental Impact Statement for the Kīhei-Upcountry Maui Highway project (TMK 2-2 and 2-3).

This project contains several components which primarily include appropriate archival/background research, identification and consultation with a number of informants, and a synthesis and assessment of findings from applicable archaeological work, archival/background, and ethnographic research.

Many individuals were recommended to SCS through consultation with OHA (O'ahu and Maui Island representatives) as well as suggestions from long term Maui and Kula community Residents. Interviews were conducted on Maui between the dates of June 19 to August 4, 2000 with Charles Ke'au, Ed Uweko 'olani, Henry Silva, Sonny Manoa, Randal Moore, Henry Rice, Nancy Purdy, Silvia Hunt, Ethel Nagata, and Frank Gouveia. Telephone interviews were also conducted.

Numerous cultural features were reported during this study including religious sites, trails, petroglyphs, and the general location of burial caves. Topographic anomalies associated with pre-Contact events, individuals, or recorded in legends and stories were also noted. Several of these sites are not located within the project area. Other sites are considered archaeological as they are no longer in use and their location is unknown.

Interviews with individuals did not lead to the identification of any specific Traditional Cultural Properties as defined by the National Register Criteria for Evaluation as:

Any historic property associated with the traditional practices and beliefs of an ethnic community or members of that community for more than fifty years. These traditions shall be founded in a community's history and contribute to maintaining the community's cultural identity. Traditional associations are those demonstrating a continuity of practice or belief until present or those documented in historical source materials, or both. These properties include but are not limited to, some types of archaeological sites.

Presently, the only known culturally significant sites in the project area are the archaeological features that have been previously identified.

------------	--

## INTRODUCTION

At the request of Parsons Brinckerhoff, Inc., Scientific Consultant Services (SCS) conducted a Traditional Cultural Impact Study to be included within an Environmental Impact Statement concerning the Kihai-Upcountry Maui Highway project (TMK 2-2 and 2-3, Figure 1). The highway project presently incorporates eight combinations of two Kihai and four Upcountry terminus options (Figure 2).

SCS provided Section 106 consultation for the project in the form of ethnographic interviews of local residents. Oral interviews were performed to determine if there were special relationships between identified cultural properties and proposed locations for the road corridors, as well as defining the characteristics and classifying the associated cultural activities and uses of those potential properties.

As stated by the Procedures For Ethnographic Inventory Surveys (Draft) a Traditional Cultural Property is defined as:

Any historic property associated with the traditional practices and beliefs of an ethnic community or members of that community for more than fifty years. These traditions shall be founded in a community's history and contribute to maintaining the community's cultural identity. Traditional associations are those demonstrating a continuity of practice or belief until present or those documented in historical source materials, or both. These properties include, but are not limited to, some types of archaeological sites.

Traditional Cultural Properties might include presently used ancient fishing *ko'a*, coastal zones providing edible shell fish and seaweed, land areas harvested for culturally significant plants, and structures associated with ceremonies conducted for graduates of *hula hula*.

It is also stated in National Register Bulletin No.38 that an eligible site may be:

...the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archaeological value of any existing structure.

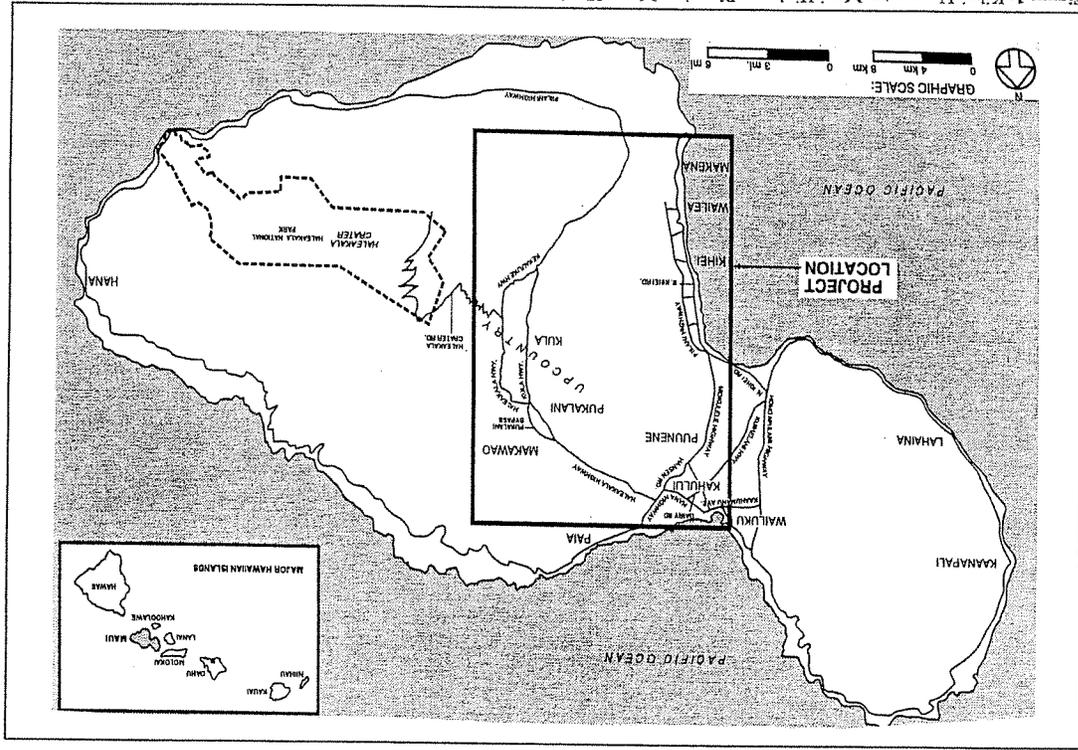

Figure 1: Kihai-Upcountry Maui Highway Planview Map of Project Area (From Draft EIS 1999).

A property could be considered a cultural site and eligible for the National Register if association with a significant event or activity can be established, even if there is no tangible evidence of the event or activity (National Park Service 1990).

Although the National Register does not encompass intangible resources as actual "cultural properties", it recognizes the relationship between the property and the activities and beliefs associated with it as significant, in as much as it may be these activities and beliefs that give the property its importance.

According to the Guidelines for Assessing Cultural Impacts adopted by the State of Hawai'i (1997):

The types of cultural practices and beliefs subject to assessment may include subsistence, commercial, residential, agricultural, access-related, recreational, and religious and spiritual customs. The types of cultural resources subject to assessment may include traditional cultural properties or other types of historic sites, both man made and natural, including submerged cultural resources, which support such cultural practices and beliefs.

#### INTERVIEW GUIDELINES

Several publications pertaining to the process of evaluating and documenting Traditional Cultural Properties and for assessing cultural impacts provided guidance in gathering information for this report. The National Park Service was directed to prepare guidelines to assist in the documentation of intangible cultural resources and to encourage the identification and documentation of such resources by State and Federal agencies. National Register Bulletin No. 38 (National Park Service 1990) was developed and intended to be an aid in determining whether properties thought to have traditional cultural significance are eligible for inclusion in the National Register.

The National Register of Historic Places states:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association.

Criteria established within the National Register for evaluating a property's eligibility for listing in the National Register includes properties that:

- (a) are associated with events that have made significant contribution to the broad patterns of our history; or
- (b) are associated with the lives of persons significant in our past; or
- (c) embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- (d) have yielded, or may be likely to yield information important in prehistory or history. [36 CFR, part 60.4]

Guidelines adopted by the State of Hawaii's Environmental Council provide information concerning cultural practices and cultural features that may be impacted by certain activities, such as land development, and requires environmental assessment of cultural resources in determining the significance of a proposed project (OEQC 1997).

Consultation on February 10, 2000 with a State Historic Preservation Division (SHPD) representative resulted in guidance provided in the "Draft Procedures For Ethnographic Inventory Surveys" (pers comm. Holly McEldowney, State Historic Preservation Office 1999).

Preparation for the archival-historical section of this report included reviewing Hawaiian Land Commission Award (LCA) records from the Māhele (Land Division) of 1848; archival issues of *The Honolulu Advertiser*; *The Polynesian*; journal information recorded by Capt. King (in Beaglehold 1967), LaPérouse (1798), George Vancouver (1984), Archibald Menzies (1920); Samuel Kamakau (1961), Abraham Fornander (1917-1919 and 1969), Isabella Bird (1974); Elspeth Sterling (1998); Inez Ashdown (1970); Daisy Kalaupa and Mary Kawena Pukui (1983); and Craighill and Elizabeth Handy (1972).

An archaeological reconnaissance conducted within the proposed bypass highway segments identified 25 historic sites (Folk *et al.* 1997). Other archaeological projects through the years have contributed to our understanding of traditional settlement patterns and economic strategies. Preparation of this report included reviewing articles and documents describing archaeological data and surveys of the project area including those by Thomas Thrum (1906-18), John Stokes (1909-16), Winslow Walker (1931), and more recent scholars.

### SCOPE OF WORK

The Scope-of-Work (SOW) for this project includes archival/background research, identification and consultation with a limited number of informants, a synthesis and assessment of the findings from appropriate archaeological work, and archival/background and ethnographic research.

The general intent of this Section 106 effort focused on a selected number of knowledgeable individuals to aid in determining the spatial relationships between potential Traditional Cultural Properties and locations for the proposed highway corridors and characteristics and uses of any potential properties. Of particular concern to the present project was the identification of places and/or natural features or objects that may not have been physically modified by humans and were, therefore, not readily recognized as historical properties during conventional archaeological work. In addition, the identification and description of associated cultural practices were deemed of utmost importance.

Archival/background research required accessing both published and unpublished sources including surviving recorded legendary and traditional accounts, early historical journals, narratives and other written accounts describing life-styles and noted events, missionary accounts, land records such as Land Commission Awards and their associated claims and testimonies, Royal Patent Grants, Boundary Commission records containing survey notes and maps; and information supplied by previous archaeological studies.

Informant interviews form a critical part of the assessment process. Individuals having knowledge of traditional practices and beliefs associated with a project area or knowing of historical properties within a project area are sought for interviews. Those persons whose knowledge is founded in a continuity of traditions passed down from preceding generations and the individual's personal familiarity with the project area, are important. Ethnographic inventory survey, which identifies and acceptably documents historic properties within the project area is founded on this information.

Preliminary contact was made to individuals recommended to SCS by OHA and Parsons Brinckerhoff, Inc. An announcement was sent over the Internet to members of the Hawaiian

Nation on Maui asking for contacts of individuals that were familiar with the project area. During this project, more than 50 people were contacted and interviewed pertaining to Traditional Cultural Properties and activities in the project area. Unless the interviewee indicated knowledge of Traditional Cultural Properties, the conversation was not taped. General points of interest were recorded in field notes and summarized below.

The proposed Kīhei-Upcountry Highway alignments mainly impact ranch and agricultural lands. Several avenues of investigation were, thus selected, including contacting individuals associated with the ranches and those previously living in plantation camps near the proposed highway alignments. A descendant of an upcountry Land Commission Award recipient whose family had remained was also contacted (Mrs. D. Purdy).

This report contains a cultural historical overview of the project area, a review of archaeological and ethnographic studies of the project area, land tenure history, the results of consultations with knowledgeable individuals in the community, and a synthesis and assessment of the findings.

### GENERAL DESCRIPTION OF PROJECT AREA

The island of Maui encompasses 1,873 square kilometers (729 square miles) and ranks second in size of the eight main islands in the Hawaiian Archipelago. The island was formed by two volcanoes, Mount Kukui in the west and Haleakalā in the east. The younger of the two volcanoes, Haleakalā, soars 2,727 m (10,023 feet) above sea level and embodies the largest section of the island.

Unlike the amphitheater valleys of West Maui, the flanks of Haleakalā are distinguished by gentle slopes. Although it receives more rain than its counterpart in the east, the permeable lavas of the Honomanū and Kula Volcanic Series prevent the formation of rain fed perennial streams. The few perennial streams found on the windward side of Haleakalā originate from springs located at low elevations. Valleys and gulches, such as Waiohuli Gulch, were formed by intermittent water run-off.

Along the coastal side of the windward side of Haleakalā, rainfall has been measured to 4,000 mm a year and over 9,000 mm near the mountain's summit (Stearns and Macdonald 1942:35-42).

Kula, situated on the leeward slope, is located in the rain shadow of Haleakalā. On the leeward side of East Maui, rainfall averages range from 500 mm to 750 mm in the project's uplands to less than 400 mm in the coastal section. The combined arid conditions and lack of reliable water sources resulted in the importance of the expensive upland dryland field systems established within the project area. Kula consists of sloped plains with finger ridges and a outcrops (Figures 3, 4, and 5).

The boundaries of the project area extend from Pi'ilani Highway on the coast, west, to the western flank of Haleakalā and Kula Highway (Upcountry Maui). Project area elevation ranged from approximately 18 to 31 meters (60-100 ft.) above mean sea level (amsl) on the Kihei coast to approximately 732 meters (2,400 ft.) amsl at terminus U3 in the upland *ahupua'a* of Pūlehuui (see Figure 2).

Figure 3: Kula Lands (June 21, 2000).

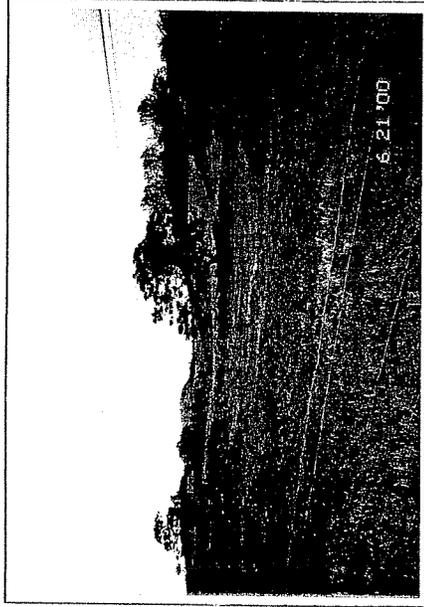

Figure 4: Photograph of Up-Country Kula Lands (June 21, 2000).

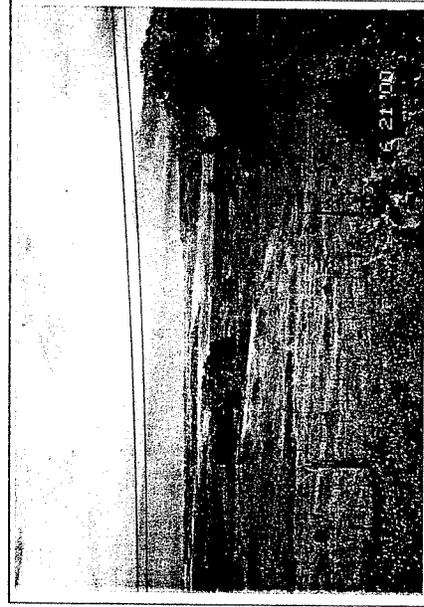

Figure 5: Photograph Showing Downslope Kula Looking Towards West Maui (June 21, 2000).

The north/south boundary extends from Kailua to Kama'ole Ahupua'a. A total of 13 ahupua'a, or portions thereof, are incorporated within project boundaries including Kailua, Keahua, A'apueo, Kaliahinui, Oma'opio, Pūlehu Nui, Kealahou 3 and 4, Waiakoa, Ka'ono'ulu, Kōheo 1 and 2, Waiohuli, Kēōkea, and Kama'ole.

### TRADITIONAL AND HISTORICAL LAND TENURE

Traditional Hawaiian subsistence was based on agricultural production, marine exploitation, animal husbandry, and wild plant and bird collecting. Extended household groups settled in various ahupua'a, smaller land divisions within a district, that customarily continued inland from the ocean. Within the ahupua'a, residents were able to harvest from both the land and the sea. Ideally, this situation allowed each ahupua'a to be self-sufficient by supplying needed resources from different environmental zones (Lyons 1875:111). Many ahupua'a (Kōheo, Alae, Kamehame Nui, Pūlehu Iki, etc.), in the traditional Kula District were not typical as they were land locked (Figure 6).

In pre-Contact Hawai'i there were primarily two types of agriculture, wetland and dryland, both of which are dependent upon geography. Conditions in West Maui with its perennial streams were ideal for wetland *kalo* (*Colocasia esculenta*) agriculture incorporating pond fields and irrigation canals. Other cultigens such as *kō* (sugar cane, *Saccharum officinarum*) and *mai'a* (bananas, *Musa* sp) were also grown and where appropriate, the production of such crops as *uala* (sweet potato, *Ipomoea batatas*) occurred. This was a typical agricultural pattern seen during traditional times on all the islands of Hawai'i (Kirch and Sahlins 1992:5, 119; Kirch 1985).

Dryland agriculture was an important component of Kula's traditional economy. Although West Maui contained vast wetland pond fields, they produced the least amount of taro of the main Hawaiian islands. East Maui's extensive dryland fields are thought to have produced crops of sweet potato equal to Hawai'i Island, and outproduced O'ahu and Kauai (Handy and Handy 1972:488).

An account of traditional planting methods from the newspaper *Ka Nuipepa Ku'oko'a* began: "...rocky lands in the olden days were walled up all around with the big and small stones of the patch until there was wall (*kaiaiwai*) about 2 feet high..." (March 24, 1922).

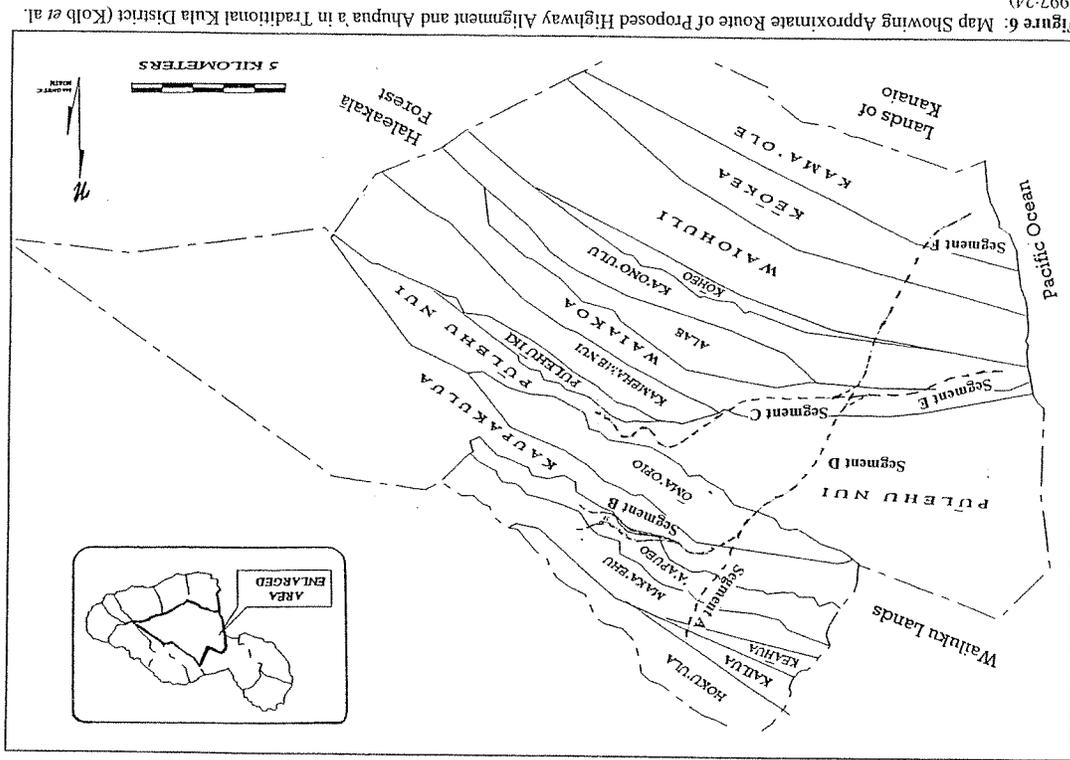

Figure 6: Map Showing Approximate Route of Proposed Highway Alignment and Ahupua'a in Traditional Kula District (Kolb et al. 1997:24)

More relevant to the project area is Handy and Handy's description of environmental conditions on the leeward side of Haleakalā:

The great bulk and altitude of Haleakalā makes its southern flank practically a waterless desert, and the southeast and west flanks relatively dry, so that there were no *lo`i* (pond fields) cultivation at all. The arid country below the west and south slopes of Haleakalā, including Kula, Honua`ula, Kahikinui, and Kaupo, were dependent on sweet potato (Handy and Handy 1972: 488).

Handy and Handy described planting methods in the drier sections of Kula:

Where potatoes are planted in crumbling lava with humus, as on eastern Maui and in Kona, Hawaii, the soil is softened and heaped carelessly in little pockets and patches using favorable spots on slopes the crumbling porous lava gives ample aeration without much mounding (1972:131).

As the land was cleared for dryland agricultural fields, the upland native forest deteriorated. The forest was an important resource to pre-Contact populations as well as historic settlements as it provided medicinal plants, wood, and birds hunted for food as well as their feathers. However, as agriculture expanded, deforestation occurred. Traditional clearing methods are illustrated in the story of Kihapi`ilani, a chief of Maui in the 1600s. The chief went to the boundary of Kula and Makawao: "...Seaward of this place, along the stream on the side adjacent to Kula...that is the place Kihapiilani set fire to. There he farmed and planted sweet potatoes" (Manu 1884).

A typical dryland forest might include a mixture of *namane* (*Sophora chrysophylla*), *ʻōhi`a lehua* (*Metrosideros polymorpha*), *naio* (*Myoporum sandwicense*), *koa* (*Acacia koa*), *ʻiitihi* (*Santalum* sp.), *tama* (*Diospyros hillebrandii*), *olopua* (*Nestegis sandwicensis*) and others. Avifauna valuable for feathers would have most commonly included *ʻamakihi* (*Hemignathus virens*), *ʻapapane* (*Himatione sanguinea*), *ʻi hwi* (*Vestiaria coccinea*), and *ʻoma`o* (*Myadestes obscurus*). A number of flightless ground-dwelling birds, now extinct (*Porzana* sp.), were hunted as food as were other endemic and indigenous birds (Kolb *et al.* 1997:227).

Kula was always an arid region. In spite of this factor, a considerable population existed along its extended, low seashore (where the fishing was excellent) and the lower westward slopes of Haleakalā. So far as is known, the Kula region supported no Hawaiian taro and the fishermen in this section must have been dependent mainly on *poi* brought from the wet lands of Waikapū

and Wailuku across the plain. This supplemented their usual sweet potato diet: "... *uala* was the staple of life here" (Handy and Handy 1972:511).

In spite of the dry, inhospitable conditions of Kula, many chose to settle on the coast as well as inland. An important component of the traditional Kula subsistence economy was fish ponds, several of which were constructed on the south Maui coast. The remnants of two ponds still exist: those of Kalepolepo and Waiohuli. Three other fishponds were identified in aerial photos along the coastline of Waiohuli and Keōkea (Kolb *et al.* 1997:27).

Kalepolepo, located on the boundary of Ka`ono`ulu and Waiohuli Ahupua`a was a royal fishpond containing mullet. Although it is not known when it was first built, it is recorded that while acting as overlord on Maui in the sixteenth century, Hawai`i Island chief `Umi rebuilt the sea walls of three ponds one of which may have been Kalepolepo (Sterling 1998:251). When Kamehameha I ruled as chief over Maui, it is reported that he rebuilt the collapsed south side of Kalepolepo (Kamakau 1869).

#### PRE-CONTACT

The division of Maui's lands into districts (*moku*) and subdistricts was supposedly performed by a *kahuna* named Kalaiha `ōhi`a, during the time of the *ali`i* Kaka`alaneo (c., 1500s) (Beckwith 1940:383). Traditionally, Maui consisted of twelve political districts: Honua`ula, Kula, Hāmākuapoko, Hāmākuāloa, Kahikinui, Kaupō, Kīpahulu, Hāna, and Ko`olau in East Maui and Wailuku, Ka`anapali, and Lahaina in West Maui (Figure 7).

In historic times, the original twelve traditional districts were reduced to four: Lahaina, Wailuku, Hana, and Makawao which included the former Hāmākuapoko, Hāmākuāloa, Kula, and Honua`ula. Makawao is also the name of an individual *ahupua`a* located inland of the present town of Hāli`imaile.

Traditional boundaries occurring between Kula and Hāmākuapoko were the lands of Hāli`imaile and Hōkū`ula. These *ahupua`a* are not typical as they are land locked and do not extend to the sea.

Kula translates as "plain, field, open country, pasture" and is used to describe the country in back of the seashore or the name of a region near the base of a mountain (Pukui and Elbert 1957:164; Lucas1995). In 1884, a governmental act differentiated between dry or *kula* land and wet or *kalo* land (Pukui and Elbert 1957:164).

The few references to the Kula District found in traditional sources illustrates its relative lack of importance compared to Hana, Lahaina, Waikuku and other population centers on Maui. Most references to Kula are minimal even when describing important battles and their participants.

#### Traditional Legends and Associations

A chant from the 1800s reproduced in Sterling (1998:7) notes the names of the winds of Maui and Moloka'i, including mention of Kula:

...The cold wind travels over the uplands of Kula  
And tears down on the pili grass.  
The wind of Kula is the Nau [The kehau is of Kula]...(Formander 1919:100).

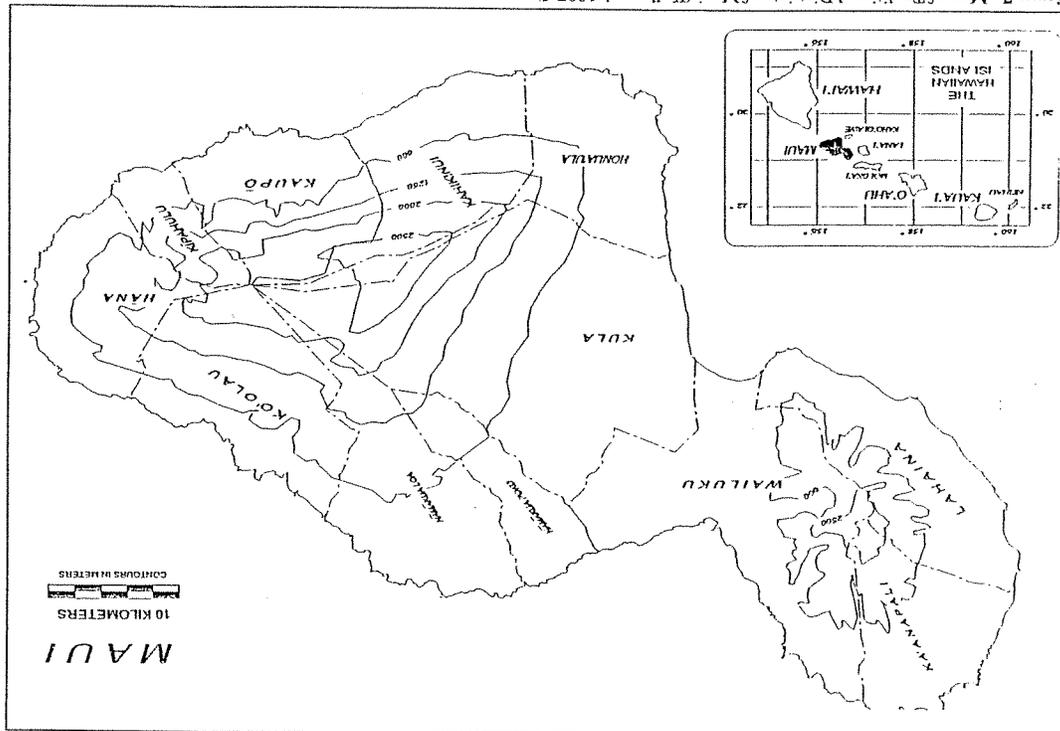

Several historical and legendary sayings regarding Kula and the lands contained therein survived and were recorded by Mary Kawena Puku'i (1983). Some are derogatory and some compare natural phenomena of Kula to human qualities representing some of the traditional cultural values held by the Hawaiians of Maui.

According to surviving traditions, the skills of the people of Kula appear to have been confined to the upland environment. It was said that in their ignorance of fishing matters, they would try and scale the suckers off a squid's legs (Sterling 1998:243).

*He aina o Kula na kaulana  
Mai na ahi kahido  
he aina i pihia ka e'epa  
Kau na nahi i ka pikopiko i ka he'e*

Kula is a land that is famous  
From the days of the ancient chiefs  
A land full of peculiarities  
For the scaling of the suckers of the octopus (Daisy Kalaupa, in Sterling 1998).

Figure 7: Map of Traditional Districts of Maui (Kolb et al 1997:5).

Handy and Handy reported that Haleakalā crater was a final resting place for the people of Kula and Honua ulua of the "Clan of Pele" (1972:336). These devotees would travel at night to the edge of the crater and throw the bones of their dead into the volcano.

Kula, lying in the lee of Haleakalā, would periodically suffer from droughts resulting in famines. During a drought in the time of Kihapi'ilani (c., A.D. 1500-1600s) people were forced to subsist on weeds such as *lau'ele*, *pualele*, and *popolo* (Kamakau 1961:23). They could restore their crops only by obtaining potato slips from neighboring Hāmākuapoko and Hāi'i'maile.

The place names of political entities were often derived from legends, significant events, or land features. An example of this is the story of 'A'apueo, the owl.

According to legend, a female owl lived in the upland of Kula during the reign of Kanenuiakiwākalu (n.d.). A man named Kapoi from Wailuku smashed her eggs inciting a battle between the owls and the people of Wailuku. 'A'apueo found revenge for the destruction of her eggs at the death of Kanenuiakiwākalu during the battle (Uaua 1871:2). Thus, the origin of the name of one of the *ahupua'a* in Kula.

The sacred site of Pu'u Pane is located in the *ahupua'a* of 'A'apueo (up slope of the project area). Located on a crest of a hill, east of Halekalā Highway at approximately 2573 feet amsl, Pu'u Pane was described by M. Manu in an article in *Ki'io'ko'a* (Feb 23, 1884). Manu stated that Pu'u Pane was declared by Kihapi'ilani as sacred and no commoner could climb the hill because it was a *heiau* for the high chiefs of Maui from ancient times to Kihapi'ilani. A *kahuna* lived at 'A'apueo to guard the hill. Several one course high basalt rock alignments were identified on the hill in 1973 and may be the remains of the religious structure.

A small land division named Kohoito located between Makaehu-Keahua and 'A'apueo Ahupua'a appears on a map surveyed between 1872-1879 (W. D. Alexander and M. D. Monsarrat). Within this section is a hill named Pu'u o Welī. Although distinctive in form, no traditional references were found associated with it except that it was included in Grant No.1829 held by someone named Keawe in the 19<sup>th</sup> century.

According to Ashdown, Central Maui was known as the Kula o Ka Ma'omao, or the land of mirages. It was here that the lost souls wandered until they could find their way to rest (Ashdown n.d.). Ashdown recorded:

In the area of Waihin'oma'o (now called the "Baseball Park" above the modern Poli-Poli camp) and nearby lua-na-na-ne in the ahupua'a of Kama'ole, was a structure said to be for bird catching ceremonies because that region was full of birds... The woman of 'Omano dwelt at Mamane and she was called Mamao because she was of very high rank. She was so sacred that others must keep their distance... A handsome lesser chief tried to win her. Of course this was kapu. Her heart was heavy with the knowledge that because he came near to her shadow he had to be punished. A high priest conducted ceremonies of purification at the temple there and revived happiness...(1971:46)

Maui is home to important chiefly lineages and paramount chiefs of the Ulu-hema line.

Leaders including Hāho, who played an important role in formally establishing chiefly prerogatives of rulership and prestige by forming an archipelago-wide chiefly council, Pi'ilani and his son Kihapi'ilani, who began construction of public works, Kekaulike, paramount chief of Maui in the 1700s, the great warrior chief Kahekili, and Ka'ahumanu, *kāhuna waihinē ali'i o ka 'i'i* (the favorite wife) of Kamehameha I, are but a few (Formander 1969, vol. 2:28-29; Kamakau 1963; Desha 2000:49).

By A.D. 1400 to 1500, Maui's political districts were consolidated into two polities: East and West Maui (Formander 1969, Vol. 2:79; Kolb *et al.* 1997:16). The ruling *ali'i* of each polity were from separate genealogical lines (Figure 8) which contributed to the mutual hostility which was frequently sustained by skirmishes and wars. The *ali'i* of East Maui traced their origins to Kalahuimoku, a Hawai'i Island chief who had emigrated to Hāna and those in West Maui to a much older Maui line (Formander 1969, Vol. 2:78-79).

East Maui's ruling center was in Hāna but just as important were the districts of Ko'olau, Kīpahulu and Kaupō. West Maui had political centers at both Wailuku and Lahaina (Formander 1969, Vol. 2; Kamakau 1961, Kolb *et al.* 1997:15). Even by this early period, large settlements were appearing at Waihe'e, Waikapū, Honua'ula, Lahaina, and upcountry Kula, and the building of religious temples flourished (Kolb *et al.* 1997:17).

While Kahekili was subduing O'ahu's population, all was not well in Kula. Kamakau says:

During this period there were disturbances among the country people, not only on Oahu but also on Maui. The trouble arose through one of the lesser chiefs (*kaukauai'i*) named Ku-keawe, a favorite (*aikāne*) of Kahekili to whom Kahekili had given the privilege of letting his pigs run over the land of Kula and roasting them as he needed them. But he seized also the pigs belonging to the country people of Kula, Honua'ula, and Kahikinui, as far as Kaupo, and went with a large party to rob them of their wealth even with violence. This was the cause of the uprising of the country people called the "Battle of the pig-eating of Ku-keawe" (*Aipua ā-o-Ku-keawe*) (1961:142).

Both Maui and Hawai'i, now under the leadership of Kamehameha I, continued their war for dominance with Maui eventually being annexed by Kamehameha as he consolidated the Hawaiian Islands under his rule.

#### TRADITIONAL SETTLEMENT PATTERNS

Kula can be divided into four environmental zones (Kolb *et al.* 1997:147). The first is the coastal zone which includes the shoreline and surrounding area up to approximately 0.25 miles inland. The second is the "barren" or intermediate zone which is the largest and least agriculturally productive. The third is the upland zone located above the 30 inch rainfall line and extending into the fourth, or forest zone. Gardens were cultivated here during traditional times. The project area extends through portions of the first, second, and third environmental zones.

Archaeological investigations indicate a large amount of permanent settlement in the upland, at elevations above the 30 inch rainfall line in Kula (1997:191). Based on the feature types, number and size of *heiau* (9), rock art sites, and ancient agricultural fields found in this part of Kula (vicinity of alignments K2, U3, U2B), a large, permanent population is indicated.

Coastal settlement was also common. The existence of fish ponds (three at Kalepolepo in the vicinity of terminus K1) and coastal *heiau* (2) confirm the presence of a stable population relying on coastal and marine resources. Agriculture may have been practiced behind the dune berms in low-lying marsh land in the vicinity of Kealia Pond (*ibid.*:101). It is suggested that permanent habitation and their associated activities occurred from A.D. 1200 thru the present in both the uplands and coastal regions (*ibid.*:101)

Trails extended from the coast to the mountains, linking the two for both economic and social reasons. Several trails were identified and described in a study of Waiohuli and Kōōkea conducted in 1997 (Kolb *et al.* 1997:33). A trail known as the *alanui* or "king's trail" was located along the coast and traversed all the major communities of Kula. An upland trail running from 'Ulupalakua in Honua'ula to Olinda, extended through the same communities at an altitude of 700 m amsl. Two community trails linked the coast to the uplands. One trail called Kekuawaha'ula'ula or the "red mouthed god," extended from upcountry Kōōkea down to the Kīhei coast. It extended very near Pu'u o Kali. Kalepolepo Trail is the second coastal/upland trail network that extended from upland Waiohuli down to Kalepolepo fishpond. It also, followed a course very close to Pu'u o Kali, in the *ahupua'a* of Waiohuli.

The documented agricultural system of Waiohuli and Kōōkea can serve as a model for traditional settlement and cultivation in the Kula region (*ibid.*:99). Based on archaeological studies and early historic records, this would include small sets of linear terraces descending down intermittent drainages and informal agricultural features on rocky ridges along the swales. The latter were indicated by short irregularly-shaped terraces, mounds, modified outcrops, short walls, oval and irregularly-shaped alignments and enclosures near house sites often consisting of several structures. Agricultural features extended downslope as far as 460 meters amsl (1,500 feet) in Kōōkea and Waiohuli.

#### **HISTORIC PERIOD**

Much knowledge of traditional land use patterns is based on what was recorded at the time of, and shortly after, known Western Contact (1778). Early records (such as journals kept by explorers, travelers and missionaries), Hawaiian traditions that survived long enough to be written down, and archaeological investigations have assisted in understanding the past. However, early descriptions of the project area are brief and infrequent.

Captain King, Second Lieutenant on the *Revolution* during Cook's third voyage, briefly describes the coastal portion of the project area from a vantage point of "eight or ten leagues" out to sea as his ship departed the islands in 1779 (Beaglehold 1967). He mentions "...a small hillock to the Southward off which there is a fine sandy bay with several huts on the shore and a number of cocoanut trees growing about them." It is probable that the hillock was Pu'u Oia'i located south of Kīhei. King describes the island, enumerates the observed animals, thriving groves of breadfruit, the excellence of the taro, and almost prophetically, says the sugar cane is of an unusual height.

The next reference to the southwestern coast occurs eight years after Cook's initial arrival in the islands.

In 1786, LaPérouse sailed up the western coast of Maui, stopping and recording his impressions while anchored in Keone ō io (south of the K2 terminus). Although the leeward section of the island appeared hot, dry, and rough, the visitors were offered "...hogs, potatoes, bananas...taro, with cloth and some other curiosities..." (LaPérouse 1798:345). Landing on the morning of the 21<sup>st</sup> of May, he was greeted by approximately 120 natives. LaPérouse notes the soil is "...wholly composed of lava and other volcanic matter". Water was scarce and the villagers drank from a shallow, brackish well.

LaPérouse continues:

"During our excursions we discovered four little villages, each containing about ten or twelve houses, which are not only covered but built with straw and shaped like those of our poorest peasants; the roofs being in the form of a penthouse. The door, placed at the gable end is only three feet and a half high, admits of no entrance without stooping, and is shut only with a hurdle which anyone may open. The furniture of these islanders consists of mats, strewed like carpets on which they sleep; and their only kitchen utensils are very large gourds which they shape at pleasure while green. They varnish and delineate various designs on them in black... Their cloths, of which they have a great quantity, are made like those of the other islands, but not withstanding, they are variously painted yet in manufacture they are not equally skillful with the latter." (*ibid.*:113-129).

Nathaniel Portlock and George Dixon sailed down the southern coast in 1786 without landing and missing LaPérouse, who was at that moment anchored in Keone ō io. Vancouver recorded his impressions of the southern and then the western coast of Maui during his second visit in 1793:

...it may be useful to remark, that the part we were abreast of [east of Pohakuea Point] at day-light in the morning, though terminating very abruptly in the ocean, and though its surface was very uneven, had yet a verdant and fertile appearance, and was seemingly in an advanced state of cultivation. From the number of villages and distinct houses, we were led to consider it as tolerably well inhabited. This pleasant scene was shortly changed on our advancing a few miles to the westward. The face of the country became totally different, the shores and sides of the hills had no indications of being inhabited and were almost destitute of vegetable productions. They appeared to be a rude mass of naked barren rocks, broken into many deep gulleys, that extended from the mountains to the water side. Beside these, were many small circular hills that appeared to be composed either of sand or stones, and had acquired a very smooth surface of a light brown colour.

Perpendicular veins separated the different strata, and descended down the mountains; these, so far as our glasses enabled us to distinguish, betokened this part of the island to have undergone some violent effects from volcanic eruptions (1984:850).

Vancouver was greeted by some of the inhabitants who paddled out to meet the foreign ship:

We passed the south point before mentioned at the distance of about half a mile; it is formed by rugged craggy rocks, and the sea breaks at a little distance to the north west of it... Whilst in this situation, we were visited by a few of the poor natives from a small sandy cove, where they had some miserable habitations. The poverty of these people was apparent, by their bringing only a few small packages of salt to dispose of, and by their canoes being very small and out of repair... In the afternoon, we were visited by a chief in the only decent canoe we had yet seen at Mowee. From him I learned, that he was sent by *Titeeree* [Kahekili] to inquire who we were and if we had friendly intentions towards the island... He informed me that the best anchorage was near the north-west part of the Island, called Raheina [Lahaina], and that if I would proceed thither, *Titeeree* would not hesitate, under this, and my other assurances of friendship, to pay us a visit (*ibid.*:855).

Archibald Menzies, a naturalist accompanying Vancouver stated " ... We had some canoes off from the latter island [Maui], but they brought no refreshments. Indeed, this part of the island appeared to be very barren and thinly inhabited" (Menzies 1920:102). According to Kahekili, the extreme poverty in the area was the result of the continuous wars between Maui and Hawai'i causing the land to be neglected and human resources wasted (Vancouver 1984:856).

Other explorers and traders followed. Lahaina, which provided a sheltered roadstead and where the *ali'i* were in residence, was the hub of activity. The importance of Hawai'i to merchants increased with the discovery of sandalwood and the growth of the trans-Pacific fur trade. Subsequently, the whaling industry, lasting to ca.1860, brought hundreds of ships every year to Lahaina. The winter months would find ships replenishing their supplies from the produce grown on Maui, much of it from the upcountry Kula region.

Cultivation of Irish potatoes in the Kula District began shortly before 1840. The Kula area became known as "the potato district" because of the great success in their cultivation. The most extensive potato cultivation area in the Hawaiian islands was Kula. In the 19<sup>th</sup> century, during Kula's peak potato producing period, dryland gardens in the uplands extended all the way from Kula to Kaupō. The resulting deforestation for potato cultivation adversely affected the amount of rainfall in the district and periods of drought became more common. Before the mid

1800s, the forest began just above the Kula Highway, approximately 1,036 meters amsl (3,400 feet) in Kēōkea and Waiohuli (Kolb *et al.* 1997:99).

Jarvis describes the potato fields as they appeared in 1846:

It ranges along the mountain (Halekaiaia) between 2000 and 5000 feet elevation, for the distance of 12 miles. The forest is but partially cleared, and the seed put into the rich virgin soil. The crop now in the ground is immense. The fields being all in blossom have a fine appearance, spreading as they do, over the broad surface of the mountain (*Polyesian*, Feb. 20, 1846).

It was estimated that by the spring of 1847 the crop would amount to 20,000 barrels and in 1854, G. D. Gilman stated that the local Hawaiian market including the whale ships would consume about 20,000 barrels of Irish potatoes (*ibid.*)

In 1849, the California gold rush opened a new market for Hawaiian produce. Along with potatoes and other vegetables, sugar, molasses, and coffee were suddenly in great demand (Kuykendall 1968:321).

In November of 1849 an article in the *Polyesian* stated:

The call for [potatoes] is loud and pressing, as some vessels bound for California have taken as many as a thousand barrels each. The price is high, and the probability is that the market can not be supplied this autumn. Kula, however, is full of people. Strangers from Waiuku, Hamakua and Lahaina are there preparing the ground and planting, so that if the demand from California shall be as urgent next spring as it is now the people will reap a rich harvest... They often repeat the saying of a foreigner, who, after having visited the mines of California, came back to Maui quite satisfied, and said to his neighbors at Waikapū, "California is yonder in Kula. There is the gold without the fatigue and sickness of the mining country." (November 24, 1849).

*The Honolulu Advertiser* describes the changes to Kula brought about by extensive cultivation:

Before 1850 Kula was supplied with moisture naturally through the existence of a large forest. "That forest was cut down when land was cleared in Kula to open farm plots in 1850. This was in answer to the demand for food in California during the gold rush... [and] by ranchers clearing for pasture." Secondary result of clearing forests was destruction of existing fresh water ponds in Kīhei on the Maalaea Bay coast below Kula. When forest was cleared, water was free to rush down the mountains carrying soil from Kula and filling with mud, the ponds for which Kīhei was once famous. Meanwhile Kula is dependent on Pipe for Waikamoi watershed (1962 A:15).

A small whaling station had previously been established at Kalepolepo in Kīhei. John Halstead built his residence and a store referred to as the Koa House in 1849. The store flourished due to the whaling and potato industry and providing an accessible port for exported produce.

The privy council voted to sell government lands in one to ten acre sections to Hawaiians at three dollars per acre to support the growing economy. In 1851, 43,923 barrels of Irish potatoes, along with 56,717 barrels of sweet potatoes, were exported. In 1851, as California endured several disasters and Hawai'i suffered a drought, the potato industry continued to excel (Kuykendall 1968:321). It was not long before potatoes were being grown in California and Oregon and by the fall of 1851, the potato boom was over in Hawai'i.

In reply to partitions from his subjects, Kautikeaouli had made experimental efforts to sell some land to Hawaiian subjects on O'ahu (Mānoa Valley) and in Makawao, Maui. In 1845 and '46, while the king was at Makawao, it was announced that the entire district would be offered for sale at \$1 per acre (except for McLan's plantation). Reverend Green handled the sale of land and Reverend Armstrong contributed by making surveys of the mostly five to ten acre sections. The bought parcels were registered as Grants and were not listed in the Indices of Land Commission Awards beginning in 1848. Eventually, approximately 9000 acres were sold and the experiment was pronounced a success (Kuykendall 1968:283). However, this was an isolated instance and it soon became necessary to revamp the traditional land tenure system.

### The Chinese in Kula

The expanding agricultural markets opened by the growing whaling fleet and the California gold rush attracted many Chinese to Kula in the 1840s. Government lands were leased to ranchers who then subleased the lands to the Chinese.

Initially, the Chinese were accepted on their own merit, as were all new comers, by the native Hawaiians. In fact, their association with the people of Hawai'i was congenial with, in some cases, Chinese men marrying *aiti'i* women. Land was made available to Chinese by the Governors of Maui and Hawai'i for sugar cultivation. Often, the governors would arrange for Hawaiian laborers to work in the cane fields (Glick 1980:328). With the rising influence of the Caucasians and the influx of larger numbers of Chinese as servants and laborers, the status of the Chinese in Hawai'i changed for the worse (*ibid.*:329).

The Chinese moved to Kula lands from Makawao, Pa'ia, and Wailuku on Maui, from Kohala on Hawai'i Island, and from Honolulu. Many went directly from China to Kula. About 95% of the Chinese were Hakkas from Kwangtung Province. As stated, Much of the Kula land was owned by the government which leased it to the ranchers, who would then sublease to Chinese. Payment was often made in farm produce, as exemplified by a farmer leasing from 'Ulupalakua Ranch who paid five bags of corn for every acre of land he farmed (Mark 1975).

Even as the demand for potatoes declined the Chinese population continued to grow. Between 1880 and 1910 there were approximately 80 Chinese families living in Kula. There were some 700 Chinese living in Kula by 1900 (*ibid.*). By this time, Kula had become cosmopolitan supporting such activities and institutions as Chinese and English schools, Christian churches, the Hung Men Society, gambling houses, opium dens, and general stores along with the cattle ranches and vegetable farms (*ibid.*).

The Chinese and other Kula farmers planted corn, beans, onions, Chinese cabbage, round cabbage, sweet potatoes, wheat and other grains, and cotton. Much of the produce was transported to Mākena harbor where it was then sent to Honolulu where it would be sold by markets in Chinatown (*ibid.*, Figures 9 and 10).

Water was not piped into Kula until 1905. Farmers depended mostly on rainfall, as was done in pre-Contact times. When droughts occurred every few years, water was brought from Poipoli Springs or from the beach at Olinda in barrels on the back of mules (*ibid.*).

#### The Māhele

In the 1840s a drastic change in traditional land tenure resulted in a division of island lands, this system of private ownership was based on western law.

While a complex issue, many scholars believe that in order to protect Hawaiian sovereignty from foreign powers, Kamehameha III was forced to establish laws changing the traditional Hawaiian economy to that of a market economy (Daws 1968:111; Kuykendall Vol. I, 1938:145 footnote 47, 152, 165-6, 170; Kame'eleihewa 1992:169-70, 176; Kelly 1983:45).

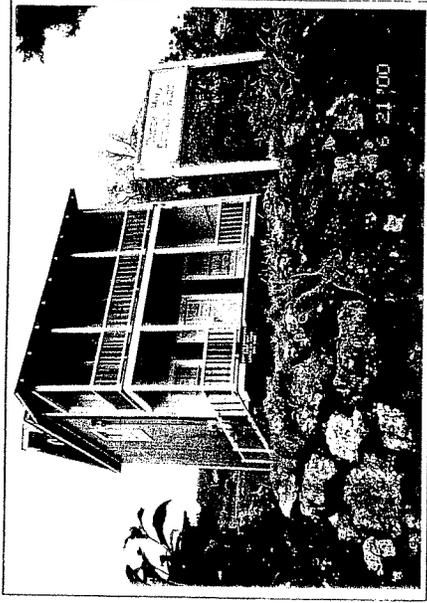

Figure 9: Photograph of a Chinese Society Building in Kēōkea Kula (June 21, 2000).

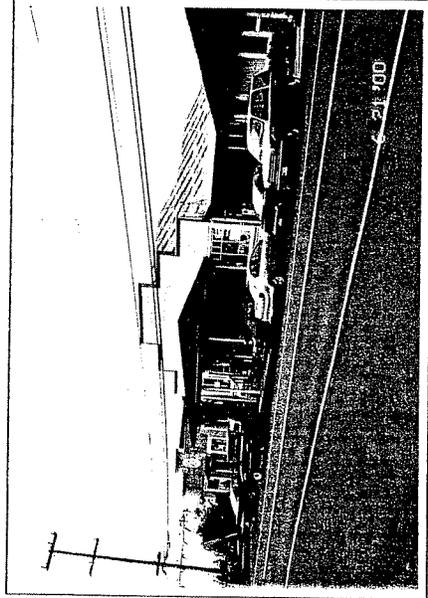

Figure 10: Photograph of Fong Store Kēōkea View to West. (June 21, 2000).

Among other things, foreigners demanded private ownership of land to insure their investments (Kuykendall Vol. 1, 1938:138, 145, 178, 184, 202, 206, 271; Kame'eleihuwa 1992:178; Kelly 1998:4). Once lands were made available and private ownership was instituted, the *makā āina* (commoners) were able to claim the plots on which they had been cultivating and living, if they had been made aware of the foreign procedures (*kūleana* lands, Land Commission Awards, LCA). These claims could not include any previously cultivated or presently fallow land, *ōkēpu*, stream fisheries, or many other resources necessary for traditional survival (Kelly 1983; Kame'eleihuwa 1992:295; Kirch and Sulzins 1992). This land division, or *Māhele*, occurred in 1848. The awarded parcels were called Land Commission Awards. If occupation could be established through the testimony of two witnesses, the petitioners were awarded the claimed LCA, issued a Royal Patent number and could then take possession of the property (Chinen 1961:16, Figure 11).

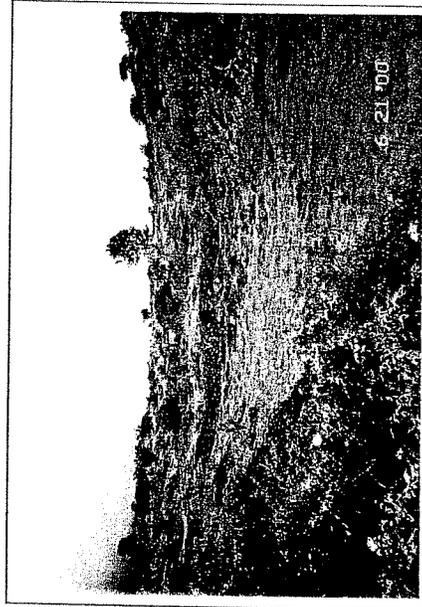

Figure 11: Photograph of Post-Māhele Boundary Walls in Kula (June 21, 2000).

Individual LCA claims within the present project area are discussed in detail by Folk *et al.* (1999) and will only be briefly considered here. The thirteen *āhupua`ā* impacted by the alternative termini were acquired by various individuals and the government. (LCA information from Waihona Aina Corporation, 1998 Database, Honolulu).

Kailua (U1 terminus), Ōma opio (O1 intersection), and Makaehu-Keahua (U2A terminus) were *āhupua`ā* included among Kula lands controlled by Miriam Keohokalole, mother of Kalākaua and Lili`uokalani (see Figure 7). She transferred these *āhupua`ā* to the government in lieu of commutation fees and retained A`apueo (U2B terminus) and Kamehame Ahupua`ā, both containing eight claims. A large portion of Makaeha was eventually sold to the Maui Land and Pineapple Company. Keohokalole also received Kealahou (3&4) which had 22 land claims.

Kōōkea was Crown land from the beginning and had 46 LCA claims. Waiohuli was made Crown Land in 1890 by Kalākaua and had 41 land claims. Kōheo Ahupua`ā (1&2) with 11 land claims, Pūlehu Iki and Nui (P1, P2 intersection and U3) and Waiakoa Ahupua`ā with 17 land claims each, were government lands.

In the Indices of Land Commission Awards, 25 LCAs were claimed for Ōma opio. Most of these LCAs were located in the area of the Ōma opio Homesteads between the Hamakua Ditch and Kula Highway. Forty-six LCAs were claimed in Kōōkea and forty-one in Waiohuli. The majority are listed as *kūla* land and house lots suggesting dryland agriculture. Based on the testimony for the *āhupua`ā* of A`apueo, primary usage was pasturage (LCA 9026, Native Testimony Vol. 7:53).

The *āhupua`ā* of Kaitālinui was awarded to Kamaikaioa and had 14 LCA claims and Kama`ōle (K2 terminus), received 49 claims. Hapakuka Hewahewa, whose family had supported Kamehameha I, received the *āhupua`ā* of Ka`ono`ulu (K1 terminus) which had 35 land claims.

Traditional settlement patterns are reflected in the land records of the 1800s. A total of 254 *āpana* (section, parcel) were granted by the Land Commission in Kula to 187 claimants. No located claims were identified within any of the road alignments which were surveyed to a width of two hundred feet either side of the center line (Folk *et al.* 1999:7). The majority of claims

were located upland, between the 610 meter (2,000 foot) and 1,219 meter (4,000 foot) elevation along the old Kula road (which was called the *ala aupuni*), and extending down to the 700 meter (2,300 foot) elevation in Kama'ole and the 335 meter (1,100 foot) elevation in 'A'apueo. Only a few coastal claims were awarded (15, represented by black dots on Figure 12). They were clustered in close proximity to, and slightly inland from, Kalepolepo Fishpond (east of Kī terminus).

The historic records of both awarded and unawarded claims suggest that many individuals had house lots on the coast as well as an upland residence. Some potato and banana plots were claimed in conjunction with some coastal house sites. The majority of the claims were for *kūla* lands to be used for sweet potato or Irish potato. There were some claims for "dry lo'i", "winter *kūla mekai*" (a term particular to Māui-Kūla), bananas, and house lots. A number of claims was for *moku māui*, suggested to mean small arable pockets of stony soil (by the Native Register translator; see Folk *et al.* 1999:21).

#### Ranching

Ranching was present in Kūla prior to the 1840s (Land Court Awards, State Archives). Large sections of Crown Lands were leased for grazing cattle and by the 1880s, lower Kūla consisted primarily of pasture land for ranching (Figure 13). The Māhele awards list large portions of Kama'ole Ahupua'a as government cattle ranges with Irish potato being cultivated on other parcels.

In 1888, Edwin H. Baily, Lorrin A. Thurston, W. H. Baily, and Henry P. Baldwin met in Honolulu and purchased Māui ranch lands owned by Charles Alexander for \$50,000. The resulting ranch included 33,817 acres with 400 to 500 acres set aside for corn cultivation. A dairy was started in 1896 which eventually evolved into Haleakalā Dairy. The land of Kōōkea, particularly the lowland/coastal portion, was historically used for ranching activities by Haleakalā Ranch Company. Segment E of the proposed highway extends through these ranch lands. In addition to Haleakalā Ranch, large land portions were used for cattle by Ka'ono'ūlu Ranch Co., Ltd. and 'Ulupalakua Ranch, Inc.

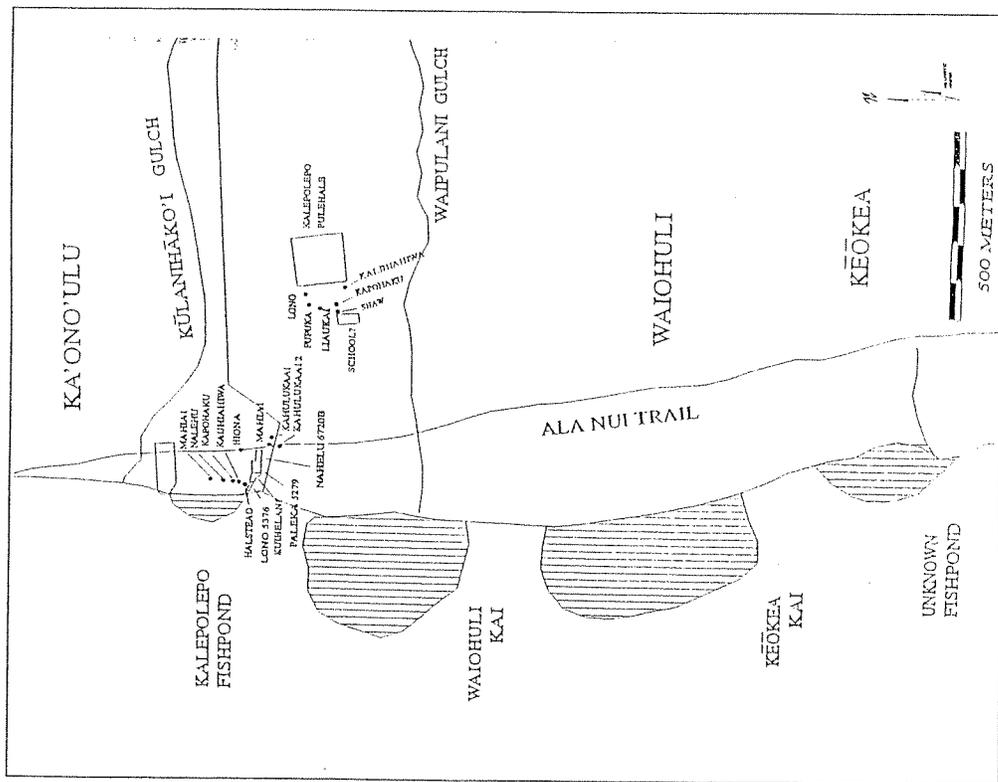

Figure 12: Map Showing LCA Claims on the Coast (Kolb *et al.* 1997:65).

Figure 13: Photograph Showing Kōōkea Historic Pasture Lands, Mauka (June 21, 2000).

By the late 1800s, the changes occurring in Kula lands were dramatic. While surveying in Kula, E.D. Baldwin recorded his impressions of the terrain. He stated:

During 1888, Kula was an open country, there were no fences to stop you from riding in any direction that you wished, even as far as Makawao or Waiuku. There were none of the owners of Waiakoa kuleanas living above the Government Road and only a few makai of said road (Sterling 1998:252).

He continued:

...Waiakoa had been over run with cattle for years and about a mile above the Government road Chinamen had planted Irish potatoes and corn for years so that the location of the numerous kuleana had been almost obliterated. We found only one old kamaaina left on mauka Waiakoa, old "Puanau," who knew approximately the location of the kuleanas. But he piled many of them on top of each other and as we had to lay out the Government portion of the land in Homesteads, there was only one thing to do and that was to give each kuleana its location, bathed as close as necessary, as the land seemed all of equal value; this we did and they have ever since stayed where we located same...[we] appraised it from 3, 5 to 6 dollars an acre (*ibid.*:253).

## Sugarcane

As early as 1828, sugar was being grown on Maui by two Chinese merchants who formed the Hungtai sugar works in Wailuku (Speakman 1981:114). Sugarcane was cultivated in Honua'ula in 1845 by a man named Torbert who had purchased large portions of several *ahupua'a*. The Torbert Plantation holdings included a road and landing at Mākena to expedite the shipping of potatoes, animal stock, and sugar. Captain James Makee, owner of Rose Ranch, purchased the Tolbert Plantation in 1856 and continued stock raising and sugar cultivation (Barrère 1975:70; Kuykendall 1968:316).

With the discovery of the less expensive kerosene for lamps and a number of shipping disasters in the late 1850s came the end of the whaling industry. The Civil War provided the next agricultural niche for Hawai'i to fill with its growing sugar industry. As southern U.S. sugar disappeared from the market, sugar plantations in Hawai'i could make an ever-growing profit exporting their product to the continental United States.

In 1873, Isabella Bird traveled by inter-island schooner to Hawai'i Island, stopping at Mākena which was bustling with activity:

We called at Maaleia, a neck of sandy scorched, verdureless soil, and at 'Ulupalakua [Mākena Landing], or rather at the furnace seven times heated, which is the landing of the plantation of that name, on whose breezy slopes cane refreshes the eye at the height of 2,000 feet above the sea. We anchored at both places, and with what seemed to me a needless amount of delay, discharged goods and natives, mats, and calabashes were embarked... It was all glorious, this fierce bright glow of the Tropic of Cancer, yet it was a relief to look up the great roiling, featureless slopes above 'Ulupalakua to a forest belt of perennial green, watered, they say, by perpetual showers, and a little later to see a mountain summit [Haleakalā] uplifted into a region of endless winter, above a steady cloud-bank as white as snow (Bird 1974:32, 33).

After her ascent of Haleakalā in 1873, Isabella Bird journeyed to Makee's 'Ulupalakua Ranch (then called Rose Ranch) while still in sugar and before it was converted to a cattle ranch:

The plantation is 2000 feet above the sea, and is one of the finest on the islands; and owing to the slow maturity of the cane at so great a height, the yield is from five to six tons an acre. Water is very scarce; all that is used in the boiling-house and elsewhere has been carefully led into concrete tanks for storage, and even the walks in the proprietor's beautiful garden are laid with cement for the same purpose. (*ibid.*:228).

Sugar had been established in the Makawao area in the late 1800s and by 1899, the Kihei Plantation Company (KPC) was growing cane in the plains above Kīhei. In 1878, Claus Spreckels founded the Hawaiian Commercial Company which was located in Pu'u Nene. In 1882, it became known as the Hawaiian Commercial and Sugar Company (HC&S). The Kīhei Plantation was absorbed by the Hawaiian Commercial and Sugar Company (HC&S) in 1908, which continued to cultivate the most productive KPC fields. Nineteen years later, HC&S was bought by investors who replaced the plantation's agents with Alexander and Baldwin. Lands under the new management expanded and in 1948, HC&S acquired the Maui Agricultural Company located in Pā'ia (Conde and Best 1973:208-210, 213). Portions of the U1 alignment of the proposed highway extends through HC&S land (Figure 14).

Abraham Formander toured Maui in 1865 as Inspector General of Schools. His visit to the southwestern coast included a stop at a school at Kalepolepo, Mākena Bay attended by many children from Upcountry, Kanahena, Keone ō'io, and Kanaio. In his report, Formander, praised the benefits brought to the Hawaiian people through commercial farming of sugar:

It may not be amiss, here to remark briefly on the influences which the establishment of the sugar plantations on the island of Maui is exercising on the material and social condition of the Hawaiian people in the immediate vicinity and within reasonable distance of said plantations. They furnish steady and remunerative employment to all, male or female, who wish to work. The work thus obtained sets large sums of ready money in circulation among those who formerly, even if disposed to work, had no way of obtaining a dollar except at the expense of immense labor, time, and trouble. The engagements are short, the pay fixed and sure. The health of the laborers is well attended to—on the Makee plantation not one had died in five years.—In many and increasing instances the money thus obtained goes to build better houses, improve the homesteads and to clothe themselves and their children better. In places where the sugar mills grind for others the cultivation of the cane among the native population and others is systematically pursued and rapidly increasing, adding largely to the wealth and comfort of the people, and they begin to appreciate the value of their lands and take a pride in their culture. It keeps the people more at home and diminishes that roaming, loafing propensity, which was engendered after the breaking up of the feudal system, from unbounded and ill-directed liberty, want of means and ignorance and inability to obtain them [sic]. Even those who do not choose to engage as laborers on the plantations, feel the influence of them in the remotest valleys, stimulating to labor to furnish poi, firewood and many other things of which the plantations are constantly in need, and for which fair prices and ready cash are always paid... (Formander in Barrère 1975:58).

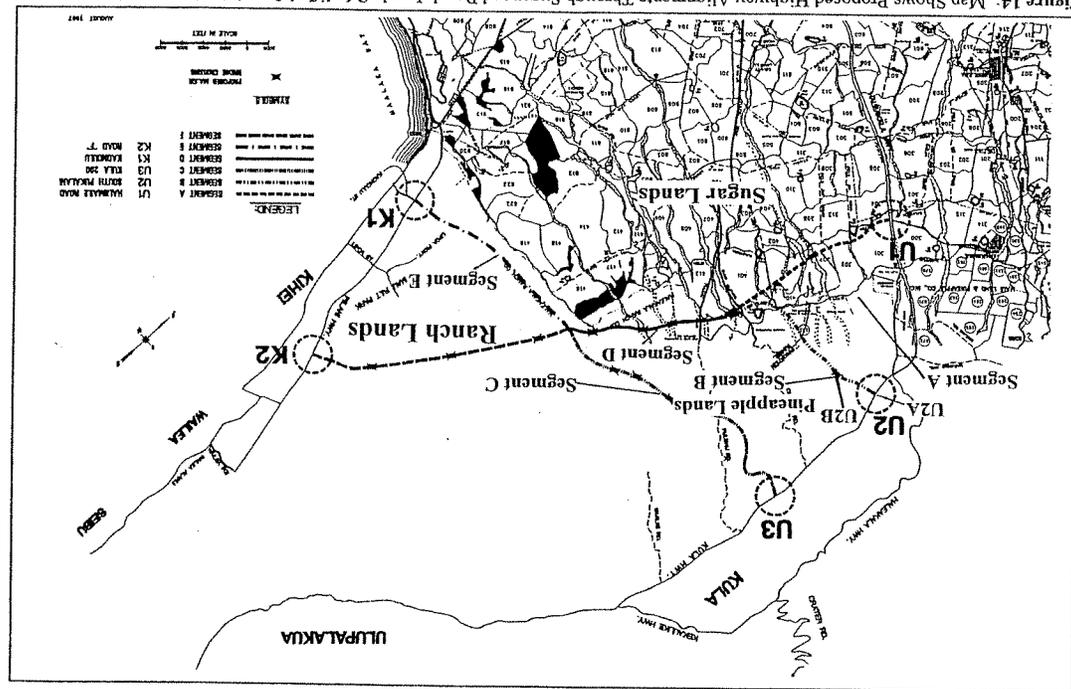

Figure 14: Map Shows Proposed Highway Alignments Through Sugar and Ranch Lands (Modified from Map by Hawaiian Commercial and Sugar Company).

## Pineapple

In addition to sugar, conditions on some Kula lands were ideal for cultivating pineapple. The same Baldwin who developed the sugar lands became a company called Baldwin Packers which evolved into Maui Pineapple Company (MPC), the largest producer of pineapple on Maui (Speakman 1984:130). When the Cameron family took control in the mid-20th century, the name was changed to Maui Land and Pineapple Company (ML&P Co.). Kailua Ahupua'a and Hāli'imaile Plantation have been under cultivation by ML&P Co. or Baldwin Packers for over 30 years (Donham 1990a). Pineapple was being grown in the *ahupua'a* of 'A'apueo as late as 1979 and is still being grown in western portions of the project area. Portions of proposed segments B, C, and D extend through pineapple fields (see Figure 14).

## 20<sup>th</sup> Century

Living conditions deteriorated in Kula during the 1910s and 1920s and many families moved to other places. Severe drought, poor crops due to exhausted soil, and the promise of better opportunities elsewhere depleted the population. Much of the upcountry land had been parceled into homesteads with the previous tenants losing their farms. A large portion of the Kula land had become pasture for cattle ranching by the early 1900s. In 1918, forty more families left as their leased lands were purchased by Harold Rice for use by the Ka'ono'ulu Ranch (Speakman 1978:143). Ka'ono'ulu Ranch, Haleakalā Ranch, and 'Ulupalakua Ranch, are still in operation.

Twentieth century activities in the Kula District included a significant WW II military presence along the beach of Ma'alaea Bay, a Combat Demolition training Station at Kama'ole, two naval air stations at Pu'urēnē and Kahalui, and Army camps and hospitals in the Kula and Makawao area.

In the 1970s, Kula was producing 35% of Hawai'i's vegetables. There were 35 family-operated farms of five to fifty acres that produced Kula crops of various vegetables and flowers. Large acreage was used for livestock breeding for approximately 20 full and part-time cattle ranchers comprising the majority of the land use (Mark 1975). Rapid commercial resort development and private residences, especially in the Kīnei area, has occurred in the Kula coastal section since the 1970s.

## PREVIOUS ARCHAEOLOGY

Archaeological studies have been conducted in both upland and coastal Kula. For an in depth discussion of the archaeology of Kula the reader is referred to Folk *et al.* (1999) and Kolb *et al.* (1997). Some of the findings are mentioned below. Table 1 is a list of archaeological studies conducted in the project area.

Table 1: Previous Archaeology Within The Kula/Makawao Districts.

Name	Area	Type
Cox 1976	Pūlehu Nui, Kama'ole	Inventory Survey
Cordy 1977	Pūlehu Nui, Kama'ole, Paēhu	Inventory Survey
Mina 1982	Kōōkea-Waiohuli	Inventory Survey
Riford 1987	same as above	Inventory Survey
Brown and Haun 1989	Waiohuli-Kōōkea	Inventory Survey
Hammat and Shindler 1989	Kama'ole	Inventory Survey
Donham 1990a	Kailua, Makaeahu	Inventory Survey
Donham 1990b	Kōōkea	Inventory Survey
Kolb 1991	Kōōkea	Data Recovery
Fredericksen and Fredericksen 1991, 1992	Hōkū'ula	Data Recovery
Fredericksen and Fredericksen 1993	Waiohuli	Data Recovery
Folk and Hammat 1993	Ōma'opio	Data Recovery
Fredericksen <i>et al.</i> 1994	Kama'ono'ulu	Inventory Survey, and Botanical Survey
Fredericksen and Fredericksen 1995	Hōkū'ula	Inventory Survey
Burgett and Spear 1995	Ka'ono'ulu	Inventory Survey
McPhatter and Rosendahl 1996	'A'apueo	Reconnaissance Survey
Wilzen 1996	'A'apueo	Inventory Survey
Kolb <i>et al.</i> 1997	Waiohuli and Kōōkea	Data Recovery
Dunn <i>et al.</i> 1999	Waiohuli	Data Recovery
Folk <i>et al.</i> 1999	Kula	Reconnaissance Survey

The earliest archaeological studies of the Kula region were conducted by Thomas Thrum between 1906 to 1918, John Stokes in the early 1900s, and Winslow Walker in 1931. The primary focus of these reports were identifying religious sites. In total, 33 *heiau* from Olinda to Kanaloa at the 526 to 915 meter (2,000 to 3,000 ft.) elevation amsl were recorded (Walker 1931).

A few of the more significant sites within the relative vicinity of the proposed road segments and termini are noted below.

Several petroglyph sites were identified in Kaihainui Gulch (State Site 1061) and Kaluapulani Gulch (State Site 1062, vicinity of segment B) in the 1970s and relocated as part of archaeological reconnaissance survey for the proposed Kīhei to Kula Road corridors (Cox and Stasack 1970; Folk *et al.* 1999, Site 4178). Additional petroglyphs and religious structures are mentioned by Inez Ashdown for Oma opio, Ka'ono'ulu, Pūlehu, Waiakoa, Keōkea, and Kama'ole Ahupua'a (1971). Folk and Hammatt (1993) also re-identified 20 petroglyphs in Upper Pūlehu Gulch (State Site 1268), east of terminus U3, a small rock shelter with 15 pictographs and approximately 139 petroglyphs downstream was delineated State Site 1267. A sailing canoe petroglyph site (State Site 4178) was identified near the U2A terminus in 'A apueo during a 1996 inventory survey (McPhatter and Rosendahl 1996). This survey also extended the boundaries of the Kaluapulani petroglyph site to the south side of the gulch and further *makai*.

A large burial cave (State Site 1264) was located at the southwestern edge of Pukalani town along the cliffs of Kaihainui Gulch near its intersection with Hamakua Ditch (between segment B and C). It is an approximately 33 meter long lava tube containing the remains of between 30 to 50 individuals.

An extensive survey of 1,025 acres of pastureland in Keōkea and Waiohuli between 1,800 and 3,000 ft amsl identified 159 sites including 335 features representing agricultural, residential, and ceremonial complexes, trails, and "footprint" petroglyphs (Figure 15). The study, conducted in the 1980s, resulted in 16 radiocarbon dates providing overlapping ranges from A.D. 1270 through A.D. 1955 for activities in *mauka* Keōkea (Brown 1989, Brown and Haun 1989).

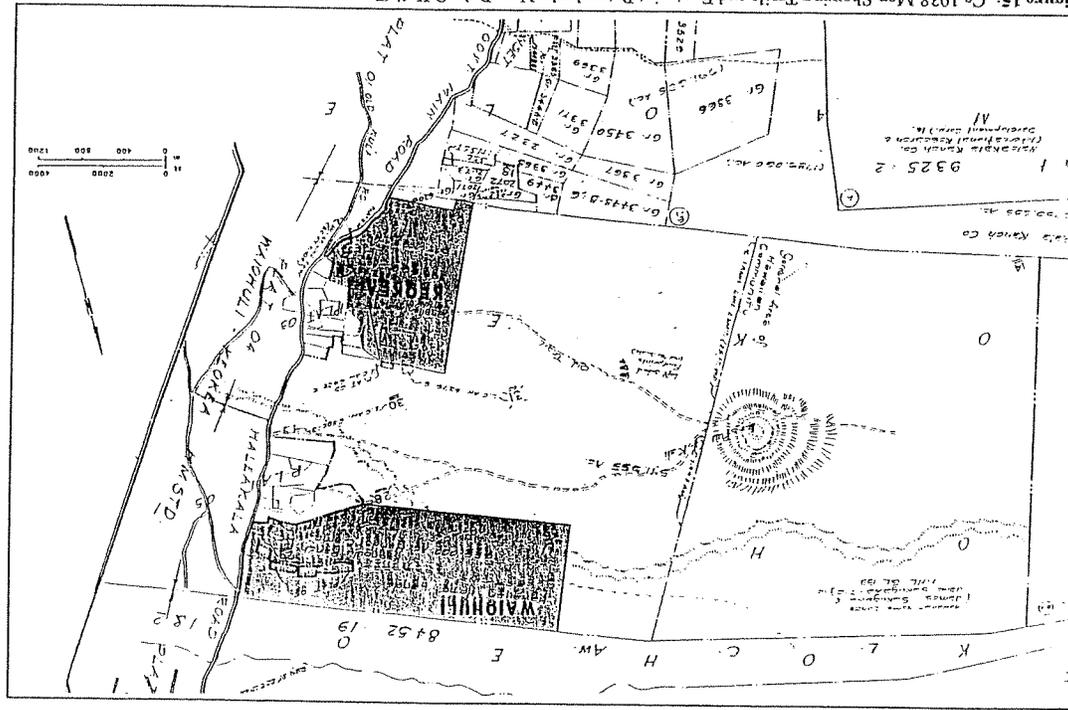

Figure 15: Ca 1938 Map Showing Trails and Footprint Petroglyphs Near Pu'u O Kahi (Brown and Haun, 1989).

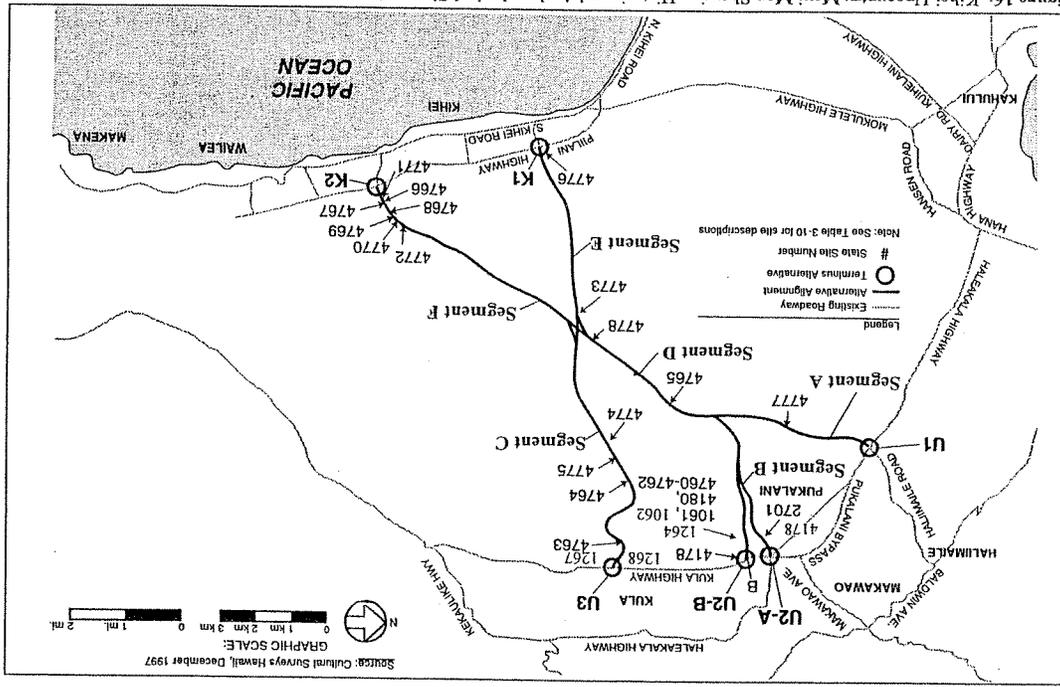

Figure 16: Kihel-Upcountry Maui Map Showing Historic and Archaeological Sites on Proposed Highway Alignments (From Draft EIS 1999).

Traditional references to bird-catching sites are found in recorded oral histories concerning Kula upcountry (Ashdown 1971:46). Corroborating evidence for bird-catching was recovered from Molohai, Kēōkea in a small temporary habitation at approximately 700 meters amsl (2,200 feet). A variety of extinct forest bird species were recovered from the earliest occupation level and dating between A.C. 1057 and 1440 (Kolb 1994).

Data from the same project indicated that initial permanent habitation and agricultural pursuits in the Kula region began as early as ca. A.D. 1200 to 1400 (*ibid.*). Radiocarbon and pollen analysis suggests a settlement pattern including expanding agricultural fields and habitations through the 1600s to 1700s when less desirable lands both *mauka* and *makai* of the prime upland region were utilized.

Archaeological data recovery was conducted at ten permanent habitation sites and one agricultural site (Dunn *et al.* 1999). Fifteen charcoal samples were submitted for radiocarbon dating from ten of the sites. Dating results indicated that the first of the permanent habitation sites between 549 to 915 meters (1,800 to 3,000 ft) in Waiohuli dated to the A.D. 1400s, slightly later than those suggested by earlier studies (Kolb *et al.* 1997). However, it was concluded that the small sample size precluded having strong confidence in the results of the distributional analysis (*ibid.*).

A total of 25 archaeological sites were identified within the various segments of the proposed bypass highway (Figure 16). Five archaeological sites were identified in Segments A, D, and E of the proposed bypass corridor during the initial reconnaissance (Folk *et al.* 1999).

Site 4765, located between Pūlehu Road and Ōma'opio Road, contained an historic irrigation ditch, historic agricultural clearing mounds, and a small road segment. Site 4773, located in segment E, consisted of two square enclosures and seven U-shaped enclosures interpreted as WW II temporary military command post and rifle positions. Site 4776, located in segment E near the K1 terminus, consisted of a midden and lithic scatter/mound that was interpreted as recurrent habitation and agriculture. Site 4777, located along the north side of Kailiinui Guich in segment A, consisted of a wall interpreted as a field boundary or animal control. Site 4778, located on a southern edge of Waiaōkoa Guich in segment D, was an L-shaped enclosure interpreted as a temporary habitation.

## METHODOLOGY

Initial assistance was provided by a number of organizations and many individuals including the Office of Hawaiian Affairs (OHA), O'ahu and Maui branches, the Hawai'i Sugar Museum, Hawaiian Commercial & Sugar Company, Maui Historical Society, State Historic Preservation Division Maui and O'ahu Branches, Haleakalā Ranch, 'Ulupalakua Ranch, Ka'ono'ulu Ranch, Maui Land and Pineapple Co., Kona Historical Society, the Hawai'i State Archives, State Survey Office, and the Hawai'i State Library. A list of the contacted individuals can be found in Appendix A.

Preliminary contact was made to individuals recommended to SCS by OHA and Parsons Brinckerhoff, Inc. General points of interest were recorded in field notes. Unless the interviewees indicated knowledge of Traditional Cultural Properties, the conversation was not taped. As a result, only one interview was recorded (Appendix B). Several individuals demonstrated reluctance at being taped. However, their information did not lead to the identification of any Traditional Cultural Properties. None of the interviewees knew of any specific Traditional Cultural Properties although they supplied the names of more contacts, suggesting additional avenues of investigation. Several had interesting anecdotes concerning life in Hawai'i in the early 1900s.

An announcement was sent over the Internet to members of the Hawaiian Nation on Maui asking for recommendations of individuals that may be residents, may be familiar with the project area, or know of those who were, to e-mail responses and suggestions to a Maui contact.

As the proposed road alignments mainly impact ranch and agricultural lands, several avenues of investigation were selected. All three of the large ranches, Haleakalā, Ka'ono'ulu, and 'Ulupalakua, were contacted and asked for names of long-time cowboys who would be the most likely familiar with the land in the project area and its history.

The mapping department of Hawaiian Commercial & Sugar Company, under the jurisdiction of Randal Moore, was most helpful in supplying maps of the fields and locations of the former plantation camps. It was hoped that individuals that lived in some of these camps near the proposed road alignments could be interviewed as they also may have special knowledge of Traditional Cultural Properties in the project area vicinity.

Cultural Surveys Hawai'i, Inc. (CSH), was contracted by Parsons Brinckerhoff, Inc. to conduct an archaeological investigations for the proposed highway alignments. To save time and prevent repetitive interviews, a list of questions from CSH were presented to the interviewees when appropriate, along with the inquiries concerning Traditional Cultural Properties.

## INFORMANT INTERVIEWS AND TRADITIONAL CULTURAL PROPERTIES

An archaeological report (Brown and Haun 1989) includes a previous interview with two former employees of Ka'ono'ulu Ranch, William Poepoe and Henry Kekiki. The information was summarized here as it refers to land features in the vicinity of the road alignments.

Mr. Poepoe, an employee of Ka'ono'ulu Ranch for 46 years before he retired in 1983, reported that in the past people grew corn near Pu'u Kali (Red Hill). According to Mr. Poepoe, there was once a Hawaiian settlement, including sidewalks and grave sites, on the border of Kama'ole and Kēōkea. He also added that within the caldera of Pu'u Kali is a fence that the Army erected during WWII for target practice.

Mr. Kekiki, an employee of Ka'ono'ulu Ranch for 42 years before he retired, stated that the ranch had previously run 2,500 head of cattle. Stone walls to contain the cattle had been built in 1800s on the ranch lands. Land use necessitated that cattle be kept at lower elevations near Pu'u Kali in winter and then moved to *mauka* areas in June. Due to heat, Hawaiian and Chinese inhabitants would also move from the Pu'u Kali area further upland to Kēōkea during the summer months. Mr. Kekiki pointed out many *heiau* to the archaeologists in the general vicinity of Molohai and Papakea in Kēōkea and in Waiohuli and identified three left footprints imprinted in the lava rocks on the way to Pu'u Kali (see Figure 16).

Additional information is presented in Kolb *et al.* (1997:30) concerning Pu'u o Kali:

...the most prominent landmark in Kula is the cinder cone of Pu'u o Kali, or "Hill of Waini". It is located at an elevation of 300 m AMSL (1000 ft) and marks the border between the *ahupua'a* of Waiohuli and Kēōkea. Commonly called "Red Hill" in modern times, this cinder cone has a prominent history. It is associated with the Goddess Pele, who was reputed to smite those who spoke evil from this very place (Ashdown, n.d.).

A major component of the pre-historic upcountry settlement landscape is located upslope of the Pu'u. Walker identified three *heiau* in the upcountry Waiohuli section and three *heiau* and a rain shrine in Kōōkea.

Conversations with several cowboys of Haleakalā Ranch on June 19 and 20, 2000, revealed that information concerning significant places was most likely known by those of the previous generation who had since disappeared. Sonny Manoa, Henry Silva, and Ed Uweko 'olani were aware of old stone foundations and walls within the ranch boundaries, but none with associated stories. A road extending off Na'alaie Road in Kōōkea was reportedly called the Army Road and had originally been an old horse road to the coast. This closely followed a traditional Hawaiian trail known as the Waia'aoa Trail. Mr. Merlin Kekikiwi and Michael Purdy of 'Ulupalakua Ranch referred the author to older residents of Kula for further information. Unfortunately, a field trip within the boundaries of the Haleakalā Ranch that was tentatively scheduled for the beginning of August was unable to be completed due to ranching activities occurring at the same time.

Although only 64 years of age, Mr. Uweko 'olani described a very traditional Hawaiian upbringing in Kanaio including seasonal living locations (*makai*, *mauka*), planting methods, water procurement, and instruction from his parents, who were native speakers, as to *ahupua'a* protocol. He moved to the mainland at the age of 17 and did not begin work as a cowboy on Haleakalā Ranch until ten years ago (Figure 17).

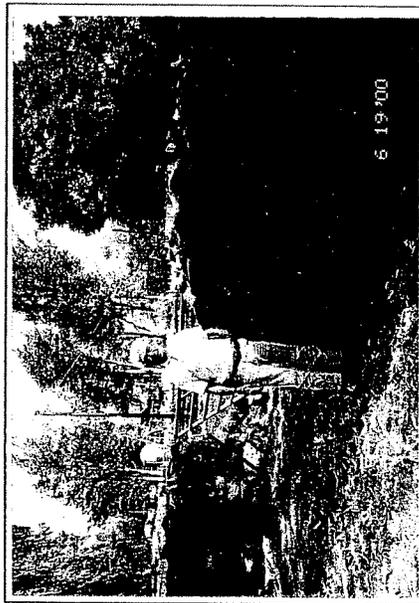

Figure 17: Photograph of Mr. Ed Uweko 'olani of Haleakalā Ranch (June 19, 2000).

An interview was conducted in Kahului on August 4, 2000 with Mr. Henry Rice, owner of Ka'ono'u Ranch. Mr. Rice descended from a *kama'āina* family long established in Hawai'i. The ranch consists of approximately 9,000 acres of land that has been held by the Rice family since 1916.

Mr. Rice revealed that land use on the three main holdings in Kula (Haleakalā, Ka'ono'u, and 'Ulupalakua) are similar and may vary only slightly in timing of ranching activities throughout the year. Land at all elevations is used for pasturage with rotation of sections according to vegetation growth. Yearly ranch activities range from calving, branding, weaning, moving calves to better pasture, picking replacement heifers, and shipping of yearlings to market. In the 1950s, most of the breeding herds were kept on the *makai* lands, with *mauka* lands being used for pasture for the cows. Presently, breeding herds are kept both *mauka* (above the Kula highway) and *makai* with the yearlings in between.

Calves from the *makai* herd are born in October and November when the winter rains brings grasses providing for successful lactation of the cows. Calves from the *mauka* herd fall (are born) in April and May and benefit from the rains that can still occur as late as March. Water is brought down for the cattle from the Upper Kula Line which provides water for agriculture and residential use in Kula.

Mr. Rice knew of a foot-print near Pu'u o Kali and had been told it was that of a child's, imprinted and preserved in lava (See Brown and Haun 1989). No old trails or other traditional properties on ranch lands were known to him. He reported that in the late 1800s, people from Kula were obtaining fish from the still viable Ka'ono'u fishpond in Kīhei (*makai* and in close proximity to the project area).

An interview was held with Mrs. Nancy Purdy on August 3, 2000 at 'Ulupalakua Ranch where she now lives (Figure 18). Mrs. Purdy was raised on family (Wilcox) *kuleana* land located about one mile *makai* of Kula Highway in 'Ulupalakua. Her great grandfather was a farmer growing such crops as corn, sweet potato, beans, and Irish potatoes. People would walk down the dirt road of what is now Kula Highway to Kōōkea to catch a bus when they needed to go to Kahului. The family would walk down the Old Mākena Road to the beach at Mākena for swimming and fishing. She also remembers fish being sold door-to-door by the Japanese. The Chinese peddlers would bring big bags of *poi* several times a week. Although Mrs. Purdy has spent her entire life in the region, none of her comments indicated knowledge of any specific Traditional Cultural Properties in the area.

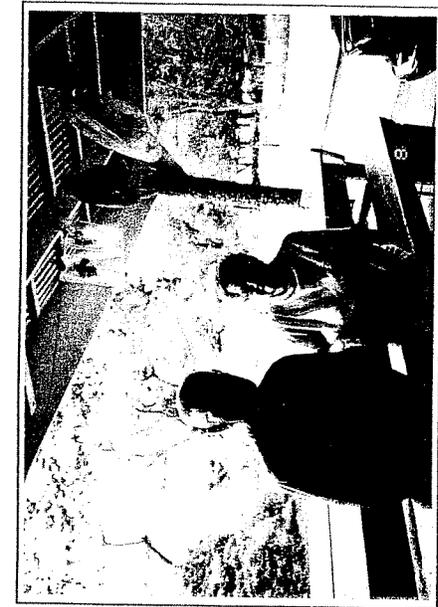

Figure 18: Photograph of Mr. and Mrs. D. Purdy of 'Ulupalakua Ranch (August 4, 2000).

An interview was held with Mr. Frank Gouveia in Hāli'imaile on August 3, 2000 (see transcript of Mr. Gouveia's interview and release form in Appendix B)(Figure 19). Mr. Gouveia, now 85 years old, began his career as a water boy for the pineapple company at 10 cents a day. His family originally came from the Madeira Islands off Portugal in the late 1800s. Once his father had settled on Maui they "never looked behind." One of 16 children, Mr. Gouveia's father worked for the pineapple company and later, at the dairy at Pu'urēhē. While at the dairy, Mr. Gouveia remembers the Chinese bringing their vegetables by donkey from Kula down an old county road, skirting what is now Pukalani and meandering through the cane fields to the landing at Kīhei. While Mr. Gouveia was an excellent source of information concerning life on Maui, he did not know of any Traditional Cultural Properties.

Mr. Bob Hobby, District Manager of Forestry for the Department of Land and Natural Resources on Maui, was contacted to obtain more details on Mr. Gouveia's trail/county road information. Mr. Hobby knew of three *mauka-makai* trails in Kula. The Waiahoa trail extended from the bottom of Na'ala Road in Kula and was a horse and wagon trail in the 1800s. The old Mākena Road zig-zagged from 'Ulupalakua Ranch to the landing in Mākena and was used for animal and produce transportation. This trail would also date from the 1800s. The third trail extended from Kalama to 'Ulupalakua. All of these trails are evident on an 1885 map drawn by W. D. Alexander, Surveyor General for the Hawaiian Islands.

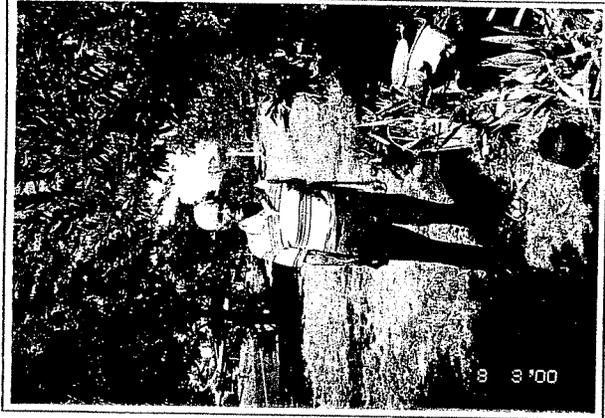

Figure 19: Photograph of Mr. Frank Gouveia at Home in Hāli'imaile (August 3, 2000).

Mr. Hobby noted that an Old Government Road is still shown on tax map keys for the region of Kula extending from Haleakalā Highway just below what is now Pukalani, through the cane fields and eventually disappearing in cane field 13, directly *mauka* of Kīhei where the landing would have been. A 1929 map of the island of Maui, surveyed by W. E. Wall and compiled from all previous available data, identifies the same road (Figure 20). This is most likely the trail/road referred to by Mr. Gouveia.

A telephone interview was conducted with Mr. L. Douglas MacChuer, manager of the Maui Pineapple Company, Ltd. (a subsidiary of Maui Land and Pineapple Company, Inc.). Before pineapple cultivation, land parcels near Pūlehu Road on the Kīhei side were used for pasture. In the early 1900s there had been small farms growing corn and onions in the vicinity of what became known as Cornmill Camp. Maui Pineapple brought their own water for irrigation in

Okinawans, Japanese, Filipinos, and Portuguese all lived, shared, and helped each other there. Not only would they work together, but celebrations and picnics were held where everyone was welcome. Mrs. Nagata feels there is more separation between cultural groups today than there was amongst the first generation of immigrants.

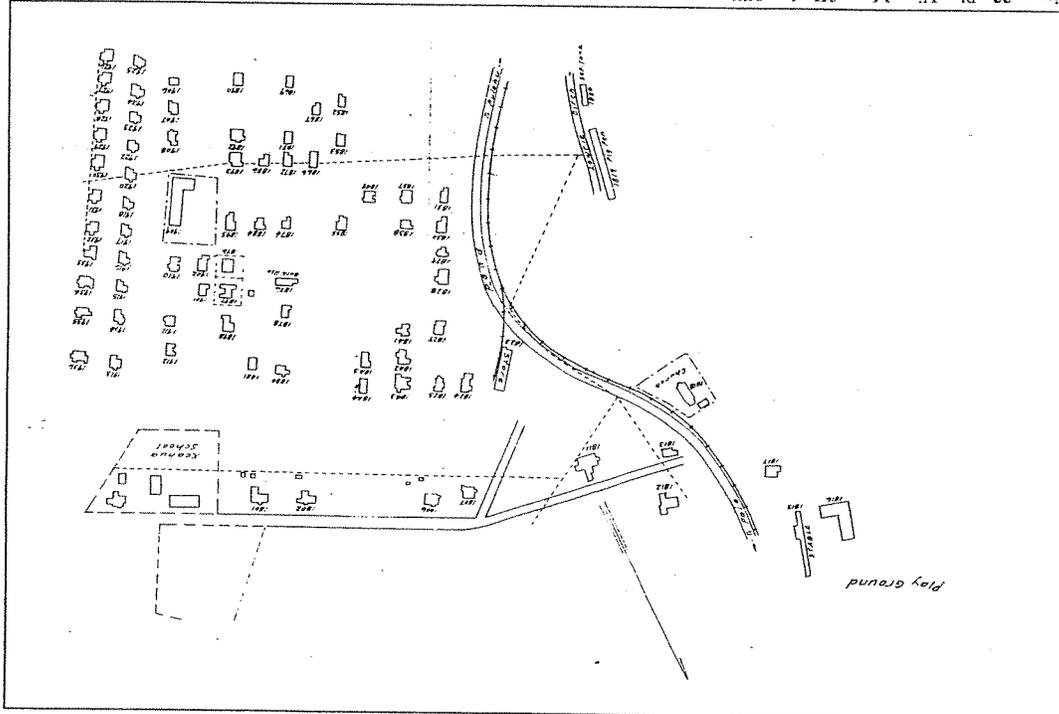

Camp life was basic and nothing was wasted. Piles of newspapers were sewn together as disposable mattresses for babies. There was a communal toilet for several families where the Sears and Roebuck catalogue was an important item along with the highly prized, soft tissue paper used to wrap individual fruits. These valued items were collected from the plantation store. Colorful comics were saved for special wrapping paper and soda cans, bottle tops, magazine pages, and even the large Saloon crackers, were modified for festive Christmas decorations. Dried shrimp stored in wooden barrels was a special treat from the plantation store. There was no electricity so firewood and kerosene were delivered to the camps. In the camp was a Catholic church, a plantation store, and a Japanese school for the children.

Mrs. Nagata's family was hard working but very poor. None of the children could go to high school except for the youngest, who everyone in the family supported through dress making school at the Community College. Tragically, this sister died at only 53 years of age. Mrs. Nagata's grandfather was buried at Waiakoa Cemetery near the Waiakoa sugar camp. Later, his remains were moved to the Buddhist church in Pā'ia.

There were no Hawaiians in Keahua camp and it was not until they had moved to Waikapū that Mrs. Nagata remembers seeing Hawaiian people. She spoke highly of the traditional *kuleana* water rights instigated by the Hawaiians that allowed her family to farm for so many years, as well as the excellent rock walls built and fitted together with out mortar. However, Mrs. Nagata was not aware of any Traditional Cultural Properties within the vicinity of the camps in Kula.

A telephone interview was conducted with Mr. Charles Maxwell on 1 August 2000. He confirmed information previously recorded as testimony that in general, both Kaliaupulani and Kaliaimui Gulches, as well as those in Ōma'opio and 'A'apueo, contain numerous petroglyphs and sealed burial caves which were not mentioned in the archaeological reports. Mr. Maxwell said he had personal knowledge of six sealed caves in these gulches. Two wooden images (*kr'i*) previously recovered from a cave in one of the gulches are now on display at the Bishop Museum.

Figure 22: Plan View Map of Keahua Village, a Typical Plantation Camp (Hawaiian and Commercial Sugar, N.D.).

According to Mr. Maxwell, the area of Kamehameha Schools in 'A'apua'o is associated with a female goddess of the same name and past agricultural plots were associated with Maui's *Ali'i*, Kihapi'ilani. He reported that Kenneth Emory of the Bishop Museum had referred to the area impacted by the proposed termini U2A and U2B (and upper portions of segment B) as "most likely a place where the annual Makahiki were held". A *heiau* has been identified close to the U2A terminus (Site 2701). It was Mr. Maxwell's opinion that it would be, "a cultural and spiritual insult to have a highway impacting (visually) a site such as this."

### IMPACT ASSESSMENT

Numerous cultural features were reported during this study including religious sites, trails, petroglyphs, and the general location of burial caves. Topographic anomalies associated with pre-Contact events, individuals, or recorded in legends and stories were also noted. Several of these sites are not located within the project area. Other sites are considered archaeological as they are no longer in use and their location is unknown. Based on the previously presented definition for a Traditional Cultural Property stated by the Procedures For Ethnographic Inventory Surveys (Draft), no specific Traditional Cultural Properties were identified.

Archaeological sites and features associated with traditional legends, stories and important individuals were identified and reviewed during this study, including Pu'u Pane, Pu'u o Kali, the *alanui*, ancient trails, and various fishponds.

As religious and cultural significance are associated with archaeological features such as *heiau* and Makahiki sites, it is necessary to apply the criteria of adverse effect to properties such as those mentioned by Mr. Maxwell (36 CFR Part 800, Sec. 800.5). Adverse effect is found when:

... an undertaking may alter, directly or indirectly, characteristics that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association... (National Preservation Institute 1999:49).

Examples of adverse effects include physical damage to all or part of the property, and the "...introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features" (*ibid.*:50).

It appears that the alignment involving segment B may have an adverse impact on the integrity of the *heiau* site, both visually and aurally. Therefore, any alignment using segment B may need to be re-routed so as not to affect this archaeological feature. However, the *heiau* along with the other archaeological sites are addressed by Folk *et al.* (1999).

Pu'u Pane, located in the *ahupua'a* of 'A'apua'o, was declared sacred by the paramount chief, Kihapi'ilani. Commoners were not allowed to climb the hill as it was considered a *heiau* for the high chiefs of Maui (Sterling 1998:258). This site will not be impacted by the proposed highway alignments as it is situated out of the project area (see Figure 2).

None of the informants or archival material provided any information concerning Pu'u o Weii located in close proximity to the U2 terminus (see Figure 2).

Several old trails were discovered in the course of research. However, none of them were Traditional Cultural Properties because they are no longer used. Some of these archaeological features are found out side of the immediate project area and would, therefore not be impacted by any of the proposed alignments. For example, situated in the vicinity of Pu'u o Kali, located in the *ahupua'a* of Waiohuli, are two trails and petroglyph foot prints. These archaeological features will not be impacted by the proposed highway alignments as they are situated outside the project area (see Figure 2).

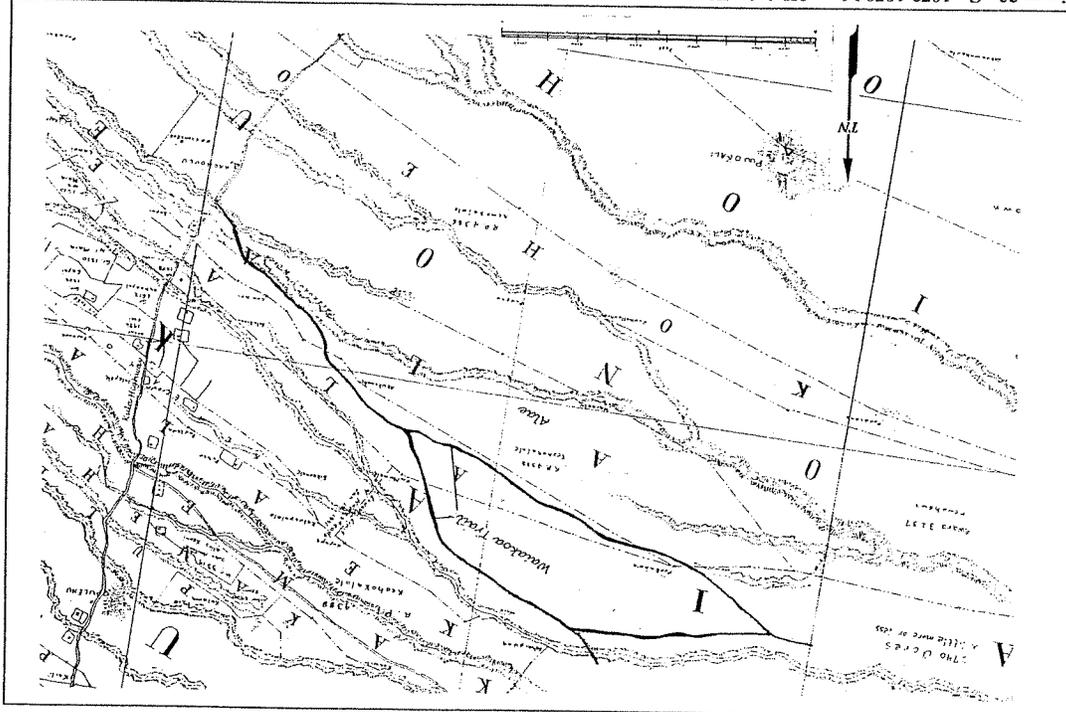

The ancient *alanui* coastal trail (Site 572) and the upland trail, only portions of which are now visible, are also archaeological features that will not be impacted by the proposed highway alignments as they are located outside of the project area. The fish ponds, such as Kalepolepo and others, are archaeological sites listed with the State Historic Preservation Division and will not be impacted by the proposed highway alignments as they are situated along the coast outside of the project area (see Figure 2).

A Map of Kula, Maui, surveyed by W. D. Alexander and M. D. Monsarrat in 1872-1879, shows a trail extending from the bottom of the present Na'ala'e road in Alae Ahupua'a down slope where it splits, one leg continuing in Alae, and the other crossing into Waiaho'a Ahupua'a (north). Another split occurs and continues a short distance into Pūlehūmūi. The two original trails eventually intersect and continue as a single trail until slightly more than half way between Kula Highway and the coast (Figure 2).

Sometime between 1879 and 1929 the north fork of the same 1872-1879 trail is intersected by a trail from Palauca and continues all the way to Kīhei, becoming a road and eventually joining the coastal highway (Figure 24). The southern fork of the trail on the earlier map disappears. The remaining trail was the Waiakoa trail mentioned by Mr. Hobby and known to Mr. Manoa as an old horse trail. On a current USGS map, a jeep road loosely follows in the direction of the old Waiakoa trail to the coast. Physical evidence of the Waiakoa trail today has not been identified but it is shown on the 1929 map to be in close proximity to the K2 terminus in the western portion of the project area.

Other ancient foot trails reportedly extending from Kēōkea to Kīhei (Kēkuawaha ʻula ʻula) and from Waiohuli down to Kalepolepo fishpond (Kalepolepo Trail), would be intersected by segment E and segment F of the proposed highway, as would the old trail/government road through the upland cane fields to Kīhei referred to by Mr. Gouveia. However, because none of these trails are still in use, and archaeological surveys have not identified physical evidence of their routes, these trails are not Traditional Cultural Properties. For the proposed alignments to be in close proximity to these trails would not constitute a cultural impact.

Figure 23: Ca. 1872-1879 Map of Kula by W. D. Alexander and M. D. Monserrat Showing Waiakoa Trail.

## CONCLUSIONS

Interviews of appropriate individuals were conducted by SCS. These informants were recognized by other community members as knowledgeable, long-time residents of Maui and the Kula region. Conversations with these individuals did not identify any specific Traditional Cultural Properties within the project area as defined in the Criteria for evaluation. Presently, the only known culturally significant sites are the archaeological features that have been identified within the project area. Mitigation of these resources are discussed within the archaeological report presented by Folk *et al* (1999).

**APPENDIX B**

Interview with Frank Gouveia

Interview with Frank Gouveia August 3, 2000, Hali'imaile, Maui  
Conducted by Leann McGerty of SCS, Inc.

Leann: ...I was just over with Sylvia [Hunt, former Records keep of Maui Land Pineapple Company] who lives on your street. I thought that Laura was going to arrive when I was talking to Sylvia. I'm hoping that this is going to start working...[referring to tape recorder]

I would like to ask you a few questions [formally]. Your name please.

Frank: Frank Gouveia and I'm 85 years old. We started working for ten cents an hour and worked for 46 years. I started as a water boy and worked my way up to the department head of transportation.

Leann: Ten cents an hour?...was it six days a week?

Frank: Sometimes six sometimes seven, depending on the pineapples. No overtime.

Leann: So if you worked twelve hours a day you got the same?

Frank: Yes, the same thing.

Leann: Were you born here?

Frank: I was born in Kokomo and raised in Maui.

Leann: What about your family? Are they also here?

Frank: My mother and father came from Madeira, Portugal. When the plantation was looking for workers, they [looked for workers in] went to Portugal. They didn't plan what kind of people they needed to do the work. The people in Madeira did everything from clothing to all kinds of labor, just like here. My grand father, [was a] Gouveia, and I'm [a] Gouveia, rode the sailing boats and vessels and came to Maui. Then they started to work in the plantation.

Leann: Do you know what year that was?

Frank: In the 1880's. That's how the Portuguese came here mostly from there. Mostly working people. Madeira, where my parents came from, is just like West Maui mountain. Right around the island there is blue water. There is two places where you can go to the ocean. The rest is blue water.  
You take a basket of grapes and all that up to the road on the top of the mountain. I went there on a bus tour.

Appendix B Pg. 2

Leann: Oh, you went?

Frank: Yes, I went there. The old people never wanted me to go back. They never talked about Portugal.

Leann: Really?

Frank: Yes, once they got here nobody would go back. The only time we would go was when we retired. My wife and I went when I retired. I'm glad that we never looked behind. It took three months to get here and a lot of people died when they originally came here.

Leann: Very difficult. Did you find relatives? [when you went back to Madeira]

Frank: Yes, I did. They thought that they died on the way here. Then we talked about Portugal.

Frank: My father said, you don't have to know about Portugal. I'm glad you're in America.

Leann: Did they speak Portuguese to you?

Frank: I had a hard time because my grandmother was the last one to speak. We understood each other a little bit with English, etc. in between. They said they were poor and worked hard just like us.

Leann: How many brothers and sisters do you have?

Frank: I had sixteen. Five girls and eleven boys.

Leann: Where were you in that?

Frank: I was number eight. We were in a different group. The other group left when we moved to Hali'imaile, the rest all got married or something. We went to Hali'imaile in 1926 or so.

Leann: Where was your family before?

Frank: We lived right across the gym. When you came down, one of the big houses over there [referring to the gym in Hali'imaile]. The house on the hill, we moved into that house. In the meantime we were living in the Grove Ranch.

Leann: What was that, the Grove Ranch?

Appendix B Pg. 3

Frank: It was a big ranch for cattle. Harry Baldwin was the head of the Maui Agriculture of Pa'ia so he had Maui Pine and Sam Baldwin had Haleakala Ranch and Frank Baldwin had H. C. & S., Puunene. Then Harry broke away from Maui Pine and we broke away from the sugar but he was the head man yet and then his daughter married Walter Cameron. Walter Cameron was brought in by Sam Baldwin out from Haleakala. Haleakala pineapples were up there and we were down in this area. All the pineapple would be brought in from Pukalani. This is pineapple here.

Where are we now? Hali'imaile. This is pineapple here and Maui Pineapple Company came up. They combined and became one. Anything above Pukalani and Honolua is owned by the Cameron's.

Leann: What was the pineapple land before? What was it used for?

Frank: It was pastures for Haleakala Ranch and Grove Ranch and Honolua Ranch, and then pineapple came.

Leann: What about Pukalani?

Frank: It was just pasture land.

Leann: Where is Honolua Ranch? It's up in Kula. (Mr. Gouveia is showing the map to the south of Pukalani).

Frank: The Rice's had a slaughter house and they had a corn [mill] and their headquarters was up in Kula. They had land up there where the government had \_\_\_\_\_. That was Rice's Ranch. Then pineapple began to take place over here. The Camerons own their own land and Haleakala is owned by the Camerons, too.

Leann: Oh yes, as well as Baldwins?

Frank: Yes. Maui Pine is also Camerons. I think they still own 51% of that and other historical places.

Leann: Oh yes, trails. Were you aware of some old trails that might have gone across the land that somebody told you, "You know what, before this..."

Frank: Yes, Hali'imaile Road. Right up here. This is Pukalani. This is all pineapple field. Right in here there was a trail that went to Sudas place where the wharf was right down through Oma'opio Road. The wharf would be down here. Do you know who used the trail? The Chinese with their cargo and their donkeys and all that and would come to Kihei. Right here by the wharf.

Leann: And it [the trail] would go all the way down [to the coast]?

Frank: Yes, someplace in the canefield and all that.

Leann: Wow!

Frank: And there is a county road that goes down to it. Then they used to use the Pulehu Road and other roads to go to Kahului. There was one that came to Kihei.

Leann: How come they used that road instead of the one more towards 'Ufupalakua? [referring to the Old Makena Road].

Frank: This wharf takes you to Kaho'olawe or Lāna'i. The boat would stop here and Ma'alaea.

Leann: And this is where you would load the sugar?

Frank: No, the sugar would be in Kahului.

Leann: So this would be cattle down there? What I was wondering is why they took that road (the Chinese) instead of the one by Haleakala Ranch but then it would not go to this wharf?

Frank: Some would go to Kahului and go to Lāna'i.

Leann: And even in your time when this road was still being used?

Frank: No. So that was the Chinese road. There were a lot of donkeys. We lived in Kahului when my dad was running the Pu unenē Dairy. They unload, go to Kahului and load what they buy, that I remember.

Leann: How long did it take them? It would take them about three hours to go down and three hours to get back?

Frank: Yes, about that.

Leann: Where was the dairy?

Frank: Remember the dairy road? The airport road that goes to Lahaina and that, that's why its called the dairy road because it was right around here.

Leann: I see. What did they do for water in these pineapple fields? Did they have *auwai* or just depended on the rain?

Frank: The rain. We never had ditch irrigation in those days and we had a lot of rain. Kona rains that took care of the dry lands. But today there's no rain so we had to go back to drip irrigation.

Leanni: Yes, its been really bad the last couple of years too. What about the pipeline that came in 1905? The Kula pipeline in 1905--was that anywhere near the pineapple land?

Frank: Above. Above the pineapple lands.

Leanni: Where did that take water to? The sugar?

Frank: The Kula guys. The forest over there. That's where we get some of our water from. We pick it up from Nahiko-Hana and goes to right above us. The ditch is right above us.

Leanni: I see, I see. That would take water to the Kula farmers.

Frank: What they did, they always gave us bad time with water. All these people.

Leanni: Still yet, huh?

Frank: But they're showing big improvement...

Leanni: I had some questions written down here so the water was rain, ... pineapple was used for grazing and pasture. Did you have anything to do with any of the ranching activities at all?

Frank: No, we'd use some cane land and rotate, but not too much of that.

Leanni: Sometimes cane, sometimes pasture... I'm wondering what things happened at different elevations like up here, you have pasture. What about Kīhei? What do they do down there?

Frank: They wait for the Kona rain--November, December, January, February. This would soak them and last for the whole year. They had nice *kenwe*, a lot of beans, and it was all pasture land.

Leanni: So it was all pasture land.

Frank: So today you only see stones. No grass.

Leanni: Well, I'm wondering if there were any--when people wanted to get fish, what do they do, do they go down to Kīhei? Did they go down to Pa'ia?

Frank: People on this side, they go to Pa'ia or Kahului.

Leanni: I know that the land was in cane and in ranching over 100 years so many of the stories are gone. They're lost.

Frank: They're lost.

Leanni: I'm wondering if you recall anything besides the trail. That was very good information because I didn't know about that trail. Again, any areas that you recall had a special meaning, any caves, you don't even have to know [exactly] where they were--you may say, "I remember in this area there were some interesting places..."

Frank: Up in the gulches--the pineapple field up in the Homokea there was a big house and guys said they saw artifacts in there. But the water would end up in Kahului. They covered all these streams in Kīhei. When the gully up there comes down, it will be trouble.

Leanni: There's going to be trouble. The water used to feed the fishponds long ago but not now. They did the same thing in Waikiki... [a brief discussion concerning Waikīki followed]

Frank: I remember Waikiki in 1940, when I was in the National Guard. We joined in 1940. When we went on maneuver in Waikiki, there were all swamps over there. These Honolulu boys would enter there and we couldn't get to them. We didn't know the streets. All the swampy areas I remember, today has buildings.

Leanni: I understand there were some military World War II activities over in this area somewhere. Do you know where that might be?

Frank: That was in Pu'urēnē.

Leanni: Which is gonna be in this area [referring to map].

Frank: The army was right in this Pu'urēnē area too. They had a big airport over there. The navy moved their original airport over there. It is now the Kahului airport. The other people were stationed at Haiku.

Leanni: So what were they doing? Maneuvers and war games?

Frank: They did go up this area--Kīhei and all that, and practice over there. And they did all that Training practice up in all in that area. Jungle in the Pacific.

Leanni: Oh, really, all the way up to Kokomo?

Frank: They went to Hana, and stayed there for three months because we were too much from one area that's...

Taps stops and then picks up.

Frank: ...that is the right many gulches and plenty private lands. This is to deal with the plantations.

Leanni: So the main thing you remember of course is this trail that the Chinese used all the way down to Kihei by Suda Store.

Frank: Suda Store is an old landmark. That is where the wharf used to be. You haven't been to Kihei lately?

Leanni: I have been. I go there now and I don't-I don't like it.

Frank: All the big hotels down there, its terrible.

Leanni: Terrible, I know.

Frank: The local people had the right of way and these haoles come and close it up.

Leanni: Its really too bad because there was such good fishing areas and they're doing the same on the Big Island. They're doing the same in Kona too.

Frank: Kaula'i and the Big Island has to start thinking for their own. You have these people around here run you, you're going to be nothing.

Leanni: We're gonna loose all of it. Yes, I agree. I can't think of anything else [to ask] because, as I said, I'm aware that this has been so long in sugar cane and ranching.

Frank: They used to have a lot of villages scattered in this area.

Leanni: You mean, the cane [plantation] camp villages?

Frank: Transportation was a hard thing so the villages Keahua, Kekania Camp, and they would have Keahua camp numbers-camp 1, camp 2, camp 3, etc.

Leanni: I actually have a list of some of the [plantation] camps that were near this area. Are there people living now in Haili'imaile that used to live in some of the sugar camps?

Frank: I only know some of them--they might be grandchildren living but not the older

people.

Leanni: I'm going to go tomorrow and see at Mrs. Nagata, who I guess was in Keohua [plantation camp]. She has a barbershop in Kahului but she was raised in Keohua camp where she lived for a long time.

Frank: Hipako was a big camp where Maui High used to be. It was a very big camp. Pa'a was a big camp too.

Leanni: But the pineapple didn't have the camps like the sugar did, yeh?

Frank: We had a little camp in Ha'ikū and we had a little camp up in Kapalua and we started off in a gulch over here--Kaluauui gulch. That's where the first \_\_\_ camp started..

Leanni: In the gulch itself?

Frank: That's where the camp first started. It used to be bungalows.

Leanni: Which gulch is that?

Frank: Kaluauui. And then they consolidated everybody. We had pineapple and then they moved the whole thing.

Leanni: Was this only pineapple people? Or pineapple and sugar people too?

Frank: No just pineapple. Local people stayed over there. Then after the war, sugar people put camps all over. Plantation got to do more modern things--weed killings, H-1, and all that. Kahului was all keawe trees so they made a village out of that and sold them for \$7,000 and today they are \$3,000 houses and they didn't want to go. They had a problem to move people away from camps.

Leanni: Up here is nice and cool. I'd rather be here than Kahului.

Frank: We had a plantation sugar camp right next to us and that would be the thing that would be effecting the \_\_\_ line. Outstanding things is all out of our hands.

Leanni: Do you know where Pu'uoweli is? Is that familiar to you at all?

Frank: No. Maybe they have a different name.

Leanni: I don't know...They say the land form Pu'uoweli translated as "hill of fear". I looked at my [modern] map and I couldn't find it but ...

Frank: Yes, several different islands—600 miles from Portugal. I have a sketch like this. But their on the same equator right?

Leann: So this was like home to them.

Frank: Yes, everything is the same. You walk down the street and you say, "Damn, I know this guy". I gotta know this guy, he look a Decoites, he looks like a Santos and could be. Then the old people wear white shirt and black pants. The ladies would wear dresses and the girls started to wear slacks. For the first time they dressed like that, and I had to talk to them.

Leann: Do you still speak Portuguese?

Frank: I can understand if they talk but sometimes you meet some tourist and they say they're Portuguese and they start talking to me. But they speak Portuguese on the mainland more than they do in Hawai'i. I can see why the people didn't want to tell us off—because the king over there at that time. What we have here its over there—coffee, potatoes, tomatoes everything that we have here, came from there. I like to see these young Portuguese boys throw 'em back to them.

Leann: It's a different way of life. Is that a picture of your mother and father?

Frank: Yes, it is. This one is my wife's mother. This came from Portugal, my grandfather and grandmother. My grandmother outlived my grandfather. That's how they were dressed when they came from Portugal.

Leann: Oh my, that's wonderful.

Frank: All the Castros, not too many of them have a long life, but the Gouveias have long life. I have three brothers that died back home and they didn't reach 70. My father lived until 81, my aunty lived until 100 and 6 months, another aunty until 98. I had a sister that lived until 94.

Leann: [His] the genetics—something genetic. Do they still live here? [referring to his brothers and sisters]

Frank: No, they're all gone. There's only four of us left, one sister and three brothers.

Frank: Kiholu [Pi'iholo?] is way up here by Makawao.

Leann: Kiholu, do you know what that means? Do you hear any stories about it?

Frank: No. These people from the mainland come here with the number of the streets and the name and all that and they find the place. People here say, turn right, turn left, etc.

Leann: It's because we live by landmarks. I know...

Frank: Yes. I have a daughter that works in the Ha'ikū Post Office. They say "...how long more are we going to get to Lahaina? You gotta go down the other way... [back around through Kahului].

Leann: Oh, no!

Frank: Then you get some bad people that say you take this road and go right to Lahaina.

Leann: I guess they do...

Frank: All these young people that moved because of too much rain, they go there and they like it and they're building houses. They like that. They call it "valley", we called it "gulches".

Leann: There was a big Portuguese community here then. How big a community was it? Do you remember? Do you how old?

Frank: Yes, lots of standard houses. My cousin came here and moved to Pā'ia. Some of them stayed in Pā'ia and my grandfather worked for the sugar. So his house was close to the water where they start ditches to get water. My father live in \_\_\_\_\_ where we always went. And then we moved to Olinda when they opened Homestead land. That's when we went to Kahului about 1930 and then we came back up. Makawao was a big Portuguese town.

Leann: It wasn't just ranching?

Frank: Most ranches were small ranches I think they had a two year contract and after they finished that, where would they go? Up there. Like Madeira over there. H Coco was a big Portuguese camp, and Pu'unenē had a lot of Portuguese, Wailuku had the rich Portuguese. Big businessmen, and all the big guys. Those were the businessmen. Actually all businessmen, they went into merchants.

Leann: Did all of the Portuguese men come from Madeira?

KIHEI-UPCOUNTRY MAUI HIGHWAY ALTERNATIVE ALIGNMENTS

BOTANICAL SCREENING RECONNAISSANCE STUDY  
KIHEI-UPCOUNTRY MAUI HIGHWAY ALTERNATIVE ALIGNMENTS

INTRODUCTION

On 28 December 1995, a helicopter flyover was made along the corridors of the alternative alignments for the Kihei-Upcountry Maui Highway project. Accompanying the botanical investigator were David Atkin and Deneitra Hutchinson, Parsons Brinckerhoff representatives working on the project. Windward Aviation, Inc., provided the helicopter service.

The primary objectives of the aerial reconnaissance were to identify the general vegetation types along the alternative alignments and to search for sensitive areas which might harbor native plant communities, that is, lowland dry forests and shrublands. In general, these native plant communities tend to be associated with the stonier soils and the more rugged topographical features such as steep-sided gulches, large rocky outcroppings, and pu'us where grazing animals are less likely to visit. An important component of these lowland communities is williwili (*Erythrina sandwicensis*), an endemic member of the legume family. The distinct branching pattern and orange-yellow colored bark of the williwili is easily picked up from the air. Thus, most areas with native plant communities can be quickly identified by looking for this indicator species.

Prepared for: PARSONS BRINCKERHOFF

March 1996

Alternative alignments which support native plant-dominated communities are identified and the rationale for eliminating them is discussed. For the remaining alternatives, a comparative ranking is provided.

## RESULTS

The plant names used in the following discussion are in accordance with the most recent treatment of the Hawaiian flora by Wagner et al. (1990).

### Uncultivated Lands

Three broad bands of vegetation can be recognized on the uncultivated slopes of this portion of Haleakala, their distribution influenced primarily by rainfall, substrate type, and human activities.

From Pi'ilani Highway and upslope to about the 1,500-foot elevation contour, the vegetation consists of an open forest composed of kiawe trees (Prosopis pallida). Buffel grass (Cenchrus ciliaris) is the most abundant ground cover with the amount of grass cover varying with the season, i.e. rainy vs. dry. This vegetation type occurs where there is soil, although shallow and stony. Annual rainfall is about 15 to 20 inches in these areas.

Scattered through the kiawe forest are areas with 'a' lava flows; these are mapped as "Very Stony Land" (rVS) on the soil maps (Foote et al. 1972). These very stony lands support large stands of wiliwili trees and other native species. Alternatives 6A and 6B cross over a portion of the large 'a' flow around Pu'u o Kali. Two listed endangered species, the ko'oloa'ula (Abutilon menziesii) and ma'o hau hele (Hibiscus brackenridgei), and two candidate 2 endangered species, the 'awikikiwi (Canavalia pubescens) and koaia (Acacia koaia), are known from the dry forest on this 'a' flow (U.S. Fish and Wildlife Service 1994a, 1994b). Alternative 7 crosses a large flow also identified as "rVS" on the soil maps. A small portion of the flow was surveyed for the Maui Wailea 670 project (Char and Linney 1988), and plants of the 'awikikiwi as

well as maiapilo or the Hawaiian caper (Capparis sandwichiana), a candidate 2 species, were found. The occurrence of other listed and candidate endangered species on this flow are likely to be very high.

Above the 1,500-foot contour, the vegetation changes to an open scrub community composed of patches of lantana (Lantana camara) and panini cactus (Opuntia ficus-indica) with scattered kiawe trees. A mixture of various grass species and smaller, mostly weedy species fills in the matrix between the woody components (Char 1994).

At about the 2,000-foot elevation contour to just above the Kula Highway, the vegetation changes to kikuyu grass (Pennisetum clandestinum)-dominated pastures interspersed with large blocks of black wattle (Acacia mearnsii) forest. Smaller stands of various Eucalyptus species are also common. The soils in this area are deeper and rainfall increases to about 30 inches per year.

### Cultivated Lands

Portions of Alternatives 1 to 4A and 4B as well as Alternative 8 will cross over actively cultivated sugar cane (Saccharum officinarum) and pineapple (Ananas comosus) fields. A few smaller vegetable and flower farms may also be within or close to these alignment corridors.

## RECOMMENDATIONS

### Alternatives Recommended for Elimination

Alternatives 6A, 6B, and 7 will cross over sensitive native lowland forests dominated by wiliwili trees. On Alternatives 6A and 6B, two listed and two candidate 2 endangered species are

known from the lava flow around Pu'u o Kali. Two candidate 2 species are known from a portion of the 'a'a flow along Alternative 7, and it is highly likely that this flow also harbors other endangered plants.

Besides the direct impact of the construction itself on these dry forests, there are a number of indirect impacts which include the increased chance of fires with more human activity in the area, pollution from petrochemical products, and an increased chance of invasion by weedy alien species. Many of these dry forests also provide habitat for native invertebrates, primarily insects, some of them candidate endangered species.

If Alternatives 6A, 6B, and 7 are considered, the U.S. Fish and Wildlife Service as well as the State's Division of Forestry and Wildlife would require a review of the possible impacts and long-term mitigation measures, including a fire plan. A Section 7 Consultation and a biological assessment will be required if the project involves Federal funding. These requirements would increase the cost and time of completion for the proposed highway.

#### Comparative Ranking of Remaining Alternatives

From a botanical perspective, Alternatives 1 to 5 and 8 are the least likely to have a significant negative impact on the native botanical resources. These alignments cross over vegetation types dominated by introduced or alien species such as kiawe, buffel grass, black wattle, kikuyu grass, panini, etc., and actively cultivated agricultural lands. There are no 'a'a lava flows ("rVS") mapped along these alignments.

A comparative ranking among these alternatives, with justification, is presented below. The alternatives are arranged numerically with "1" being the most preferred and "5" the least preferred.

<u>Rank</u>	<u>Alignment</u>	<u>Rationale</u>
1	Alt. 1	Both Alternatives 1 and 2 cross kiawe forest with buffel grass along their lower sections. The remaining portions cross actively cultivated sugar cane fields. These fields do not support rare or endangered species and sensitive native plant communities. Portions of the kiawe forest appear to have been burned at one time.
1	Alt. 2	This alternative will remove the most cultivated lands. Because most of this corridor is cultivated or disturbed, it is very unlikely to support any rare or endangered species and sensitive native plant communities.
1	Alt. 8	This alternative crosses kiawe forest with buffel grass and disturbed and cultivated lands from Omaopio Road to Pukalani. Portions of the kiawe forest appear to have been burned at one time.
2	Alt. 3	Both 4B and 4A cross kiawe forest with buffel grass and open scrub which has long been used for grazing cattle and horses. Thus, there is little native vegetation left, primarily in the larger, deeper gulches. A higher ranking is given 4B as it passes through some disturbed, weedy areas below the reservoir and portions of the kiawe forest along its lower corridor appear to have been burned at one time.
3	Alt. 4B	This alternative crosses kiawe forest and scrub vegetation as well as several fairly large and deep gulches. Near its Kula Highway terminus, the alignment corridor is fairly narrow (there are more developed areas then is shown on topographic map). If rare plants or archaeological features are present, it may be difficult to avoid them.
4	Alt. 4A	
5	Alt. 5

Honolulu, Hawai'i

Prepared for: PARSONS BRINCKERHOFF

May 1997

Draft

SUMMARY

Field studies to assess the botanical resources found on the proposed Kihei/Upcountry Maui Highway alternative termini and alignment segments were conducted in January and February 1997 by a team of three botanists. The termini and centerline for the alignment segments were staked and flagged prior to the botanical field studies. A corridor 200 feet wide, that is, 100 feet on each side of the centerline, was surveyed. Where the alignment segment crossed over a large gulch, then a corridor 500 feet wide was surveyed. Remnant populations of native plants are more likely to occur on steep, inaccessible areas such as gulch walls and rocky outcroppings away from agricultural disturbances and out of the reach of grazing animals.

Actively cultivated lands occur on the upper elevation portions of the alignments. Sugar cane fields and their associated network of canehaul roads and irrigation systems are found primarily on Segment A and the lower portion of Segment B. Pineapple fields are found along portions of Segments B, C, and D. A portion of Segment C crosses through the Kula Agricultural Park near Pulehu Road.

Uncultivated lands through which the alignments pass are covered primarily by a kiawe/buffelgrass association. Kiawe trees (Prosopis pallida), native to tropical America, and buffelgrass (Cenchrus ciliaris), native to Africa and tropical Asia, are the dominant components of this vegetation type. The kiawe/buffelgrass association occurs along all of Segments E and F, and along the greater length of Segments C and D. The remaining smaller sections of uncultivated lands support Kikuyu (Pennisetum clandestinum)/mixed grass pasture lands (Segments B and C), and gulch vegetation.

Gulch vegetation is found along all of the segments where they cross large, steep-walled gulches such as Waiakoa, Pulehu, and Kaliahinui gulches. Most of the uncultivated lands are used for grazing cattle and horses.

One population of the endangered ko'oloa'ula (Abutilon menziesii), a member of the mallow or hibiscus family, is known from Kaliahinui Gulch. Three small clusters of plants are found between 690 and 750 feet elevation. None of the plants occur on the alignment segments; Segment A crosses Kaliahinui Gulch high above the ko'oloa'ula population at about the 840-foot contour.

Almost all of the vegetation on the proposed termini and alignment segments is composed of introduced or alien plant species. Introduced species are all those plants which were brought to the Hawaiian Islands by humans, intentionally or accidentally, after Western contact, i.e. Cook's discovery of the islands in 1778.

A total of 173 plant species were recorded during the field studies. Of these, 153 (88%) are introduced species; 4 (2%) are originally of early Polynesian introduction; and 16 (10%) are native. Of the natives, 8 are indigenous, that is, they are native to the Hawaiian Islands and also elsewhere. Eight species are endemic, that is, they are native only to the Hawaiian Islands.

The 8 endemic species are the kumu niu fern (Doryopteris decipiens), nehe (Lipochaeta rockii), Sicyos hispidus, williwili (Erythrina sandwicensis), nama (Nama sandwicensis), pua kala (Argemone glauca), Panicum pellitum, and kakonakona (Panicum torridum).

None of the plants found during the survey is a listed, proposed, or candidate threatened and endangered species; nor is any plant a species of concern. There are no areas on or adjacent to the termini and alignment segments which support sensitive native plant-dominated communities.

BOTANICAL SURVEY  
KIHEI/UPCOUNTRY MAUI HIGHWAY

INTRODUCTION

A four-lane highway which would link Kihei and Upcountry Maui is being proposed. Three termini are being studied for the proposed Upcountry portion and two termini are being considered for the Kihei portion. A total of six alternative alignments made up of six segments, Segments A through F, are being evaluated (Figure 1).

Field studies to assess the botanical resources found on the alternative termini and alignment segments of the proposed Kihei/Upcountry Maui Highway were conducted by a team of three botanists. The field studies were made on 07 to 10 January, 10 to 14 February, and 26 February 1997. The primary objectives of the botanical studies were to:

- 1) provide a general description of the vegetation types found on the alternative termini and alignment segments;
- 2) inventory the flora;
- 3) search for threatened and endangered species as well as species of concern; and
- 4) identify areas of potential environmental problems or concerns and propose appropriate mitigation measures.

SURVEY METHODS

Prior to undertaking the field studies, a search was made of the pertinent literature to familiarize the principal investigator with other botanical studies conducted in the general area. Topographic maps as well as black and white aerial photographs with the alignments plotted on them were examined to determine

None of the alternative termini and alignment segments are "more favorable" or "least favorable" from a botanical perspective. Use of any of the termini and alignment segments for the construction of the proposed highway is not expected to have a significant negative impact on the botanical resources. However, there is some concern for fires and soil erosion. Segments which cross the kiawe/buffelgrass association should have wide, gravel-lined shoulders. This vegetation type is especially fire-prone during the dry summer months. On the upper elevation portions of the proposed highway where it is wetter and the topography somewhat steeper, areas cleared of vegetation during construction should be revegetated as soon as possible to prevent soil loss.

Where landscaping is needed, it is recommended that native trees and shrubs be considered. These plants are already adapted to the local growing conditions and would require less water and soil amendments. Some native species which could be used include wili-wili (these occur naturally in some of the larger gulches along the alignment segments); naio (Myoporum sandwicense) -- a glossy, dark green shrub with fragrant white flowers; nehe -- a member of the daisy family (it occurs on Segment C); 'ilima (Sida fallax) -- a small shrub with bright orange flowers and used in landscaping; and 'akia (Wikstroemia uva-ursi) -- a low, mat-forming shrub and excellent ground cover already in use for landscaping. The Maui Native Plant Society and the Division of Forestry and Wildlife's Na Ala Hele program should be contacted for additional suggestions for planting as well as planting material.

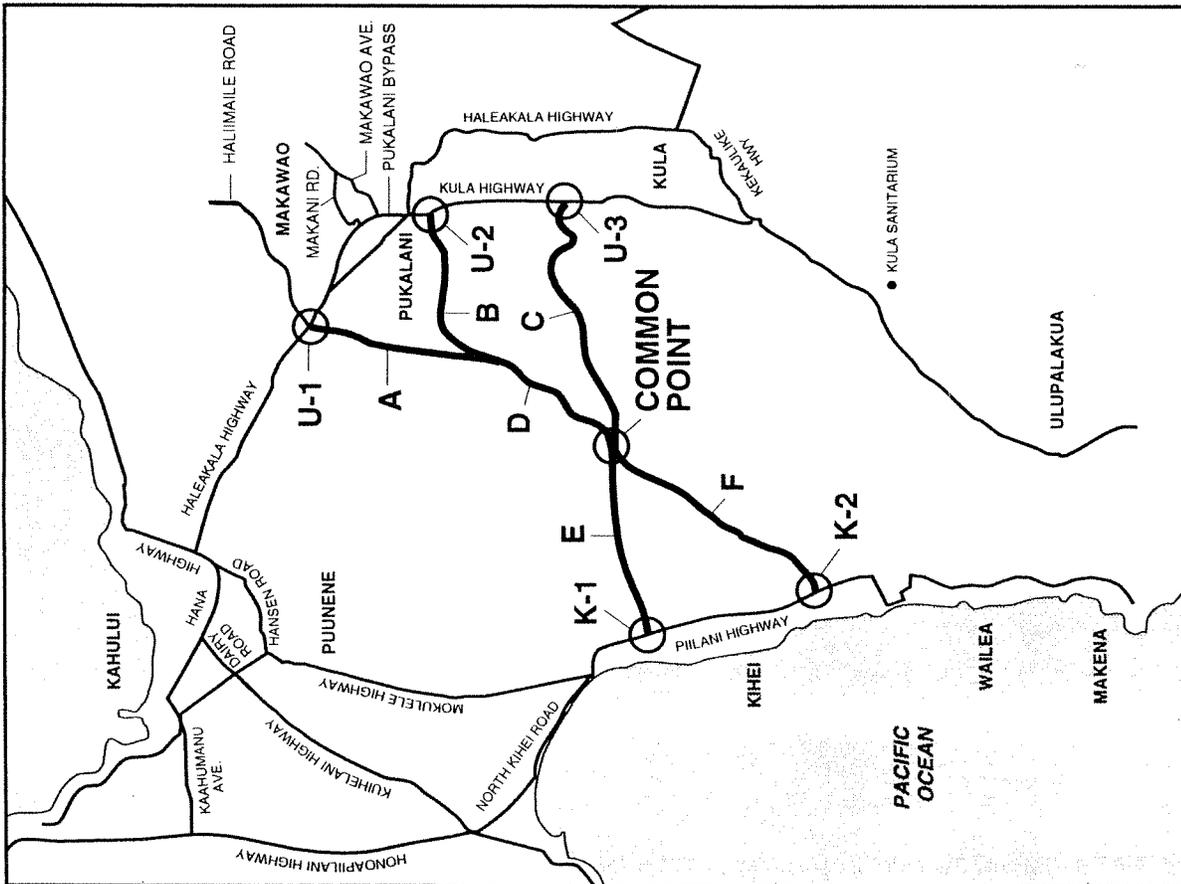

vegetation cover patterns, terrain characteristics, access, boundaries, and reference points.

The termini and centerline for the alignment segments were staked and flagged prior to our field studies. The survey work was conducted in January and February 1997 during the wet (rainy) season. A corridor 200 feet wide, that is, 100 feet on each side of the centerline was surveyed. Where the alignment crossed a large gulch, a corridor 500 feet wide was surveyed. A walk-through survey method was used. Notes were made on plant associations and distribution, substrate types, drainage, exposure, disturbances, topography, etc. Plant identifications were made in the field; plants which could not be positively identified were collected later determination in the herbarium (University of Hawai'i, Manoa -- HAW), and for comparison with the taxonomic literature. The less disturbed, steeper gulch walls, rocky outcroppings, and uncultivated lands were more intensively surveyed than the cultivated areas as these portions of the alignments were more likely to harbor sensitive native plant communities and rare plants.

### DESCRIPTION OF THE VEGETATION

Actively cultivated lands occur on the upper elevation portions of the alignments. Sugar cane fields are found primarily on Segment A and the lower portion of Segment B. Pineapple fields are found along portions of Segments B, C, and D. Part of Segment C crosses through the Kula Agricultural Park near Pulehu Road.

Uncultivated lands through which the alignments pass are covered largely by a kiawe/buffelgrass association; this vegetation type occurs along all of Segments E and F, and along the greater length of Segments C and D. The remaining smaller sections of uncultivated lands support Kikuyu/mixed grass pasture lands (Segments B and C), and gulch vegetation. Gulch vegetation is

Location of Alternative Termini and Alignment Segments  
KIHEI-UPCOUNTRY MAUI HIGHWAY  
Botanical Survey  
FIGURE 1

found along all of the alignment segments where they cross large, steep-walled gulches. The majority of the uncultivated lands are used for grazing cattle and horses.

A more detailed description of the vegetation types is presented below. An inventory of all the plant species observed on the alternative termini and alignment segments during the field studies is found at the end of the report.

#### Cultivated Lands

Fields of sugar cane (Saccharum officinarum) along with their accompanying network of canehaul roads and irrigation systems cover the majority of the cultivated lands. Sugar cane fields are found along the entire length of Segment A and the lower portion of Segment B. The fields can be found in various stages of cultivation, ranging from bare recently harvested fields to open, low stands of young cane, 2 to 3 feet tall, to closed, very dense, mature stands of cane 12 to 15 feet tall. Sugar cane fields are found on soils of the Waiakoa-Keahua-Molokai association; these are deep to moderately deep, nearly level to moderately steep, well-drained soils that have a moderately fine textured subsoil. This soil association occurs on the low uplands of Maui (Foote et al. 1972).

Pineapple fields are found along portions of Segments B, C, and D on soils of the Waiakoa-Keahua-Molokai association. The rows of pineapple (Ananas comosus), following along the contour of the land, form a rather harsh, gray-green colored vegetation cover up to 3 feet tall. Like the sugar cane fields, the pineapple fields can also be found in different stages of cultivation.

A portion of Segment C crosses through Kula Agricultural Park

which supports small agricultural lots which produce a number of crops for the local market; these include green onions (Allium fistulosum), broccoli (Brassica oleracea var. botrytis), banana (Musa X paradisiaca), Maui onions (Allium cepa), edible-podded pea (Pisum sativum var. macrocarpa), etc. Plant nurseries which offer potted ornamental as well as cut foliage and flowers are also found on the agricultural park. No inventory was made of the cultivated species on this portion of the study area.

The actively cultivated fields themselves tend to support only a few weedy species. The majority of the weedy plants associated with agricultural lands are found adjacent to the fields, that is, along the margins of the fields, along and on the dirt roads, on rock and debris piles, along irrigation ditches and reservoirs, and other areas which are only occasionally disturbed. These sites are sometimes treated with herbicides to control the weedy growth.

This weedy association of plants is composed primarily of grasses and annual, herbaceous species. The weedy assemblage of plants found in the sugar cane fields are similar to those found in the pineapple fields and the agricultural park. Frequently observed species include Guinea grass (Panicum maximum), swollen fingergrass (Chloris barbata), nutgrass (Cyperus rotundus), garden spurge (Chamaesyce hirta), smooth rattlepod (Crotalaria pallida), spiny amaranth (Amaranthus spinosus), buffel grass (Cenchrus ciliaris), and little bell (Ipomoea triloba). Along the irrigation ditches and reservoirs, a few species which prefer a wetter environment are found; these include honohono (Commelina diffusa), Leptochloa uninerxia, primrose willow (Ludwigia octovalvis), California grass (Brachiaria mutica), and the ho'i'o fern (Diplazium esculentum).

### Kiawe/Bufelgrass Association

This vegetation type is dominated by two introduced or alien plant species. Kiawe (Prosopis pallida), native to tropical America, was first introduced into the Hawaiian Islands in 1828 and now is the dominant component of the vegetation in low elevation, dry, disturbed sites on all of the main islands (Wagner et al. 1990). The seeds are very hard and pass through the digestive tract of livestock, and have thus been quickly and widely spread. Bufelgrass (Cenchrus ciliaris) is native to Africa and tropical Asia. It was first observed in 1932 on the island of Hawai'i. Today, it is common to abundant in dry areas in a wide variety of disturbed habitats.

The kiawe/bufelgrass association forms the major plant cover on the uncultivated lands. It covers all of Segments E and F, and major portions of Segments C and D. The soils generally belong to the Waiakoa-Keahua-Molokai association, but in many places contain the stonier variants of these soil types. For example, along the lower portions of Segments E and F, the substrate is Waiakoa extremely stony silty clay loam, 3 to 25% slopes, mapped as "WD2" on the soil maps (Foote et al. 1972). Thin soils over fragmental 'a' belonging to the Keawapuka-Makena association and the Kamaole-Oanapuka association are also found in the areas with this vegetation type.

Typically, the physiognomy is of an open canopy forest with dense grass cover filling in the matrix between the trees. Tree canopy cover is 30 to 60%, but tends to be somewhat denser in small gullies and low lying areas where runoff may accumulate during the rainy season. The trees vary in height from 12 to 40 feet tall, with most trees around 25 to 30 feet tall. In most places, bufelgrass forms dense, almost monodominant, clumping mats, 2 to

3 feet tall. On the stonier soils, bufel grass cover is reduced and patchy with a number of other, mostly annual, species common to abundant. These include peppergrass (Lepidium virginicum), burgrass (Tragus berteronianus), allseed (Polycarpon tetraphyllum), feather fingergrass (Chloris virgata), male hohono (Ageratum conyzoides), wild zinnia (Zinnia peruviana), and pitted beardgrass (Bothriochloa pertusa).

There are a few minor variants of this vegetation type. Around water troughs and the larger, shadier kiawe trees where the cattle and horses tend to congregate and rest, peppergrass, Lepidium oblongum, cheeseweed (Malva parviflora), feather fingergrass, 'aheahea (Chenopodium murale), stinkgrass (Eragrostis cilianensis), and apple of Peru (Nicandra physalodes) are locally abundant. Along portions of Segments E and F, the kiawe trees become widely spaced and klu (Acacia farnesiana) shrubs, 3 to 6 feet tall, form large, open thickets.

Along the middle portion of Segment C, from where it crosses Waiakoa Gulch and upslope to the pineapple fields at about the 1,400-foot contour, panini cactus (Opuntia ficus-indica) is codominant with kiawe and bufelgrass. Panini forms dense prickly stands, 9 to 15 feet tall and 20 to 30 feet wide; the cactus cover is about 15 to 20%. The substrate is loose fragmental 'a' and small boulders with a dense cover of bufelgrass. Surveying through this area is somewhat hazardous as the loose substrate can cause one to easily fall into a cactus patch. Large rock outcroppings in this area support a few native species such as 'ilima (Sida fallax) -- which is locally abundant, kumu-niu fern (Doryopteris decipiens), nehe (Lipochaeta rockii), Sicyos hispidus, and ilie'e (Plumbago zeylanica).

Along the lower portions of Segments E and F, where they join Pi'ilani Highway (K1 and K2 termini), there is evidence of past

fires. Burnt snags (standing dead) of kiawe trees are frequent and tree cover is more open, about 20 to 30% cover. In places, there are young saplings of kiawe, 1 to 4 feet tall, regenerating. Feather fingergrass forms extensive patches in the areas which have been recently burned.

#### Kikuyu/Mixed Grass Pasture Land

This vegetation type occupies only a small portion of the study site where it is found on the U2 terminus and along the upper portion of Segment B. Kikuyu grass (Pennisetum clandestinum), native to tropical Africa, is an excellent pasture grass which forms a thick, low, greenish-yellow colored mat. Other grasses which occur here in scattered patches or clumps include Rhodes grass (Chloris gayana), pitted beardgrass, Natal reedtop (Melinis repens), Guinea grass, Bermuda grass (Cynodon dactylon), and buffelgrass. In places, Rhodes grass and pitted beardgrass may be locally abundant, that is, they form large, extensive patches.

This portion of the study site is at a higher elevation and is cooler and wetter. A number of species which prefer these cooler, moister conditions were found only in this vegetation type. These include fennel (Foeniculum vulgare), Childing pink (Petrorhagia velutina), Spanish clover or ka'imi (Desmodium incanum), rat tail fescue (Vulpia myuros), and narrow-leaved plantain (Plantago lanceolata). Scattered here and there throughout the pasture land are small stands of trees and shrubs which include silk oak (Grevillea robusta), Christmas berry (Schinus terebinthifolius), jacaranda (Jacaranda mimosifolia), klu, black wattle (Acacia mearnsii), lantana (Lantana camara), and pepper tree (Schinus molle).

A variant of this vegetation type is found on Segment C, between the Kula Agricultural Park and the pineapple fields which begin at about the 2,000-foot contour. In this area, the pasture land contains scattered trees of kiawe and silk oak. Large patches of panini cactus are abundant. Glycine wightii, a climbing legume introduced as a fodder plant, is also abundant. Buffel grass and pitted beardgrass form extensive mats while Kikuyu grass is restricted to swale areas and small drainageways.

#### Gulch Vegetation

The alignment segments cross six major gulches: Kaliaiinui, Pulehu, Kalalooa, Waiakoa, Kulanihako'i, and Waipu'ilani Gulches, as well as several, smaller unnamed gulches. Where Kaliaiinui Gulch and Pulehu Gulch pass through the sugar cane fields, they are fenced and used for grazing.

The smaller, shallower gulches do not support a wide range of species and are dominated primarily by buffelgrass, Guinea grass, green panicgrass (Panicum maximum var. trichoglume), small thickets of koa haole shrubs (Leucaena leucocephala), and scattered kiawe trees.

Along the bottoms of the larger gulches and on the less steeply sloping gulch walls, scattered stands of kiawe, Chinaberry (Meila azedarach), and the native williwili (Erythrina sandwicensis) trees are found. Trees of Java plum (Syzygium cumini), kukui (Aleurites moluccana), silk oak (Grevillea robusta), and Chinese banyan (Ficus microcarpa) are also found in Kaliaiinui Gulch, the largest gulch within the study area. Shrubs commonly found in these large gulches include koa haole, lantana, Christmas berry, and the native 'ilie'e (Plumbago zeylanica).

Lana'i (near Pu'u Mahanaiua and north of Kaumalapau Road); Hawaii (Puako, South Kohala); O'ahu ('Ewa Plain); and Maui (Pu'u o Kali and Kalialinui Gulch).

The Kalialinui Gulch population is made up of three small clumps of plants at elevations between 690 to 750 feet on red soils. Segment A which crosses the nearest to the ko'oloa'ua population is found at the 840-foot contour, well above the endangered plants.

#### DISCUSSION AND RECOMMENDATIONS

All of the vegetation types recognized on the alternative termini and alignment segments are dominated by introduced species. Sugar cane fields cover the majority of the cultivated lands, that is, all of Segment A, a small portion of Segment B, and the U1 terminus. Pineapple fields and the Kula Agricultural Park make up the remaining cultivated lands. Pineapple fields are found along Segments B, C, and D, and on the U3 terminus. The agricultural park is found on Segment C.

Uncultivated lands are covered largely by a kiawe/buffelgrass association. This vegetation type covers the greatest area throughout all of the study site. It is found on the K1 and K2 termini, on all of Segments E and F, and along the majority of Segments B and C. Kikuyu/mixed grass pasture land is found on the upper elevation sections of Segments B and C, and on the U2 terminus. Gulch vegetation is found where the segments cross several gulches, some of them large and steep-walled. Most of the uncultivated lands are used for grazing cattle and horses. The lower elevation portions of the kiawe/buffelgrass association also show evidence of past fires.

A total of 173 plant species were recorded during the field

Ground cover is composed primarily of buffelgrass, Guinea grass, and green panicgrass. Because these large, deep gulches are shaded during part of the day and provide a moister habitat, they support a rich assortment of species. These include lion's ear (Leonotis nepetifolia), petty spurge (Euphorbia pepylus), castor bean (Ricinus communis), four-o'clock (Mirabilis jalapa), hairy abutilon (Abutilon grandifolium), Galinsoga parviflora, oriental hawkbeard (Youngia japonica), staggerweed (Stachys arvensis), Jimson weed (Datura stramonium), etc.

Scattered clumps of plants are found on the steep, almost perpendicular gulch walls. Large, succulent rosettes of sisal (Agave sisalana) and Mauritius hemp (Furcraea foetida) are occasionally observed on many of the gulch walls. The native 'a'ali'i shrub (Dodonaea viscosa) is found on the walls of Kalialinui Gulch. Other native species which can be found on the steep gulch walls are 'ilie'e, 'ilima, kumu-niu fern, wiliwili, koali 'awa (Ipomoea indica), 'uhaloa (Walteria indica), and popolo (Solanum americanum).

#### THREATENED AND ENDANGERED SPECIES

One small population of the endangered ko'oloa'ua shrub (Abutilon menziesii) is known from Kalialinui Gulch (Wagner et al. 1990; U.S. Fish and Wildlife Service 1995).

The ko'oloa'ua is a member of the mallow or hibiscus family (Malvaceae). It is a much branched, rounded shrub up to 9 feet tall. The coarsely-toothed, heart-shaped leaves as well as the young branches are covered by a velvety, silvery, stellate pubescence. The pendent, solitary flowers are medium red to dark red (maroon) and about 0.8 inch across. The fruit is a hairy capsule, and five to eight-parted, usually with three seeds per cell. Extant populations of the ko'oloa'ua are known from

studies. Of these, 153 (88%) are introduced species; 4 (2%) are originally of Polynesian introduction; and 16 (10%) are native. Of the natives, 8 are indigenous, that is, they are native to the Hawaiian Islands and also elsewhere. Eight species are endemic, that is, they are native only to the Hawaiian Islands. The 8 endemic species are the kumu-niu fern (Doryopteris decipiens), nehe (Lipochaeta rockii), Sicyos hispidus, wiliwili (Erythrina sandwicensis), nama (Nama sandwicensis), pua kala (Argemone glauca), Panicum pellitum, and kakonakona (Panicum torridum).

None of the plants found during the survey is a listed, proposed, or candidate threatened and endangered species; nor is any plant a species of concern (U.S. Fish and Wildlife Service 1992, 1997a, 1997b). There are no areas on or adjacent to the termini and alignment segments which support native plant-dominated communities (Gagne' and Cuddihy 1990; Hawai'i Heritage Program 1994).

None of the alternative termini and alignment segments is "more favorable" or "least favorable" from a botanical perspective. Use of any of the termini and alignment segments for the construction of the proposed Kihei/Upcountry Maui Highway is not expected to have a significant negative impact on the botanical resources. The vegetation on the alternative termini and alignment segments is dominated by introduced species and there are no rare plants on or adjacent to the proposed project. However, there is some concern for fires and soil erosion. Segments which cross the kiawe/buffelgrass association should be designed with wide, gravel-lined shoulders. This vegetation type is especially fire-prone during the dry summer months. On the upper elevation portions of the proposed highway where it is wetter and the topography somewhat steeper, areas cleared of vegetation during construction should be revegetated as soon as possible to prevent soil loss.

Where landscaping is needed, it is recommended that native trees

and shrubs be considered. These plants are already adapted to the local growing conditions and would require less water and soil amendments. Some native species which could be used include wiliwili (these occur naturally in some of the larger gulches along the alignment segments); naio (Myoporum sandwicense) -- a glossy, dark green shrub with fragrant white flowers; nehe -- a shrubby member of the daisy family (it occurs on Segment C); 'ilima -- a small shrub with bright orange flowers and used in landscaping; and 'akia (Wikstroemia uvz-ursi) -- a low, mat-forming shrub which is an excellent ground cover and already in use for landscaping. The Maui Native Plant Society and the State Division of Forestry and Wildlife's Na Ala Hele program should also be contacted for additional suggestions for planting as well as planting material.

PLANT SPECIES LIST -- Kihei/Upcountry Maui Highway

The following checklist is an inventory of all the plants observed on the alternative termini and alignment segments during the field studies. The plants are arranged alphabetically by families within each of three groups: Ferns, Dicots, and Monocots. The taxonomy and nomenclature of the Ferns are in accordance with Lamoureaux (1988), while the flowering plants, Dicots and Monocots, follow Wagner et al. (1990).

For each species, the following information is provided:

1. Scientific name with author citation.
2. Common English and/or Hawaiian name(s), when known.
3. Biogeographic status. The following symbols are used:
  - E = endemic = native only to the Hawaiian Islands.
  - I = indigenous = native to the Hawaiian Islands and also elsewhere.
  - I? = questionably indigenous = data not clear if dispersal by natural or human-related mechanisms, but weight of evidence suggests probably indigenous.
  - P = Polynesian = plants originally of Polynesian introduction prior to Western contact, that is, Cook's discovery of the Hawaiian Islands in 1778.
  - P? = questionably Polynesian = may be a Polynesian introduction or possibly introduced in historical times (after 1778).
  - X = introduced or alien = all those plants brought to the Hawaiian Islands by humans, intentionally or accidentally, after Western contact.
  - X? = questionably introduced = date of introduction unclear or very early, may possibly be indigenous or of Polynesian introduction.
4. Presence (+) or absence (-) of a particular species within

each of four vegetation types recognized within the study area (see text for discussion):

- c = Cultivated Lands
- k = Kiawe/Bufelgrass Association
- m = Kikuyu/Mixed Grass Pasture Land
- g = Gulch Vegetation

BOTANICAL SURVEY  
KIHEI/UPCOUNTRY MAUI HIGHWAY  
ADDITIONAL STUDIES -- U2-A ALIGNMENT

BOTANICAL SURVEY  
KIHEI/UPCOUNTRY MAUI HIGHWAY  
ADDITIONAL STUDIES -- U2-A ALIGNMENT

INTRODUCTION

A botanical survey report was prepared for the proposed Kihei/Upcountry Maui Highway in May 1997 (Char 1997). Since then, the plans for the U-2 terminus have been modified and two alternate alignments, U2-A and U2-B, are now being considered.

by

A discussion of the botanical resources found on the Alternative U2-A alignment is presented in this report. Field studies for the U2-A alignment were conducted on September 13 to 14, 1997 by a team of three botanists. The centerline of the alignment was staked and flagged prior to our field studies. The survey methods outlined in the earlier study (Char 1997) were used.

CHAR & ASSOCIATES  
Botanical Consultants  
Honolulu, Hawai'i

DESCRIPTION OF THE VEGETATION

In the discussion below, the vegetation along the U2-A alignment is described from mauka to makai, that is, from the U2-A terminus to where it terminates near Puiehu Gulch. Locations are referenced to the centerline station numbers.

October 1997

Prepared for: PARSONS BRINCKERHOFF

The alignment crosses two vegetation types which were not encountered during the earlier study; these are abandoned pineapple fields and Christmas berry/mixed shrubland. They are described in more detail in the report. A list of the plants observed during the field studies is presented at the end of the report.

### Vegetation Along the Alignment

From its terminus at the existing signaled intersection of Haleakala Highway, Pukalani Bypass, and Kula Highway to about station 307, the alignment crosses abandoned pineapple fields. Scattered remnant patches of pineapple (Ananas comosus) are found in overgrown fields now covered with dense clumps of Rhodes grass (Chloris gayana) and other weedy species. Young trees of jacaranda (Jacaranda mimosifolia), 10 to 12 ft. tall, and Christmas berry (Schinus terebinthifolius) shrubs, 10 to 15 ft. tall, are scattered widely throughout the overgrown fields. In the areas which support remnant patches of pineapple, there are also tangled mats of wild bittermelon (Momordica charantia) and white passion flower (Passiflora subpeltata) vines, prickly clumps of bull thistle (Cirsium vulgare), wild fennel (Foeniculum vulgare), and sourgrass (Digitaria insularis).

From station 307 to station 314, the alignment crosses through Christmas berry/mixed shrubland. Christmas berry shrubs form large, rounded thickets up to 20 ft. tall and 25 to 30 ft. wide. Filling in the matrix between the Christmas berry shrubs is a varied mixture of grasses such as Rhodes grass, Kikuyu grass (Pennisetum clandestinum), pitted beardgrass (Bothriochloa pertusa), and smaller herbaceous species which include Spanish clover or ka'imi (Desmodium incanum), Sida rhombifolia, 'ilima (Sida fallax), spiny amaranth (Amaranthus spinosus), etc. In many places, dense patches of mixed shrubs are common to abundant; shrubs found here include lantana (Lantana camara), indigo (Indigofera suffruticosa), castor bean (Ricinus communis), and hairy abutilon (Abutilon grandifolium). Portions of the Christmas berry/mixed shrubland were used for pineapple cultivation at one time as there are remnants of black plastic sheeting as well as dried out, dead pineapple plants.

From about station 314 to station 317, the U2-A alignment crosses Ha'akakai/Kaluapalani Gulch, and gulch vegetation. Stands of Chinaberry (Melia azedarach) and the native wiliwili (Erythrina sandwicensis), 30 to 50 ft. tall, are found in the gulch. Also common are plantings of large trees of various Eucalyptus species up to 70 and 80 ft. tall. Ground cover is primarily Guinea Grass (Panicum maximum), pitted beardgrass, and buffelgrass (Cenchrus ciliaris). As in the earlier study (Char 1997), this gulch as well as the other gulches along the alignments support only intermittent streams along their bottoms. The dry stream beds have been eroded down to the solid bedrock in most places, or are strewn with large boulders.

From station 317 to 333, the alignment crosses Kikuyu/mixed grass pasture land. A detailed description of this vegetation type is given in the earlier report.

Gulch vegetation is again encountered where the alignment crosses Kaliainui Gulch between stations 334 and 341. From station 341, the alignment then crosses cultivated lands consisting of pineapple fields and also gulch vegetation where a few shallow gulches cross the pineapple fields. At about station 365 and on to Pulehu Gulch (station 386), the U2-A alignment passes through recently planted sugar cane fields.

### DISCUSSION AND RECOMMENDATIONS

The findings along the proposed U2-A alignment are similar to the earlier botanical study (Char 1997). All of the vegetation types found along the U2-A alignment are dominated by introduced species. The few native species are more or less found in or adjacent to the gulches. Native plants found during this field survey are the kumu-niu fern (Doryopteris decipiens), koali 'awa (Ipomoea indica), pa'u o Hi'iaka (Jacquemontia ovalifolia), wiliwili, 'ilima, pua

kala (Argemone glauca), 'a'ali'i (Dodonaea viscosa), and 'uhaloa (Waltheria indica). All except the pa'u o Hi'iaka were found during the earlier survey.

As in the earlier study, none of the plants found along the proposed U2-A alignment is a listed, proposed, or candidate threatened and endangered species; nor is any plant a species of concern (U.S. Fish and Wildlife Service 1997). Again, no wetlands were found where the intermittent streams run along the bottom of the gulches. These areas are not dominated by wetland indicator species (Reed 1988), and the soils along the alignment are not listed as hydric soils (Soil Conservation Service 1990).

The construction of the highway along the U2-A alignment should not have a significant negative impact on the botanical resources. However, it is recommended that areas cleared of vegetation be revegetated as soon as possible to prevent soil loss and discharge of sediments into the intermittent streams (during the rainy season). Again, it is recommended that native plants be used whenever possible for landscaping.

## PLANT SPECIES LIST -- U2-A Alignment

The following is a list of all the plants observed along the U2-A alignment of the proposed Kihei/Upcountry Maui Highway. The plants are arranged alphabetically within each of three groups. The taxonomy and nomenclature of the Ferns follow Lamoureux (1988), while the flowering plants, Dicots and Monocots, are in accordance with Wagner et al. (1990).

For each species, the following information is provided:

1. Scientific name with author citation.
2. Common English and/or Hawaiian name(s), when known.
3. Biogeographic status. The following symbols are used:
  - E = endemic = native only to the Hawaiian Islands.
  - I = indigenous = native to the Hawaiian Islands and also elsewhere.
  - I? = questionably indigenous = data not clear if dispersal by natural or human-related mechanisms, but weight of evidence suggests probably indigenous.
  - P = Polynesian = plants originally of Polynesian introduction prior to Western contact, i.e. Cook's discovery of the Hawaiian Islands in 1778.
  - P? = questionably Polynesian = may be a Polynesian introduction or possibly introduced in historical times (after 1778).
  - X = introduced or alien = all those plants brought to the Hawaiian Islands by humans, intentionally or accidentally, after Western contact.
  - X? = questionably introduced = date of introduction unclear or very early, may possibly be indigenous or of Polynesian introduction.
4. Presence (+) or absence (-) of a particular species within each of five vegetation types recognized along the alignment (see text for discussion):

INTRODUCTION

An earlier botanical survey report (Char 1997a) which covered all of the then proposed Kihei/Upcountry Maui Highway alignments and termini was prepared in May 1997. Since that time, the plans for the U-2 terminus and alignment segment have been modified and two alternate alignments, U2-A and U2-B, are now being proposed. The U2-A terminus is found at the intersection of Haleakala Highway, Pukalani Bypass, and Kula Highway, by the existing traffic signal. The U2-B terminus is located on the Kula Highway, across from the Kula 200 Subdivision and south of the Ha'akakai Gulch bridge.

Field studies to assess the botanical resources along the U2-B alignment were conducted on September 14 to 15, 1997 by a team of three botanists. The centerline of the alignment was staked and flagged prior to the field studies. The survey methods outlined in the earlier study (Char 1997a) were followed.

DESCRIPTION OF THE VEGETATION

In the discussion which follows, the vegetation found along the U2-B alignment is described from mauka to makai, that is from the U2-B terminus at Kula Highway to where it adjoins the U2-A alignment at station U2-B 500. Locations are referenced to the centerline station numbers.

The alignment crosses over three vegetation types: Kikuyu/mixed grass pasture land, gulch vegetation, and cultivated lands (pine-

Prepared for: PARSONS BRINCKERHOFF

October 1997

apple fields). A short description is provided for each of these vegetation types; a more detailed discussion is found in the earlier botanical survey report (Char 1997a). A list of all the plant species found along the U2-B alignment is presented at the end of the report.

#### Vegetation Along the U2-B Alignment

From its terminus at Kula Highway (station 550) and downslope to about station 521, the U2-B alignment crosses Kikuyu/mixed grass pasture land. Along this alignment, Kikuyu (Pennisetum clandestinum), Rhodes grass (Chloris gayana), and pitted beardgrass (Bothriochloa pertusa) are the most abundant grass components. In some places, spiny amaranth (Amaranthus spinosus) plants are locally abundant. Trees and shrubs which include various Eucalyptus species, Chinaberry (Melia azedarach), Christmas berry (Schinus terebinthifolius), jacaranda (Jacaranda mimosifolia), pepper tree (Schinus molle), etc., occur as scattered individuals or small stands. Where the alignment passes near a cinder pit (Pu'u o Weli), there is a grove of Eucalyptus and other tree species as well as scattered thickets of koa haole shrubs (Leucaena leucocephala).

From station 521 to station 519, the alignment crosses Kalialinui Gulch and gulch vegetation. The gulch supports tall stands of Chinaberry and williwili (Erythrina sandwicensis) trees. Koa haole shrubs are common and Guinea grass (Panicum maximum) forms dense clumps between the woody components. Rocky outcrops are frequent along the steep gulch walls. The gulch bottom supports an intermittent stream which is composed of shallow, dry soil and large boulders. For the greater part of the time, the streams are dry with flowing water present only during periods of very heavy rainfall. The cattle which graze in the gulch use the dry streambed as part of their network of cattle paths.

From station 519 and on to where the U2-B alignment joins the U2-A alignment, the U2-B alignment crosses recently planted pine-apple fields or cultivated lands and a few shallow gulches with gulch vegetation.

#### DISCUSSION AND RECOMMENDATIONS

The vegetation types found along the U2-B alignment are dominated by introduced species such as Kikuyu grass, koa haole, Chinaberry, Christmas berry, etc. The few native plants are usually found associated with the gulch areas. All of the native plants can be found in similar habitats throughout the Hawaiian Islands. None of the plants inventoried during the field studies is a listed, proposed, or candidate threatened and endangered species; nor is any plant considered a species of concern (U.S. Fish and Wildlife Service 1997). Similar findings were recorded from the earlier botanical study (Char 1997a) and also from the most recent study for the U2-A alignment (Char 1997b). No wetlands or wetland vegetation occur along the alignment.

Given the findings above, the proposed U2-B alignment should not have a significant negative impact on the botanical resources. As in the previous studies, it is recommended that areas cleared of vegetation be revegetated as soon as possible to prevent soil erosion. Native plants such as the williwili are recommended for landscaping wherever possible.

PLANT SPECIES LIST -- U2-B Alignment

The following is a list of all the plants observed along the U2-B alignment of the proposed Kihei/Upcountry Maui Highway. The plants are arranged alphabetically by families within each of three groups. The taxonomy and nomenclature of the Ferns follow Lamoureux (1988), while the flowering plants, Dicots and Monocots, are in accordance with Wagner et al. (1990).

For each species, the following information is provided:

1. Scientific name with author citation.
2. Common English and/or Hawaiian name(s), when known.
3. Biogeographic status. The following symbols are used:  
 E = endemic = native only to the Hawaiian Islands.  
 I = indigenous = native to the Hawaiian Islands and also elsewhere.  
 I? = questionably indigenous = data not clear if dispersal by natural or human-related mechanisms, but weight of evidence suggests probably indigenous.  
 P? = questionably Polynesian = may be a Polynesian introduction prior to Western contact, i.e. Cook's discovery of the Hawaiian Islands in 1778, or possibly introduced very early after Western contact.  
 X = introduced or alien = all those plants brought to the Hawaiian Islands by humans, intentionally or accidentally, after Western contact.
4. Presence (+) or absence (-) of a particular species within each of three vegetation types recognized along the alignment (see text for discussion):  
 c = Cultivated Lands  
 m = Kikuyu/Mixed Grass Pasture Land  
 g = Gulch Vegetation

Scientific name	Common name	Status	Vegetation type		
			c	m	g
<b>FERNS</b>					
ADIANTACEAE (Maiden hair fern family)					
Adiantum hispidulum Sw.	Australian maiden hair	X	-	-	+
SINOPTERIDACEAE (Cliffbrake fern family)					
Doryopteris decipiens (Hook.) J. Sm.	kumu-niu, manawahua, 'iwa'iwa	E	-	-	+
<b>FLOWERING PLANTS</b>					
<b>DICOTS</b>					
AMARANTHACEAE (Amaranth family)					
Amaranthus spinosus L.	spiny amaranth, pakai kuku	X	+	+	-
Amaranthus viridus L.	slender amaranth, pakai	X	+	-	-
ANACARDIACEAE (Mango family)					
Schinus molle L.	pepper tree	X	-	+	-
Schinus terebinthifolius Raddi	Christmas berry	X	-	+	+
ASCLEPIADACEAE (Milkweed family)					
Asclepias curassavica L.	butterfly weed, laulele	X	-	+	-
Asclepias physocarpa (E. Mey.) Schlechter	balloon plant	X	-	+	-
ASTERACEAE (Daisy family)					
Cirsium vulgare (Savi) Ten.	bull thistle	X	-	+	-
Conyza bonariensis (L.) Cronq.	hairy horseweed, ilioha	X	+	+	-
Emilia fosbergii Nicolson	pualele	X	-	+	+
Heterotheca grandiflora Nutt.	telegraph plant	X	-	+	+
Lactuca serriola L.	wild lettuce	X	+	-	-
Senecio madagascariensis Poiret		X	-	+	-
Sonchus oleraceus L.	sow thistle, pualele	X	-	+	-

<u>Scientific name</u>	<u>Common name</u>	<u>Status</u>	<u>Vegetation type</u>		
			<u>c</u>	<u>m</u>	<u>g</u>
GENTIANACEAE (Gentian family) Centaurium erythraea Raf.	bitter herb	X	-	+	-
MALVACEAE (Mallow family) Abutilon grandifolium (Willd.) Sweet	hairy abutilon, ma'o	X	-	+	+
Malvastrum coromandelianum (L.) Garcke	false mallow	X	-	+	+
Sida fallax Walp.	'ilima	I	+	+	+
Sida rhombifolia L.		X	-	+	-
MELIACEAE (Mahogany family) Melia azedarch L.	Chinaberry, pride of India, 'inia	X	-	+	+
MORACEAE (Mulberry family) Ficus microcarpa L. fill.	Chinese banyan	X	-	-	+
MYRTACEAE (Myrtle family) Eucalyptus spp.	eucalyptus, gum tree	X	-	+	+
Psidium guajava L.	guava, kuawa	X	-	+	-
NYCTAGINACEAE (Four-o'clock family) Mirabilis jalapa L.	four-o'clock, naniahiahi	X	-	-	+
OLEACEAE (Olive family) Olea europaea ssp. africana (Mill.) P. Green	olive, 'oliwa	X	-	+	-
OXALIDACEAE (Wood sorrel family) Oxalis corniculata L.	yellow wood sorrel, 'ihi 'ai	P?	-	+	-
PAPAVERACEAE (Poppy family) Argemone glauca (Nutt. ex Prain) Pope	pua kala, kala	E	-	+	-

<u>Scientific name</u>	<u>Common name</u>	<u>Status</u>	<u>Vegetation type</u>		
			<u>c</u>	<u>m</u>	<u>g</u>
BIGNONIACEAE (Bignonia family) Jacaranda mimosifolia D. Don	jacaranda	X	-	+	-
BRASSICACEAE (Mustard family) Lepidium oblongum Small		X	-	+	-
Sisymbrium altissimum L.	Jim Hill mustard, tumble mustard	X	-	+	-
CACTACEAE (Cactus family) Opuntia ficus-indica (L.) Mill.	panini	X	+	+	+
CONVOLVULACEAE (Morning glory family) Ipomoea indica (J. Burm.) Merr.	koali 'awa	I	+	-	-
CUCURBITACEAE (Gourd family) Momordica charantia L.	wild bittermelon	X	+	+	+
EUPHORBIACEAE (Spurge family) Ricinus communis L.	castor bean, koli	X	-	-	+
FABACEAE (Pea family) Acacia farnesiana (L.) Willd.	klu	X	-	+	-
Acacia mearnsii De Wild.	black wattle	X	-	+	-
Chamaecrista nictitans (L.) Moench	partridge pea, lauki	X	+	+	-
Crotalaria pallida Aiton	smooth rattlebox, pikakani	X	-	+	-
Desmodium incanum DC	Spanish clover, ka'imi	X	-	+	-
Desmodium triflorum (L.) DC	three-flowered beggarweed	X	-	+	-
Erythrina sandwicensis Degener	wiliwili	E	+	+	+
Indigofera suffruticosa Mill.	indigo, 'iniko	X	+	+	+
Leucaena leucocephala (Lam.) de Wit	koa haole	X	+	+	+
Macroptilium lathyroides (L.) Urb.	wild bean, cowpea	X	+	+	-
Prosopis pallida (Humb. & Bonpl. ex Willd.) Kunth	kiawe	X	+	-	-

<u>Scientific name</u>	<u>Common name</u>	<u>Status</u>	<u>Vegetation type</u>		
			<u>c</u>	<u>m</u>	<u>g</u>
<b>MONOCOTS</b>					
BROMELIACEAE (Pineapple family)					
Ananas comosus (Stickm.) Merr.	pineapple	X	+	-	-
CYPERACEAE (Sedge family)					
Cyperus rotundus L.	nutgrass, nut sedge	X	+	-	-
POACEAE (Grass family)					
Bothriochloa pertusa (L.) A. Camus	pitted beardgrass	X	-	+	+
Bromus willdenowii Kunth	rescue grass	X	-	+	-
Cenchrus ciliaris L.	buffelgrass	X	+	+	+
Chloris barbata (L.) Sw.	swollen fingergrass, mau'u-lei	X	-	+	-
Chloris gayana Kunth	Rhodes grass	X	-	+	-
Cynodon dactylon (L.) Pers.	Bermuda grass, manienie	X	+	+	-
Digitaria insularis (L.) Mez ex Ekman	sourgrass	X	+	+	+
Melinis repens (Willd.) Zizka	Natal redtop, Natal grass	X	+	+	+
Panicum maximum Jacq.	Guinea grass	X	+	+	+
Pennisetum clandestinum Chiov.	Kikuyu grass	X	-	+	-
Sporobolus africanus (Poir.) Robyns & Tournay	African dropseed, smutgrass	X	-	+	-

<u>Scientific name</u>	<u>Common name</u>	<u>Status</u>	<u>Vegetation type</u>		
			<u>c</u>	<u>m</u>	<u>g</u>
PLANTAGINACEAE (Plantain family)					
Plantago lanceolata L.	narrow-leaved plantain	X	-	+	-
PORTULACACEAE (Purslane family)					
Portulaca oleracea L.	pigweed, 'akulikuli kula, 'ihi	X	-	+	-
PROTEACEAE (Protea family)					
Grevillea robusta A. Cunn. ex R. Br.	silk oak, 'oka-kalika	X	-	+	+
RUTACEAE (Citrus family)					
Murraya paniculata (L.) Jack	mock orange	X	-	+	-
SAPINDACEAE (Soapberry family)					
Dodonaea viscosa Jacq.	'a'ali'i	I	-	+	+
SOLANACEAE (Nightshade family)					
Nicandra physalodes (L.) Gaertn.	apple of Peru	X	+	-	+
Nicotiana glauca R.C. Graham	tree tobacco	X	+	+	-
Solanum linnaeanum Hepper & P. Jaeger	apple of Sodom, popolo kikania	X	-	+	-
STERCULIACEAE (Cacao family)					
Waltheria indica L.	'uhaloa, hi'aloa, kanakaloa	I?	+	-	+
VERBENACEAE (Verbena family)					
Lantana camara L.	lantana, lakana	X	-	+	+
Stachytarpheta dichotoma (Ruiz & Pav.) Vahl	owi, oi	X	-	+	-
Verbena litoralis Kunth	weed verbena, owi, oi	X	+	+	-

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Elapsed ASTM days:** Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

### FEDERAL ASTM RECORDS:

**CERCLIS:** Comprehensive Environmental Response, Compensation, and Liability Information System

Source: EPA/INTIS

Telephone: 703-413-0223

**CERCLIS:** CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 04/30/97

Date Made Active at EDR: 06/30/97

Database Release Frequency: Monthly

Date of Data Arrival at EDR: 05/19/97

Elapsed ASTM days: 42

Date of Last EDR Contact: 08/22/97

**ERNS:** Emergency Response Notification System

Source: EPA/INTIS

Telephone: 202-260-2342

**ERNS:** Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 03/01/97

Date Made Active at EDR: 06/24/97

Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 04/10/97

Elapsed ASTM days: 75

Date of Last EDR Contact: 08/26/97

**NPL:** National Priority List

Source: EPA

Telephone: 703-603-8852

**NPL:** National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC).

Date of Government Version: 04/01/97

Date Made Active at EDR: 05/29/97

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 04/21/97

Elapsed ASTM days: 38

Date of Last EDR Contact: 07/01/97

**RCRIS:** Resource Conservation and Recovery Information System

Source: EPA/INTIS

Telephone: 800-424-9346

**RCRIS:** Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 04/01/97

Date Made Active at EDR: 06/30/97

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 04/25/97

Elapsed ASTM days: 66

Date of Last EDR Contact: 09/04/97

**CORRACTS:** Corrective Action Report

Source: EPA

Telephone: 800-424-9346

**CORRACTS:** CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 12/01/96

Date Made Active at EDR: 03/03/97

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 12/30/96

Elapsed ASTM days: 63

Date of Last EDR Contact: 07/07/97

## Section 5

# Databases Searched and Update Dates

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

### FEDERAL NON-ASTM RECORDS:

**BRS:** Biennial Reporting System  
Source: EPA/NTIS  
Telephone: 800-424-6346  
BRS: The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/93  
Database Release Frequency: Biennially  
Date of Last EDR Contact: 08/04/97  
Date of Next Scheduled EDR Contact: 09/22/97

### CONSENT: Superfund (CERCLA) Consent Decreases

Source: EPA Regional Offices  
Telephone: Varies  
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: Varies  
Database Release Frequency: Varies  
Date of Last EDR Contact: Varies  
Date of Next Scheduled EDR Contact: N/A

### FINDS: Facility Index System

Source: EPA/NTIS  
Telephone: 703-908-2493  
FINDS: Facility Index System. FINDS contains both facility information and "pointers" to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 09/30/95  
Database Release Frequency: Quarterly  
Date of Last EDR Contact: 08/22/97  
Date of Next Scheduled EDR Contact: 11/04/97

### HMIRS: Hazardous Materials Information Reporting System

Source: U.S. Department of Transportation  
Telephone: 202-366-4526  
HMIRS: Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 12/31/95  
Database Release Frequency: Annually  
Date of Last EDR Contact: 07/28/97  
Date of Next Scheduled EDR Contact: 10/27/97

### MLTS: Material Licensing Tracking System

Source: Nuclear Regulatory Commission  
Telephone: 301-415-7169  
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 01/15/97  
Database Release Frequency: Quarterly  
Date of Last EDR Contact: 07/14/97  
Date of Next Scheduled EDR Contact: 10/13/97

### NPL LIENS: Federal Superfund Liens

Source: EPA  
Telephone: 205-564-4267  
NPL LIENS: Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91  
Database Release Frequency: No Update Planned  
Date of Last EDR Contact: 08/25/97  
Date of Next Scheduled EDR Contact: 11/24/97

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

### PAADS: PCB Activity Database System

Source: EPA  
Telephone: 202-260-3936  
PAADS: PCB Activity Database. PAADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCBs who are required to notify the EPA of such activities.

Date of Government Version: 01/27/97  
Database Release Frequency: Semi-Annually  
Date of Last EDR Contact: 08/19/97  
Date of Next Scheduled EDR Contact: 11/17/97

### RAATS: RCRA Administrative Action Tracking System

Source: EPA  
Telephone: 202-564-4104  
RAATS: RCRA Administrative Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95  
Database Release Frequency: No Update Planned  
Date of Last EDR Contact: 07/01/97  
Date of Next Scheduled EDR Contact: 09/15/97

### ROD: Records Of Decision

Source: NTIS  
Telephone: 703-416-0223  
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 03/31/95  
Database Release Frequency: Annually  
Date of Last EDR Contact: 09/03/97  
Date of Next Scheduled EDR Contact: 12/01/97

### TRIS: Toxic Chemical Release Inventory System

Source: EPA/NTIS  
Telephone: 202-260-1531  
TRIS: Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III, Section 313.

Date of Government Version: 12/31/92  
Database Release Frequency: Annually  
Date of Last EDR Contact: 07/02/97  
Date of Next Scheduled EDR Contact: 09/29/97

### TSCA: Toxic Substances Control Act

Source: EPA/NTIS  
Telephone: 202-260-1444  
TSCA: Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. USEPA has no current plan to update and/or re-issue this database.

Date of Government Version: 01/31/95  
Database Release Frequency: Annually  
Date of Last EDR Contact: 06/16/97  
Date of Next Scheduled EDR Contact: 09/15/97

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

### STATE OF HAWAII ASTM RECORDS:

**LUST:** Active Leaking Underground Storage Tank Log Listing  
Source: Department of Health  
Telephone: 808-586-4228  
**LUST:** Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.  
Date of Government Version: 12/31/96  
Date Made Active at EDR: 04/21/97  
Database Release Frequency: Quarterly

### SHWS: CERCLIS

Source: Department of Health  
Telephone: 703-603-8504  
**SHWS:** State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.  
Date of Government Version: 04/30/97  
Date Made Active at EDR: 06/30/97  
Database Release Frequency: Monthly

### SWFLF: Permitted Landfills in the State of Hawaii

Source: Department of Health  
Telephone: 808-586-4245  
**SWFLF:** Solid Waste Facilities/Landfill Sites. SWFLF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.  
Date of Government Version: 04/18/97  
Date Made Active at EDR: 06/05/97  
Database Release Frequency: Annually

### UST: Lising of Underground Storage Tanks

Source: Department of Health  
Telephone: 808-586-4228  
**UST:** Registered Underground Storage Tanks. UST's are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA) and must be registered with the state department responsible for administering the UST program. Available information varies by state program.  
Date of Government Version: 12/31/96  
Date Made Active at EDR: 04/29/97  
Database Release Frequency: Annually

### Historical and Other Database(s)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

**Former Manufactured Gas (Coal Gas) Sites:** The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. © Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

### Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

### DELISTED NPL: Delisted NPL Sites

Source: EPA  
Telephone: 703-603-8769  
**DELISTED NPL:** The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

### NFRAP: No Further Remedial Action Planned

Source: EPA/NTIS  
Telephone: 703-413-0223  
**NFRAP:** As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

### FRDS: Federal Reporting Data System

Source: EPA/Office of Drinking Water  
Telephone: 202-260-2805  
**FRDS** provides information regarding public water supplies and their compliance with monitoring requirements, maximum contaminant levels (MCL's), and other requirements of the Safe Drinking Water Act of 1986.

### Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA State Residential Radon Survey and the National Residential Radon Survey. The

study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

**Oil/Gas Pipelines/Electrical Transmission Lines:** This data was obtained by EDR from the USGS in 1984. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000 Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

**Sensitive Receptors:** There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

**USGS Water Wells:** In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.

**Flood Zone Data:** This data, available in select counties across the country, was obtained by EDR in 1994 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

## GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

**Epicenters:** World earthquake epicenters, Richter 5 or greater  
Source: Department of Commerce, National Oceanic and Atmospheric Administration

**Water Dams:** National Inventory of Dams  
Source: Federal Emergency Management Agency  
Telephone: 202-646-2801  
WATER DAMS: National computer database of more than 74,000 dams maintained by the Federal Emergency Management Agency.

*Thank you for your business.*

## TRANSCRIPT OF PROCEEDINGS

## PUBLIC HEARING

1  
2  
3  
4 MR. GALBRAITH: I am Kimo Galbraith, PO Box 1728, Kihei.  
5 Right now I drive on these roads every day, I'm a taxi driver,  
6 and I see the conditions of the road and then I see the  
7 traffic. The traffic is getting so bad right now already at  
8 Lipoa that it doesn't make sense to go up from Lipoa. All your  
9 growth right now is getting so heavy in the Kihei area that  
10 within five years Kihei is going to be full, and everything is  
11 moving towards Makena. So why do they want to put another rode  
12 and make it more congested right here in the middle of town,  
13 when they should go down to Wailea.

14 They had the alternate road in Wailea originally,  
15 but they did away with it. Going from Wailea was going up to  
16 Kula Road, which would be simpler for everybody on this side,  
17 of course, and it would still be simple for the people up in  
18 Pukalani to drive down the highway and come down here. And it  
19 would cause less traffic because the traffic would be going  
20 down from the main highways down from Pukalani. But they have  
21 done away with that one.

22 So the second best one, which is the only one that  
23 they've proposed now, is going from the Kamalii school up to  
24 the Kula area, which will in some ways release some of that  
25 congestion. But you know, this is not even going to happen for

1 five years. Within five years it's going to be such a mess  
2 around here with traffic that this road will be obsolete before  
3 they finish it. They have got to get a good plan. I mean, you  
4 know, they can't make everybody happy. But I see so much  
5 growth going down towards Wailea, and we have a huge influx of  
6 tourism that want to go Upcountry. People in Kihei that want  
7 to work Upcountry and have to work Upcountry can also drive and  
8 relieve the traffic by going to Wailea and going up that way,  
9 rather than make the traffic heavier coming through this way.

10 I am not only considering the traffic, but tourism  
11 is a major factor with all the traffic. I mean how do I say  
12 it? I wish they would have left the Wailea and Kula Road  
13 proposal in, because I think that would be the most practical,  
14 and probably the most reasonable in the long run, and will  
15 relieve traffic congestion. Eventually they could put another  
16 road across in the proposed area, and by the time they get done  
17 proposing it -- it's been 20 years since they have proposed  
18 this one already, since the '60's, and nothing has been done.

19 Well, how do we get things done? Somebody has got  
20 to take a stand, somebody has got to get the thing going.  
21 That's why these meetings are happening, now I understand. But  
22 trying to make people agree on everything is never going to  
23 work. But they're just going to have to make a decision  
24 whether it makes everybody happy or not, and get a road  
25 Upcountry ASAP.

1           The last time we had a heavy rain, Ohukai Street was  
2 nothing but a flood of water going down. You could hardly even  
3 drive through it. The whole bottom part of Kihei flooded,  
4 because there's no storm drains. They don't figure it's going  
5 to rain in Kihei. When it does, it makes a mess. At Welakahao  
6 they're finally getting some drains in there. That's what  
7 they're working on, on this road stuff now, that's taken over a  
8 year. In that area, every time it rains there's nothing but  
9 flooding in there. On Welakahao they tore it up and did not  
10 patch it worth a damn, pardon me, but it's nothing but a  
11 washboard.

12           They left the Kihei Road that way until enough  
13 people complained. They finally had to do the repatching that  
14 they did on that. That road is disgusting. Wait until they  
15 start from Welakahao to Lipoa, about a half mile stretch. It's  
16 going to take them three years to do that, if it takes them  
17 over a year to do two blocks. I give up. Something has got to  
18 be done about our County roads. Thank you very much.

19           MR. PHILLIPS: I am John Phillips, I live at 523  
20 Ekahi Way in Kihei. As far as my comments, I would like to  
21 propose, I would like to vote for the K1 Upcountry 3 route,  
22 because I live in Kihei and I commute to Kula. I work as a  
23 nurse in Kula, Kula Hospital, and it would make my -- it would  
24 cut down on my expense to get there, and it would cut down on  
25 traffic. Traffic-wise, it's a lot easier for me to get there

1 that way. I'm not sure what else.

2 Fuel efficiency-wise, I believe that it's in the  
3 best interest of a lot of people coming from the area of Kula  
4 to Kihei or Wailea to be able to have an access that way or  
5 some way, or vice versa. As in my case, coming from Kihei to  
6 Kula it's less dangerous. As far as me traveling through  
7 Hansen Road and up Hana Highway and Kula Highway, that would be  
8 a lot less dangerous for me, and fuel efficiency-wise and time  
9 efficient-wise to travel that way, for me. I guess that's  
10 pretty much all I have to comment on.

11 I just wanted to put in my two cents worth in this  
12 forum, and I appreciate this forum. This is a nice way to deal  
13 with the public in a way of getting responses and feelings from  
14 all throughout the community, I think, because I think a lot of  
15 the Upcountry or whoever it is in particular will voice their  
16 opinions. It's important, and I felt it was important for me  
17 to come here tonight to voice my opinion, and I'd like to think  
18 that my opinion counts.

19 MR. HIRONAKA: My name is Sam S. Hironaka, and I  
20 live at 99 Naniluna in Wailuku town. I'm a member of the Ekua  
21 Purdy Road Committee from Ulupalakua, made up of people  
22 primarily from Ulupalakua, but also people from Kula. Ekua  
23 Purdy was just named to the Hall of Fame of rodeo stars, rodeo  
24 champions of the world, just recently, two weeks ago. He died  
25 in Ulupalakua. Half of the people of Ulupalakua are related to

1 Ekua Purdy. No matter which way you go in Ulupalakua you come  
2 across a Purdy.

3 But anyway, we formed this committee about 13 years  
4 ago, after the road between Makena and Ulupalakua, which was in  
5 existence for like, oh, if you go back from today, it's 15  
6 years. But the road was closed after 75 years of usage in  
7 1984, because the then Mayor of Maui, Hannibal Tavares, decided  
8 that it was too expensive to maintain that road, which was not  
9 a County road. It was a public road used by the public, but  
10 not improved. But everyone used the road if they wanted to go  
11 down to the ocean, to Wailea from Kula.

12 At that time, this was the mid-1980's, at that time  
13 no mention of K1, K2 or U1 or U2 or U3 or U4 was discussed. We  
14 didn't, I don't know whether we even had -- perhaps we had the  
15 High Tech Park then, the beginning of the High Tech Park. At  
16 that time the legislators, the County Councilmembers, the Maui  
17 News editors, the Kihei Community Association, the Kula  
18 Community Association were all unanimously in favor of doing  
19 something to reopen that road between Makena and Ulupalakua.  
20 But for whatever reason today, 15 years after the road was  
21 closed, the road still remains closed.

22 The reason I'm here tonight is not to oppose the  
23 routes, because the routes up for proposal in the draft EIS  
24 would benefit a great many people. No matter which route you  
25 select, it's going to be more advantageous for some people and

1 less advantageous for other people in other areas. It depends  
2 where they live, right. You cannot have roads to every single  
3 village or subdivision, you have got to have a single one.

4           And our thrust is that one of the routes be selected  
5 and construction proceed as quickly as possible, because the  
6 island needs more roads to relieve congestion, to provide  
7 escape routes in case of a disaster. But we should be careful  
8 that we do not unduly harm agriculture, whether it be a sugar  
9 plantation or Maui Land & Pineapple. And also, we should try  
10 to avoid hurting the small farmers, particularly the vegetable  
11 farmers of the bread basket area of Maui, which is the Kula  
12 area.

13           But having said that, because of the magnitude of  
14 the proposal, no matter which road we select, the magnitude of  
15 cost, from the standpoint of cost, the magnitude of engineering  
16 designs, and the cost itself of building the highway, no matter  
17 which one we select it's going to cost anywhere between 50 to  
18 70 million dollars. So what we're saying is build a secondary,  
19 not necessarily a superhighway, but build a road between  
20 Wailea, which is one of the most important segments of the  
21 economy of Maui, as well as the State of Hawaii, Wailea and  
22 Makena.

23           We should take care of the tourists. More and more  
24 tourists come to Maui for more than just the golf courses and  
25 the ocean, because we have just as beautiful oceans on Oahu and

1 golf courses too. But why do they come to Maui? Because of  
2 the scenic, natural beauty of what Maui has to offer,  
3 particularly Haleakala, and places like Keanae, Hana, Kipahulu,  
4 where Lindberg died. There must have been a reason why  
5 Lindberg chose to die in Kipahulu, and Kaupo. And the winery  
6 in Ulupalakua, the only winery that's doing well, not only in  
7 existence, but doing extremely well in Ulupalakua.

8           So we should build, if nothing else but to satisfy  
9 the tourists, but also we need that road very importantly to  
10 provide an escape route in case of an emergency. Because if  
11 you look at the map, if there is a disaster south of K2, our  
12 most important people in Wailea and Makena would be cut off  
13 because they are on the wrong side of the disaster. For that  
14 reason alone we should have a roadway, if you want to call it  
15 an escape route, a temporary road.

16           But if we are going to build a temporary road, we  
17 might as well build a safe road, which means a paved road. Not  
18 necessarily to meet the federal highway requirements, but  
19 perhaps a road which would meet the requirements, the minimum  
20 requirements of the County of Maui. Because the cost of the  
21 road from Wailea to Ulupalakua will be just minuscule compared  
22 to the other road. If we can afford to build a highway costing  
23 70 million dollars, surely we can spend 5 or 6 or 7 million  
24 dollars for a road from Wailea up to Ulupalakua.

25           It may be interesting to learn, and I believe a

1 thorough study should be done, because according to our  
2 committees, our own committee's study, the distance between the  
3 High Tech Park and Haleakala would be reduced by more than 25  
4 percent by way of South Maui, by way of Wailea up to  
5 Ulupalakua. So if we are talking distances, that route should  
6 be very attractive.

7           The other consideration is that the road by way of  
8 Wailea to Ulupalakua would be much, much less congested because  
9 we would be having people go in opposite directions. You know,  
10 certain people, part of the population, the traffic would  
11 naturally be on Piilani Highway, but the tourists or the  
12 employees from Upcountry Maui would not even use Piilani  
13 Highway, see, because they will go straight into Wailea from  
14 this shortcut road from Ulupalakua.

15           So from the standpoint of cost, that road could be  
16 built by just the interest that is saved from delaying these  
17 so-called K1, K2, U2, U3, U4 roads. If they're delayed one or  
18 two years, they'll save enough money on the interest alone to  
19 build that road, because there won't be any tunnels, there  
20 won't be any bridges, it will all be through waste pasture  
21 land. I shouldn't say waste, but very low productive land,  
22 primarily through lava fields and very soft, easy to excavate  
23 type of land.

24           The other important consideration is this: No  
25 matter which route we choose, from K1, K2 or U1, U2, U3, or U4,

1 the State will have to improve the road between Keokea and  
2 Ulupalakua anyway, because the tourists, if the road between  
3 Wailea and Ulupalakua is not built, we will continue to force  
4 the tourists and others to go around the island. And those who  
5 merely want to go to the winery for a free taste of wine,  
6 they'll be forced to drive on that road, the winding road  
7 between Keokea and Ulupalakua.

8           At present, we have 40 foot containers on that road  
9 merely to deliver bottles to the winery, and also to take the  
10 wine from the winery, bottled wine from the winery to the docks  
11 for shipment primarily to Japan and the far east. Now, on top  
12 of that, we are beginning to have more and more great big tour  
13 buses travel on that road, that winding road between Keokea and  
14 Ulupalakua. It's a winding narrow road. It's much better  
15 since the State took over the road about six or seven years ago  
16 from the County. It's a greatly improved road, but it's still  
17 winding and fairly narrow, and somewhat dangerous.

18           So if we are going to have the cost of improving  
19 that road anyway, due to the ever increasing traffic, then the  
20 cost of improving the road between Ulupalakua and Keokea should  
21 not be attached or blamed on the road between Wailea and  
22 Ulupalakua, because we are going to have that expense anyway,  
23 no matter what.

24           So when you take that into consideration, if we take  
25 merely the cost of building the road between Wailea and

1 Ulupalakua, you see the cost will be very nominal because it's  
2 easy to grade, it's easy to build, there are no bridges, no  
3 archaeological sites to consider. And best of all, I have  
4 heard time and again that Ulupalakua Ranch, because it's low  
5 cost land, primarily low use, very low production type of land,  
6 that Ulupalakua Ranch would be willing to donate the  
7 right-of-way in addition, so that's another factor.

8           So why can't we have, if you want to call it just an  
9 escape route, merely to appease the people of South Kihei.  
10 Let's build the road from K2 to U2 or U3 or U4, but let's also  
11 build an escape route from Wailea to Ulupalakua. Doesn't that  
12 make sense? All I'm asking for is common sense and justice  
13 because -- and again, I repeat -- the fact that the road was  
14 built during the whaling days, during the whaling era and kept  
15 open for the use of local residents and tourists alike. To use  
16 the shortcut road between the Makena area to Ulupalakua, why is  
17 it that today when we have all the modern facilities, and  
18 certainly a road is a citizen's privilege and right to have a  
19 road, we shouldn't be closing that road.

20           The road has been closed now for 15 years. To deny  
21 the tourists and to deny the local people who live on the south  
22 end of the Kula area, and also to deny the people of Kihei to  
23 just go to the cool climate of Ulupalakua, amidst the tall  
24 jacaranda and sandalwood trees, you know, to have a picnic  
25 lunch up there. They could do it in just a matter of a few

1 minutes from the hot area of Kihei.

2           A tourist who goes around the island, when they come  
3 home from Ulupalakua to Wailea it will save them, the round  
4 trip, 34 miles each way, 34 miles. That's more than an hour.  
5 Because under the present route the road is so congested that  
6 it would probably take them an hour and a half to get back to  
7 Wailea. Whereas coming down the hill from Ulupalakua they  
8 would be able to be home in five minutes. I mean that's how  
9 ridiculous it is.

10           I wish I owned the bank, I would build it. Maybe I  
11 should talk to Bill Gates, because it's so ridiculous. If I  
12 were Mr. State of Hawaii, I would do it without even giving it  
13 a second thought. And you know, if I owned the State of Hawaii  
14 I would build that road and make it into a toll road. I bet  
15 you the tourists would be happy to pay \$10 just to use the road  
16 one way, because it would save them almost \$10 worth of  
17 gasoline and \$20 worth of time. Now, tell me, is there any  
18 other road in Hawaii where a tourist would be willing to pay  
19 \$10 to use the road? I think not.

20           You know, these roads, K1, K2, you know, the  
21 alternative roads, if we were to charge them even \$5 to use the  
22 road, I don't think the tourists would even be willing to pay  
23 that much. And the local people wouldn't use the road even if  
24 the cost was \$3. I don't think they would pay that much.  
25 That, in a nutshell, would give you a valid, a very valid

1 reason to build this so-called secondary escape road, whatever  
2 you want to call it, but certainly a great convenience. Let's  
3 call it the Convenience Road, the Common Sense Road. I want to  
4 call it the Ekua Purdy Road. Thank you.

5 MR. KENNEDY: I am Russ Kennedy. I live at 2274  
6 South Kihei Road, in Kihei. Okay, I feel that the K2 should be  
7 the Kihei connection. Basically, it's far enough south to  
8 where a majority of the people could still get to it. It's  
9 away from the Mokulele Highway area, which gets flooded all the  
10 time. The upper connection I don't have a strong opinion  
11 about, except it should not go to U1. Haleakala Highway is  
12 already a design disaster. That's a polite way of putting it.  
13 To add to the congestion there would not be a logical  
14 decision. U2-A or B would probably be the preferable choice.  
15 U3 is a little far out.

16 The other purpose for K2 would be to provide access  
17 to the Hawaiian Homelands, where they could go up and be able  
18 to connect on to it and get to their land without having to go  
19 all the way around. That's about it, short and sweet.

20 MR. BELWAY: I'm Ed Belway, Post Office Box 1581,  
21 Kihei. We bought our properties in 1979, 20 years ago. We  
22 moved in 18 years ago. We watched everything grow,  
23 communities, highways, schools. At this point we have a chance  
24 to do something that would benefit a lot of people, so good  
25 planning is critical. We believe that the access in Kihei

1 should be at K2. There are numerous benefits, and I just don't  
2 want to go into all of them, but it's an obvious choice. For  
3 practical purposes, we like U2-A. Again, for practical  
4 purposes, for access by the most people.

5           This would be a valuable service that cannot be  
6 measured at this time, possibly estimated by somebody, but a  
7 single person could not, because there are so many parts of the  
8 island that would be served by this one item. So the two  
9 terminals, K2 and U2-A are critical choices, and we do not give  
10 the other choices much chance. For practical and financial  
11 value, we feel this is important. That's it.

12           MR. MARSH: I'm Jeff Marsh, and I live at 2387 South  
13 Kihei Road. In looking at the plan for additional highway  
14 construction, I am struck by the lack of additional manners of  
15 addressing the challenge of moving people from and to Upcountry  
16 to Kihei. The emphasis on roadway building stresses the  
17 proliferation of individual vehicular transport, and does not  
18 seem to give voice to other manners of public transportation.

19           I'm curious about something along the lines of if  
20 you are going to build a roadway, why not have it be a closed  
21 roadway system with nothing but public buses running up and  
22 down the roadway. Something that would encourage public  
23 transportation, reduce vehicular emissions, and hopefully  
24 reduce the noise and police enforcement problems on that  
25 roadway. I would also like to see the encouragement of bicycle

1 transportation, and this all seems really viable and easy to  
2 address. On the more expensive side, but possibly something  
3 that would have a longer term benefit, would be some sort of  
4 light rail or hard public transportation system.

5 I was also interested in the investigation of a  
6 private transportation system running on the existing roadway  
7 on Ulupalakua Ranch. I don't know how amenable the owners  
8 would be to having an improvement on the roadway, or even going  
9 into some sort of partnership with the County or the State in  
10 providing transportation from Upcountry to Kihei, but I'd like  
11 to see these addressed, or at least give it some  
12 consideration. Thank you for listening to me.

13 MS. FEINBERG: I am Lucy Feinberg, F-e-i-n-b-e-r-g,  
14 and I live at 483 South Kihei Road. I have lived here since  
15 1986, and we need, first of all, an exit route out of Kihei for  
16 any kind of disaster. We had a close call several times, and  
17 we just can't continue like that. So we've been lucky so far,  
18 but we need a roadway exit. Five years is too long, but I  
19 guess it's only five years.

20 The one that I like is the U3, K1. It does follow  
21 the natural grade. It gets us up to Kula and closer to  
22 Haleakala, or closer just to Upcountry. It takes us away from  
23 the congestion over in Pukalani and Makawao. It would be easy  
24 to get to Kekaulike and go up to Haleakala, if that's what  
25 people want, or if they want to go to Makawao it's no big

1 deal.

2           There needs to be a bike lane immediately with the  
3 construction, not after. There needs to be -- I actually think  
4 it needs to be four lanes right away, because we went through  
5 that with Haleakala Highway, and I think it was ridiculous.  
6 Now they have the stupid three lanes, and it doesn't help that  
7 much. That's all I have to say.

8                               ---oOo---

## 1 PUBLIC HEARING

## 2 TRANSCRIPT OF PROCEEDINGS

3  
4 MR. BOTEILHO: My name is Nelson A. Boteilho, B like  
5 Bravo, O T E I L H O. My address is 3311 Haleakala Highway,  
6 Pukalani, Hawai`i, 96768. My daytime telephone, of course,  
7 area code (808) 572-7274, then evening 572-9147. Now, this is  
8 what I would like to say. I was active in the task force at  
9 the beginning of this project and has continued my interest and  
10 concerns in this project. You are all to be commended for the  
11 outstanding studies, preparation for public hearings, displays,  
12 good, able people available to provide information to the  
13 public. I reserve my choice of the highway connection  
14 upcountry at this time and leave the intersection at Kihei for  
15 the community to select.

16 Once again, quotations, job well done to all  
17 Governmental agencies involved and to Warren Unemori Engineers  
18 for their outstanding, professional work or services.

19 MR. ESKER: My name is Jack Esker, E S K E R, 2531  
20 South Kihei Road, Apartment C502, Kihei. I'm just curious,  
21 Sunday's paper talked about the funding for this road was to  
22 improve the defense related activities at the Maui Research and  
23 Technology Park in Kihei and Science City at the top of  
24 Haleakala. I'm curious what do these people favor, which route  
25 do they favor? And I think their opinion will be more opinion

1 than mine. Though I favor the one at, what is it, K1 and that  
2 goes up to Number 3.

3 MS. ENGEL: Cristin Engel, C R I S T I N, Engel,  
4 E N G E L, 3310 Wailea Alanui, Number 4D, Kihei, 96753. I  
5 believe that Haliimaile connection is most practical connecting  
6 to K1. That's the best ending into Kihei. This route will  
7 save time for more people as well as gasoline from upcountry to  
8 Kihei as well as West Maui. Upgrade of North Kihei Road,  
9 Mokulele Highway, conservation as well as Piilani needs to be  
10 done. It will make safer the congested area around Five Trees  
11 in Kula and give Kula residents more privacy. I think that  
12 will do it, and it's going to cost less money, too.

13 MS. MALONEY: My name is Kathryn Maloney,  
14 K A T H R Y N, M A L O N E Y. My address is 300 Lakau,  
15 L A K A U, Place, Kihei, 879-3562. I am in favor of K2 in  
16 Kihei and either U2A or U2B. My comments on Kihei is because  
17 of the large population we have in our hotels and South Maui,  
18 we need to have a southern terminus as possible should the need  
19 for evacuation occur. My objections to the Haliimaile  
20 intersection is according to the report here we would be  
21 building a multi-million-dollar project that would start off  
22 with intersections currently rated D and C, which means we  
23 would build a new road with unacceptable traffic patterns.

24 MR. GRIES: My name is Herbert Gries, G R I E S.  
25 Well, I live in Kihei, but my mailing address is Box 695,

1 Puunene, 96784. My phone number is 874-0696. I only have one  
2 number. I'm retired. I think that the intersections of this  
3 new road from Kihei to Kula should be as far north as possible  
4 both in Kula and Kihei. Basically, the reason is that anyone  
5 living out at Ulupalakua, Keokea or the end of Kula has to use  
6 the Kula Highway anyway to go anywhere just going to Wailuku or  
7 if they have to go around to Lahaina. The same thing is true  
8 in Kihei, everyone living in Wailea or South Kihei has to use  
9 the Piilani already. I don't think it makes any sense to add  
10 an intersection partway down either one of those roads to have  
11 transient people use the highway just to go through to places  
12 like Maalaea, Lahaina, Waikapu golf courses and so forth.

13 So therefore, the furthest north alternatives would  
14 be my choice, but I would like to even consider since the  
15 Mokulele-Piilani intersection is going to be completely redone,  
16 that that might be a place where the Kihei-Kula road could also  
17 intersect, which is actually further north than the most  
18 northern intersection that we have now.

19 And I also understand that in the future there may  
20 well be a bypass road around the back of Kealia Pond, which  
21 would make the beach road at North Kihei a secondary road and  
22 it might even be sensible to consider having the upcountry road  
23 come in at that point at Mokulele and be a continuation of that  
24 road. Basically what I'm saying is it would be good to look at  
25 the big picture and see what other major projects are going to

1 be done in future years in this same area so that the thing  
2 could all be coordinated instead of each project looked upon as  
3 independent -- as independent, and therefore, when you come  
4 along to the next project, you've got conflicts. That's it. I  
5 was a member of the Kihei Advisory Committee for the master  
6 plan for both 1980 and 1990.

7 MR. NICHOLS: My name is Bob Nichols,  
8 N I C H O L S. And my address is 2737 South Kihei Road, and  
9 that's in Kihei. My comments are short and sweet. Based on  
10 their presentation, A2, the southern most route in Kihei, would  
11 be my recommendation. I have no recommendation as to  
12 upcountry. My feeling is though that if the prime intent of  
13 this project is to service the people at the Tech Center and  
14 the top of the mountain, none of these are good alternates.  
15 They should be using what they would classify as Number 7,  
16 which is the route that extends the current highway, reconnects  
17 it to the upcountry and comes out in Kula Sands.

18 The rationale for that is that it would be less  
19 traffic, it would be faster for people to get up in terms of  
20 time. The rationale that they are using evidently is not to  
21 get the road from the Tech Center to the top of the mountain.  
22 It's to get it from the population center of Kihei to the  
23 population center of upcountry, which are two different things,  
24 and I think they're making a mistake in that respect. We need  
25 the road because Kihei is land locked, which is with just one

1 road getting out of here. We've had man-made disasters and  
2 accidents that, of course, if we ever have a big tsunami or  
3 something like that, it could be a real problem for us. We've  
4 got to get people out, especially people south of Kihei as  
5 opposed to just central Kihei. Other than that, thank you very  
6 much.

7 MS. YANAGAWA: I'm Lora Yanagawa and this is Russ  
8 Yanagawa, L O R A, Y A N A G A W A. Our address is 2823  
9 Puuhoolai, P U U H O O L A I, Street, Kihei. Information to  
10 the public about the pros and cons of each, what do I call  
11 this, termini, to get I guess to really get it to the public.  
12 Another comment would be publicity for these meetings, they  
13 should go on the radio so more people know. The route we favor  
14 is K1-U3 probably for cost. B1 is the shortest and it's South  
15 Kihei, further from my house and the school.

16 MR. YANAGAWA: I think it will make more sense to be  
17 K1 instead of K2 being the entry point or exit or whatever  
18 because the Lahaina traffic will go upcountry instead of going  
19 toward the south. And I like K1-U3 because U3 exit or entrance  
20 is far enough upcountry where traffic would be almost  
21 eliminated I think. Because it's not in the populated  
22 bottleneck area I guess of upcountry, Pukalani, Makawao  
23 Avenue.

24 MS. YANAGAWA: I support the road, but probably the  
25 one hesitant part I have with it or whatever I want to say is

1 that I'm afraid there will be developments all the way up the  
2 road and we don't need a whole lot more building right now.

3 MR. YANAGAWA: I think the reason why we support it  
4 is, one, traffic alleviation, and two, is, and one of the  
5 points I saw on one of the charts is evacuation, the quick  
6 evacuation route from the South Maui to upcountry instead of  
7 taking Mokulele, which is already congested and heading up that  
8 way, having a straight shot up and a quick shot relatively.

9 MS. YANAGAWA: That's about it.

10 MR. LAMADORA: My name is Earl Lamadora,  
11 L A M A D O R A, and my address is 3550 Haleakala Highway,  
12 96768. My comment is pick any route that you would like except  
13 U2A. Personally the reason why is I live next to -- I live  
14 close to U2A, and it will impact me very much. When the State  
15 wants to do that, they should consider the people who live  
16 around there. Now, for example, U1, there's no houses there.  
17 It won't affect nobody, and U3 won't affect anybody. And the  
18 U3-K1 is one of the cheaper ones, and U3-K2 is also one of the  
19 cheapest ones. Okay. That's all. The State should be  
20 conscious on what's going on on the island of Maui because  
21 tomorrow night starts the County Fair. I think that's one of  
22 the purposes why they did it that way.

23 MS. GREEN: My name is Deborah Green. My mailing  
24 address is 550-A Kupulau Drive, Kihei, 96753. Well, what I  
25 want to say is that I oppose the new roadway, any of the

1 options, and I oppose the assumption of progress  
2 unquestionably. I like the fact that Kihei and Makena and  
3 Wailea are relatively isolated from upcountry, and I want to  
4 stay that way. Maui is different from Oahu and it's not the  
5 mainland and I think if people want those kinds of  
6 conveniences, they could live elsewhere. I really hope that  
7 the options of mass transit will be looked into, either a  
8 closed light rail system that just runs back and forth or even  
9 buses or establishing bike routes would be good options. It  
10 would be much less expensive and have much less impact on the  
11 environment and the existing communities and it would make  
12 better use of the existing resources.

13           Also, I hope they will please look into leasing the  
14 existing private road on the ranch property since it already  
15 exists and could be used and save lots of money.

16           MS. MOSCHETTI: My name is Christine,  
17 C H R I S T I N E, last name is M O S C H E T T I. My address  
18 is P.O. Box 741, Kihei, 96753. Okay. So my preference is the  
19 U3-K1. It's the least expensive. It follows the natural ridge  
20 up the mountain. And it doesn't run into the current highway,  
21 Haleakala Highway. It also allows for Kihei to have a  
22 alternative route out of Kihei rather than everything coming  
23 together at the existing what entrance, I don't know the name  
24 of the entrance, Mokulele.

25           Because if there's a fire or a flood or something,

1 Kihei has no way out. It's in a different place. It doesn't  
2 have to go over through that way if we have an alternative exit  
3 in an emergency. So I think that if we went with that U3-K1, I  
4 still think so, that because it's significantly less expensive  
5 than the other alternatives, that serious consideration should  
6 be given to just making a four-lane highway immediately and  
7 that it must have a bike path on it.

8           There's most likely going to be protest from Kula  
9 residents not wanting it going through their quiet, residential  
10 area, however, Kihei has a large highway running through it.  
11 It impacts most everyone who lives in Kihei, so that's the  
12 price we're going to have to pay. That's all.

13           MR. STURTZ: My name is Ron Sturtz, S T U R T Z. I  
14 live at 874 Kumulani Drive, K U M U L A N I, Drive in Kihei,  
15 Maui Meadows. After reviewing all of the options of that are  
16 presently being presented, I would like to suggest that the  
17 K2-U2A option seems most viable from a variety of  
18 perspectives. Dealing first with the Kihei side, I think the  
19 K2 provides the more viable option for the evacuation in the  
20 case of wildfires or tsunamis to the South Kihei area based  
21 upon slated further development of the South Kihei-Wailea  
22 area. It's going to become even greater challenged in the  
23 future.

24           While K1 might provide an alternative access to  
25 people coming from Lahaina alternative to the Haleakala

1 Highway, I think if you look at the traffic patterns, the  
2 current Lahaina commute takes the Kuihelani Highway as the most  
3 direct access. I'm not sure the DOT has statistics as to how  
4 many people commute between upcountry and Lahaina. I think  
5 there are rather significant statistics of those who commute  
6 between Kihei and upcountry, so I think that should be probably  
7 the highest priority in terms of analysis. In terms of the  
8 upcountry options, the most obvious advantage of the U2A  
9 connection is that it gives the direct access to the upper  
10 Haleakala Highway, and since the military base at the top of  
11 Haleakala and its connection with the Maui Hi-Tech park is one  
12 of the strong motivational forces behind the creation of this  
13 highway, I think this would give the most direct access route  
14 between those two facilities.

15 I think the U2A connection also is advantageous  
16 because it gives the easiest access into the Makawao Avenue and  
17 creates greater access to Makawao as well as Pukalani. With  
18 respect to the process of developing information, I would like  
19 to commended the DOT for this particular approach being taken  
20 tonight. I think it's a viable alternative to public  
21 hearings. I think as the DOT apparently are aware, public  
22 hearings are a viable and valuable way of obtaining information  
23 because it permits people to hear each other's perspective and  
24 get cross-fertilization of views and sometimes more  
25 sophisticated output or input from that process.

1           Finally, I understand that the funding approach is  
2 80/20, 80 percent Federal funds, 20 percent State funds. I  
3 also would like to understand that if the primary purpose of  
4 this highway is to enhance defense capabilities that the  
5 Federal Government has the option of funding 100 percent. And  
6 since it seems real clear to many people who live on the island  
7 that that is a prime motivating force behind the conception of  
8 this project, I wonder if it's possible to have the Federal  
9 Government pick up the whole cost. I think that sums up my  
10 views, and I appreciate the opportunity to speak. Thanks very  
11 much.

## 1 PUBLIC HEARING

## 2 TRANSCRIPT OF PROCEEDINGS

3 \* \* \*

4 JOSEPH KAIWI: My name is Joseph K. Kaiwi. My  
5 address is P.O. Box 1179, Paia, Maui.

6 I can tell you I choose this U-3, K-1 -- my option  
7 is this U-3 to K-1. The reason why, I got piece property up in  
8 Hawaiian homes. To me I feel that it's not that busy as here,  
9 by the school, King Kekaulike school. So, you know, about  
10 halfway to where I live, in that section.

11 JERRY KAIWI: Me and my husband agree with option  
12 U-3 to K-1 because the proposed highway is in the central area  
13 right within the Kula district, and it would be easy for us,  
14 because we are staying at Hawaiian homes, to get from Kula to  
15 Kihei area. Rather than from Haliimaile to Kihei, we had to go  
16 all the way to get to Kihei. The U-3 to K-1 would be more  
17 appropriate for us. That's it.

18 ALAN KAUFMAN: My name is Alan Kaufman. My address  
19 is P.O. Box 297, Kula, Maui.

20 I'm a veterinarian. I live and work Upcountry on  
21 Maui. I'm a member of the American Association of Wildlife  
22 Veterinarians. And one of the things I don't see addressed in  
23 the information presented tonight is the potential for  
24 conflicts in the highway will have with axis deer population  
25 that is in the area that the highway will transect, no matter

1 which location is chosen.

2           There have been regular deer/vehicle accidents even  
3 on the existing roads. Though currently the county and state  
4 does not have the mechanism to track them to record the actual  
5 numbers. I know of at least one fatality resulting from the  
6 deer/vehicle collision on the island of Molokai. And I believe  
7 that both the state and the county need to give consideration  
8 to the fact that when this highway goes in with people  
9 travelling at fairly high speeds, going through areas where  
10 there are substantial populations of axis deer, then we will  
11 begin to see some accidents.

12           We already have them at five trees, but there's a  
13 much slower speed there, typically. So when we have  
14 deer/vehicle collisions on the new highway, we're much more  
15 likely to have greater vehicle damage as well as potential  
16 fatalities, human fatalities. That's it.

17           RICHARD KANADA: My name is Richard Kanada. My  
18 address is 2868 Iwalani Street, Pukalani, Maui.

19           What I'm concerned about is that I live in Pukalani,  
20 and every morning I know what kind of traffic we have. I am  
21 concerned about the intersection of Haliimaile and the Pukalani  
22 bypass. When you have the improvement using that Haliimaile as  
23 the route to Kihei, that traffic intersection is going to be  
24 with traffic lights, as I understand. Now, that's going to  
25 cause some backup on the Pukalani bypass that contains all of

1 Kula residents, Makawao residents and Pukalani residents. And  
2 then also, of course, Haliimaile.

3 Now, when we come down from Pukalani, we have the  
4 road that comes to a point onto the highway with no traffic  
5 light, no nothing. How do I get onto the highway? When, you  
6 know, at that time when we have that, what kind of improvements  
7 they are going to make for us to get on the highway with  
8 safety. That's my concern. So I am saying that I prefer not  
9 to have it at Haliimaile, unless they can show me a way that  
10 they can -- you might say, where I'll be approved to that, you  
11 know, happy about it. If not, I won't go for that.

12 KAORU MURAOKA: I'm Kaoru, K-A-O-R-U, Muraoka,  
13 M-U-R-A-O-K-A. My address is 388 Aliiolani, Pukalani, Maui.

14 I agree with Richard about that congestion going be  
15 when you make the left turn to go to Kihei and it would back up  
16 all the way to this traffic light. I have seen it happen  
17 before when we had a fire one time. It has happened. And I  
18 telling you we had to take the Baldwin Avenue to go down to  
19 Kahului. And I prefer making four lanes and forget about  
20 making the highway to Kihei.

21 We have been talking about that for ten years. Look  
22 how much expense there is for this county workers to put the  
23 cone up every morning, take them off, next morning do the same  
24 thing for five days. We spending over \$10 million over the  
25 last ten years. Now, people in Kula, they don't want that

1 highway to go down to Kihei. Pukalani people, they don't want  
2 it down at Haliimaile or Pukalani. So let's drop the whole  
3 thing and make the four lanes, Mokulele, Pukalani four lanes,  
4 then it will solve most of the problem, not all. That's all I  
5 have to say.

6 CLIFFORD GREEN: Clifford Green. My address is 160  
7 Alohilani Street, Pukalani, Maui.

8 The route that I like is the one that goes from K-1  
9 to U-3. The reason being that this keeps the public away from  
10 two high schools, which would be Kamehameha School, which is  
11 now being built, and also the new King Kekaulike High School.  
12 Both of those are already a congested area and I don't feel  
13 that we need to be endangering the lives of our young high  
14 school students who are 15 and 16 years old just learning how  
15 to drive, and adding more congestion to their area.

16 I do not like the U-1 location off of Haliimaile  
17 because, one, it cuts the farming area in half again and being  
18 from a farming background, I know what happens when you cut a  
19 farm in two. Also, the K-2 to U-1 route is much longer and  
20 doesn't seem to do -- seem to improve anything more than the  
21 original route that we presently have without this new road.

22 The K-1 to U-3 is a more direct route and in keeping  
23 with the thought process of access from the high-tech park in  
24 Kihei and the communications on top of Haleakala mountain, U-3  
25 would be a better location. That's all for right now.

1           TONY PARESA: Tony Paresa, P-A-R-E-S-A. My address  
2 is 27 Aeloa Road, Pukalani, Maui.

3           I'm here as a concerned resident of Pukalani. And  
4 in my view, if the state is planning to expand Haleakala  
5 Highway, as well as Mokulele Highway to Kihei, that the  
6 alignment alternatives of the proposed roadway should not be  
7 built, because with the four-lane highway along Haleakala  
8 Highway travelling mauka or makai, and Mokulele Highway  
9 travelling to and from Kihei, in my view, it would be  
10 sufficient to transport people from Upcountry to Kihei and vice  
11 versa. With this strict economic hard times, feasibly, I don't  
12 think the government should be spending this millions of  
13 dollars.

14           However, should this alignment alternatives  
15 Kihei/Upcountry bypass come to view, I would prefer to see the  
16 road from K-1 being built up to U-3 since it's the most  
17 feasible and economical of all the existing roadways proposed.  
18 It is, in my view, if any of K-1 or K-2 should be built along  
19 with U-1, connecting to Pukalani/Haliimaile roadway, in my  
20 view, this would definitely cause a hardship.

21           Since from a prolongation line from Pukalani bypass  
22 or the old Haleakala Highway down to Haliimaile junction is  
23, approximately .9 tenths of a mile, should an automobile crash  
24 or fatality exist within this stretch of roadway, we would  
25 definitely be right back to square one causing a backlog and

1 detain the traffic congestion. Eliminating strong  
2 possibilities of any exiting or ingress or egress into the  
3 area. So it is my view that U-1 would definitely be out of the  
4 question, plus it's the most expensive and costly.

5 Another question which came up, in any of the  
6 alignment alternatives, whichever is being selected, should  
7 there be a motor vehicle accident involving cars and the deer,  
8 who would be liable for the cost and repairs other than the  
9 operator of these motor vehicle accidents? That's my  
10 question.

11 Because from past experience, the county, who has  
12 taken over the old Haleakala Highway and the bypass mauka and  
13 as well as Makawao Avenue to the intersection of five trees,  
14 they have recently placed those deer crossing signs and  
15 recently the amount of accidents involving deer and cars have  
16 increased in that area causing a financial loss to the people  
17 operating those cars.

18 From past experience, I know of two who have told me  
19 that the state or the county refused to claim responsibility or  
20 ownership for the deer, subsequently causing them to utilize  
21 their own personal automobile insurance. On the long run,  
22 having the cost of insurance go up in years to come.

23 EDWARD CEBALLOS: I am Edward Ceballos. I live on  
24 Piiholo Road -- 960 Piiholo Road.

25 I live on Maui all my life and I recommend the

1 Haliimaile to Kihei, what they call that -- the Haliimaile to  
2 Kihei, the proposal. That's my first choice. My second choice  
3 is the five trees, from Kihei. That's the second choice. I  
4 recommend the Haliimaile Highway first. That's all.

5           CYRINA BROGOITTI: Cyrina, C-Y-R-I-N-A. Last name  
6 is Brogoitti, B-R-O-G-O-I-T-T-I. My address is P.O. Box 1276  
7 Kula, Hawaii.

8           I feel as though they should actually widen the  
9 existing road to Kihei. Going down Haleakala and then the  
10 exiting road and at that time see what it does to the traffic.  
11 And if, in fact, it doesn't lessen the flow of traffic and the  
12 road is needed, I feel like the Haliimaile intersection is the  
13 best intersection to use. That's it.

14           PATRICK CONSTANTINO: My name is Patrick  
15 Constantino. My address is 3188 Kilani Place, Pukalani, Maui.

16           I can start? I'm in favor of the Pukalani -- I  
17 don't know what they -- U-1; was it? I favor that K-1 to U-3.  
18 But the Haliimaile one to the K-2 -- K-2 or K-3. Anyway, the  
19 one that connects -- I think the one that's nearest the new  
20 Kihei school, that section.

21           For reason that the Haliimaile, instead of having  
22 all the traffic emerge up in the upper section of Pukalani, it  
23 would be safer that, you know, at least it merge down at  
24 Haliimaile junction and then saturate down, otherwise we'll  
25 have something like another Dairy Road down in Kahului. For

1 safety reasons. As far as the traffic lights, whatever needs  
2 to be installed can be worked out later. That's it.

3 CLARENCE DE MELLO: My name is Clarence DeMello. I  
4 live at 218 Pukalani Street.

5 I figure the Haliimaile junction should be the one,  
6 Kihei, K-1. They already have a new highway from Haliimaile to  
7 five trees, and they don't need another section like that. So  
8 that's my opinion.

9 EDWARD ORSZULA: Edward Orszula. My address is 83  
10 Pi'imauna Street, Pukalani.

11 My opinion would be that there should be a traffic  
12 interchange at Haliimaile and Haleakala Highway, so that  
13 traffic would move a lot more smoother, because, you know,  
14 otherwise you put a traffic light at Haliimaile, you are moving  
15 the bottleneck down by Paia road, you are moving it uphill.

16 Second part would be what was suggested. Both legs  
17 be built from here and from here to go down that way, so that  
18 the traffic would bleed off of Kula and in from Paia into Haiku  
19 and Makawao. They would have their own traffic pattern going  
20 in, but they would meet in this intersection here. That would  
21 be about it.

22 STEVE HARMAN: Steve Harman. My address is 826  
23 Alamoku Street, Haliimaile.

24 The comments I have are about the Upcountry  
25 terminus, U-1, the Haliimaile. It has to do with the fact that

1 you get a lot of people coming from Haiku through Kaluanui  
2 Road, which is a very narrow, windy road, with a one-lane  
3 bridge that crosses Maliko gulch, and then on to Haliimaile  
4 Road.

5 I think they will have to look at that because  
6 that's a lot of traffic on a very nasty, narrow road.  
7 Switchbacks and steep and blind curves and one-lane bridge.  
8 And that's the most direct route for all of those people from  
9 Haiku to take to get to that U-1 terminus. I don't see they  
10 are addressing that at all.

11 ELLIOTT KRASH: My name is Elliott Krash. My  
12 address is 331-9 Waiakoa Road, Kula, Maui.

13 I favor no build. That's what I would prefer. But  
14 I realize that probably there is a need for this road. That  
15 being the case, I favor the Haliimaile, the U-1 terminus  
16 Upcountry, with an interchange. Not a grade level crossing,  
17 but an interchange. Down country, I would favor the southerly  
18 terminus, that's K-1. That's it.

19 EMILY AGUSTI: My name is Emily Agustí. My address  
20 is 361 Nalani Street, Pukalani, Maui.

21 I would prefer the U-1 alternative, the Haliimaile  
22 one, because I feel that would serve the greatest number of  
23 people coming from Pukalani and Makawao. The greatest  
24 population, also Paia, wanting to get to South Maui. I would  
25 also like to see an overpass at the intersection, at Haliimaile

1 intersection.

2           And I would like to see underpasses for the cane  
3 hauling vehicles along the highway, because I think it's very  
4 dangerous. I travel Haleakala Highway every day and that red  
5 light comes on and you are flying down the highway at six  
6 o'clock in the morning and traffic hits the brakes. I think  
7 it's a very dangerous situation. Oftentimes those hauling  
8 trucks, they hit the thing and they just pull right out without  
9 waiting to see if traffic is going to stop.

10           HARI AJMANI: Hari Ajmani. My address is 102-17  
11 Kauai Place, Kula, Maui.

12           My comments are how much of the Upcountry traffic  
13 goes to Kihei that you are trying to relieve from the present  
14 highway? And what role that has played in designing the  
15 routing that they have chosen? And similarly, how much of the  
16 traffic is going from Hana to Kihei? That will not be helped  
17 by any of the alternatives. And what impact that might have in  
18 the planning of the highway.

19           And my third comment is that one of the alternatives  
20 should be the improvement of Hansen Road. Or somewhere close  
21 to it. And that will probably alleviate the need for making  
22 any of the highways at much less cost. The U-3 alternative,  
23 U-3 termination [sic] on the Kula Highway is going to create  
24 disasters in the Kula traffic patterns in the city or town of  
25 Kula. And that is the most or the least desirable termination

1 on the highway.

2           The termination U-2A and U-2B are really safety  
3 concerns for the children of the Upcountry high school. King  
4 Kekaulike High School, and I think this should never be  
5 considered, for safety reasons. I don't know if the full  
6 safety impact has been studied in any of the proposals they  
7 have done.

8           And the lastly -- the termination of the Kihei one,  
9 alternative in Kihei does not really address the fire escape  
10 and fire safety escape routing from Kihei, so that, in my  
11 opinion, does not serve any purpose. It should be studied.  
12 That doesn't need to be pursued further. It doesn't do any  
13 good.

14           And I think the major thing is this should be an  
15 alternative added to all the possible alternatives, to use the  
16 Hansen Road or improve the Hansen Road and that's a big  
17 omission from the studies.

18           GINA FLAMMER: Gina Flammer, F-L-A-M-M-E-R. My  
19 address is 2102 Naalae Road, Kula, Maui.

20           My biggest concern is safety. I would like to see  
21 the road not be two lanes going head-on, head traffic. We had  
22 enough deaths on the islands with the roads that we have. I  
23 would like to see some space put between the lanes if they are  
24 not going to do the divided highway right away. Also, I would  
25 not see the -- I would not like to see the highway go by

1 schools, putting the high school -- it doesn't seem to be the  
2 best place to put it. Or by Kamehameha School. Thank you.

3 PERRY MARGOLIN: Perry Margolin. My address is 183A  
4 Pukalani Street, Pukalani.

5 I don't support any of the alternatives, but the  
6 alternative I would prefer is for the road to fork on the way  
7 Upcountry, with the Upcountry lane intersecting the five trees,  
8 down country portion intersection of Haliimaile. It would  
9 create less impact altogether Upcountry and will take maximum  
10 advantages of the already existing Pukalani bypass.

11 SANDY RYAN: Sandy Ryan. My address is 1071 Ulele  
12 Street, Makawao, Maui.

13 I am in favor of building a new highway. I work at  
14 -- live in Makawao and work in the research tech park in  
15 Kihei. So I would definitely be a user of the new highway. A  
16 couple of comments. I just want to be sure that any alignment  
17 that occurs mitigates any damage to archeological sites,  
18 Hawaiian sites.

19 I also am curious to know whether a new highway  
20 would eliminate -- it would eliminate traffic on Haleakala  
21 Highway, but I'm wondering if it would eliminate the  
22 contra-flow lanes that the county workers -- the cones that the  
23 county workers have to put out every morning and every  
24 evening. I'm hopeful that that's the case. I'm less in favor  
25 of a U-3 Upcountry terminus; more in favor of a U-1 and U-2.

1 And in the Kihei area, I'm more in favor of the K-1. Thank  
2 you.

3 DAN EVERT: My name is Dan Evert. My address is  
4 2760 Palalani Street, Pukalani, Maui. I'm a resident of  
5 Pukalani. Also a member of the Pukalani/Makawao/Kula community  
6 association -- Citizens Advisory Committee that considered this  
7 project three years ago. I was one of the people that voted to  
8 improve the existing roadways and if the highway really had to  
9 be built, that the terminus be at the Haliimaile.

10 My major concern is, is that I don't know why this  
11 EIS in this whole process went forward after the  
12 Upcountry/Makawao/Pukalani community plan was adopted by the  
13 county council and signed into law by the mayor of Maui  
14 County. It should have ended at that point and it should have  
15 concentrated on the building at Haliimaile or clearly studying  
16 what could be done to improve the existing roadways.

17 The other thing that bothers me in the EIS statement  
18 is the Hansen Road, any considerations of improvement to that  
19 have been totally ignored. I don't know where we go from  
20 here.

21 As a father of two high school boys, I'm just  
22 totally baffled as to why there's been no mention in the EIS of  
23 any concerns of the safety by the two terminus which would end  
24 this road close to King Kekaulike High School. No  
25 consideration to safety of the students and the parents and

1 commuting has been given any consideration.

2 The other thing is that I would love to know what  
3 the cost of this EIS statement has been to the taxpayers.  
4 Nobody seems to be able to answer that question. That's all I  
5 have to say for that.

6 KENNCO HOFMAN: My name is Kennco Hofman,  
7 K-E-N-N-C-O, H-O-F-M-A-N. I live at 345 Lokelani Place,  
8 Pukalani, Maui, Hawaii.

9 I think this project is being steered in a way from  
10 what was started 10 or 15 years ago to get the old roads  
11 improved, which I feel that they should have had the four lanes  
12 in Haleakala and Puunene roads. They should have that project  
13 in the forefront, is what I'm trying to say. This current  
14 alternative bypass is a smoke screen, to me, to avoid going  
15 ahead with the project that was supposedly approved years ago.

16 On this new project, it's very expensive. The  
17 logical thing was, of course, out of Wailea up to the  
18 ranchlands. That was the safest answer. But when the  
19 government got into it, they want to go up to Haleakala in a  
20 straight line. Well, a straight line is not going up through  
21 the U-2A or the U-2B routes. The straight line would be taking  
22 K-2 to the junction and up to Kula on the U-3, and that is  
23 supposedly what is currently approved or under consideration.

24 The straightest line between two points is straight  
25 up K-2, up to Kekaulike highway and straight on up; not looping

1 all the way around Pukalani, for example. Cutting through  
2 Pukalani is going to be disastrous. They are going to have to  
3 have feeder roads, bridges across, and going right through the  
4 heart of Pukalani. I feel that the old setup should be done  
5 first.

6           Bypass this table temporarily, until -- if they have  
7 so much money to spend, why aren't they finishing these other  
8 three roads that I have mentioned? To continue, in regards to  
9 the bridges, it's ridiculous to be putting in all these bridges  
10 when they could be cut down into a much shorter and more  
11 feasible route and not have to cut the beautiful greenbelt  
12 across the bottom of the valley here.

13           As far as the -- the federal aid allows for a  
14 two-lane access road up here on the bypass. Two lanes is  
15 ridiculous. We found that out on the Haleakala Highway when  
16 they did not put in four lanes at the time when they should  
17 have and it would have saved millions and millions of dollars.  
18 Now they want to put it in, whoever is behind this wants to put  
19 in a two-lane road now, which in a very short time is not going  
20 to be sufficient.

21           And then, let's say ten years down the road, how  
22 much will it cost to make it four lanes, and they would  
23 probably wait another ten years on top of that and then it's  
24 going to cost that much more. Economically it's not feasible.  
25 The people of Maui have to start standing up and let this

1 steamroller slow down and back off so the people can  
2 understand.

3 I have talked to literally dozens of people in the  
4 last week or two and it's amazing how 80, 90 percent of them  
5 don't know the first thing about this. They have no idea what  
6 is going to happen to the community or the explosion of the  
7 population around here with all the new developments and  
8 everything. All anybody can think of is their own selfish  
9 interest, oh boy, I can get up and down to Kihei real fast this  
10 way, and not consider the entire development that's going to  
11 blow up and explode in their face.

12 I thank you for taking the time to listen to me for  
13 a few minutes. I'm sure I missed a few things I wanted to  
14 make, but I believe you get the idea that I am opposed to  
15 anything that wants to cut Pukalani in half. Thank you very  
16 much. Mahalo.

17 ROB PARSON: My name is Rob Parsons. I live in  
18 Haiku. My address is 579A Kawelo Road, Haiku, Maui. I have  
19 lived on Maui for 22 years.

20 I would like to see the Department of Transportation  
21 give higher priority to improving existing roads rather than to  
22 spend multimillions of dollars to add a new highway. When  
23 Mokulele expands to four lanes and Haleakala expands to four  
24 lanes, both slated to begin in the next two years, we will have  
25 greater time savings in commuting from Upcountry to South

1 Maui.

2           The draft EIS overlooks or dismisses the Upcountry  
3 community plan's mandate that highest priority be given to  
4 improving existing roads. And that if the road is to be built,  
5 that it would only be connected at Haliimaile. Before this  
6 common period ends, I believe all of the Upcountry community  
7 associations will concur with this. That is, Haiku, Pukalani  
8 Makawao and Kula. And I believe King Kekaulike's PTA or  
9 vice-principal has gone on record with his recommendation.

10           I carefully studied the planning going into the  
11 Kulamalu subdivision two years ago. At that time the county  
12 planning commissioners looked at the traffic analysis contained  
13 in the Kulamalu studies. It indicated levels of service at F  
14 for six out of nine intersections studied. It would be  
15 horrifying to connect this highway at the Kulamalu project,  
16 being that it would encounter not just the existing high school  
17 traffic but what would eventually grow to be a kindergarten  
18 through 12th grade Kamehameha schools, which could have 2,000  
19 students commuting, as well as a 20-acre commercial center,  
20 five acres of elderly housing, and perhaps 400 new residence.

21           Besides that kind of congestion within and near the  
22 project, it would also create a situation, commuters from  
23 Haiku, Makawao, and Pukalani would have to go up to go down.  
24 This would clog the five trees intersection further and also  
25 Makawao Avenue would be major gridlocked.

1           My personal hope is that the Department of  
2 Transportation will spend more time looking at wide  
3 possibilities of solutions such as mass transit. I believe  
4 that if hotels were required to pick up their incoming visitors  
5 at the airport and shuttle them to the hotels, that we could  
6 reduce the number of rent-a-cars dramatically.

7           I'm also concerned that the cost estimates for the  
8 various alternatives do not reflect Everett Dowling's  
9 willingness to connect to his existing entranceway without  
10 charging for right-of-way acquisitions. This could amount to  
11 several million dollars, and I believe that this ought to be  
12 indicated to the public as they scrutinize this project. I'm  
13 happy that open meeting was added to this format because I  
14 believe that this sort of open house meeting, rather than a  
15 traditional town meeting, may be a Chapter 91 violation.

16           I'm concerned about letters in the draft EIS from a  
17 Mr. Mau and also from Mr. Kobayashi, both regarding the  
18 Kulamalu alignment. Mr. Mau's letter tends to indicate  
19 knowledge of a preferred Upcountry terminus well before a final  
20 decision was to be made. And Mr. Kobayashi's letter seemed to  
21 offer great savings to the Department of Transportation by  
22 connecting through the U-2B terminus, and also noted that if  
23 the road were to connect at U-2A, that they would be left with  
24 remnant parcels and they would need to be compensated at full  
25 value for unusable parcels.

1           There seemed to be the most challenging gulch  
2 crossings with the U-2B terminus. I've learned that  
3 Mr. Dowling has also traveled to Washington D.C. to lobby  
4 Senator Inouye for alignment to this project. I think the  
5 public deserves to know this. I think the public needs to know  
6 what is the status of an airport reliever road, as far as  
7 whether that is an independent project or if it can only be  
8 completed if Kahului Airport expansion of the runway goes  
9 through.

10           If there were to be a reliever road to replace  
11 Hansen Road, this would once again streamline the time savings  
12 from down country. I understand that there was a small turnout  
13 at the Kihei meeting last evening, but that each of the 14  
14 people who gave testimony were in favor of building the road.  
15 This is a bit curious to me since one of the stated purposes of  
16 the road is to bring hotel workers living Upcountry down  
17 country. Why would the down country residents favor the road?  
18 I don't believe many of them work Upcountry.

19           I will be submitting written comments before the end  
20 of the comment period. Thank you for the opportunity to  
21 present my feelings across. Mahalo.

22           RICHARD POHLE: My name is Richard Pohle,  
23 P-O-H-L-E. I live in Crater Road. My address is R.R.1 Box  
24 426, Kula, Hawaii.

25           I work sometimes at the top of the science -- and

1 sometimes at the research and technology park. My wife and I  
2 run the Valley View protea farm, which we ship out. And our  
3 daughter has moved back on the island and her husband works in  
4 the Lahaina restaurants area. We all strongly favor the road.  
5 Obviously -- and I favor the K-1, U-1 connection, the one --  
6 Haliimaile and near Lahaina on the bottom connection.

7           Why Haliimaile, because when people, when they want  
8 to go downtown, they don't want to have to come up to go down.  
9 And the U-1 -- the K-1 because it's closer to Lahaina and it  
10 would take the travel off of the Mokulele Highway. We feel  
11 this road is necessary for the future. The adverse impact of  
12 Pulehu Road, extra travel, it's true, but eventually we'll get  
13 around to making the Pulehu Road better, anyway.

14           There is no reason not to do this except to make  
15 life -- except to reduce population in the Upcountry area by  
16 strangling the infrastructure development. So I can't say --  
17 I can't be any more in favor of this and I support the DOT and  
18 Senator Inouye for putting together this fine show and the  
19 funding that goes with it and I'm very impressed by the  
20 procedure. And my wife and daughter agree with that and family  
21 agree with that. Thank you.

22           ZANDRA AMARAL: My name is Zandra Amaral. My  
23 address is 365 Hoalike Street, Kihei, Hawaii.

24           And I would like to give testimony regarding the  
25 forum of this presentation. I have had three or four older

1 couples, constituents of mine, in the Kula and Kihei area, who  
2 was very appreciative. Because the other forums of public  
3 hearings becomes very, how can I say, intimidating for them.  
4 It's hard for them to get in front of the public to speak their  
5 piece, and they feel like they need to have words of  
6 eloquence.

7           Some are blessed with the gift of speaking, and they  
8 really are not. They are gifted with more humble traits. And  
9 by sitting here and speaking to someone such as yourself, the  
10 court reporter, they get to give their testimony from their  
11 heart of hearts, without feeling they are being judged and they  
12 are very grateful, and there were several of them that brought  
13 it to my attention, the older ones, and for that I am very  
14 grateful.

15           And I would like to encourage the state to publicize  
16 this forum and let the public know that this is the way it's  
17 being done and that it is safe for all to testify, and it is  
18 okay for people to say what is in their heart, that they don't  
19 have to worry about debates, being ridiculed, being chastised,  
20 being judged or even worry about the words they need to use.  
21 But I want to thank the state Department of Transportation for  
22 this forum on behalf of myself, Zandra Amaral, as well as the  
23 older couples that approached me, both here Upcountry and in  
24 Kihei.

25           And I cannot tell you so you can put it in writing

1 the look in their faces when they got through testifying. They  
2 were so empowered. And these are people that have attended  
3 many public hearings but never felt they were safe to get up in  
4 front of a bunch of people to testify. But for me, it was  
5 gratifying just to see that look of empowerment in their face,  
6 to know that there was a safe environment for them to testify  
7 without feeling like they were competing.

8           And there are people who, with our other forums, who  
9 get up and testify with agendas other than the welfare of the  
10 topic being discussed, whether it could be to be heard, to  
11 listen to oneself talk or just to be exposed to the public, and  
12 that's okay, but I don't believe it's okay in matters that  
13 concerns individuals who are not as outspoken, outgoing, or as  
14 courageous to get up in front of people. So I cannot express  
15 enough my gratitude.

16           And as I stated earlier, I have been given the gift  
17 of gab and for that I am grateful and I like getting up in  
18 front of people. But I think I like more than being in front  
19 of people, is seeing the look of these older people's faces  
20 after they had been given a safe opportunity to share their  
21 manao. I believe that it is our older people that really have  
22 the answers that we are looking for. And through this forum,  
23 we provide a venue to get the valuable information we need and  
24 make it safe for them to share their manao.

25           I thank you all again and my only wish is to

1 advertize this forum so that people will be aware of it so they  
2 can take the stereotype public hearing of debate, arguing,  
3 fighting and getting in front of people away from their mind  
4 and know there is a safer venue. Because I believe that had  
5 more people from Kula or the island knew that this is the way  
6 this public hearing was going to be handled, where you could  
7 sit comfortably, as I am talking with you, sharing my manao,  
8 more of them would come because it would have been okay and  
9 safe for them to share their manao.

10 I don't know what else I can say, outside of the  
11 fact that I wish there was some way I could transcend in the  
12 words that describing now, the feeling I got from these older  
13 people, the look in their eyes of power and being able to  
14 contribute and know that seeing that feeling of like they have  
15 a say and it's safe for them to say what it is they want to  
16 say. I know I'm being redundant, but I am very grateful.

17 And as I said, I'm the type of person who likes to  
18 talk, as you probably know. I can go on forever and I love  
19 getting up in front of people. But I don't believe that serves  
20 the purpose of allowing all people the opportunity to say what  
21 it is they want to say, and I believe this venue fulfills the  
22 desire of people to speak up, both people like me who like to  
23 talk, and other people, like the older generation, who just  
24 want to be heard.

25 So I thank you. And advertise, please let them know

1 there's a safe venue in our public hearings for them to come  
2 sit and share their manao. Mahalo.

3 JANINE CARROLL: Janine Carroll. My address is 217  
4 Pukalani Street, Pukalani, Maui.

5 I'm here on behalf of the Pukalani Community  
6 Coalition for Neighborhood Safety, which consists of two  
7 divisions: the Pukalani neighbor of crime watch and the  
8 Pukalani safe community group. The Pukalani Community  
9 Coalition for Neighborhood Safety members represent  
10 approximately 98 residents in the Terrace community, most of  
11 which support the construction of the highway.

12 More than 80 percent of the members support the U-1  
13 Haliimaile terminus. It seems to be the most logical choice to  
14 be effective in reducing traffic congestion on not only  
15 Haleakala and Mokulele Highway, but Hana Highway, Paia town,  
16 and Dairy Road as well. Over 95 percent of members strongly  
17 oppose the U-2A and U-2B terminus because of an increase of  
18 unnecessary traffic coming through Pukalani.

19 Residents of the Terrace are concerned about the  
20 developer's plan to tie in the highway into the Terrace via  
21 Liholani Street using an existing roadway which is currently  
22 barricaded. This back entrance into the community would expose  
23 the community to more crime and safety concerns. Therefore,  
24 residents strongly oppose these, the U-2A or the U-2B  
25 terminus.

1           In conclusion, the Pukalani Community Coalition for  
2 Neighborhood Safety supports the construction of the urgently  
3 needed highway only if U-1 Haliimaile terminus is used. If the  
4 U-1 terminus is not chosen, we support a no build for the  
5 highway.

6           And that's about it. Thank you. Also, I have --  
7 should I just turn this in? This is from one of our members.

8           JEFFREY JAMES: Jeffrey James. My address is P.O.  
9 Box 182, Paia, Maui.

10           I feel a little upset because of a lot of my  
11 friends, who I respect highly, don't agree with my conclusion.  
12 They are very attuned to the needs to protecting the Maui  
13 environment, and I am as well. And yet I feel the need to  
14 balance that with a concern for the humans living here and the  
15 traffic -- the situation of traffic congestion has become so  
16 extreme that I continuously think that an Upcountry connector  
17 road would be just a wonderful blessing for many people, not  
18 only for tourists but especially for the kamaaina who are doing  
19 the daily commute.

20           When I look at some of the posters with information  
21 here for purposes and concerns in the building of such a road,  
22 one of the things I would like to see added is concern for, as  
23 much as possible, the continued preservation of the Kula area  
24 and its environs. So with that consideration, the Upcountry 3  
25 option isn't as viable to me. Better than that would be the

1 Haliimaile or five trees or Kulamalu. I understand there's a  
2 concern for residents and congestion in that area.

3           And an interesting thought has crossed my mind, I  
4 don't know how feasible it is, but perhaps it would be  
5 appropriate to make a Y, a double outlet connector at the top,  
6 one going to Haliimaile and one going to five trees that  
7 connected a little further down the hill. And perhaps the same  
8 consideration at the bottom of the hill between K-1 and K-2.  
9 Or between K-2 and Lipoa at the tech park, where there's a  
10 couple of emergency exits from the Kihei area, and so there  
11 wouldn't be so much congestion at any one outlet.

12           And I would also love to see avoiding building --  
13 scratch that. Thank you. Thank you very much.

14           JONATHAN STARR: My name is Jonathan Starr. I am  
15 concerned about the possible impacts of additional streetlights  
16 at the intersections of the new proposed road. I hope that if  
17 the road does get constructed, that it not add additional  
18 streetlighting similar to the type of lighting that was added  
19 on Kula Highway at the intersection of Kulamalu. Thank you.

20           ARIC NAKASHIMA: Aric Nakashima, Aric with an A,  
21 A-R-I-C. I live at 121 Aulii Drive, Pukalani. Phone number is  
22 572-1674.

23           My first comment would be about site U-1. It was  
24 mentioned before, that in a public hearing, public meeting with  
25 Pukalani Community Association, Mr. Sarat, Bob Sarat, mentioned

1 that the fourth lane of the Haleakala Highway, fourth lane of  
2 the Haleakala Highway would have -- already in the design of  
3 the fourth lane, lights, traffic lights, traffic control lights  
4 scheduled for the intersection of Haleakala Highway and  
5 Haliimaile Road. I would like to know if that's true. It's  
6 very important, my own decision making for myself whether I  
7 would choose the other sites over U-1.

8           Also, between U-1, Haleakala -- I mean, the U-1 site  
9 and U-2A, there is a place at the lower part of Pukalani where  
10 the road, old Haleakala road adjoins the bypass where they  
11 merge as you are coming down. Downwards. And we find that  
12 it's a very dangerous situation for the residents of Pukalani  
13 who use that; that there have been many near misses and  
14 accidents, actually, accidents happening at that point.

15           Because the traffic coming down in speeds of, say,  
16 45 or better and a person just shooting out from that lane, the  
17 merge lane, sometimes overshoots it, making the other person  
18 swerve off the road. This happens every morning. If there was  
19 an observer there, they better not park on the side of that  
20 site because they would probably get killed. It is very  
21 dangerous.

22           My third thing -- by the way, that was not, I guess,  
23 related to this issue of the terminuses. Hopefully, the  
24 Department of Transportation would consider as far as the  
25 fixing.

1           My third thing, my third comment would be on the  
2 access to the rear of U-2A and U-2B roads, from the interior of  
3 Pukalani Terrace, this huge residential area that has a road  
4 called Ainalani Drive. Ainalani Drive is located right next to  
5 the gulch, with a small subdivision there. This other road  
6 that comes through the Pukalani Terrace is called Liholani  
7 Street. Liholani intersects Ainalani Drive.

8           Right now if you came to a stop at Liholani and  
9 Ainalani, to your right would be the residential. To your left  
10 going up the mountain is two iron gates which has a barricade  
11 across now. If you go beyond that, you would see some sewer  
12 manholes already put into the ground. This is supposedly the  
13 road that is supposed to join up with the Kamehameha school  
14 road. Now, if the U-2A or U-2B terminus would be used, this  
15 road would intersect those roads.

16           We would like to know the feasibility of this.  
17 Pukalani association, people over here should be let known  
18 about the feasibility of how many cars would be coming from the  
19 Makawao, Haiku, and Haliimaile residential sites areas, coming  
20 through Pukalani using the terrace road to go to the back of  
21 these terminuses. I say "the back," that means not coming to  
22 the stoplights where they are intended to go. They are using  
23 this as a short cut.

24           Our last meeting for the Pukalani Community  
25 Association, I'm speaking as an individual, I heard many

1 comments about the usage of this road, and how much this would  
2 impact the lifestyle and safety of kids walking down the street  
3 to the Pukalani Elementary School, possibly walking to  
4 Kamehameha school. How much traffic would be there every  
5 morning because these people refuse to use the intersection,  
6 seeing this as a short cut.

7           Could you please comment on that, please? And if  
8 you do comment, would you please tell me where you get your  
9 information from. Because I know myself and some neighbors  
10 would like to know about that. Safety is an issue and, of  
11 course, it can be held as a second matter when it comes to  
12 small children walking, using the bicycles. And in the  
13 afternoon when people come back from Kihei, they come back  
14 through there because they don't want to hit the intersection  
15 again going home. That's also a concern. Kids on the street,  
16 kids coming home from school, baseball practice, whatever.

17           We already seen people get hurt on the Terrace  
18 alone, being run over by cars, and this is something we just  
19 want to avoid. The residents do care about their children and  
20 their lifestyle. Right now there is a 20 miles an hour speed  
21 limit on these roads, there's also speed bumps. You can  
22 imagine possibly the impact on this area with traffic. As far  
23 as that goes, I think that's it. Those are my main concerns.

24           Probably I will be attending the October 13th  
25 meeting, also, at Kahului School, and probably give additional

1 comment there too. I would really like to have these questions  
2 answered, if possible, and again, the sources of your  
3 information. Because I am told from the Maui Economic  
4 Development Board that out of 12,000 workers, hotel workers,  
5 hotel and restaurant workers on Maui, that over half live  
6 Upcountry. I'm quoting them. If that's the case, I really am  
7 looking at some huge, tremendous traffic possibly coming  
8 through Pukalani or probably going to any place, and using any  
9 one of those terminuses.

10 Thank you very much.

## 1 PUBLIC HEARING

## 2 TRANSCRIPT OF PROCEEDINGS

3

4 MS. D'ENBEAU: I am Madelyn D'Enbeau, my address is  
5 Post Office Box 1869, Makawao, 96768. I'm speaking on behalf of  
6 the Makawao Main Street Association. The Board has authorized  
7 me to come and make these comments.

8 The Makawao Main Street Association follows the  
9 guidance of the Makawao-Pukalani-Kula Community Plan, which if  
10 there is to be -- the first option is no build, that would be  
11 the first preference in the community plan. But if there is to  
12 be a highway, the choice of the Makawao Main Street Association  
13 is the Haliimaile intersection, which is U1.

14 As far as the Kihei portion of it, we felt like that  
15 really wasn't such an important matter for us, it was more a  
16 matter for the people in Kihei. But the reason that the  
17 Makawao Main Street Association was opposed to the U2-A, U2-B  
18 and U3 is because of a concern that increasing traffic would go  
19 through Makawao town, which is already pretty much at capacity  
20 in the early morning.

21 But if there are going to be residents from the  
22 Makawao-Haiku areas using this road to access Kihei, then they  
23 would have to go through Makawao town. Whereas at Haliimaile,  
24 Haiku people and Makawao people can go down Baldwin Avenue and  
25 come across and go from Haliimaile to Kihei. That would be the

1 first concern.

2           The second concern is there's nothing in the  
3 Environmental Impact Statement, the Draft Environmental Impact  
4 Statement about the effect on business in Makawao. Right now  
5 we have a fair number of people, visitors who come to Makawao  
6 because they go to the crater and then they perhaps want to  
7 eat, or they want to do something on their way back, or maybe  
8 on their way up there.

9           But particularly, if the selection were either --  
10 well, actually, any of the three, U2-A, U2-B or U3, there's  
11 already a large shopping area planned at Kulamalu. And  
12 contrary to what we were originally told when the Kulamalu  
13 project came up, it was supposed to be a small country-town  
14 business district, but that metamorphocized into a large  
15 shopping center, with the anticipation that the Upcountry  
16 highway would come through Kulamalu. So there's been no study  
17 of what impact that would have on the businesses in Makawao,  
18 and we're concerned that it would be very detrimental. So  
19 that's it.

20           MR. WILSON: I'm John Wilson, and I live at 121  
21 Holopuni in Kula. First of all, I'd like to state the official  
22 Kula Community Association board of directors' position, which  
23 is in here, but I'll say it again.

24           If an Upcountry-Kihei road is to be built, the Kula  
25 Community Association board considers the Haliimaile terminus

1 the best option available. The Kula Community Association  
2 board of directors opposes the Pulehu, Kulamalu and Five Trees  
3 termini options of the Upcountry-Kihei highway. Further, the  
4 Kula Community Association board supports as its highest  
5 priority the upgrading and improvements to existing roads  
6 connecting Upcountry and Kihei: Piilani Highway, Mokulele  
7 Highway, Hansen Road and Haleakala Highway, to alleviate  
8 growing traffic concerns. If an Upcountry-Kihei road is to be  
9 built, the Kula Community Association board considers the  
10 Haliimaile terminus the best option available.

11 In addition, in the draft EIS -- and I am speaking  
12 as president of the board of the Kula Community Association --  
13 I have a concern about the emphasis on the water supply being  
14 used as a perceived concept for the slowing of development.  
15 There seems to be an argument presented which discounts  
16 development because there won't be any water. Currently, the  
17 board of directors of the Kula Community Association is working  
18 on a policy statement that in essence will provide the  
19 intention of supporting the Board of Water Supply adequately  
20 supplying water to avoid drought situations. In non-drought  
21 situations, this will alleviate or tend to alleviate the lack  
22 of water argument for slowing development.

23 Throughout the EIS, the draft EIS, there is that  
24 comment being used to not address the impact of development by  
25 the road alternatives. In section 4.1.1.2, the DOT should be

1 aware that in the last review of the Upcountry Community Plan,  
2 that Alexander & Baldwin had proposed a 200 acre residential  
3 development at the intersection of Haliimaile and Haleakala.  
4 This would be on the Makawao side of the intersection, directly  
5 opposite the terminus of the U1 alternative. This is not shown  
6 as a possibility in the draft EIS. That section talks about  
7 the Upcountry land use impacts, and I would suggest from a  
8 planning standpoint, based on the already proposed development  
9 by Alexander & Baldwin, that a logical fill-in of the land  
10 between the U1 alternative and Pukalani would be something that  
11 would be easily forseen.

12 Further, the Kulamalu development includes a park  
13 area, I think it's approximately 15 acres, that was not  
14 identified in the draft EIS. This would be on the Kula side of  
15 the proposed U2-B terminus. That ends my comments relative to  
16 the official board position.

17 Now I will speak as John Wilson, a resident, 121  
18 Holopuni Road, Kula Glenn, Kula, Hawaii. Of the various  
19 alternatives, I would select the U1 alternative, as it serves  
20 the greater population needs of the Upcountry area, primarily  
21 Pukalani, Makawao, Haliimaile, Haiku and Paia, as well as parts  
22 of Kula.

23 I support the mitigation of the cane hauling by use  
24 of underpasses, which there are two shown in the draft EIS. I  
25 would support that that alternative also show grade separation

1 and no intersection at Pulehu and Omaopio Roads, at this  
2 particular time, i.e., in the design stage, to avoid the misuse  
3 of those two routes as shortcuts to Kihei and Lahaina by some  
4 Kula residents, and to leave those roads as direct  
5 farm-to-market routes from Kula to Kahului.

6           As I have commuted to Wailuku on Pulehu Road from  
7 Holopuni every day for the last 19 years, I am aware that those  
8 roads are primarily used as shortcuts for commuter traffic, and  
9 are most heavily used between 6:30 and 8:00 in the morning, and  
10 4:30 and 6:00 in the afternoon. I believe having grade  
11 separations of any of the alternatives would be appropriate.  
12 And given the terrain and slope of that area of the country,  
13 that with a little planning, the cut and fill could easily  
14 provide for underpasses for both those roads.

15           One other thing, the impact of lights. In the draft  
16 EIS what is not spoken to, aside from the very evident impacts,  
17 is the light impacts of any of the alternatives, specifically  
18 of those that would go through non-habitable areas at this  
19 time, such as U3. From my deck, the ridge upon which that road  
20 would go up towards the Lower Kula Highway would create  
21 approximately a quarter of a mile effect, and would create  
22 quite distinctive light impacts at night, and this has not been  
23 addressed in the EIS, and is part of the charm of the Kula  
24 country area.

25           In developing the U1 alternative intersection at

1 Haleakala Highway, that should be definitely a nongrade  
2 separation. Not just because of the traffic going onto the  
3 Kihei-Kula route, but because of the overwhelming traffic  
4 congestion of cars going up and down Haleakala Highway to and  
5 from Central Maui. Single crossings at that point would be  
6 absurd, creating multi-mile backups during rush hours. As it  
7 is, the average speed during the rush hour period is probably  
8 only 30 to 35 miles an hour because of the constant traffic.  
9 This would become the second planned overpass on Maui, the  
10 first one being the over-crossing of Haleakala Highway for the  
11 proposed new airport entrance.

12           The no build alternative is not inconsistent  
13 necessarily with the alternatives of the various routes at this  
14 time, because the real decision in terms of the road planning  
15 for the Kihei-Kula connection or Upcountry connection is a  
16 timing one. In fact, I am concerned that whatever alternative  
17 is chosen, that in the long run there will be a need for  
18 additional connections to that road, or another one to Kihei.  
19 And for long-range planning, that might impact the decision as  
20 to which alternative to choose at this time, including possibly  
21 the no build alternative.

22           Also, the U1 alternative avoids a conflict with  
23 school areas, such as Kekaulike and Kamehameha. And the grade  
24 situation at Kulamalu, as pointed out in the draft EIS, is a  
25 very serious concern for anyone who drives vehicles of any

1 size, including four-door passenger cars.

2 I think that's pretty much it. I think, in summary,  
3 I want to emphasize that the U3 alternative would destroy a  
4 very rural, agricultural area. It goes through one of the few  
5 places where our small farmers have a possibility of  
6 economically farming, i.e., the Maui Agricultural Park, as well  
7 as it ruins large sections of pineapple fields that were  
8 developed as part of the Maui Agricultural Park trade-off for  
9 water supply. Everything considered, if a no build alternative  
10 is not the chosen one, again, I would support the U1  
11 alternative as my first choice.

12 MR. ST. JOHN: Skip St. John, 113 Pekelo Place,  
13 Kula. I favor having the Upcountry terminus as far towards the  
14 Rice Park end as possible because the area around Five Trees,  
15 with the new Kamehameha School opening, is very congested, and  
16 the Kihei terminus would be much more convenient. The Research  
17 and Technology Park works fine for me, but I think if you get  
18 down the mountain towards Haliimaile it defeats the whole  
19 purpose of the highway.

20 So in other words, let's rethink some of the earlier  
21 alternatives which were discarded, and try and put the  
22 Upcountry terminus around the telephone exchange, and work from  
23 this end down and see where we can come out, for a positive  
24 approach and a better driving environment for Upcountry  
25 citizens.

1 MR. DEPBONDE: I am Erwin DepBonde, RR4, Box 66-A,  
2 Kula, 96790. My opinion is I want the highway at Haliimaile  
3 because it would service a majority of the people that's  
4 working down in the down country area. One stipulation: When  
5 they bring it down Haliimaile they should go under the highway  
6 to make the section safer for Upcountry. I guess that's all I  
7 have to say.

8 MS. SMITH: My name is Louise Smith, and I live at  
9 RR1, Box 530, Kula, 96790. That is Kimo Drive. I feel very  
10 strongly in favor of the Haliimaile U1, I guess it's called, U1  
11 to either K1 or K2. That part I have not taken a thorough  
12 study of as to the feasibility of either one of them being the  
13 one to come to.

14 I feel that the taxpayers of Maui deserve to have  
15 the one that's benefiting them the most, and to benefit the  
16 most people would be U1 because they're coming from Haiku and  
17 the east part of Maui, that not only are going to Kihei to work  
18 but some are going to Lahaina to work. And I don't think that  
19 we need to go over Kula to bring them down to go to Lahaina. I  
20 don't think Kula needs to have a road coming in any place near  
21 Kekaulike School, it's going to be too congested.

22 I believe that the Kula area doesn't have a roadway  
23 to take care of the majority of these people who have to drive  
24 through Upper Kula to get to the road. I also feel that the  
25 one going straight up from Kihei or Wailea almost to the top of

1 the mountain is not necessary. They have technology nowadays  
2 that they can do a lot of their work down below and not have to  
3 go to the top of the mountain. And if you are going to have  
4 one such as that road, I think they're only accommodating about  
5 a hundred people. And I don't believe there's anything that is  
6 urgent to have to get up there in a hurry. And nowadays we do  
7 have helicopters that can get them up there at a lot less  
8 expense than building a road from an area that is not going to  
9 benefit a majority of the taxpayers.

10 The other areas I didn't even consider because,  
11 well, I don't think they're as convenient as would be the  
12 Haliimaile option. I believe that as a former board member of  
13 the Kula Community Association, they have already gone on  
14 record supporting the Haliimaile junction. Thank you.

15 MS. BARRETT: I'm Gwendolyn Barrett at 104 Kalihi  
16 Place, Kula, Maui. Okay, I feel like Haliimaile is the best,  
17 personally. This is what I like the best because I feel like  
18 the people from Haiku and Makawao can feed in without coming up  
19 Kula Highway and adding to the congestion so that they would  
20 have to pass the school and all of the area that's in  
21 Pukalani. So I feel like that would be less congestion, and  
22 yet it's a very short distance for us to come down.

23 I really don't know what else to add to that, other  
24 than I'm sure any of them has their assets and their  
25 liabilities. But for me, because all of Upcountry goes to

1 Kihei, and Kihei goes to all of Upcountry, that's the best  
2 choice. That really I think is it.

3 MR. BROGOITTI: I am Mark Brogoitti, my address is  
4 Post Office Box 1276, Kula. It appears that the State has a  
5 vested interest in building a new highway where one is not  
6 needed. It also appears that the State has already made up  
7 their mind that they're going to build a new highway. I  
8 disagree with this decision. I think that the existing highway  
9 infrastructure should be improved. The Haleakala Highway, our  
10 three lane highway, should be a four lane. They should improve  
11 the Hansen Road, which connects Mokulele Highway, and make that  
12 four lanes, and make four lanes on Mokulele Highway all the way  
13 across to Kihei.

14 The Kihei traffic situation could also be improved  
15 by widening the existing Piilani Highway and putting in light  
16 controls which are timed with automobile speed. From the State  
17 of Hawaii video, the most viable alternative showed a 25  
18 percent drop in miles traveled. Currently, it takes me 40  
19 minutes to get from Kula to Kihei. If you drop the distance  
20 traveled -- strike that part. A reduction in mileage traveled  
21 could be far offset by improving the existing infrastructure,  
22 allowing people to drive more fluidly with less stops and  
23 delays on existing roads.

24 The current idea of putting in a two lane road and  
25 shortening the travel distance by 25 percent does not address

1 the actual time that a person will spend in his automobile. I  
2 believe that the two lane road will not allow the speeds that  
3 we have on the existing infrastructure, due to slow drivers.  
4 So the 25 percent reduction in distance traveled does not  
5 represent a 25 percent reduction in time spent in the  
6 automobile.

7 In closing, I think that Hawaii's money would be  
8 better spent if it was spent on upgrading the existing highways  
9 and solving our existing traffic problems using the  
10 infrastructure that exists. Thank you.

11 MS. GISE: There are four reasons for the new road,  
12 all of which are problematic. First of all, there are few  
13 scientists traveling from the technology park to the summit.  
14 Second, the projected increase in tourists is excessive. The  
15 proposed road will decrease travel time only about 10 minutes  
16 in a two hour trip. Third of all, this location has a low  
17 hurricane and tsunami risk. The fourth reason, commuters, is  
18 the only remaining reason for the road.

19 The road will encourage development; a shortage of  
20 water has been shown not to control development. Of the four  
21 Upcountry intersection possibilities, U1, the Haliimaile  
22 intersection, is already dangerous, and will become a death  
23 trap. The Environmental Impact Statement does not mention a  
24 traffic light at Haliimaile. Potentially, a cloverleaf  
25 overpass would be a solution, but this is not desired by the

1 community, and current funding requires more traffic before  
2 allocating the extra 10 million dollars for such an  
3 intersection.

4           The Haliimaile intersection will furthermore greatly  
5 increase the traffic down residential Holopuni and Pulehu  
6 Roads, which are not designed for traffic. Accident statistics  
7 on these roads are already bad.

8           With regard to the Five Trees intersections, U2-A  
9 and B, the impact statement is based on traffic studies which  
10 were done before King Kekaulike High School was built, and  
11 Kamehameha School as well, before the Kamehameha School plan.

12           With regard to the Kula Hardware Store intersection,  
13 U3, this choice will make the trip to the summit worse for both  
14 scientists and tourists, and 50 percent of the benefit to the  
15 Pukalani-Kihei hotel commuters will be lost. They will have to  
16 go to the Kula Hardware Store, and would need four lanes from  
17 Pukalani to the Kula Hardware Store, and there are no plans for  
18 this. The intersection of the Hana Highway and the Haleakala  
19 Highway is already bad, especially during school times, really  
20 needing a cloverleaf overpass.

21           Finally, Hansen Road could be fixed and/or moved and  
22 would siphon traffic away from the Hana Highway/Dairy Road  
23 intersection, which is also bad.

24           MRS. KAVANAGH: Patricia Kavanagh, 238 Nalani  
25 Street, Pukalani. Well, the route that I chose that makes the

1 most sense to me is U2-A to K2. I could be persuaded possibly  
2 on U2-B, but as of now, I would say U2-A, because it seems to  
3 make the most sense to me and would be the most convenient for  
4 us. We're back and forth to Kihei almost every day of the week  
5 from Pukalani, and this route would work the best for us,  
6 definitely. Thank you.

7 MR. KAVANAGH: My name is Walter Kavanagh. I live  
8 at 238 Nalani Street in Pukalani. I chose U2 because it's the  
9 most convenient, the shortest, and not the most expensive.  
10 Every day I drive down to Kihei clear around by Hana Road, and  
11 it's too far and too dangerous. All our friends live in Maui  
12 Meadows. They think we're foolish to live up here because it's  
13 too dangerous and too far away. They won't come up and see  
14 us. So this way it would make it a lot better and safer for  
15 everyone. There would be less traffic going in the same  
16 direction, and just a lot better situation.

17 I just hope it will happen, and not be talked about  
18 like everything else here, put off and put off, because that's  
19 how they live here. Everything is tomorrow. I have been  
20 working down there for 14 years, and we go down to Kihei every  
21 day of the week using two cars. We have to, because she has to  
22 have one and I have to have one, and it uses a lot of gasoline  
23 at \$1.70 a gallon. Anyway, it is so nice that all you people  
24 are getting together to make progress on this wonderful island,  
25 thank you.

1           Also, there isn't any escape route at all. If any  
2 major catastrophe happens, everybody is in bad shape because  
3 there's no outlets for Wailea or for here or for Kihei. And it  
4 could happen. Look what's happening around now, earthquakes,  
5 tidal waves, and all those kinds of things. We have got to  
6 think of that for our kids. I'm getting up there, I'm 81, and  
7 I'm still working. I get up real early and go, and it's so  
8 beautiful in the morning. It's dark at that time, but I love  
9 to see the sunrise. I love living here, and the people are so  
10 nice, and everyplace we go we make friends. It just makes a  
11 happy life and you live longer that way. Thank you so much.

12           MS. CLAYTON: Okay, my name is Donna Clayton, and I  
13 live in Pukalani at 249 Kaulani Street. I feel that the new  
14 bypass highway right by the highway at Five Trees would be the  
15 best place for that intersection to go, mainly because it's  
16 busy now. And I don't think it's quite perfect yet, and this  
17 would give the State the opportunity to enhance that area, now  
18 that everybody is using it.

19           There's a lot of traffic from the school right now,  
20 and there's another school that's going to go in, and there's  
21 going to be more traffic in that whole area from the school,  
22 and I really think that whole area needs more work. By  
23 terminating the highway there it will all be cleaned up and  
24 just be smoother. It will also bring people a little higher  
25 up. I thought it was a road Upcountry rather than

1 mid-country. I think that's a more Upcountry terminus.

2 For me, I would prefer it there. I think any other  
3 site, the other sites are too far over. The U2-B and U3 and  
4 Haliimaile intersection is going to be improved anyway one day  
5 to Waiko Road, so that will be taken care of. So I really  
6 think the area should be cleaned up at Five Trees. Thank you.

7 MR. PARKER: My name is Stephen Parker. I live at  
8 PO Box 1209, Kula. I have lived in Kula for 30 years, on  
9 Pulehuiki Road for the entire time. I have traveled both to  
10 Wailuku, Kahului and to Kihei throughout that whole time. I  
11 primarily drive down Pulehu Road traveling to Kihei, and  
12 presently it takes me about 40 minutes traveling time and a  
13 tank of gas every four days. So energy conservation I think is  
14 the primary purpose of this.

15 Of the alternatives, I favor U1 to K2 for the  
16 following reasons: The backflow from the Haiku area through  
17 the Makawao/Baldwin Avenue intersection to U2-A and U2-B and U3  
18 I think would make Makawao terribly congested. The far reaches  
19 of the uplands, Haiku area, traveling down the Kaluanui Road  
20 and Haliimaile and getting on the bypass road, and the  
21 Makawao/Pukalani people can travel easily enough down to that  
22 intersection.

23 I feel that the Kula to Ulupalakua people probably  
24 could go down Omaopio and Pulehu Road, which will put some  
25 pressure on those areas. But having traveled those areas

1 already, I am not sure how much of an increase in traffic  
2 they're going to see with that bypass road.

3           Living on Pulehuiki Road, the U3 terminus Upcountry  
4 will increase the traffic on a very substandard steep road, and  
5 I think it would cause a lot of traffic congestion and  
6 dangerous travel. The terminus in Kihei at K2 would provide a  
7 parallel alternative to Piilani Highway, so that for any  
8 accidents, the closing of the Piilani Highway would be an  
9 alternative method to get out of Kihei. I have been stuck a  
10 number of times in Kihei when they have closed Piilani Highway,  
11 and it takes at least two hours to get out of Kihei when that  
12 happens.

13           To my way of thinking, the choice that would have  
14 the least traffic impact and serves the most people is the  
15 U1-K2 alternative. Those who want to address planning issues  
16 and the fact that a highway might promote development  
17 Upcountry, I think there's nothing, as far as I know, no proof  
18 that this would happen. Development is more a function of  
19 planning and having other services available, rather than  
20 having a highway.

21           I object to the U2-B terminus in Kula or Upcountry  
22 due a lot to the expense at that portion, having to condemn  
23 urban zoned land and construct a very expensive bridge  
24 structure that they're going to have to plan, and the steepness  
25 of the slope. I believe the slope at the worst portion of the

1 Pukalani bypass is seven percent, and they propose a 10 percent  
2 slope. I think that would be absolutely dangerous going down.  
3 And coming up it's going to be hard on a lot of vehicles to  
4 make that kind of grade. Thank you for this format.

5 MS. CHAMBERS: My name is Kelly Chambers. My family  
6 lives at 1920 Baldwin Avenue in Makawao. I think that they  
7 should do the U1-K1, because if they do it, the cheapest one  
8 they said was at the Five Trees, but that's kind of -- it's  
9 like I go to school there, and it takes like 10 minutes to get  
10 through that intersection.

11 And even like going to Keokea, that is too far. And  
12 I think the one in Haliimaile could help everybody, like from  
13 Makawao and even Haiku and Kula and Keokea and everything like  
14 that. And they need like a stoplight there anyway. You know,  
15 that intersection, gosh, it's horrible. It takes like 30  
16 minutes to get out of there.

17 I don't know anything about Kihei, but even by  
18 Kamehameha School is a bad idea because in the morning that is  
19 so congested that there would be too many cars trying to get in  
20 and out. Thank you.

21 MR. FLAMMER: I am William Flammer, and I live at  
22 2102 Naalae Road in Kula. I think there should definitely be a  
23 divided highway. If you travel the highway to Kihei on  
24 Mokulele Highway it's incredibly dangerous. I was a traveling  
25 road rep for 17 years. I traveled in my car all day long every

1 day, and I never had an accident. This road scares me, this  
2 Mokulele Highway. If they don't put a divided highway, the  
3 road will be much, much more dangerous.

4           Also, I understand it's a two lane highway for now,  
5 what they're proposing, but by the time they get it built they  
6 will need four lanes, guaranteed. So the people that are in  
7 charge, do you realize how many baby boomers from the mainland  
8 are going to start moving here in the next five years? I don't  
9 know if you considered it. With the runup in real estate  
10 values on the mainland, with the appreciation of the 401(k)'s,  
11 of their other stocks outside of their 401(k)'s, and the baby  
12 boomers are set to inherit approximately two trillion dollars  
13 from their parents, they're going to have plenty of money to  
14 move to places like Maui. You are going to need four lanes by  
15 the time it's built.

16           My final comment, on a personal note, it pains me to  
17 see that the U3 possibility is the cheapest. I think that is  
18 the worst option. I think the road should go to U2 either A or  
19 B. I guess that's it. Thank you very much.

20           MS. ANDERSON: My name is Diane Anderson. I live at  
21 114 Kainana Place in Kula. I just want to put in my  
22 preferences. I prefer either number 8 or number 6, and I'm  
23 very excited about having a road from Upcountry to Kihei. It's  
24 very much needed. And the way Maui is growing we need to plan  
25 ahead and really do something that's going to help the people

1 who live here and work here to be able to get to work and get  
2 back, and not be sitting in lines on 37 because there's only  
3 one route. Even now it's crowded. And if we don't look ahead  
4 and get this done, we're going to be sitting in lines just like  
5 they do on the mainland, and we don't want that. Thanks.

6 MR. ANDERSON: I am Donn Anderson, I live at the  
7 same address as Diane. Well, first of all, I just wanted to  
8 say thank you for this format. If we didn't have this kind of  
9 open house format I really doubt that my wife and I would be  
10 here, because the other style is very boring and takes too much  
11 time. So we're very happy with this.

12 I would just like to go on record to say no build is  
13 no choice. We are not in favor of a no build option at all.  
14 So my first choice would be number 8, which would be U3 to K1.  
15 My second choice would be number six, U2-B to K1, and the  
16 sooner this can be built the better. That's what I want to  
17 say.

18 MR. MAYER: My name is Richard D. Mayer, and I live  
19 at RR1, Box 518, Kula, 96790. I want to give some of my  
20 testimony today, but I am going to reserve most of it for the  
21 meeting on October 13th. The presentation today I feel is  
22 illegal and improper in the sense that the charts that have  
23 been shown to the public do not include the no build  
24 alternative. The public is being misled to think that we have  
25 to choose among the eight alternatives, not realizing that the

1 no build alternative is a viable statement, a viable position.

2 I strongly support the adopted community plan for  
3 the Upcountry region, which states very clearly that the  
4 preferred alternative is no build. It is beyond me to  
5 understand why the State Department of Transportation and  
6 Senator Inouye have totally disregarded the wishes of the  
7 community in this matter. This project seems more to be  
8 "Inouye's invasion" and is paralleling the project on Oahu  
9 which for 20 years involved many, many community groups, namely  
10 the H-3 freeway.

11 This is another project which is being built against  
12 the wishes of the residents of the Upcountry region, who  
13 through their legal community plan process have indicated the  
14 wish is for a no build. The community wishes were accepted by  
15 the Maui County Planning Commission, and the Maui County  
16 Council, and the Maui County Mayor. The exhibits presented  
17 this evening do not reflect those legally adopted statements  
18 regarding the no build alternative.

19 On another matter, the presentation maps indicate  
20 that the baseline route linking the Upcountry region and  
21 Mokulele Highway is from the Hana Highway along Dairy Road, and  
22 then left along Puunene Avenue to Mokulele Highway. This  
23 routing is absolutely not a routing that anyone from East Maui  
24 or Upcountry would take to go to the Kihei-Wailea area. All  
25 residents of those communities would utilize Hansen Road, which

1 has been totally disregarded in the presentations and in the  
2 EIS.

3           This is all the more surprising, because during the  
4 scoping meetings which took place several years ago, it was  
5 made clear that Hansen Road was the base route that should be  
6 considered. It was also indicated at that time that a routing  
7 which would include Haleakala Highway, Hansen Road and Mokulele  
8 Highways would not only be a viable alternative to the routes  
9 being presented, but a preferred route.

10           Let me add something else here. The format of this  
11 evening's meeting, which excludes oral presentations by  
12 community members and community leaders, is a travesty to open  
13 government and open decision making. We have no idea what  
14 others have said, and no ability to ascertain whether the  
15 comments being made by each individual are being accurately  
16 transcribed, replicated, and publicized. It would be very easy  
17 to have the record changed and have no one in the community  
18 know what others said.

19           This process of closed meetings and closed  
20 government is probably illegal under the Sunshine Law, which  
21 prescribes that all public meetings be held openly and in the  
22 sunshine. It is useful to allow people who do not wish to  
23 speak in public to utilize this transcription method if they so  
24 choose. However, there should be an opportunity for those who  
25 wish to speak publicly to do so. That's all.

1 MR. BARBIN: My name is Ry Barbin, my address is 24  
2 North Church Street, Wailuku. I'm a 25 year resident of Maui,  
3 and I have resided Upcountry for 15 years, and I own a house  
4 near the Upcountry high school. I speak as a resident of Maui,  
5 and I consider that this road is not just an Upcountry-Kihei  
6 road, but an island road.

7 I support the road. First I want to say that I'm  
8 speaking strictly as an individual, not representing any  
9 organizations or individuals. I support the road as a vehicle  
10 for economic development, to provide jobs for the future, to  
11 support the high tech industry on Maui, to relieve congestion  
12 on other roads, to relieve maintenance on other roads, and to  
13 assist workers to get to and from work easily and quickly.

14 With regard to the alignment, I think we should  
15 choose the alignment that is the most direct from the Kihei  
16 High Tech Park to the Science City. I believe that the  
17 Haliimaile Road intersection does not serve the purpose for  
18 which the road is being constructed, from a traffic flow  
19 standpoint. Any of the other alignments I would support,  
20 although I believe U2-A and U2-B are probably the most direct.  
21 Beyond that, I don't really take a position over those two  
22 alignments. That's it.

23 MR. STARR: My name is Hugh Starr, and I live in  
24 Makawao at PO Box 33, and I'm in favor of the Haliimaile  
25 alternative Upcountry. I feel that the project area needs to

1 be expanded to include Haiku, Kokomo, Kaupakalua, because many  
2 of the people who work in Kihei-Wailea have to right now go  
3 through Paia to get down there from East Maui. The project  
4 district appears to actually end east, somewhere between  
5 Makawao and Pukalani. So I think the project area needs to be  
6 expanded. That's it.

7 MR. BURT: Thomas Burt, 277 Olulani Street,  
8 Pukalani. I really feel the best route would be the Haliimaile  
9 route, because it doesn't impact any residential neighborhoods  
10 or archaeological sites or anything along the way. The other  
11 consideration I feel would be to make, instead of doing any of  
12 it, any of the new proposals, would be to just make the  
13 highway, Pukalani -- not Pukalani Highway, Haleakala four lanes  
14 down through just the existing roads, improving those to four  
15 lanes. So that would be something that's not considered right  
16 now, but an alternate to everything that they're proposing, and  
17 probably cheaper. But if we have to do one of them, I'd rather  
18 see the Haliimaile route. Thank you.

19 MRS. BURT: I am Elizabeth Burt, and I live at 277  
20 Olulani Street. Well, I think that improving the existing  
21 roads would be the best alternative. If that is not an  
22 alternative that's going to happen, then the Haliimaile route  
23 to Kihei. But I think that the roads that we already have, if  
24 they were improved into four lane roads instead of just two  
25 lane roads, it would accommodate the traffic flow a lot better

1 than it does now. That would be my first choice. It would  
2 have less impact on existing neighborhoods, archaeological  
3 sites, better planned for commercial use. That's it.

4 MS. MORRISON: My name is Sheri Morrison. I live at  
5 2770 Palalani in Pukalani. I guess I empathize with the people  
6 in Kihei that we need another way out of Kihei besides the  
7 current situation. So I would support something, some kind of  
8 road rather than the no build. But of those options that are  
9 then available, I would prefer the one that runs from the  
10 northern-most part of Kihei to the Haliimaile intersection,  
11 which is U1. It seems to have the least negative impact, from  
12 my perspective. I live in Pukalani and I would use it, it  
13 would be a nice thing.

14 I also see it as a benefit to the population living  
15 in Haiku, Paia, the East Maui section, because it would give  
16 them another way to come Upcountry. South Maui, they would use  
17 that route rather than having to go through Paia, which is just  
18 inundated right now with traffic. So it seems the most  
19 positive link to me.

20 I don't like at all the intersection at Five Trees.  
21 It seems that we've already messed that up enough. It still  
22 has some meaning to people Upcountry, as opposed to just from  
23 an engineering standpoint. So I would hate to see them use  
24 that as the intersection. I would not like the intersection to  
25 go through the new Kulamalu area because it would be a

1 throughway right by Kamehameha Schools, and then also by the  
2 King Kekaulike school. So even though it would offer options  
3 for those people as far as traffic, it just seems a shame to  
4 have these schools next to high volume traffic.

5           The Omaopio/Pulehu area I don't think is good  
6 either, because it impacts negatively on the County  
7 agricultural park there, and just in general seems a huge  
8 expense, just looking at it from the expense side. So I end up  
9 dreaming about the good old days and wishing there was no  
10 build. But if we have to do something I would go from the  
11 northern-most intersection in Kihei to the Haliimaile  
12 intersection. Thank you.

13           MR. OHTA: I am David M. Ohta, and I live at 2678  
14 Akalani Loop in Pukalani, Maui. Where it comes out at  
15 Haliimaile it would seem like that -- I mean after looking at  
16 this whole thing, not that the highway even crosses where I  
17 live. I won't even see the highway, I don't think. It's just  
18 that the school up there, I drive up there, I see the school,  
19 and you have got King Kekaulike and then you have got the  
20 Kamehameha School. It just seems like a bad intersection.

21           When I was talking with Unemori, he said, "Wouldn't  
22 that be the best place to bring a highway because that's where  
23 you have a gathering of people right there, a concentration of  
24 people." I said to him that I thought it would be just the  
25 opposite. To bring a highway into someplace where you have got

1 so many more things to consider when you bring it up to there.  
2 That's why I'm picking U2.

3           The Pukalani Association and the Kula Association, I  
4 think we just voted unanimously not to bring the highway up to  
5 U2-A and B. But I guess there was a meeting here the other  
6 week that I missed, when Everett Dowling came. I think Kathy  
7 Hall brought him up there. And the way he made it sound is  
8 that's where the highway is coming up already, U2-A or U2-B,  
9 right where he's got all his projects happening right there.  
10 And the people, the association, we didn't like that idea,  
11 somebody saying that's where the project is coming out already,  
12 the terminus.

13           That's all I have to say. I could care less where  
14 it comes out in Kihei, K1 or K2. As far as Upcountry goes, I  
15 have lived up there for almost 22 years, and I've seen the  
16 place grow. I mean when I first came up here there was no  
17 Pukalani here. There were like three houses over there. I  
18 think the Hicks Homes were right there where Ace Hardware is.  
19 That was it, there was no Pukalani. When we first moved up  
20 here I think there was no lights and it was a dirt road here at  
21 the end. And I have seen it grow and grow, and God, I just  
22 can't see a highway coming up here.

23           I mean people have selfish reasons why they don't  
24 want to look out at the highway, but I won't be seeing the  
25 highway. It's just I can't imagine that much traffic coming

1 right by the school. It would be a horrible place for that  
2 thing to come out. Thank you.

3 MR. STARR: My name is Jonathan Starr. I live in  
4 Kaupo and also at 3150 Wailea Alanui in Kihei, 96753. Okay,  
5 well, my largest concern is to see another route out of the  
6 southern end of Kihei. I think that's essential for a  
7 emergency evacuation. And also there are many days when I try  
8 to commute from Wailea to Kahului to go to work and there's an  
9 accident on Piilani Highway or Mokulele Highway, and it just  
10 ties up everything. In fact, even an accident on South Kihei  
11 Road will tie up Piilani Highway for a half hour or so. So my  
12 greatest interest is to see a way to get out of the southern  
13 end of Kihei without having to backtrack all the way down  
14 Piilani and Mokulele Highway.

15 So as far as the lower terminus, I feel it needs to  
16 be the one that's furthest south, and that to me is the most  
17 critical. As far as the upper terminus, I really feel that  
18 that should be up to the Kula community to decide, more than  
19 the Kihei community. But in any case, I'd like to see a  
20 connection that heads back toward the airport or Puunene, so  
21 that the road would be able to serve the people of southern  
22 Kihei, which is a very rapidly growing community, probably the  
23 fastest growing community in the state, with another route back  
24 toward the airport and back toward Kahului and also the  
25 government center.

1           As an aside, I really miss having the old  
2 Ulupalakua\Makena road. I used to use that road a lot before  
3 it was closed down years ago, and it was a very sad day for our  
4 community when that road became closed down. And I wish there  
5 was some mechanism for local citizens to be able to utilize  
6 that road without it being turned into a major highway.

7           I don't know how that could fit in with the plans,  
8 but that would really help both as an emergency evacuation  
9 route, also for those members of the community who have to get  
10 from the South Maui, Kihei side toward Ulupalakua, or in my  
11 case, where my other house is out in Kaupo and on toward Hana.  
12 So those are my comments.

13           MS. NIELSEN: I'm Helen Nielsen. I live at 3150  
14 Wailea Alanui Road in Kihei. I wish I could remember exactly  
15 which is which. I guess now that I have my map in front of me  
16 I think I prefer the K1 to U2-A as my first choice. However, I  
17 just heard that U2-A is an archeologically sensitive site, so  
18 if it is and they haven't gone around those sites, then I would  
19 prefer U2-B.

20           I'd like to request that they be more sensitive to  
21 the lighting. I don't want to see more of the Dowling\Kula  
22 Highway lighting repeated at every intersection where the  
23 highway passes Pulehu\Omaopio, because I don't think the folks  
24 who live there would appreciate all the bright lights.

25           I would also ask that the side of the highway is

1 wide enough so that if people do want to bicycle up and down  
2 for the entire length it should be done in a safe manner. I  
3 understand they only have bike lanes for the urban areas, but  
4 they should consider bike lanes all the way up and down. And  
5 since Maui is such a sport center internationally, I think  
6 there's only going to be more and more people coming to do more  
7 cross country biking, and I think that would be a nice way to  
8 get around. And I appreciate the chance to comment. Thank  
9 you.

10 MR. MEYER: (The written testimonies of Paul J.  
11 Meyer and Thomas Worthington, Ph.D., are attached to the  
12 transcript)

## 1 DEPARTMENT OF TRANSPORTATION

## 2 PUBLIC HEARING

## 3 TRANSCRIPT OF PROCEEDINGS

4

5 MR. TSUZUKI: It's a little past seven o'clock, and  
6 I think we had published in the ad that we had regarding this  
7 meeting, this public hearing, that we would be starting at  
8 seven o'clock, giving the public an opportunity to speak before  
9 an audience. So this is what this portion of the public  
10 hearing is about.

11 I wanted to extend my greetings to you, and we will  
12 come unite to this public hearing for the Upcountry to Kihei  
13 highway project. I bring something to you from the director of  
14 transportation, Kazu Hayashida, and also Pericles Mantos, who  
15 is the administrator of the Highways Division. Unfortunately,  
16 the two gentlemen I just mentioned are not able to attend  
17 tonight. But we will hear your testimony tonight, and I have a  
18 panel in front of you, and I am going to be introducing them  
19 tonight.

20 To my far left is David Atkin. David is with the  
21 consulting firm Parsons Brinckerhoff and Associates, Parsons  
22 Brinckerhoff Quade and Douglas, and their company is actually  
23 doing a lot of the environmental studies for this project. To  
24 my immediate left is Bob Siarot, our Maui District Engineer for  
25 Highways. To my immediate right is Warren Unemori of Unemori

1 Engineering, who is the prime consultant for this project.

2 And to Warren's right is Domingo Galicinao. Domingo  
3 is actually the bridge engineer for the Federal Highways  
4 Administration. The Federal Highways Administration has an  
5 important role in this project, since they will be providing  
6 most of the money for this project. Domingo handles all  
7 projects on the island of Maui.

8 Tonight what we wanted to do was try and receive as  
9 many public comments as we can about the project, and that's  
10 really the purpose of all of these public hearings that we have  
11 held so far. Some of you may have already attended the two  
12 hearings that we held about two weeks ago, one in Kihei and one  
13 in Upcountry Maui.

14 Some of you may be wondering why we are holding a  
15 third meeting. The primary purpose of holding this meeting  
16 tonight was the fact that I had received a phone call from,  
17 what was the name of that person, the president of the  
18 Kekaulike High School PTSA called me just before the public  
19 hearing was scheduled, about a week before the public hearing  
20 for Upcountry was scheduled, and he told me that the Upcountry  
21 public hearing conflicted with the opening of the Maui County  
22 Fair. And I guess we weren't aware of that when we had  
23 scheduled the hearing for Upcountry Maui.

24 He told me that a lot of the parents of students and  
25 whatever, were involved with the county fair and would not be

1 able to attend, so if we could either reschedule the Upcountry  
2 meeting or schedule another meeting. So we decided that we're  
3 going to go ahead with the meeting in Pukalani, but also  
4 schedule a third meeting, and this is the meeting that we  
5 scheduled to allow people who were not able to attend the  
6 previous meetings.

7           As most of you know, we used a different type of  
8 format for the two public hearings in Upcountry Maui and also  
9 in Kihei. That format did not allow for public testimony  
10 before an audience, and we received a lot, not a lot, but a few  
11 letters complaining about that format. And that's also another  
12 reason, a secondary reason why we're holding this meeting  
13 tonight, because we didn't want that to be an excuse for people  
14 not testifying about this project. We wanted to get as many  
15 comments as we could about the project and really find out what  
16 people thought about it.

17           As far as how we're going to run this portion of the  
18 public hearing, we have a court reporter in the front of the  
19 room, and we want to make sure that she captures all of your  
20 comments that you are making verbally. We have a microphone  
21 that's set up right over there in that aisle, and each person  
22 will have to go up to that microphone, state his or her name  
23 very clearly. Also if you could spell your name, because  
24 sometimes we can get the names misspelled, so we want you to  
25 spell your name, and also indicate if there's any organization

1 or whatever, that you represent or whether you are representing  
2 yourself.

3           We also have another court reporter that's just  
4 outside that exit sign in the far left of this room, and this  
5 is for people who are not used to speaking before an audience  
6 and who may want to still give comments to us. So we do have  
7 an opportunity for those of you who may be a little timid in  
8 speaking before an audience to go to that court reporter  
9 outside. We also have comment sheets which are located next to  
10 the table that you had signed in on, and those sheets can also  
11 be filled out and turned in tonight or mailed back to us. We  
12 want to make sure that all comments are received by October  
13 28th or roughly toward the end of this month.

14           Also, if you testify at the microphone, we want to  
15 make sure we capture everything that you say. Some of you may  
16 have a written copy of what you plan to speak about, and if you  
17 do, we would appreciate it if you could turn that in to our  
18 court reporter, it will really help her.

19           The other thing we are going to observe is a  
20 four-minute time limit on each person. After all the people  
21 have had an opportunity to speak, we will give them extra time  
22 if they need it later. And we're going to take people in the  
23 order of how they signed in. So actually I'm going to go  
24 according to the list that was available at the sign-in table,  
25 and I'll call each person up individually.

1 Any questions? Yes, sir?

2 UNIDENTIFIED SPEAKER: Are we going to have a map  
3 for people to visually see what people are commenting on? How  
4 about the No. 2 map there?

5 MR. TSUZUKI: If we have to, we can bring a map up  
6 when you speak, if you need it.

7 UNIDENTIFIED SPEAKER: We will. Please bring it  
8 now.

9 MR. TSUZUKI: Okay, we will. I think they're  
10 getting it now. Okay, let's get started. Yes, sir?

11 UNIDENTIFIED SPEAKER: I know on numerous times you  
12 got public testimony, your two other meetings. This meeting we  
13 have verbal and written, so one individual could actually  
14 continue testifying throughout this process?

15 MR. TSUZUKI: That's correct. That's correct. And  
16 that's your right to do so.

17 Any other questions about the format of tonight's  
18 meeting and how we're going to run this? If not, let's get  
19 started. I am going to call on the first person, his name is  
20 Roger Dennis Hawley, who is the first person who came tonight,  
21 so he should be the first one to speak.

22 MR. HAWLEY: My name is Roger Hawley, I have been a  
23 resident of the Hawaiian Islands for the past 32 years. My  
24 last name is spelled H-a-w-l-e-y. I've testified at numerous  
25 state highway projects all over the Hawaiian Islands,

1 especially the H-3 freeway, which I started back in 1973. I  
2 have hiked just about every inch of all this territory, of all  
3 the proposed alternates, for many years, for the past 30 years,  
4 and all I can see under the present designs is that it's all  
5 half-assed as it presently is designed.

6 I'm from California. I've watched the freeways  
7 overtake all the residential areas, all the back country  
8 roads. And it was kind of sad, but there was, once in a great  
9 while, a beautiful highway, like a parkway that was used by  
10 everyone, the local people and the tourists. I feel that if  
11 people really understood how much tax money they have just  
12 expended in the last ten years through their income tax, it is  
13 nearly a hundred million dollars per year for ten years. That  
14 is a billion dollars for just the island of Maui. I believe  
15 that Maui should get a better deal in this whole thing.

16 I believe that this proposed highway from Kihei to  
17 Upcountry should not be a two-lane suicidal road where many  
18 people might be killed in the next 10 to 20 years. I feel it  
19 should be four lanes, and it should be divided. To prevent any  
20 delays and inconveniences in the following years, it should be  
21 concrete. I believe that the people of Maui have paid enough  
22 price through their income taxes that they deserve a very fine  
23 parkway between Upcountry and Kihei, and I am against all the  
24 proposed routes as they are.

25 I bet most of you have never even seen the herds of

1 deer that plague this entire region. They're in groups of 30,  
2 40, 50, 60, vast quantities of deer all over this mountain  
3 site. Try to imagine driving at 55 miles an hour down or up  
4 this highway and a deer comes loping across the highway, and  
5 you hit it at speeds of 45 to 55 miles an hour. You are going  
6 to do a lot of damage to not only your car but to the deer, and  
7 you might end up dead.

8 I believe that as they presently are designed, I  
9 think and I feel that all the alternates should not be  
10 considered until a good four-lane highway from Pukalani down to  
11 Kahului, and a four-lane highway from the middle of the  
12 Haleakala Highway down to Kihei are built, that's what my  
13 feelings are. Thank you very much. (Applause.)

14 MR. TSUZUKI: Thank you.

15 The next person is Perry Artates.

16 MR. ARTATES: Good evening, Department of  
17 Transportation officials and project consultants. My name is  
18 Perry Artates, A-r-t-a-t-e-s, a construction resource  
19 specialist representing the Hawaii Operating Engineers Industry  
20 Stabilization Fund, and I have a copy for the reporter.

21 MR. TSUZUKI: Okay, thank you.

22 MR. ARTATES: I'm here this evening in support of  
23 the Kihei-Upcountry highway project because we are the pioneers  
24 of the Building Trades Industry. We build observatories on  
25 Haleakala and also the roads that lead to it; we build the

1 harbors in Kahului so that we can support the ships bringing in  
2 the necessities of our everyday life; We build schools for our  
3 children to have a better education; we build hospitals to take  
4 care of our sickly; we build police and fire stations to  
5 protect our communities; we bring electricity and water to your  
6 home for your everyday life consumption; and yet the trades  
7 industry work are not long term but short.

8 Work here on Maui for our membership of all of the  
9 trades keep us here that are born and raised, but statistics  
10 show that a lot of our people are moving elsewhere for work  
11 because of our economy. By supporting the highway from Kihei  
12 to Upcountry gives our local people hope to come back home to  
13 the island they love, Maui. Mahalo for your time and letting  
14 me express my testimony. Thank you. (Applause.)

15 MR. TSUZUKI: Could you turn that in to the court  
16 reporter?

17 The next person is Clarence Tavares.

18 MR. TAVARES: My name is Clarence M. Tavares. I  
19 have a residence at Kula and today I live in Makena. And when  
20 I say Makena, you must know how long we have got to get around  
21 to go to Kula again. I feel --

22 MR. TSUZUKI: Could you spell your name for the  
23 court reporter? Could you spell your name out for the court  
24 reporter?

25 MR. TAVARES: Last name or first name?

1 MR. TSUZUKI: Last name.

2 MR. TAVARES: T-a-v-a-r-e-s.

3 MR. TSUZUKI: Thank you. Sorry for interrupting.

4 MR. TAVARES: I feel that this project -- I have  
5 been talking to some people and mentioned that as a small boy  
6 with my dad we used to travel down the Ulupalakua way. And all  
7 those years he talked about it, and he told me he was waiting  
8 to see a road going to Kihei or Makena to Kula some day. Well,  
9 he's gone many years ago, and I tell you, I'm 70 years old  
10 today and I speak the same thing what he said. I want to see a  
11 road going from Makena to Kula and serving the people, because  
12 I know how it is and how they feel when you have to come all  
13 the way from Kula to Makena, what we face, the traffic, the  
14 time.

15 There's a lot of people that works in Ulupalakua,  
16 Kanaio, that goes to Lahaina, and I know everybody is fighting  
17 about the Pukalani road. But my feeling is and my proposal is  
18 let's have a road from Kihei to Kula. We've got a chance now,  
19 and I hope to see the road before anything happens to me.  
20 Thank you. (Applause.)

21 MR. TSUZUKI: Thank you.

22 Madelyn D'Enbeau.

23 MS. D'ENBEAU: Good evening. My name is Madelyn  
24 D'Enbeau, it's spelled D' E-n-b-e-a-u, and I gave testimony  
25 Upcountry to the court reporter on behalf of the Makawao Main

1 Street Association, I'm on the board of directors, expressing  
2 the concerns that the Main Street Association has about the  
3 choice suggested for the Dowling intersection. I don't know  
4 what number, I think it's U2-B, but you all know which one I  
5 mean, I'm sure. Because what wasn't taken into consideration  
6 is the negative impact that this will have on Makawao town.

7           And I won't reiterate what I've already said, but I  
8 just want the other members of the community organizations here  
9 to know that the Makawao Main Street Association is very  
10 concerned about the affect on their town for putting this  
11 roadway through Mr. Dowling's proposed shopping center. Which  
12 incidentally, according to his own market study, would not be  
13 feasible without this highway intersecting there.

14           But more particularly as an individual I would like  
15 to say that I am concerned about -- I don't even know what word  
16 to put on it. This process has already been gone through at  
17 great lengths over a great number of years by the county  
18 council. We have a community plan for Upcountry Maui; we have  
19 a community plan for Kihei. You cannot, in fact, as I  
20 understand the law, spend money on something that's in  
21 contradiction to the community plan.

22           So what are we doing here since the community plan  
23 has already designated what it saw as the most appropriate  
24 location for the most appropriate way of solving this  
25 transportation problem? That's a good question. I don't

1 understand that myself.

2           But just for the sake of the audience that doesn't  
3 have, perhaps, access to these community plans, the Upcountry  
4 community plans give priority consideration to the no-build  
5 alternative of the proposed Upcountry-Kihei connector highway  
6 and give secondary consideration to the alternative routes with  
7 the least negative impact to the Upcountry lifestyle and  
8 character by locating the Upcountry terminus in the vicinity of  
9 the intersection of Haliimaile Road and Haleakala Highway. So  
10 the first choice was no-build and the second choice was, I  
11 guess you have designated that as U1.

12           Now, the Kihei plan says, Upcountry transportation  
13 connection. The need to provide a transportation link to the  
14 Upcountry area has been identified for some time. This would  
15 result in saving valuable commuter time between the primarily  
16 residential area of Upcountry and job centers within the Kihei  
17 region. Choosing the optimal route for this length will  
18 involve consideration of positive and negative impacts to both  
19 regions. The focus should be on improving transportation  
20 services for island residents, thus the route should minimize  
21 travel times for the maximum number of island residents.

22           So we have two different perspectives here, but the  
23 more specific one, the Upcountry plan should govern, because  
24 that does follow the request by the Kihei plan and does  
25 designate a particular area. So I think that we need to show

1 that -- the state would be wise to show respect to the county  
2 council and to its community plans. And I understand that  
3 rather than looking at the community plan and saying, well, we  
4 have gone through a long process here and the community wants  
5 it this way, and for whatever reason we're still considering  
6 other alternatives. So that would be my point of view.

7 Is there time to come back at the end?

8 MR. TSUZUKI: Yes. Thank you.

9 (Applause.)

10 Steven Anderson.

11 MR. ANDERSON: Hi, my name is Steven B., as in boy,  
12 Anderson, A-n-d-e-r-s-o-n. I'm a graduate student in wildlife  
13 biology at the University of California Davis seeking my Ph.D  
14 here. I've been studying the axis deer here on Maui for a  
15 while, and I am going to be leaving here in six months. I  
16 don't have a strong opinion about the orientation of the  
17 highway and some of the major issues involved in this meeting,  
18 but I do have some serious safety concerns with regard to axis  
19 deer. So I will try to present an objective perspective on  
20 highway and deer collisions that need to be addressed, and as  
21 the current EIS stands they have not been addressed.

22 The EIS does point out that the area we're going  
23 through with these highways is primarily exotic nonnative  
24 species, and it does mention that road kill will be increased.  
25 Unfortunately, it doesn't mention that road kill will include

1 humans. There is no doubt that traveling 45 or 55 miles an  
2 hour through that area will result in some deer-vehicle  
3 collisions. The axis deer when crossing roads, frequently will  
4 not turn back, but will press on and will commonly cross roads  
5 single file, 60, 80, 100 at a time in various locations on  
6 Maui.

7 I propose several mitigation measures be addressed  
8 in the EIS regarding axis deer. First, my strong  
9 recommendation is that the maximum speed limit on that highway  
10 be 45 miles an hour. If that's unacceptable, a mainland-type  
11 of alternative that might work is a daytime speed limit of 55  
12 and a nighttime speed limit of 45. The most likely  
13 deer-vehicle collisions are not going to occur midday but will  
14 be dusk and dawn, and frequently late at night.

15 The second mitigation measure I would propose is  
16 frequent signage of deer crossing throughout that highway  
17 network. Studies have shown that saying "Deer Crossing Next 12  
18 Miles" is not effective. People slow down for a mile, and then  
19 speed back up. So I would suggest signing every three miles at  
20 the bare minimum. Another problem that is presented that I see  
21 on Maui is all reflectors on highways around here are yellow.  
22 There's yellow reflectors in the roads. That's exactly the  
23 color of axis deer eyes. It's almost impossible to detect an  
24 axis deer with all the yellow that's already out there.

25 Finally, with regard to the routing, my strong

1 recommendation would be to avoid the highest density areas of  
2 axis deer, and that would include the northernmost route, which  
3 would be the U1-K1 Haliimaile junction. Basically, ranchland  
4 is the much more dense area for axis deer; agricultural land is  
5 much lower density for axis deer. We already have at least  
6 3,000 deer on the island of Maui. I expect 12,000 within the  
7 next eight or nine years total.

8           So that's pretty much what I had to say. I do have  
9 something just to flash around here. This is basically the  
10 picture we have, at the moment, of axis deer on Maui. You can  
11 see this is the Makena/Wailea strip right through here. The  
12 red area are deer approaching the thousands, and the yellow  
13 areas in Pukalani/Makawao are deer in the hundreds. So we can  
14 see that the highway is going right through the heart of the  
15 red area, and this is where my concern stems from. Thank you.  
16 (Applause.)

17           MR. TSUZUKI: Mr. Anderson, do you have anything in  
18 writing?

19           MR. ANDERSON: I will be submitting a comment on the  
20 EIS officially, and I will submit written commentary to this  
21 effect through a letter.

22           MR. TSUZUKI: What about that picture there?

23           MR. ANDERSON: I will try to get a picture of this  
24 for sure included in the written statement.

25           MR. TSUZUKI: Thank you.

1           John Wilson.

2           MR. WILSON: I want to thank you for being here and  
3 taking this time to let us speak to you in person. I have a  
4 five-page letter which I have already turned in, and I'll just  
5 read the general comments from that, and there are 13 specific  
6 comments relative to the EIS that we need to have addressed, I  
7 believe. Basically, I'm speaking for the Kula Community  
8 Association. I may want to speak later for myself, but I did  
9 not sign up for that.

10           The Kula Community Association board of directors  
11 wishes to place on the official Draft EIS record, two general  
12 comments followed by these specific comments. We expect that  
13 the final EIS will address both our questions and our  
14 concerns. The general comments about the EIS are, one, we  
15 desire that the final EIS reflect and respect the legally  
16 adopted July of 1996 Makawao-Pukalani-Kula Community Plan.  
17 Specifically, we urge you to note the following provisions.

18           Page 31 - Transportation Objectives and Policies.  
19 Give priority consideration to the no-build alternative of the  
20 proposed Upcountry-Kihei connector highway, and give secondary  
21 consideration to the alternative routes with the least negative  
22 impact to the Upcountry lifestyle and character by locating the  
23 Upcountry terminus in the vicinity of the intersection of  
24 Haliimaile Road and Haleakala Highway.

25           Page 13 - Interregional Issues. Kihei-Upcountry

1 Highway: The proposed highway between Kihei and the Upcountry  
2 regions is significant in terms of its land use and  
3 transportation impacts. The no-build alternative is the  
4 preferred option, but it is recognized that the selection of an  
5 alignment must consider the growth inducing impacts to the  
6 region's agriculture, rural character and open spaces. The  
7 need to maintain the unique Upcountry ambience is an essential  
8 parameter in analyzing alternative routing schemes.  
9 Recognizing the evaluation alternatives should weigh  
10 transportation costs and benefits as well as community and land  
11 use impacts, it is recommended that, if built, the Highway's  
12 Upcountry terminus intersect Haleakala Highway in the vicinity  
13 of Haliimaile Road.

14 Page 18 - In the Land Use section, the plan states  
15 in objectives and policies No. 4. Encourage land use patterns  
16 which will maintain a separation of character between the  
17 Upcountry and Kihei-Makena regions.

18 The Kula Community Association position on the  
19 proposed Upcountry-Kihei highway clearly prefers the upgrading  
20 of the present highway and road network connecting Upcountry  
21 Maui to Kihei. We support improvements to the existing  
22 highways as a means of solving present and future  
23 transportation problems.

24 The exact wording of our position follows: The Kula  
25 Community Association board of directors opposes the Pulehu,

1 Kulamalu, and Five Trees termini options of the Upcountry-Kihei  
2 highway. Further, the Kula Community Association Board  
3 supports as its highest priority the upgrading and improvements  
4 to existing roads connecting Upcountry and Kihei-Piilani  
5 Highway, the Mokulele Highway, Hansen Road, and Haleakala  
6 Highway - to alleviate growing traffic concerns. If an  
7 Upcountry-Kihei road is to be built, the Kula Community  
8 Association Board considers the Haliimaile terminus the best  
9 option available.

10           And I have grouped these specific comments following  
11 in -- basically in terms of specific concerns relative to the  
12 trip generation and the draft EIS and cost benefit analysis  
13 questions traffic only at the highway termini, and correcting  
14 and error in one of the Hansen Road routes, accident statistics  
15 to be addressed, impact of traffic on numerous intersections  
16 that the proposed routes go through, the concern by the bike  
17 tours and where they would go, the shortcuts of cars going  
18 through Kula, especially with the U3 alternative, and some  
19 concerns about the funding and trip volumes related to people  
20 going to and from Haleakala. So with those, I will submit that  
21 with the proposal, rather than go through it in detail.

22           By the way, the name is spelled W-i-l-s-o-n.

23 (Applause.)

24           MR. TSUZUKI: Herb Squires.

25           MR. SQUIRES: My name is Herb Squires,

1 S-q-u-i-r-e-s. I'm an Upcountry resident for pretty near 15  
2 years. I would strongly recommend that you not build this  
3 road. This is the biggest mistake that could happen to this  
4 island. It's probably the most significant project that's ever  
5 been approached here. We don't need this road, we have the  
6 four lanes of Mokulele Highway that's about to begin. None of  
7 us are in that much of a hurry that we need to save an extra  
8 five or ten minutes and spend \$60-, \$70-, \$80-, \$90 million to  
9 do that. We certainly don't need to worry about national  
10 security or national defense issues here.

11 We resent the fact that Haleakala is used as a  
12 military site and we don't want to encourage any more of that.  
13 If you are concerned about having your personnel be closer or  
14 have easier access to Haleakala, why don't you just move them  
15 up there instead of spending \$80- or \$90 million to build a  
16 road to get them there.

17 Going into Paia, we have A&B getting ready to build  
18 450 new homes over there. We need a Paia bypass, we don't need  
19 this road. We need a Lahaina bypass. We need mass transit.  
20 We need things here that are much more significant and  
21 important than this road. We don't need a \$65 million airport  
22 access road with overpasses. We need your help, we don't need  
23 you shoving things like this down our throats. And quite  
24 frankly, we're not going to take it. We'll do whatever we can  
25 to stop this project, those of us who realize the fact that

1 when you build a road, development follows.

2           We saw the rape of Kihei with the building of  
3 Piilani Highway, and we're still watching it, and it's  
4 disgusting. The whole world considers Maui the most beautiful  
5 place in the world. They come here because of the natural  
6 beauty. The more you carve up the place the more you destroy  
7 it, the strip malls, the cheap subdivisions, the less people  
8 will come. And quite frankly, you're degrading the quality of  
9 life for all of us here.

10           We know the people who stand to gain, such as A&B  
11 and all the other major players, who will go ahead and develop  
12 every square inch of that area on every side of the roadway.  
13 We want to put people to work, we want to have people doing  
14 projects that are important to us. We don't need this road.  
15 Take the road and shove it. (Applause.)

16           MR. TSUZUKI: Thank you very much. We're open to  
17 all of your comments, so that's why we're here tonight. I  
18 don't think we have a closed mind on what we're going to do or  
19 what we're not going to do.

20           The next person is Kennko Hofman.

21           MR. HOFMAN: May I defer until after all the  
22 speeches are made?

23           MR. TSUZUKI: You wanted to be last, is that what  
24 you're asking?

25           MR. HOFMAN: After what we just heard, I don't want

1 to follow that.

2 MR. TSUZUKI: All right, we'll skip you and save you  
3 for last, the best for last.

4 Zandra Amaral.

5 MS. AMARAL: Aloha Ahiahi Kou mau hoa aloha. O  
6 Zandra Amaral Ko'u inoa. Good evening, my friends. My name is  
7 Zandra Amaral, and I represent myself and my family and my  
8 neighborhood friends in Kihei who forwarded you a petition  
9 through me in 1996. I would like to open by thanking the state  
10 for the way they conducted their meetings in Kihei and Pukalani  
11 on the 29th and the 30th of September. It touched my heart to  
12 see citizens testify who would otherwise not get up in front of  
13 a group to testify.

14 Being asked by some of these citizens to assist them  
15 to the court reporters, where they could give their testimonies  
16 in private, privileged me. All expressed their gratitude in  
17 being able to speak their mind without fear of ridicule, being  
18 judged, or fear of not being eloquent and powerful speakers.  
19 There are not words adequate enough to express the pride and  
20 empowerment which radiated their being after they were given a  
21 safe haven to present their testimonies.

22 One elderly couple told me up in Pukalani, "Ms.  
23 Amaral, I always wanted to speak my piece, but I never felt  
24 safe getting up in front of a group, so I eventually stopped  
25 going to public meetings. Now I'm going to tell my friends

1 it's okay." It is my wish that many more will feel safe to  
2 share at our meetings because their manao is needed. Each and  
3 every one of your manao within Maui County and the State of  
4 Hawaii is needed.

5 I would also like to thank the state for your  
6 pursuing an alternate evacuation route for the residents of  
7 Kihei, our visitors, my friends, and for my family. We have  
8 had disasters, such as brush fires, which have crippled Kihei  
9 residents. Having only one route in and out of Kihei presents  
10 risks that we should not be taking. The risk is human life.  
11 If a major disaster occurred which blocked the existing route,  
12 we would be trapped.

13 I know what it feels like, ladies and gentlemen, to  
14 be trapped in a natural disaster. As a child growing up in  
15 Paukukalo, my parents had a farm which runs along Iao river and  
16 down to the ocean. One year we had a tidal wave. The river  
17 overflowed onto the street and there were waves coming to us  
18 from our backyard. Had we not left when we did, the river,  
19 which flooded the street and the ocean, which bordered our cow  
20 pastures and was flowing into our backyard, would have boxed us  
21 in.

22 Though this was many years ago and I was a little  
23 child, I will never forget how blessed I felt having a father  
24 who acted swiftly in securing his family at the He'au above  
25 Hawaiian Homes. The population then was not as great as it is

1 currently. Should a natural or unnatural disaster occur in  
2 Kihei now, our public safety officers would not have the  
3 passage to bring in needed emergency vehicles and/or equipment  
4 to assist our many residents and visitors.

5 I realize when streets and highways go in, there is  
6 growth around them. However, there is already a substantial  
7 amount of growth and development, my brothers and sisters, both  
8 in Kihei and in Kula, without the highway. There has been  
9 substantial growth on Maui from the time I was born into the  
10 Territory of Hawaii and until today. Nothing and no one will  
11 ever stop growth, we all know this. But we need to be prudent,  
12 diligent and insightful in preparing for this growth that  
13 allows us to live in harmony and safely. If we want to stop  
14 development, we must be diligent about attending the  
15 appropriate public hearings and address our concerns in that  
16 venue.

17 Allowing a highway does not provide for a carte  
18 blanche to all developers. They will still need to go through  
19 public review and scrutiny. It is at this stage that you have  
20 the power to stop or delay development until your concerns are  
21 addressed. Let us be proactive and not active.

22 MR. TSUZUKI: Would you wrap up your testimony?

23 MS. AMARAL: Let us address the safety and welfare  
24 of our citizens before the disaster strikes. I have six  
25 wonderful kanaka maule mo'opuna kanes, Hawaiian grandsons, and

1 I would like very much to provide an environment for them which  
2 is safe and is able to sustain their needs so they can stay  
3 here in Hawaii and not be forced off their aina, as I was.

4 I'd like to reserve the right to come back, sir, if  
5 I may, after everyone is done. Mahalo.

6 MR. TSUZUKI: The next person is Steve Sutrov.

7 MR. SUTROV: Good evening, my name is Steve Sutrov,  
8 S-u-t-r-o-v, and I'm a resident of Kula. I've been commuting  
9 from Upcountry to Wailea working, normally, five days a week  
10 for the last -- or more than 22 years now, either I've lived in  
11 Olinda or Makawao or Kula during that time. Kula for the last  
12 14 years. I never have complained about how long the ride  
13 takes, I enjoy the ride down, it gets me ready for work, and  
14 gives me a chance too unwind on the way home so I am not  
15 kicking the dog when I walk in.

16 I recognize the many advantages of keeping these two  
17 communities separated by a direct route between the two. I see  
18 the advantages of preserving Upcountry for not only the  
19 residents who live up there but for the visitor industry which  
20 come to Maui for the rural atmosphere, and to take the  
21 mountainside and change it from what it is right now, basically  
22 agricultural and open space, you are taking one of the most  
23 valuable resources of this island from us. And I think a  
24 direct highway would eventually corrupt the Upcountry to a  
25 point where it could be compared to some other island.

1 I support the Makawao and Pukalani community plan.  
2 I support all the hard work that went into it, the 50 some-odd  
3 meetings between the CAC, from people, dignified people from  
4 all over Upcountry that were met many times, and from there  
5 went on to the Planning Department, the Planning Commission all  
6 supported the CAC process and the plan. The county council  
7 adopted it, the mayor signed it into law, and I support the  
8 process and the community plan that was accepted. I support  
9 its view on the no-road bill alternative with Haliimaile if it  
10 needs to be built.

11 To improve to four lanes all the existing roadways  
12 and to make them safe and efficient intersections is what needs  
13 to be done first, and I'm sure the state can handle that, to  
14 make it as efficient as possible. It might save me another 10  
15 to 15 minutes to get to work. If you put in a new highway, it  
16 might save another 5 to 10 minutes on top of that. Improve the  
17 existing roads first. Improve the existing roads first.

18 The EIS takes into consideration -- should take into  
19 consideration all the intersections being planned from the  
20 no-build and for each alternative that's being planned right  
21 now. You have to plan those intersections now, before they can  
22 give us a level of service estimate for the year 2020. I'd  
23 like to see that in the EIS.

24 I'd like to see what the intersection is going to  
25 look like, whether they're going to be signalized and how many

1 there are going to be coming down from Kulamalu total, the  
2 quickest and the safest, and from now, not ten years from now.  
3 When you think you might have to add an intersection and might  
4 have to add another light, and then no longer an efficient  
5 rural limited access highway, you're dealing with another Kihei  
6 Road or Piilani Highway, where they're putting in even more  
7 intersections on that highway right now.

8 I want to see in the EIS a total number of  
9 intersections, the number of stop signs and lights planned, the  
10 upgrade percentage of each route, how steep they are, the speed  
11 limits that are going to be posted, and it must show what type  
12 of intersections are planned on the routes, including the  
13 no-build. The engineers said they can't do this yet, but it  
14 must be done so we can see what is going to be the shortest  
15 route. It might take much longer to travel from U to K, from  
16 Upcountry to Kihei, because of the number and the type F  
17 intersection and speed limits. It might take longer on a map,  
18 as a profile, just because of more intersections.

19 The comparison should be made in the EIS. The EIS  
20 should show a map of the community plan area with an overlay of  
21 the project district. The community plan takes up about 80  
22 of -- the Upcountry community plan area takes up about 80  
23 percent of this project district. It seems to me that the  
24 Upcountry community plan should have an overriding affect on  
25 this project. The Haliimaile connection should be the only

1 route considered if there needs to be one. The U2, along with  
2 U3, for one, they do not conform with the Upcountry community  
3 plan for the majority of the project district.

4           The EIS should show a comparison of U1 and an  
5 earlier Haliimaile version which cut a lot over, which only  
6 went over Omaopio Road, not Omaopio and Pulehu Road, which is  
7 more dangerous, more intersections that are being planned. It  
8 was only a 3.5 degree plan and now it's gone up to 6.6,  
9 something like that, and it would have been a more efficient,  
10 quicker expressway, straight shot down to Kihei, the original  
11 plan. Now it goes up, almost borders with Pukalani and then  
12 comes back down. With that design, it wouldn't be too hard,  
13 too farfetched for, let's say, the Kulamalu developer to put  
14 another road down and connect with it at his own expense.

15           Time out? Can I have more time later?

16           MR. TSUZUKI: Yes, you may.

17           Peter Wilson.

18           MR. WILSON: Unaccustomed as I am to public  
19 speaking, my name is Wilson, another good man around here with  
20 that name. My feeling is I certainly support the community  
21 plan. I think that the priority and the development of this  
22 road should focus on the well-being of the people Upcountry and  
23 their ability to move about in a safe and rapid manner. I  
24 think if you take the community plan for what it's worth, I  
25 think Haliimaile, if the road must be built, then Haliimaile is

1 the place where it should go.

2 I think that the priority, the people talk about  
3 savings and money. I don't think money should be a question at  
4 this point. If you are going to build a road, build it right.  
5 I'm sick and tired of seeing two-lane highways that go across  
6 where you have congestion. If you're going to build something,  
7 make it right so it's going to last. We have not done that  
8 anyplace that I can see around Maui.

9 The other thing is, I think the priority should be  
10 to, one, service and look after the welfare of the people  
11 Upcountry; and number two, to maintain the lifestyle, the  
12 ambiance that we have Upcountry. I mean, people come up there  
13 and they march very well at what we've got up there and it's  
14 something we should do everything we can to protect.

15 I do not like great big developments going on, I  
16 think it destroys the way we're living. Enlarging the  
17 airports, make more jobs, all it does is create more industrial  
18 development and reduces the beauty and the charm of our  
19 island. And I think that we should try to protect what we've  
20 got and make it a hell of a lot better and not bring in more  
21 buildings and more development and all that stuff. Thank you.  
22 (Applause.)

23 MR. TSUZUKI: Thank you.

24 Dick Mayer.

25 MR. MAYER: My name is Dick Mayer, M-a-y-e-r. My

1 understanding is the purpose of the meeting tonight is to give  
2 you input on the draft EIS so that you can do the right job  
3 when you put the final EIS together.

4 MR. TSUZUKI: Yes, it is.

5 MR. MAYER: I have had 15, 20 years of experience  
6 reading the EIS statements for the University of Hawaii, and  
7 this EIS in many ways fails the grade. It's deceptive, it's  
8 incomplete, it's self-serving, and I don't think the people of  
9 Maui should be putting up with a document that is so one-sided  
10 in its whole approach and methodology as this one is. And I'd  
11 like to in my discussion give you some of the reasons why I  
12 think that.

13 First of all, the county general plan of Maui, which  
14 is the overriding document that we have to look to, I am not  
15 talking about the community plans now, is very specific in the  
16 area of transportation and its roads as follows. Under the  
17 area of transportation on page 10 of the Maui County, the  
18 general plan. Development of a Maui County transportation  
19 system linked to land use planning that is less dependant on  
20 the automobile as its primary mode of moving people. Direct  
21 economic development toward existing communities in order to  
22 minimize employee commuting and foster healthy job balance.

23 It also goes on to say, support and expand programs  
24 to reduce automobiles, dependent employee commuting for hotels,  
25 commercial and industrial projects. It could not be more

1 direct and clear in saying this project should not be built.  
2 Rather we should be building up quality housing in and around  
3 the job areas and not increasing the tendency of people to  
4 commute back and forth across the island.

5           Secondly, and it's been mentioned already, but I'm  
6 going to make sure it's on the record. I was the vice-chair of  
7 the Upcountry community plan, which met over a period of about  
8 a year. We made recommendations. Those recommendations went  
9 to the Planning Commission, they went on to the county council,  
10 and they are now the law in Maui County on the Upcountry area.

11           You have heard a discussion of those, had it read  
12 into the record already. I am not going to repeat it, but I  
13 will make it very clear that taking into consideration the  
14 ideas and thoughts of lots of people in the Upcountry area, we  
15 recommended that the highway not be built at all. And then we  
16 felt that since we wanted to give direction if somehow it was  
17 going to be forced on us, and that's what I feel this document  
18 is trying to do, that it be built in the location of the  
19 Haliimaile Road.

20           We made no comment as to what would happen down in  
21 Kihei and my understanding is the Kihei people have made no  
22 recommendation where it might go Upcountry. But it's very  
23 clear we didn't want that road built and that's the law now.  
24 So you have got the plan that you would have to change and the  
25 community plan that you would have to change to get this road

1 built. The final EIS has to address how they would change that  
2 plan in order to build this road, otherwise it's against our  
3 law.

4           When I said that the plan is deceptive, what it did  
5 do, it took a look at these various alternatives, the four  
6 termini, the mix and match set of alternatives there. What it  
7 slighted was the no-build alternative. It was said in this  
8 document that the Tier 1 analysis, the no-build was rejected.  
9 It gave very false reasons for doing so, and I would like to  
10 quote something from the EIS I am going to read here. It's in  
11 a letter that Mr. Wilson gave to you prior.

12           We're concerned in the manner in which the enhanced  
13 widening alternative; in other words, to not build it and to  
14 allow Mokulele Highway, Haleakala Highway, the airport access  
15 road, if that's built, the Hana Highway, have the various roads  
16 and Hansen Road to be improved as an alternative to building  
17 this road. That was rejected. The draft EIS indicated that  
18 nonsatisfaction of project goals eliminated the enhanced  
19 widening of existing roadways. In other words, it didn't meet  
20 the project's goals, so it was eliminated.

21           The draft EIS said that enhanced widening had a  
22 fatal flaw because it would not establish a roadway linkage  
23 between Kihei and the Upcountry area. There is nowhere in your  
24 purpose in the EIS that says establishing a roadway linkage  
25 with the Kihei-Upcountry area is a legitimate purpose. That

1 was something made up by the people who wanted to reject this  
2 document.

3           Reading on, please note that the established roadway  
4 linkage is not a purpose of the project, rather it says improve  
5 roadway system linkage, that's what your purpose is in your  
6 plan, is a listed purpose. This statement clearly means that  
7 the six proposed alternatives, the eight proposed alternatives  
8 do not meet the project purpose. The eight that you have  
9 selected for us to look at do not meet your project purpose  
10 because all of them establish new routes.

11           I'll reserve time for later.

12           MR. TSUZUKI: It sounds like you have a lot more.

13           MR. MAYER: I have a lot. (Applause.)

14           MR. TSUZUKI: Lexie Baldeson.

15           MS. BALDESON: My name is Lexie Baldeson, and I'm  
16 Associated Student Body President at King Kekaulike. First of  
17 all, I'd like to say, sir, Bob, if you don't sleep through my  
18 presentation, I'd really appreciate that.

19           Okay, I've noticed that on all these boards we  
20 failed to mention, the county has failed to mention that King  
21 Kekaulike would be affected along with Kamehameha School. And  
22 I am completely against this highway, but if it's going to be  
23 built, I have a very strong recommendation. I came here  
24 tonight to give the student perspective of the future highway  
25 with these four terrible choices.

1           The only sensible and unfortunate location should be  
2 at the connection at Haliimaile. With safety, of course, as  
3 our main concern, the Kamehameha Schools in the Five Trees area  
4 would be ridiculous to construct. As you know, children walk  
5 to school and loiter around the school premises. If there are  
6 large amounts of cars speeding by our school within 300 feet of  
7 our school, I don't know if you guys have been there, but the  
8 light, the stoplight is so close to the entrance, and I can't  
9 even imagine more cars there.

10           Because of a great amount of cars, it increases the  
11 risk of being hit because of the enlargement of more careless  
12 drivers. Not only with safety as a concern, but traffic in  
13 general would be a problem. The issue of traffic flow in and  
14 out of our school is excessively troublesome to begin with,  
15 with 500 to 700 cars on any given day, including the teachers,  
16 faculty, administration and parents coming and exiting our  
17 parking lot. To increase the amount of traffic would just be  
18 completely outrageous. It would cause a lot more safety  
19 problems.

20           For example, we already have problems with  
21 rear-ending and road rage, and I just can't imagine having  
22 commuters just psyching all the time. Also, since the time  
23 that our school begins is rush hour, which is 7:50, and as you  
24 know, you guys all probably go to work at that time, so  
25 hundreds of more cars would be added to the hundreds going up

1 to King Kekaulike.

2           In addition to all the previous arguments that were  
3 already said, I feel that the Upcountry/Kula area should not be  
4 turned into a superhighway. Right now it's comfortably  
5 functioning and doesn't need to be urbanized by future  
6 commuters and highways. Our Upcountry lifestyle be  
7 jeopardized, will be ruined, just for an easier way to get to  
8 work.

9           People have been driving to South Maui for over  
10 ten-years-plus and on the highway, newly built, I might add,  
11 without traffic problems. I mean, they have the cones. I  
12 mean, come on, just build another lane. If the attainment of  
13 no highway construction cannot be met, then I feel I'm trying  
14 to defend the Haliimaile connection.

15           The outlet from Haleakala Highway could seriously  
16 benefit from a traffic light being established along with the  
17 South Maui/Upcountry Highway that would be built there. This  
18 area of the highway is nonresidential, there's just cane fields  
19 and it's a half-assed built road, anyway. So there's nobody  
20 living around there, there's no other things, schools, people,  
21 kids. That's the only reasonable way.

22           As a community member and a student leader, I leave  
23 you with a thought: The safety and the residents of Upcountry  
24 should be our major concern, not the benefits of commuting  
25 time. A highway from South Maui to Upcountry Maui is a

1 reasonable and attainable idea; however, we must make sure it  
2 doesn't negatively affect Upcountry residents and students.

3 Thank you. (Applause.)

4 MR. TSUZUKI: Rob Parsons.

5 MR. PARSONS: Aloha. My name is Rob Parsons, and I  
6 thank you for adding this meeting along with the other two that  
7 were earlier scheduled. I'm a board member of both the Haiku  
8 Community Association and Maui Tomorrow. However, I'll be  
9 speaking as an individual.

10 I may add, though, that my initial conversations  
11 with other board members of both of those associations indicate  
12 that before the end of this month and before the end of the  
13 comment period, that we're likely, both Haiku and Maui  
14 Tomorrow, to support what Mr. Sutrov and others have stated,  
15 which is the existing community plan of giving highest emphasis  
16 to improving the existing roadways. And if a road is to be  
17 built, only connecting it to Haliimaile.

18 You may ask what concerns does Haiku have in this  
19 whole equation. It was quickly pointed out to me that our high  
20 school students go to King Kekaulike and we're concerned about  
21 their safety in getting there. People that would access this  
22 road from Pukalani and from Makawao, Haliimaile and Haiku would  
23 all have to go up to go down. If U2-A, U2-B or U3 are chosen,  
24 this would intensify the existing gridlock on Makawao Avenue  
25 and create an unsafe situation at the intersections that have

1 been mentioned, particularly Five Trees.

2 I feel that the Department of Transportation has  
3 helped create the need for this highway relief by its own  
4 ineptitude. Ask people in the Paia traffic going home at night  
5 how they feel about this highway. They'd much rather see a  
6 Paia bypass. The same for people stuck in Puamana waiting 20  
7 minutes to get to the middle of Lahaina town.

8 So I would love to see an equal emphasis put on  
9 public transportation. I think it would be a brilliant idea to  
10 require our hotels to pick up their incoming visitors at the  
11 airport rather than lock them into the rent-a-cars, which is  
12 helping to contribute to the gridlock on our roads. Or better  
13 yet, I'd love to see this much emphasis and money thrown  
14 towards education. But alas, this project is largely funded by  
15 our national defense budget.

16 Overlooked in all of this is exactly the nature of  
17 the work that Maui Research and Technology Park and of Science  
18 City. No one at the Department of Transportation has asked us  
19 how we feel about being a global strategic target, and how soon  
20 we forget Pearl Harbor. Instead, we are asked which  
21 alternative do we prefer. This gives the illusion that we have  
22 an actual say in the choice. Now, the open house format was an  
23 interesting switch but didn't provide me personally the answers  
24 to the questions that I asked.

25 First, what is the cost benefit offered by developer

1 Everett Dowling for the U2-B alternative? Two letters in the  
2 draft EIS are very revealing. One is traffic engineering  
3 consultant Howard Mau to Kulamalu Partners in 1997, stating the  
4 mauka terminus of the road is through the planned Kulamalu  
5 development.

6           The second letter is from Ronald Kobayashi of  
7 Honolulu, one of the general partners in Kulamalu Development,  
8 along with Mr. Dowling and others. While he offers a  
9 connection to their project road without requiring land  
10 acquisition or construction costs, however, he says, should the  
11 proposed road cross the Kulamalu parcel and connect with U2-A,  
12 he states Kulamalu will not dedicate the right-of-way land area  
13 and design funds for U2-A area, condemnation proceeds based  
14 upon the fair market value of this urbanized and fully-zoned  
15 property.

16           So while we have cost representations for all the  
17 connecting alternatives, we do not know how much of an actual  
18 dollar figure in millions of dollars it would be to connect  
19 with the Kulamalu roadway. Now, the larger question that  
20 remains unanswered by all the officials and consultants in  
21 attendance tonight is this: Which of these alternatives will  
22 be presented in the final EIS?

23           I know there are individuals here in this room who  
24 can tell me this tonight, but they won't tell. They must  
25 maintain the illusion of a fair public hearing. So I'll tell

1 you. It's U2-B, of course. Sold to the highest bidder. If  
2 I'm wrong, I'll take you all out to lunch. The Kihei terminus  
3 is perhaps less of a fix, but remember that K2 connects to  
4 another Dowling project, the yet-to-be-built ten-acre hotel  
5 site behind Kamalii School and his residential home  
6 development. And Dowling also holds the option and water  
7 rights to the only Upcountry zoned hotel parcel just above the  
8 Pukalani Country Club.

9 I studied the Kulamalu proposal with great interest  
10 two years ago. I put in perhaps 100 to 150 hours of research,  
11 attending meetings, phone calls, writing articles. Very great  
12 concerns were raised, at that time, about traffic. We're  
13 talking about running this road past two schools, the high  
14 school and one which will eventually be from kindergarten until  
15 12th grade, which could encompass 2,000 students. Also a  
16 20-acre commercial center, an elderly housing complex and 350  
17 to 400 homes yet to be built in this area.

18 MR. TSUZUKI: Rob, could you continue later? Or  
19 could you wrap it up?

20 MR. PARSONS: I can conclude in less than a minute.  
21 The traffic showed existing or projected levels of service at  
22 six of the nine intersections studied. The county council  
23 tried to impose a condition that if a highway were built, it  
24 not connect through the project, through this project. The DOT  
25 representative persuaded them that their condition might not be

1 binding, being that this is a federal and state funded  
2 project.

3           In my 22 years on Maui, I've often spoken out for  
4 sensible sustainable planning. I now must add the issue of  
5 fairness. Please prove me wrong. Show me it's not a done  
6 deal. It would do my spirit and that of all of Maui County a  
7 world of good to know that we the people actually have a fair  
8 voice in our democracy. And as we're slowed down in our  
9 traffic, as Mr. Sutrov has been in the past years in his  
10 commute from Kula to Wailea, while we're looking at a beautiful  
11 countryside, we can remind ourselves of one of our favorite  
12 bumper stickers, "What's your hurry? This ain't the  
13 mainland." Mahalo. (Applause.)

14           MR. TSUZUKI: Thank you. I just wanted to say that  
15 we have not selected U2-B, so you're hearing it from me. We  
16 have not made a decision. I'm not saying that's not going to  
17 be selected, but I'm saying we have not made a decision.

18           Aric Nakashima.

19           MR. NAKASHIMA: Let's see, my name is Aric  
20 Nakashima. My last name is spelled N-a-k-a-s-h-i-m-a. I'm a  
21 resident of Pukalani. I am the Pukalani Community Association  
22 President, and I'm speaking on behalf of the association. I'm  
23 going to just read a few letters that either was mailed or is  
24 mailed, in the mail now, okay. The first one is on --

25           MR. TSUZUKI: Are these letters to you or --

1           MR. NAKASHIMA: To Mr. Hayashida, I'm sorry, I  
2 thought I said that. These are letters to the Department of  
3 Transportation, state Department of Transportation, to Mr. Kazu  
4 Hayashida. Dear Sir: On October 7, 1999, the Pukalani  
5 Community Association held its general membership meeting. The  
6 main agenda of this meeting was to address the proposed  
7 Kihei-Upcountry Maui Highway, which is a concern to the  
8 Pukalani community, both residents and businesses alike. After  
9 hearing testimony from many of our members at our September 9,  
10 1999, general meeting, and committee meetings of September 16th  
11 and 23rd, the matter was put to a vote on October 7th by silent  
12 ballot. The outcome of the voting members, and therefore, the  
13 position of the Pukalani Community Association is that the  
14 preferred route for the Kihei-Upcountry highway run from the U1  
15 terminus, Haliimaile to K2 terminus.

16           Further, it is our position and recommendation that  
17 the state look into a remedy to the current dangerous situation  
18 that exists at the bottom of the old Haleakala Highway as it  
19 merges into the bypass. Sincerely, and it's signed Tracy  
20 Feliciano, approved as to form by Aric Nakashima, Pukalani  
21 Community Association, cc to Daniel Inouye, Senator; James Kimo  
22 Apana, Mayor of Maui County; Abraham Wong, Administrator, U.S.  
23 Department of Highway Administration.

24           MR. TSUZUKI: Federal Highway Administration.

25           MR. NAKASHIMA: Federal Highway Administration.

1 Charles Jencks, Director of Public Works; David Morihara, State  
2 House of Representatives; Chris Halford, State House of  
3 Representatives; Avery Chumbley, State Senate; Patrick S.  
4 Kawano, Council Chair; Charmaine Tavares, Councilperson. By  
5 the way, these council people represent most of Upcountry.  
6 Okay.

7           Let's see. There is a second letter addressed also  
8 to Mr. Kazu Hayashida, Department of Transportation. In  
9 addendum to the previous letter dated October 13, 1999.  
10 Further, it is also our position and recommendation that the  
11 state DOT look into the impact of an access road located at the  
12 intersection of Liholani Street and Ainalani Drive.

13           This access road that would continue Ainalani Drive  
14 mauka of this intersection intersects with route U2-A and/or  
15 U2-B is not disclosed in the draft EIS, which is a concern  
16 among members of the Pukalani Community Association. Traffic  
17 looking for a shortcut to Kihei because of congestion at the  
18 intersection of U2-A or U2-B will ultimately use the Liholani  
19 and Ainalani access road, causing more traffic in their  
20 residential neighborhood.

21           When the state DOT officials and consultants to this  
22 project were asked about this situation, they all said they had  
23 no knowledge of this access road. Reference may be made to  
24 TMK, tax map key 2-3-61, and the Department of Transportation's  
25 map used to display the project at the September 30th hearing,

1 that was used on September 30th at the hearing at Hannibal  
2 Tavares Community Center.

3           Let me see. Here are some maps and some copies  
4 taken from the draft EIS, state draft EIS, and I'd like to turn  
5 your attention to table S-1, where it says social and economic  
6 impacts, I believe, under build alternatives. The arrow points  
7 to where it says social and economic, operational impacts,  
8 implementation of community plans would affect existing  
9 communities by increasing population and traffic and have  
10 environmental impacts, such as agricultural encroachment. This  
11 is a concern, it's on the impact statement.

12           Operational impacts. It says, I guess in response  
13 to this, no alternative would cut through or isolate existing  
14 neighborhoods. This very statement, I guess, is something that  
15 is of concern to the Pukalani residents, because as described  
16 on the map, in the circle, 2-3-61, we're worried about the  
17 traffic. Again to reiterate that, the traffic that might be  
18 caused because of backups at U2-A, U2-B. Actually, for those  
19 purposes, I guess it is a concern of the neighborhood, okay.

20           MR. TSUZUKI: Do you have another letter or any  
21 further --

22           MR. NAKASHIMA: Maybe about 30 seconds. Is that  
23 okay?

24           MR. TSUZUKI: Okay.

25           MR. NAKASHIMA: Another concern, I guess, an

1 addendum to the submitted written testimony is a verbal one I  
2 can express as far as the testimony at discussions by our  
3 members. For instance, why doesn't Maui have any overpasses?  
4 Okay, at the Pukalani bypass on Makawao intersection? The  
5 question came up, why didn't we have overpasses, okay, or an  
6 overpass.

7           At a hearing held in the Pukalani Baptist Church in  
8 the early eighties attended by members of the community and  
9 members of the Maui County Council and some people in this  
10 room, I believe, a question came up again, I mean, why can't we  
11 have overpasses? The response to that by the DOT was that  
12 there wasn't enough room. Okay.

13           So another response to that from the audience, was  
14 at Piikoi Street in Honolulu, okay, you have a five-lane street  
15 going up towards the mountain. As it turns to the left and  
16 going straight ahead, it makes a 90-degree turn, so the  
17 question was, again, why couldn't we have a road that went up,  
18 and you could have roads that adjoin and merge, or off ramps,  
19 simple off ramps that you could even make 90-degree turns.  
20 Because as far as the Piikoi Street example, again, why can't  
21 Maui have overpasses?

22           MR. TSUZUKI: Thank you. Do you have anything  
23 else?

24           MR. NAKASHIMA: I think that's about it. Thank you  
25 very much. (Applause.)

1 MR. TSUZUKI: Sam Hironaka.

2 MR. HIRONAKA: Good evening, everyone. My name is  
3 Sam Hironaka, H-i-r-o-n-a-k-a, resident of this island for  
4 seventy-eight-and-a-half years. I represent the Ikua Purdy  
5 Road Committee, which was formed in 1988, four-and-a-half years  
6 after the road between Makena and Ulupalakua was closed because  
7 of inaction by the County of Maui.

8 The county decided that the road was costing too  
9 much to maintain because the tourists began to use the old,  
10 75-years-old, very historic road connecting the extreme south  
11 end of Maui to Upcountry Maui, particularly those tourists who  
12 began to go to the winery in Ulupalakua, and a very increasing  
13 number of tourists who trekked, who drive around Haleakala from  
14 Hana to Kipahulu to Kaupo and down to the hotel.

15 The county decided that too many tourists were using  
16 the road and they couldn't maintain the cost of the expense of  
17 paving the road and fixing it up for less maintenance. When  
18 the road was closed, it really took away the rights of the  
19 citizens, and for that reason, we became very unhappy. At one  
20 point some of the members of the community wanted to sue  
21 whoever was responsible. And we've now waited  
22 fifteen-and-a-half years, and still there's no road. And one  
23 of the reasons for the delay has been this, what we're here  
24 tonight for.

25 I'm not here to advertise Springfield drinking

1 water, but I want to use this gallon to point out to you and  
2 give you some very common-sense approach to this question which  
3 we face tonight. Now, the Kula community people want to  
4 decrease, they don't want traffic to go through Kula. That's  
5 their objection. The people in Kihei have been crying for an  
6 escape route. We've had floods there. I remember once when we  
7 had a flood that just locked everything up in Kihei.

8           So the people in Kihei want an escape route and also  
9 a faster, easier way to get up to Haleakala, particularly the  
10 high tech people. But I'll show you. This gallon, you fill it  
11 with water and if you open only one end of the gallon, it's  
12 going to take much longer to empty this gallon, right? But if  
13 you were to open the other end, it's going to -- the water can  
14 flow out a lot faster, and this is what I mean when I say we  
15 need a road on the other end of Kula and at the other end of  
16 South Maui, mainly from Wailea, and in Kula, the Upcountry area  
17 from Ulupalakua.

18           If you did this, the tourists won't have to drive  
19 through Kula and they wouldn't have to go up through Kula. You  
20 decrease, you eliminate traffic when people can go the back way  
21 up to the winery or the back way up to Kaupo or Kipahulu.  
22 People who work in Wailea from Kula or Pukalani, instead of  
23 everyone coming down Haleakala Highway, they can go the other  
24 way, so that, again, we flow the traffic, in this case the  
25 water, you flow it in opposite directions, making for less

1 congestion. Because the Kula, even Pukalani people will have a  
2 shorter route and an easier route if they went to work in  
3 Wailea by way of Kula and down through Ulupalakua.

4 Now, even the high tech people can save 25 miles of  
5 driving every time they go to Haleakala if there was a road  
6 that they can use by way of Ulupalakua.

7 MR. TSUZUKI: Mr. Hironaka, do you have anything  
8 else? You can come back later.

9 MR. HIRONAKA: One last thing. You know, the study  
10 shows that the Ulupalakua route was eliminated because it was  
11 going to be too costly to fix the road from Keokea to  
12 Ulupalakua. Now, that's a very unfair comparison, because the  
13 road from Keokea to Ulupalakua is an existing road, it's there,  
14 but that road, no matter where the highway is built between  
15 Kihei and Kula or Haliimaile, that road between Keokea and  
16 Ulupalakua has to be straightened out, has to be improved to  
17 eliminate danger.

18 The reason I say this is today we have the great  
19 big, you know, Greyhound buses taking tourists to the Tedeschi  
20 winery and trying to make all the sharp turns going to  
21 Ulupalakua. Not only that, Ulupalakua is shipping wine to the  
22 harbor, and you know what, it's 40-foot containers, that's how  
23 much wine is being shipped to the harbor. Another thing, the  
24 County of Maui will save a lot of money because they're fixing  
25 the road on the back of the mountain to Kaupo, about two or

1 three miles every year.

2 Right now the trucks have to go all the way up to  
3 the 3,000 foot elevation right by the junction of Upper and  
4 Lower Kula road, and then they have to go zigzagging down to  
5 Ulupalakua, which is 1800 feet. The county could save  
6 thousands of dollars because it will be a shorter road for them  
7 to haul all the asphalt for the highway improvement, and they  
8 don't have to drive all the way up to 3,000 foot, and drive  
9 that great big trail there.

10 MR. TSUZUKI: Mr. Hironaka --

11 MR. HIRONAKA: Thank you.

12 MR. TSUZUKI: Thank you very much. (Applause.)

13 Cindy Lawrence.

14 MS. LAWRENCE: Good evening. My name is Cindy  
15 Lawrence, the last name is spelled L-a-w-r-e-n-c-e. I'm here  
16 before you this evening on behalf of the board of directors of  
17 the Maui County Farm Bureau. I have prepared testimony. The  
18 Maui County Farm Bureau opposes any route that intersects  
19 agricultural lands along the proposed Kihei-Upcountry Maui  
20 Highway. We reaffirm our past position that the selected route  
21 should have the minimum impact on the agricultural industry.

22 Transecting existing tracts of agricultural lands  
23 will mean economic hardships to existing operations. What the  
24 public sees as a mere inconvenience means significant impact to  
25 existing operators. Field layouts, irrigation systems, and

1 operational procedures will be affected, thus increasing costs  
2 of operations with no economic recovery. In routes such as  
3 those going through the Kula Agricultural Park, some farmers  
4 will need to give up their operations.

5           The Maui County Farm Bureau is opposed to routes  
6 that will transect agricultural lands. We appreciate this  
7 opportunity to voice our opinion on this subject. Thank you.  
8 (Applause.)

9           MR. TSUZUKI: Jeanne Skog.

10           MS. SKOG: I'm Jeanne Skog, I'm the president and  
11 CEO of the Maui Economic Development Board. Skog, S-k-o-g.  
12 The Maui Economic Development Board supports the building of  
13 this road, and we have for over ten years now. We are not  
14 taking a position on alignment because we simply believe this  
15 road is really important, and we'll support whatever the  
16 decision is, but we believe the road needs to be built.

17           It is very important to our economy in terms of the  
18 visitor industry, not so much in terms of the tourists,  
19 although it would certainly facilitate their moving around  
20 between Kihei and Upcountry, but in terms of the people who  
21 support and work in the visitor industry. We conducted a  
22 survey of the visitor industry workers and there was a  
23 tremendous cry for relief on the transportation that they have  
24 to undertake day-to-day to move from Upcountry to both West  
25 Maui and South Maui.

1           In terms of the support to high tech, we believe it  
2 will be a tremendous support to the high tech industry and the  
3 high tech industry is showing promise of providing jobs for our  
4 youth, our residents, and for attracting our youth back from  
5 the mainland to rewarding jobs. So we believe that anything  
6 like this that supports the continued development of tech on  
7 Maui is something that we're very, very interested in.

8           We want this, we want to not miss this opportunity  
9 to have the road built. Funding is a very real possibility,  
10 and it won't be there if we don't take advantage of it now. So  
11 we do support the road. Thank you for this opportunity.

12           MR. TSUZUKI: Thank you.

13           Charles Maxwell. I saw him here earlier. Is he  
14 back there? If not, we'll go to Rudy Ramirez.

15           MR. RAMIREZ: Hi, my name is Rudy Ramirez,  
16 R-a-m-i-r-e-z. After hearing this gentleman speak here, he  
17 brought up a really -- some really very important points. One,  
18 why does it just have to be this? Why can't we look at other  
19 alternatives? Nobody has ever talked about anything other than  
20 the plans that have been presented. I think that's something  
21 that should really be looked at.

22           Most of us that were born in Hawaii, who came here,  
23 I've been here for 35 years, I've watched Maui become exactly  
24 what it is today, and if anything, what we need to do is stop.  
25 I mean, nobody has ever talked about just stopping. Let's take

1 a look at this, look at this with some intelligence, boldness,  
2 a little creativity and let's create an environment that is  
3 going to be conducive to achieving the goals that we all want.  
4 Controlled growth, everybody has a good place to live, the  
5 quality of life stays at a high standard. This is what we have  
6 to look at.

7 I don't think I need to remind you gentlemen, I  
8 don't know if you work for the state or all of you are  
9 accountable. You work for us. We're the people, we pay your  
10 salaries, we pay your retirement, we pay your medical. You're  
11 accountable to us. You had enough people up here telling you  
12 throughout Maui expressing their views that this is something  
13 that we want to take a real good look at before we make any  
14 irrational decisions.

15 In 35 years, we've got three bypasses. When I first  
16 moved to Maui, there were 30,000 people living here, between  
17 Molokai, Lanai and Maui. We still have roads and an  
18 infrastructure that is designed for 30,000 people. We get a  
19 million-and-a-half tourists a year here. They're all driving  
20 rent-a-cars. We have no public transportation, none.  
21 Education? The public school system sucks. We've got \$80  
22 million? Come on, do we really need a road? \$80 million. Can  
23 we divert it, can we use it somewhere that will be to the  
24 benefit of the people of Maui? Our children.

25 Anyway, I say we stop doing this. This is a sham in

1 a lot of ways because you are proposing three alternatives as  
2 though one of them is going to be the one that we're going to  
3 choose. I say let's put a fourth and a fifth and a sixth  
4 alternative. Let's take a look, let's really take a look.  
5 Anyway, thank you. (Applause.)

6 MR. TSUZUKI: Thank you. Anselm Pauls.

7 MR. PAULS: My name is Anselm Pauls, A-n-s-e-l-m,  
8 P-a-u-l-s. I am a 15-year resident, I am obviously not born in  
9 Hawaii. I probably have to repeat a few things that have been  
10 said before, but my background is actually in city and regional  
11 planning, I have a degree in there.

12 First of all, there's no denying that access will  
13 create development. This is one thing we have to remember.  
14 I've seen it many, many times. And there's no denying that we  
15 will create more development in Upcountry because maybe some of  
16 the people working down there in Wailea want to move up there,  
17 the whole corridor between Kihei and Upcountry is suddenly  
18 available. There's no denying that fact.

19 What is attractive so far about Upcountry? It is  
20 its remoteness, it is fairly remote still. It is peaceful and  
21 rural still, and that's what makes it attractive. So if we  
22 create an easier access, there will be more people, it will  
23 lose its character. It will lose its character also for the  
24 visitors that come here for the peacefulness and the quietness  
25 of Maui, which we are losing every day.

1 Right now I am working as a tour guide, I am driving  
2 tourists almost every day. I managed a bed and breakfast for a  
3 few years, so I had to do -- I worked in the tourism industry  
4 for at least the last five years. The unanimous opinion of all  
5 the tourists that I have been dealing with so far is that we  
6 don't need more development on Maui. They will not continue to  
7 come here any further if this is going on the way it's going on  
8 right now.

9 Putting it in a bigger context, because it is  
10 necessary at this point, we are destroying the very basis of  
11 Maui's economy if you go on like this. The question that we  
12 have been dealing with the whole evening is, so yes, we are  
13 putting in front of a few alternatives that we seem to have no  
14 choice about choosing anything else than those, and I totally  
15 agree with Rudy that just said we should also think about  
16 alternatives.

17 It seems like the picture is almost too big, because  
18 I would definitely 150 percent urge anybody to really think,  
19 start thinking about mass transportation, public  
20 transportation. Again, if we come to the point where I would  
21 have to choose a route down to Kihei, besides not building one  
22 at all, it would definitely be the Haliimaile as well, because  
23 one thing, everybody, Haiku, Makawao, Pukalani, Haliimaile,  
24 which will be expanded by A&B very soon, we all have to go  
25 uphill first through either Makawao Avenue or Pukalani bypass

1 or old Haleakala Highway, creating a huge congestion area.

2 So if one, definitely Haliimaile, but I would prefer  
3 having one not built at all. Thank you very much. Mahalo.

4 (Applause.)

5 MR. TSUZUKI: Thank you.

6 Mr. Hofman, I know you have been waiting very  
7 patiently. We're saving the best for last.

8 MR. HOFMAN: My name is Kennko Hofman, H-o-f, one f,  
9 m-a-n. We've had so many good speakers here tonight, I'm  
10 almost embarrassed to even say anything. And like this  
11 gentleman here, I've been around a few years, not on Maui. I  
12 would like to reiterate what a couple of people said. I  
13 started to mention a number of things, and they were brought up  
14 and they were brought up very well.

15 And rather than go through a diatribe of what  
16 everyone said and everything, I am just going to say, first  
17 off, that I echo the same thing that the majority of these  
18 people said, is don't build it. Now, my reason is this, and  
19 you were right. Some of them said a lot of things that I'd  
20 like to say, and a few things that I won't say.

21 I am a member of the Pukalani Community  
22 Association. Now, you heard from our president and he gave you  
23 the formal letter. The general feeling was that if this thing  
24 goes through, we're going to have quite a problem in the major,  
25 you can't call it major streets of Pukalani because they're

1 not, but there is going to be a lot of infiltration through  
2 there, especially if there is a Liholani access, which is the  
3 heart of getting to the lower parts of Pukalani. And if a road  
4 goes in, there will be -- in coming years, we know there will  
5 be developments just below the existing town, another swat all  
6 the way around.

7           By putting a road up along the gulch on U2-A and B,  
8 it's going to create one environmental hazard, it's going to  
9 create noise. And people say, oh, the impact report says no,  
10 we're not going to have any noises there. Baloney. I live  
11 there and there's one or two other people that live there, and  
12 in the last few years, the pineapple people, when they blow up  
13 their field and work over there, even through the night and  
14 everything, those of us living near the golf course and  
15 everywhere, which is what, maybe a half a mile or better, it's  
16 plenty noisy all through the night, and the sugar cane field  
17 just down below. So don't try to tell us there won't be any  
18 noise impact.

19           My main reason for wanting to get up and speak,  
20 though, is I'd like to know how many Kahului people are here.  
21 This meeting was held here and I was assuming that there would  
22 be Kahului people that would be here speaking and expressing  
23 their views on this thing that's not even in their backyard.  
24 Is there anyone here at all from this town?

25           MR. RAMIREZ: Were they notified?

1 MR. HOFMAN: It was in the paper and everything.

2 MR. TSUZUKI: Let me explain why we held the meeting  
3 here. You know, you already know that we held two meetings  
4 earlier in September, and at the beginning of this hearing, I  
5 did mention that we decided we're going to hold this third  
6 meeting. And this was really to accommodate those people who  
7 had to go to the Maui County Fair. I think that was the  
8 primary reason. We didn't want to have to schedule two more  
9 meetings, one in Kihei and one in Upcountry.

10 MR. RAMIREZ: Why not?

11 MR. TSUZUKI: Why not? Because we already went  
12 through two of those hearings and what we decided is we are  
13 going to pick a place that's in between Upcountry and Kihei,  
14 and that's the reason why this location was chosen.

15 MR. RAMIREZ: Shouldn't you take this to the  
16 public? You represent the state that's presenting this  
17 project. Shouldn't you present it to everybody as opposed to  
18 just making it limited to certain areas? That's part of your  
19 job, isn't it?

20 MR. TSUZUKI: I'm just trying to explain why we  
21 selected this site tonight, and that's the reason why. We did  
22 not want to go to more meetings in Kihei and Upcountry, and  
23 that's the reason why we held it here.

24 MR. HOFMAN: The reason I asked the question is, you  
25 get paid, don't you, to come here?

1 MR. TSUZUKI: Yes.

2 MR. HOFMAN: We don't. Some of us drive a long way  
3 to come here and express ourselves. So you gentlemen should be  
4 at our beck and call, if we want to have another meeting. But  
5 we're getting away from what I wanted to bring up.

6 MR. TSUZUKI: I think we've got to stick to the  
7 subject of this project, that's really what we want to focus  
8 on.

9 MR. HOFMAN: I want to bring up something that has  
10 not been touched on by anybody, and that's one reason why I  
11 wanted to hear everybody. And there are no Kahului people  
12 here, so I guess my question isn't feasible. Am I correct that  
13 this is one of the major reasons for this, is that's a quick  
14 evacuation route to get people from South Maui to Upcountry and  
15 into safety areas, is that correct?

16 MR. TSUZUKI: It's one of the reasons.

17 MR. HOFMAN: One of the major reasons.

18 MR. TSUZUKI: It's just one of the reasons.

19 MR. HOFMAN: What is the major reason?

20 MR. TSUZUKI: The major reason is to provide some  
21 kind of better connection between Upcountry and Kihei.

22 MR. HOFMAN: For whom?

23 MR. TSUZUKI: For the people that live in the two  
24 communities, live and work in the two communities.

25 MR. HOFMAN: Now, where did I get the idea that

1 military and people like that and everything, wanted a beeline  
2 road up, shortest point between point A and point B? I don't  
3 know where I got that idea. I must read the paper too much.

4 MR. TSUZUKI: Let me try and explain that. For  
5 those of you who know about this project, you know that  
6 probably the funding for this project was actually obtained by  
7 Senator Daniel K. Inouye. And Senator Inouye got this money,  
8 this is called discretionary funds. In other words, it's  
9 outside of our normal highway program. It's extra money that  
10 the senator has gotten for the State of Hawaii.

11 And when he went before congress, the United States  
12 Senate, to obtain this funding for this project, for us to do  
13 this work that we're doing right now, that was one of the  
14 arguments that he used in congress to get the funding approved,  
15 but it is not the primary purpose of this project.

16 MR. HOFMAN: Well, then, who is going to benefit  
17 from all this, is what I'm trying to figure out. You're going  
18 to say the people Upcountry to get down and the people  
19 downcountry to get up, is that right?

20 MR. TSUZUKI: If the people don't want this project,  
21 I'm pretty sure Senator Inouye is not going to proceed with  
22 this. As far as whether or not we proceed with this project,  
23 if there's enough opposition to this project, we don't go  
24 ahead, we won't go any further.

25 MR. HOFMAN: How much opposition does that take,

1 sir?

2 MR. TSUZUKI: We need to find out from the people of  
3 Maui.

4 MR. HOFMAN: I've been to all these meetings and  
5 everything, and to be honest with you, there's not enough  
6 representation objecting. I mean, there's a lot of objections  
7 but there isn't multiple numbers, I'll put it that way.

8 MR. TSUZUKI: That's correct.

9 MR. HOFMAN: But you have to admit that there have  
10 been a lot of good questions raised and there's a lot more  
11 questions, unanswered questions, and that's why I say we need  
12 some more meetings. And as long as you're getting paid for it,  
13 you should be willing to go along with it.

14 MR. RAMIREZ: If the majority of people testifying  
15 don't want the road, you're not going to build it, is that  
16 correct?

17 MR. TSUZUKI: It's not a counting game of how many  
18 people are against it and how many people are for it. Because  
19 what we're going to take a look at is what is the best for the  
20 community and Maui.

21 MR. RAMIREZ: Let the people of Maui decide that.

22 MR. HOFMAN: There you are. Is there any way that  
23 there can be a vote?

24 MR. TSUZUKI: As far as a vote, not for this  
25 project.

1 MR. RAMIREZ: Oh, really, why?

2 MR. HOFMAN: We cannot --

3 MR. RAMIREZ: We can't decide for ourselves what we  
4 want?

5 MR. HOFMAN: It's power politics, that's what it is.

6 MR. TSUZUKI: As far as tonight, I am not here to  
7 debate with you as far as what's going to happen or whatever.  
8 We're here to hear what you want.

9 MR. RAMIREZ: We're getting that you don't hear us,  
10 you've already made up your mind.

11 MR. TSUZUKI: We have not made up our minds, and I  
12 told you that earlier when somebody brought up this thing about  
13 U2-B.

14 MR. RAMIREZ: It happened in the Seibu project out  
15 in Wailea when they held those meetings out there and half the  
16 guys were sleeping on the council and they passed that thing  
17 through because Seibu was willing to bring that water all the  
18 way out.

19 MR. TSUZUKI: We are not talking about Seibu or  
20 whatever.

21 MR. RAMIREZ: These are real issues. You just can't  
22 ignore them. These are real issues. I want to know who owns  
23 the property that this highway is going through.

24 MR. TSUZUKI: Mr. Hofman, I guess you have the  
25 floor.

1 MR. HOFMAN: Oh, I'm sorry. I thought I had  
2 taken --

3 MR. RAMIREZ: Can we get that now?

4 MR. TSUZUKI: So are you through, Mr. Hofman?

5 MR. HOFMAN: He brought up a point.

6 MR. TSUZUKI: Mr. Hofman, you have got to wait until  
7 the other people who wanted extra time. There is one other  
8 person -- Mr. Hofman had a lot of time. There is one other  
9 person who had signed up, Laurel Murphy.

10 MS. MURPHY: Mr. Chair, my name is Laurel Murphy,  
11 I'm a former Maui News reporter, I'm on the board of the  
12 outdoor circle and the food bank, and I'm speaking as a very  
13 impassioned local person. I think this road would be a  
14 disaster for Maui. It's presented to us, it's almost a fait  
15 accompli. Do we want this? Do we want this? I hear speakers  
16 making a choice, well, Haliimaile then, if we have to have it.  
17 But we don't have to have it.

18 Who is going to benefit? Tourists going Upcountry,  
19 they're equally happy taking a little longer, spending more  
20 money as they go. So about a hundred people that work in the  
21 tech parks. The argument for getting Upcountry people to and  
22 from work more quickly is the most obvious one, but at what  
23 price, selling out our island?

24 I'm writing a book now, I am on the history of Maui,  
25 and I am deeply saddened by the changes I see every year. This

1 island used to be the most beautiful community, little  
2 plantation communities, and in fact, this is what the tourists  
3 come here to see. This is what we love about this place. This  
4 is what old-timers, like Mr. Hironaka, remember about this  
5 place. And we are losing it daily because we are all in our  
6 cars rushing around on ever increasing faster roads, not  
7 talking to each other, not communicating with each other.

8           Everybody knows when a road goes in that development  
9 goes in. That's just been proven time and time again. So if  
10 you build this road, where it goes to help Upcountry folks get  
11 to work and Kihei folks get to the crater faster, you will have  
12 opened an entire development corridor and changed the face of  
13 the island. And even if you pick the Haliimaile route, it's in  
14 the middle of the cane fields, these people are going to be  
15 bothered by cane smoke, they're going to argue about the  
16 existence of one of the island's last agricultural industries  
17 that the tourists come to see. And please don't build this  
18 road, we don't need it. We can get around it.

19           MR. TSUZUKI: Thank you. (Applause.)

20           Madelyn D'Enbeau. We will give you a few more  
21 minutes.

22           MS. D'ENBEAU: Thank you very much. I just wanted  
23 to point out that the public hearing notice that was signed by  
24 the Director of Transportation states a panel of DOT officials  
25 and project consultants, that would be you all, I assume, will

1 convene at 7 p.m. to answer questions and accept testimony. So  
2 I think the questions certainly are in order if that -- does  
3 that mean something different than what it sounds like?

4 MR. TSUZUKI: No, you can ask questions.

5 MS. D'ENBEAU: Thanks. Well, my question is,  
6 looking at the EIS, I note and I asked this question last time  
7 but I didn't get a response, unfortunately. It says here,  
8 finally, federal highway administration participation in this  
9 project requires that transportation systems management, the  
10 acronym being TSM, be considered among the alternatives. TSM  
11 could be -- and/or augmenting Maui's paratransit system in the  
12 region and implementing selected transportation control  
13 measures, TSM's such as high occupancy vehicle lanes and ride  
14 sharing. Are you all sharing that federal requirement? Could  
15 anybody give me the citation to that?

16 MR. TSUZUKI: No, not specifically.

17 MS. D'ENBEAU: So it is a federal requirement but  
18 you don't have the -- I asked for this last time and somebody  
19 promised to fax it to my office. I'm sorry, if I had known it  
20 was not going to be done, I would have certainly taken his name  
21 down. In any case, I am going to ask that again, if you could  
22 please provide that information, I'd appreciate it. My fax  
23 number is 575-2125. And I'm referring to page 2-22 of your  
24 environmental assessment.

25 And for the sake of the audience, who is probably

1 interested in knowing why, in fact, there is no transportation  
2 alternatives considered in the plan, the reason is that that  
3 federal requirement didn't survive the fearsome Tier 1 criteria  
4 because, and I quote, the TSM alternative would also not  
5 satisfy this goal nor other goals such as providing additional  
6 roadway capacity and infrastructure to meet existing and future  
7 travel demands in the region.

8           So we apparently have a federal requirement that  
9 before you build a highway, you look at public transit and  
10 other considerations, as Maui County general plans so artfully  
11 puts forth. It's a federal law. So we're saying, well, we  
12 don't have to do that because, hey, we want to build a road.  
13 And looking at alternatives for transportation is not building  
14 a road. Well, I would suggest to you that the federal law is  
15 not quite that ingenuous.

16           In other words, they know you want to build a road,  
17 that's why you're going for federal funds so you can't come  
18 back to them and say we want to build a road. So that's a very  
19 worrisome thing, I think, that we're going to have to look more  
20 seriously at other kinds of alternatives.

21           You know the way in which the Kihei-Makena community  
22 plan was translated into the EIS, and I read this into the  
23 record before, where they talked about a primarily residential  
24 area of Upcountry, which we all agree that there's some  
25 business but it's primarily residential, and that got

1 translated in the EIS. And by the way, this isn't, as your  
2 consultant stated, an advisory type of thing, this is the law  
3 of the County of Maui.

4           People ask, well, what kind of procedure could we go  
5 through that would be fair and involve voting and so forth. I  
6 would suggest to you that we have that procedure here on Maui,  
7 we have a county council, they're elected, they go through an  
8 election process, we have the community plan process, which  
9 involves a tremendous amount of community input, and then the  
10 elected officials act on this. And why this is being ignored  
11 or how it can be ignored is just mind boggling to me.

12           At the last meeting, some state -- I'm sorry, I  
13 don't remember his name, I asked him about that and he said,  
14 "We don't have to listen to the county, we're the state."  
15 Well, your state law requires you to look at the county plans,  
16 but never mind that. So here is how it's translated just for  
17 kind of fun. So instead of having the primarily residential  
18 area, here is what they say and this is the Kihei community  
19 plan.

20           This proposed plan, of course it's already adopted,  
21 but never mind. It recommends a roadway that would link the  
22 primary residential area of Upcountry with job centers within  
23 the Kihei region. The plan, therefore, favors those  
24 alternatives with mauka termini near Pukalani and makai termini  
25 at or north of the Maui Research and Development Park.

1           Yeah, that's quite a leap, isn't it? But that way  
2 they can say that there's a conflict between the Upcountry plan  
3 and the Kihei plan. It's actually a criminal offense to alter  
4 public documents. Whether or not this would meet the intent, I  
5 don't know. What class of a felony or misdemeanor it might be,  
6 I'll leave that to the people who might be concerned about  
7 their actions to investigate themselves. But I would urge you  
8 to be careful in quoting the community plan and attempt to do  
9 it accurately and try to avoid this, and therefore we're  
10 drawing these conclusions.

11           MR. TSUZUKI: We will look into it, definitely.

12           MS. D'ENBEAU: Thank you. (Applause.)

13           MR. TSUZUKI: Zandra Amaral.

14           MS. AMARAL: Hana hoe. I will reiterate. I realize  
15 when streets and highways go in, there is growth around them.  
16 However, there has been, there is already a substantial amount  
17 of growth and development both in Kihei and in Kula, without  
18 the highway. There has been, as I stated earlier, substantial  
19 growth here in the County of Maui, which has benefited many of  
20 you who are against the highway growth, from the days I was  
21 born into the Territory of Hawaii to this very day, so nothing,  
22 as I had stated there, and no one will ever stop growth.

23           We all know this, but we need to be prudent,  
24 diligent and insightful in preparing for this growth that  
25 allows us to live in harmony and safely. If we want to stop

1 development, my friends, brothers and sisters, I suggest that  
2 we diligently attend the appropriate public hearings and  
3 address our concerns in that venue.

4           Allowing a highway, as I stated earlier, does not  
5 provide any developer with a carte blanche ticket to develop,  
6 it just doesn't work that way. These developers will still  
7 need to go through public review and scrutiny from the public,  
8 and that is you, that is me, my ohana, and the state, county,  
9 and the federal government. It is at this stage, my friends,  
10 that you have the power to stop or delay development until your  
11 appropriate and individual concerns have been addressed. Let  
12 us be proactive and not reactive in our societal needs. Let us  
13 address the safety and welfare of our citizens before disaster  
14 strikes.

15           As I stated, I have six wonderful kanaka maule  
16 mo'opuna kanes, six Hawaiian grandsons. I am a native of the  
17 territory myself and I would, like myself and my kanaka maule  
18 mo'opuna kanes, to have an environment which is safe and in  
19 which they are able to sustain their needs here on their aina  
20 so they will not have to leave Hawaii, such as I was forced to  
21 do in 1982.

22           I stand in support of route K2, Ke Ali'i Ala Nui, as  
23 the Kihei alternative. I selected this route because it is a  
24 route that was suggested by the hundred some-odd signatures  
25 that we submitted to you, it is DOT individual's petition in

1 1996, and we selected that route because it is surrounded by  
2 miles upon miles of undeveloped space from the mountains to  
3 Piilani Highway. It also comes down to where Kamali'i School  
4 is and can assist in alleviating traffic congestion. If  
5 planned properly, it could facilitate, my brothers and sisters,  
6 efficient and safe flow of traffic in and out of the school  
7 area before and after school hours.

8 I am opposed to the K1, Kaonolulu, route, so are the  
9 subscribers on the petition I issued to you in 1996, because it  
10 would have a direct impact on already existing residential  
11 subdivisions, such as Kaonolulu Estates, the highway would run  
12 right through the subdivision. Piilani Village and others  
13 which sit makai side of Piilani.

14 As for the Upcountry route, we are all in consensus,  
15 myself and all those that I speak with, my ohana as well as  
16 those that signed the petition that I submitted to you. We are  
17 in consensus in the fact that we believe that the choice for  
18 the Upcountry route should be left to the people that it  
19 impacts the most, and this would be the residents of Upcountry,  
20 Kula and their surrounding neighborhoods.

21 I realize that K2 is the most expensive alternative  
22 but money isn't everything when it comes to the safety and  
23 welfare of our citizens and there is alternative funding, as we  
24 understand, for the development of this highway.

25 I will conclude in a little bit. May I? Thank you,

1 sir.

2 From Mr. Siarot's office of the DOT, if the selected  
3 route is used as a defense route, the federal government will  
4 provide 100 percent funding. This would mean no burden on  
5 already saturated state tax dollars. This road would tie the  
6 sky lab on Mount Haleakala to our super computer housed in the  
7 tech park in Kihei.

8 This would provide opportunities for industries in  
9 astrology, which Maui could capitalize on, which my grandsons  
10 could benefit from directly and would impact them being able to  
11 stay on their island if they so chose. This partnership would  
12 bring together the people, the county, the state and the  
13 federal government all working for you, my brothers and  
14 sisters, my friends, in a cost efficient partnership.

15 In closing, I'm open to be proven wrong because my  
16 only motive in selecting a route is for the safety and welfare  
17 of our residents, visitors, my friends and my family and for  
18 mostly my ohana, my kanaka maule mo'opuna kanes. However,  
19 whatever it may be, it should be the choice of the people, the  
20 majority and not a selected few. This is our home and we all  
21 live here together, one with another. Mahalo, A hui ho, e  
22 malama pono.

23 MR. TSUZUKI: Thank you.

24 MR. SUTROV: Steve Sutrov. Do I need to spell my  
25 name again? Okay, what's lacking also in the EIS is a complete

1 destination study. A weak one was done during the long-range  
2 transportation plan in 1984, but they stopped a few people on  
3 at different locations like that. I think it's totally  
4 unprofessionally done and it was the only origin destination  
5 study that was done in the whole EIS.

6           So I suggest in a final you'd better have one,  
7 because that's pertinent information for all your formulas on  
8 LOS and how many people are actually traveling on the road from  
9 point A to B. Okay. The U-2 is -- both of them should have  
10 never been considered. I see some serious flaws that U2-B, if  
11 it wasn't for political connections, Everett Dowling, the DOT  
12 probably would have dropped that long ago.

13           You have got your own very serious concerns about  
14 the grade of that project area, and how you are going to  
15 accommodate traffic speeds, and in that area it was also --  
16 what wasn't done sufficiently was a noise study. The noise  
17 study was done before the school was built and there was just  
18 cows in the field. I was told by the engineer, "So you heard  
19 cows." You'd better get up there when trucks are coming up and  
20 down that road and commercial vehicles supplying a commercial  
21 area and do some accurate sound samplings there.

22           King K also, the sound samples that were done there,  
23 there was only two grades at that school at the time and it was  
24 during the summer, school was out. You're supposed to do it at  
25 the noisiest time to get the noisiest times possible, the

1 busiest times of the day. How about the busiest times of the  
2 year, let's try that next time around.

3           The archaeological sensitivity of the U2 is  
4 extremely important. More so, I would say that the Kulamalu  
5 area, the excavation has already been done, damage has probably  
6 already been done to the archaeological areas there that  
7 weren't even noticed. I would say the sensitivity in that  
8 whole area there should not even be considered as far as  
9 another roadway coming up into that area.

10           U3, I believe it is not a serious plan to begin  
11 with. U3 was just thrown into the mix to confuse everybody,  
12 give somebody else something to split up the opposition a  
13 little bit. And to say that you are going to mediate the  
14 traffic into residential neighborhoods with a sign, it's a  
15 joke. I guess maybe not when you consider that there's over  
16 250 signs on Piilani Highway from Mokulele to Wailea. I guess  
17 if you try signs for everything, so you might as well try a  
18 sign to say Haleakala is three miles down this way. Don't take  
19 the residential roads right in front of you.

20           Any highway can be considered a divided highway for  
21 safety, do it from the beginning, don't do it at year 2020  
22 after people have died in head-ons. Plan it now. If you are  
23 going to do a highway, do a divided highway, please. Anytime  
24 you are going to put the state Department of Transportation in  
25 the hot seat, as far as possible lawsuits for injuries on any

1 of these roads, you are boosting the cost of that highway  
2 millions of dollars, so you have to take that into  
3 consideration.

4 And as far as, hey, I sympathize with them needing  
5 another road out of their community for emergencies, but do  
6 they want to go to Kulamalu to buy a Big Mac? They want to get  
7 emergency services in and out of the Kihei area. They want to  
8 utilize the hospital, the airport to get the visitors off the  
9 island, you want to get help in and out.

10 So I believe if you are going to go for a terminus,  
11 you want the one that is closest to that area as possible and  
12 Haliimaile would be that one, connecting either up to Haleakala  
13 Highway or if necessary, go up to Omaopio, Pulehu, and then  
14 back down to town or another road possibly from Hawaiian Homes  
15 off of that exit of Kihei. That's all I've got. If I have any  
16 time left, I'd like to give it to my cohort here, Dick Mayer.

17 MR. TSUZUKI: Okay, Dick.

18 (Court Reporter Rachelle Primeaux reported the  
19 hearing from this witness forward)

20

21

22

23

24

25

1           MR. MAYER: My name is Dick Mayer, M A Y E R. I  
2 first want to ask a favor of you all. Many people have given  
3 testimony. A number of people have given written testimony and  
4 they don't know who to address it to. In the EIS it says we  
5 should send it to Mr. Wong, the Federal Highway  
6 Administration. What I'm asking for that the letters the  
7 people have written to you from the Community Association,  
8 individual letters, some addressed to Mr. Hiyashida,  
9 Mr. Matthis, various other people, yourselves, all of those be  
10 considered equal as part of the record. And I would like your  
11 public assurance on the record of that.

12           MR. TSUZUKI: Yes, it will be, because Mr. Wong is  
13 the Division Administrator of the Federal Highway  
14 Administration.

15           MR. MAYER: In the EIS it says all letters should go  
16 to him. And I want to make it very clear all the letters from  
17 the people in the community for or against, various opinions,  
18 are equally valid.

19           MR. TSUZUKI: Yes.

20           MR. MAYER: Thank you. I want to go back to the  
21 idea of the no build thing, which was neglected. Mr. Lake, the  
22 Federal Highway Director Chief here, came to a public hearing  
23 in April '93. This is in regard to the no build scenario. He  
24 said, "An analysis of the point of view of what is the cost of  
25 doing nothing is required." In other words, I think that he

1 said and the obligation to the public is a no build scenario  
2 should be considered as much as any of the alternatives in all  
3 of the analyses being done.

4           It comes in and out of the EIS at various stages and  
5 is not given its correct weight. You were very kind a few  
6 minutes ago in talking about Senator Inouye's discretionary  
7 spending. We all know it's what's called pork barrel. That's  
8 a more correct term for it. What we really seemingly have is  
9 something similar to what happened on Oahu with the H-3 Freeway  
10 in attempt by the Federal Government to lure the community into  
11 thinking funds are available. And I'm not sure if this is  
12 another of Inouye's invasions here on Maui or what, but I would  
13 very much urge us to be very cautious if money is being offered  
14 to us, that we really look at what comes with it; namely, a lot  
15 of problems.

16           One of the things, I'm going back to the EIS  
17 itself. The EIS document does not do a benefit cost ratio for  
18 the eight alternatives or for the no build or for the  
19 transportation alternative technique at all in this study.  
20 Tier 1 was done, but those are alternatives not even being  
21 considered now. We have eight alternatives being considered,  
22 and there is no benefit cost ratio. I'm asking that be done in  
23 the final EIS and that in that effort that you do that, you  
24 don't just do the dollar cost of gasoline, et cetera, but you  
25 consider safety as well because what we are really comparing on

1 these eight alternatives is a two-lane highway, traffic going  
2 55 miles an hour at each other much like Mokulele Highway is  
3 today.

4           The alternative, the no build scenario, will be a  
5 four-lane highway from upcountry down Haleakala Highway around  
6 the Hana Highway with access roads and then the Mokulele  
7 Highway and then down the Kihei-Piilani Highway, all  
8 four-lane. The stakes on that road will be far, far superior  
9 to the two-lane highway that is being proposed here. And in  
10 any benefit cost analysis, you have to weigh the cost of  
11 accidents, et cetera. And I call your attention to the traffic  
12 study that is done in the EIS showing the number of accidents  
13 that are now taking place on Dairy Road and Mokulele, two roads  
14 that are extremely dangerous and have much, much higher  
15 accident rates than the four-lane other roads that are around  
16 like the Hana Highway, for example.

17           Consider what you're proposing is a death trap and  
18 an accident trap and that has to be put into the calculus of  
19 benefit costs. It also, by being a four-lane highway, will  
20 increase the speed of what it presently would be. It also has  
21 better intersections than there presently are so people who may  
22 be visualizing that this is going to be such a direct route  
23 compared to what we have now.

24           They should not be comparing it to what we have now.  
25 They should really be comparing it to what we would have once

1 these other highways, which have been funded, are completed.  
2 Your study also talks about lots of mitigation measures. In  
3 particular, things like we'll study if traffic lights are  
4 needed, we'll study whether this has to be done, whether the  
5 signs have to be put up, et cetera, et cetera.

6 Have those costs been put into the cost of the  
7 highway? If not, which I doubt they have, you're way  
8 underestimating the cost of constructing this highway. The  
9 traffic lights at each end, the roads, either under or over for  
10 cane haul trucks, et cetera, et cetera, there are many other  
11 expenses that may or may not have been included in this. And I  
12 think the final report should be an accurate cost of the  
13 highway so we know how much the Federal Government, our tax  
14 dollars, is going to be shipping to us.

15 It was mentioned earlier that nowhere in the study  
16 is there a trip analysis. How many people would actually  
17 utilize this route? The least you could have done was taken  
18 the records from the military and indicate how many people  
19 actually commute from this so-called military base in Kihei to  
20 the military base at the top of the mountain. You must have  
21 Air Force log records, official documents, because those  
22 vehicles have to be logged in when they travel back and forth.

23 You should be able to get those records and put them  
24 into the file, whether it's 10 a day or 15 a day, which are  
25 utilizing the \$50 million to \$75-million-highway. We now have

1 a fiber optic cable connecting the computer to the summit. We  
2 do not need a road for the few people who traverse it for the  
3 military.

4           Also, please make sure when you do your trip  
5 analysis you do not include Haiku and Paia people. They are  
6 not going to go upcountry to go down to Kihei. They will go  
7 along routes, Hana Highway and Mokulele, and they are not --  
8 yet many of the studies that we were referring to earlier that  
9 the hotel industry said, Oh, we have all these people  
10 upcountry. They were adding many, many people who would never  
11 use the road in Haiku and in Paia. They would use that route  
12 to Kihei.

13           Also the no build scenario was discounted and you  
14 can look up in the chart here where it was a given a low  
15 priority on a benefit cost here on the Tier 1 scenario, and the  
16 reason was they attributed it as costing \$78 million. No build  
17 means that is money that is being spent already. That is not  
18 an additional \$78 million. There is no benefit cost analysis  
19 utilizing that \$78 million. That's money that's already  
20 spent. So your no build is a no action scenario, not a low  
21 benefit cost ratio.

22           Crime rates were mentioned in the thing and I want  
23 to call to the public's attention at least that in the study it  
24 shows that the rates of crime in Kihei were either 2, 3 or 4  
25 times higher than the communities of Pukalani, Kula, Makawao

1 and Haliimaile. And that's it. They mention it. No  
2 implication of what that might mean for the residents of  
3 upcountry and destroying the life-style that they would very  
4 much like. And that's in Appendix H.

5           A major error in the EIS is the avoidance of looking  
6 at the cumulative effects of taking agricultural land. I do  
7 not see in there the total numbers of agricultural acres taken  
8 of the various alternatives. And in addition to the acreage  
9 taken for the various routes that are being discussed, we must  
10 also consider the other, and that's where the cumulative part  
11 comes in that you're required to put in there, the other  
12 takings of agricultural land going on currently; namely, the  
13 hundreds of acres at the airport, the access road behind Eagle  
14 Hardware, the land along, next to Haliimaile that has just now  
15 been converted into urban use, the Spreckelsville project that  
16 A&B is coming forth to the County Council tomorrow on and a  
17 whole host of other projects. All that land has to be taken.

18           And what you also neglected to do is talk about the  
19 quality of the land that you're taking. This is a very  
20 important thing in Hawai'i that we respect our prime lands.  
21 You are taking agricultural land, pineapple land, going through  
22 the Kula Ag Park. You're taking a lot of prime land and you  
23 make no reference to the quality of the land. You only talk  
24 about agriculture in a very vague sense. That has to be put  
25 into the final EIS.

1           There is no letter from the DOE that I could find,  
2 it may be in there, and we have had students talking about the  
3 potential problems at King Kekaulike High School and Kamehameha  
4 School. Of course, DOE is not responsible for Kamehameha.  
5 They are responsible for Kekaulike, and what we have now are  
6 deaths waiting to happen and accidents have already happened on  
7 that intersection right in front of the school. You only  
8 mention the main entrance as if the back entrance to Kekaulike  
9 is just unimportant.

10           Kekaulike has two entrances, and the traffic,  
11 depending on the route, would pass both those entrances with  
12 students going to school at the same time that the tourists are  
13 coming down the mountain from sunrise around 7:30 in the  
14 morning, tourists descending the mountain, and depending on the  
15 routing, will pass that entrance twice taking left turns  
16 perhaps coming down the intersection and coming across the  
17 traffic of the students. We have very dangerous situations not  
18 even mentioned. We need to know what the design of that  
19 intersection will be because that's the only way we will know  
20 what the cost of the highway will be.

21           The costs right now we talk about the two lanes of  
22 traffic between two lanes of material between Kihei and  
23 upcountry, but what happens at the ends? What happens to the  
24 traffic there? We need to build sidewalks, traffic lights, et  
25 cetera, et cetera. That has to go in there, and that's why

1 these cost figures are woefully inadequate.

2           What about passing lanes? We all know that for many  
3 years the Haleakala Highway from the Hana Highway up to  
4 Haliimaile and upcountry was a very dangerous road. It had two  
5 lanes of traffic and finally a third lane and it was coned.  
6 It's safer now in the sense that people going up the hill have  
7 a passing lane. In the past, we didn't have that. You're  
8 building a highway without a passing lane with grades of  
9 5, 6, 7, 8 percent up to 10 percent depending on the  
10 configuration and there's no provision for passing lanes and  
11 what we will have are tour buses going up that hill fully  
12 loaded. We will have oil trucks going up that hill. We'll  
13 have construction equipment perhaps going up that hill and  
14 there's no provision mentioned at all in the study for any  
15 passing to take place. Are we trying to set up accidents?

16           A fire threat. That road passes through an area  
17 that is extremely susceptible to fires. Will you put up signs  
18 saying please don't smoke? If one cigarette is dropped out  
19 that window that area, it will burn up that hill. The winds  
20 every day, as you may well know, you don't have a weather chart  
21 in there, but you may know, the winds blow uphill from Kihei  
22 towards Kula every day from about 10 a.m. to about 3 p.m. If a  
23 fire were to start there, it would burn and spread out on a  
24 very wide front for several hours before any vehicles, fire  
25 fighting equipment, could get to it, it's such inaccessible

1 land. There's no roads in there, no way to stop fires.

2           You'll need to have some kind of a landscape strip  
3 on the mauka side of that highway all the way up to prevent a  
4 cigarette from burning so we have a Greenbelt essentially on  
5 that area. Once a fire starts and you've got all of Kula and  
6 Pukalani inflamed, depending on where that fire goes, it's very  
7 dry land.

8           MR. TSUZUKI: Mr. Mayer, I wanted to ask if anybody  
9 else had any further comments or whatever? Mr. Hofman?

10           MR. HOFMAN: He's doing a lot of things I was going  
11 to add, so go ahead.

12           MR. TSUZUKI: Nobody else? About how much longer?

13           MR. MAYER: About another three minutes. You used  
14 the words fatal flaws to knock out of some of the alternatives  
15 of Tier 1 level. I would argue that at least 3 of your 4  
16 routes have fatal flaws built into them as to the upcountry  
17 area. U3 itself has a fatal flaw; namely, it cuts through the  
18 Maui County Ag Park. It cuts through Maui Land & and Pineapple  
19 fields, and it's close enough to a number of minority owned  
20 Kula vegetable farms and farmed by local families for  
21 generations. And in your statement, you make a statement that  
22 you're not supposed to disrupt minority owned areas. These are  
23 minority owned operations that you don't reference. And they  
24 would disrupt the travel of these farmers and the passengers of  
25 agricultural vehicles in that vicinity. And I would argue for

1 that and a number of other reasons that are obvious, bike  
2 routes and things of that sort, U3 should not be considered.

3 U2-B has a severe 10 percent grade in the  
4 neighborhood of the recently opened Kamehameha School and the  
5 projected elderly housing project which would go just above and  
6 across the street from the Kamehameha School. There would be  
7 loud, disruptive noise from trucks and tour buses going up the  
8 mountain and application of air brakes as those same vehicles  
9 descend.

10 Many of the tour buses will pass the elderly project  
11 between 3:30 and 5 a.m. on the way up to the Haleakala summit  
12 sunrise. Furthermore, this 10 percent segment lies between  
13 Kamehameha School, the proposed park and the proposed large  
14 shopping center at the corner. We feel that the children or I  
15 feel that the children who will be walking along the highway in  
16 this area will be in great jeopardy if the 2B route is used and  
17 other reasons as well as the traffic passing by Kekaulike High  
18 School.

19 2-A is also offered as a possibility and it is in  
20 immediate proximity of Kekaulike High School resulting in a  
21 number of potential problems; A, many students now walk without  
22 sidewalks along the highway since bus service is provided only  
23 for students living over 1 mile from the campus. Many  
24 tourists, as they descend from the sunrise thing, and there  
25 already have been a number of accidents at that intersection.

1 So at least those three I think all are fatally flawed termini  
2 in the upcountry area.

3 I would argue obviously that the no trees -- the no  
4 build -- no trees, yeah -- the no build scenario be considered  
5 as the legal choice that the people upcountry have expressed  
6 and that if the highway ever were built, that only Haliimaile  
7 be considered or a variation of it in or around that  
8 intersection. Let's see if I have anything else.

9 One last thing I would like to do, and I would like  
10 to utilize the map to do that. I would think the only reason  
11 to build this road is not for some of the reasons that came out  
12 today, military or tourists, but as a safety valve for the  
13 people of Kihei. The people of Kihei, all of their safety  
14 routes funnel through the area either in front of Suda Store or  
15 behind it close to the tidal wave zone, fire danger. Somebody  
16 could be trapped on the other side of it. And I believe they  
17 do need an exit from that area, so I would like to show on the  
18 map a possibility that would be a safety valve for them that  
19 should be considered.

20 MR. TSUZUKI: Could you also try and describe it  
21 because it's going to be difficult for us to have it on the  
22 record.

23 MR. MAYER: I'll describe it. What I'm talking  
24 about is the people in Kihei at present either come from this  
25 highway or this route here all close to the ocean here where a

1 tidal wave or fire could come in. I would suggest exploring a  
2 route from somewhere around this part of Kihei, whether it be  
3 the Tech Park or a little further out here, that runs above it  
4 and over to the Puunene airport area.

5 In other words, it would be far enough from the  
6 ocean that it would not be a danger. It would not necessarily  
7 have to be a fully operational highway. I'm talking about a  
8 safety valve that might utilize cane roads in that area that  
9 would be paved up to standards that would allow ambulances and  
10 other vehicles to get in and out of that way, but would not  
11 necessarily have to be open to the public at all times.

12 This would allow for that safety valve. And I think  
13 that's the only legitimate reason perhaps to consider a  
14 highway. They could even have it gated at each end, so the  
15 public couldn't generally use it, but could be remotely  
16 controlled from the police station to open gates to allow, if  
17 there was ambulances, if there was a fire, if there was a  
18 tsunami, to allow that kind of traffic to take place on an  
19 otherwise closed road. That would allow for safety. We don't  
20 have to have a whole new highway put in to solve some of the  
21 problems that have been mentioned, because of the problems that  
22 have been mentioned. And I thank you.

23 MR. TSUZUKI: Thank you. Before I let you go up, I  
24 think Mr. Hofman indicated he wanted to go up. Also Mr.  
25 Nakashima.

1           MR. HOFMAN: Gentlemen, I know I got under your skin  
2 a little bit earlier when I said there are questions. I  
3 believe you just heard a few. Several of them I was going to  
4 bring up. And there's several people here that are over 70  
5 years old. And I am, too, and I'm sure we're getting brain  
6 fatigue and everything else, but the one thing I would like to  
7 bring up, not the one thing, but the major thing that no one  
8 has talked about, and Dick just started to touch on it and I  
9 thought he was going to steal my thunder. An evacuation route  
10 is mentioned a number of times and it's been in the paper and  
11 everything else, and one reason I wanted to come all the way  
12 down the hill here to Kahului is to find out how the people in  
13 Kahului felt about it.

14           And I guess there isn't anybody here to find out.  
15 But he's talking about an evacuation area from Kihei up. I  
16 understand tsunamis could come down from the Aleutians in  
17 Alaska and everything and hit north side, too. And what about  
18 these people getting out of here? That's a question that I  
19 think you should address. And that, of course, takes us back  
20 to what a couple of these gentlemen have said earlier. If  
21 we've had approvals and everything to have the existing roads  
22 made into four lanes and make a route here, that should cover  
23 it. You shouldn't have to go to all this trouble. Just  
24 straighten this out, get this bottleneck Puunene here squared  
25 away, and if you measure it, I'm sure if you measure it, you're

1 going to find out this distance is almost equal and this  
2 distance is almost equal and you've got existing roads. You  
3 don't have to go spending all this money. I thank you for your  
4 time.

5 MR. TSUZUKI: Thank you. Mr. Nakashima.

6 MR. NAKASHIMA: Good evening. Hello. My name is  
7 Eric Nakashima. N A K A S H I M A, that's my last name.  
8 Speaking on behalf of the Pukalani Community Association  
9 continuing on what I was saying. Let's see. I have a message  
10 for Mr. Atkin. I got called several times by one of our  
11 members asking if you received her letter and map concerning  
12 Ainalani Drive, the connection to that access road. Did you  
13 receive anything like that?

14 MR. ATKIN: I understand it's en route.

15 MR. NAKASHIMA: It's en route. Okay, you're going  
16 to have it. Thank you very much. Let's see. Getting back to  
17 the issue, well, one issue, one of many said tonight.

18 When it comes to Maui, over the years, we've all  
19 seen roads built in Kihei. We've seen them resurfaced. We've  
20 seen bridges built on Honoapiilani Highway, beautiful bridges,  
21 even back in Kaupo. But these capital improvements that the  
22 state makes on behalf of the people, I was wondering, that is  
23 in the area concerning Pukalani, which is our concern, is that  
24 getting back to the question, remember the question about the  
25 overpasses, I was wondering since I have all the experts right

1 up here in front of us right now, not to put you on the spot,  
2 but is there a simple way of saying why overpasses or more of  
3 them have not been built on Maui?

4 Is there a simple -- can any of you maybe like  
5 comment on that? Because many of our members were again saying  
6 that, why, and it's very hard to understand.

7 MR. TSUZUKI: Normally, I think when you talk about  
8 overpasses and things like that, you're talking about  
9 interchanges, you know, which we have in Honolulu. We have a  
10 lot of those where we separate traffic where there are grades  
11 separated where one roadway crosses over another one. I think  
12 that's what you're talking about, right?

13 MR. NAKASHIMA: Yes.

14 MR. TSUZUKI: At a lot of these intersections, many  
15 of them started off at grade; in other words, you know, just at  
16 one level as maybe a signalized intersection or something like  
17 that. And really the reason why we would convert say an at  
18 grade signalized intersection to a grade separated one would be  
19 because there's so much traffic that is going through that  
20 intersection where that intersection no longer, even if you put  
21 in double left turns and whatever, you know, it can't really  
22 take all of that traffic that's occurring. And that happens  
23 quite often in Honolulu, so it's justified through traffic.

24 One of the reasons why it's not done too often is  
25 because of the high cost. Because these things, whenever you

1 build a bridge, which is essentially what you're building when  
2 you have an overpass is a bridge, the cost of a bridge is very  
3 high. An interchange could cost anywhere from 20 to \$40  
4 million just by itself. You know, we're talking about a cost  
5 of a new highway about say \$80 million, but just one  
6 interchange could cost \$40 million.

7           So one of the reasons why we are slow to consider  
8 interchanges or overpasses is because of the cost and because  
9 we need to see a lot of traffic that justifies the need for  
10 that kind of overcrossing. And there are a lot of  
11 intersections in Honolulu that are still at grade. They  
12 probably could justify the need for an overpass that we haven't  
13 even done yet.

14           I can give you two examples in Honolulu. On the  
15 Pali Highway at Castle Junction, this is on the windward side  
16 of Oahu, just by the Pali Golf Course, that area justifies  
17 really an interchange, an overpass, but we haven't done it  
18 because people are against it. Actually, because they feel  
19 that it is a visual type of intrusion and that kind of thing.

20           Another area would be Kahekili Highway where we have  
21 Kahekili and Likelike. Again, an interchange could be done  
22 there, but again, because of the high cost, we haven't done  
23 it. And those areas have a lot more traffic than we're talking  
24 about than up here, than upcountry, so that's probably one of  
25 the reasons why we're not doing that kind of thing right now or

1 we're not considering it.

2 MR. NAKASHIMA: Okay. That kind of answered my  
3 question. I guess now it leaves us at a terminus, if you  
4 would, that we need to do something as far as the associations  
5 is maybe to organize and maybe appeal to our maybe the State  
6 Senators and some people in this room that maybe they could  
7 make an exception for this Kihei to upcountry road. It seems  
8 that we are looking at some huge traffic.

9 For example, the Maui Economic Development Agency  
10 had a presentation at the Research and Technology Park in  
11 Kihei. And one of the things that was touted as far as how  
12 busy this road might be is that of 12,000 hotel workers and  
13 restaurant employees that live on this island, over half live  
14 upcountry. That's what was told to us at this meeting. That  
15 seems to be quite a lot of people and quite a lot of cars if  
16 you think about it.

17 And that's just hotel and restaurant workers, so if  
18 you think about how much people might be traveling this road.  
19 I know this is not Honolulu, okay. Honolulu Proper probably  
20 contains about a million and a half, 1.8 million people,  
21 something like that, yeah. But anyway, if you think about it,  
22 I think our lives are just as important as those people there.  
23 Maybe if we can just get together and appeal to our Senators  
24 and our Congressmen, our Legislators, maybe we can all enjoy  
25 one of the first capital improvements that is money driven for

1 Maui that we haven't seen in a long time, okay.

2 I don't think there's been any overpasses built on  
3 Maui yet besides the Wailuku Bridge I think. So, if possible,  
4 maybe we can appeal to the Department of Transportation in this  
5 testimony. Maybe as a Community Association that are present  
6 tonight, maybe we can all just appeal to them and say please  
7 ask, consider an overpass for this road because I think it  
8 would be very helpful wherever we put it, you know.

9 Besides saving lives. Again, I go back to the  
10 Makawao Avenue and the bypass road, okay. That was pretty  
11 horrendous. We've never seen accidents like that happen on  
12 Maui at any intersection I think in the history of Maui. But  
13 going back to the person that died and the lady who amputated  
14 the leg, that was pretty graphic. But the thing is, again, on  
15 behalf of the people of Maui, I thank you very much for helping  
16 us. I thank Mr. Bob Siarot for coming to our meeting and all  
17 the rest of the politicians that also came to our meeting, too,  
18 for Pukalani Community Association. I really thank you, but  
19 please consider Maui. Thank you.

20 MR. TSUZUKI: We will, thank you.

21 MR. HIRANAKA: Thank you. My name is Sam Hiranaka.  
22 After listening to the many speakers this evening, I would just  
23 like to take a minute to summarize that and ask you to please  
24 consider the Wailea-Ulupalakua route for a simple common sense  
25 reason that, Mr. Mayer, you talked about the escape route. I

1 think it makes more sense to have an escape route on the  
2 extreme opposite end of the present way to get away from Kihei,  
3 which is the Mokulele Highway. And anything closer to Mokulele  
4 would still cut off the people on the extreme south end, which  
5 is Maui Meadows, Wailea and Makena.

6           So we need that escape route from the extreme  
7 opposite end, which is the Piilani Highway from Wailea up to  
8 Ulupalakua. And another thing that I want to reemphasize is  
9 the fact that the only road which will not sacrifice any  
10 agricultural or farm land is the road from Wailea to  
11 Ulupalakua, because that's 100 percent pasture land at low, low  
12 value, low need, you know, really, you won't be taking away  
13 anything from the economy of Maui and the State of Hawai'i.

14           In fact, it will be enhancing the economy of that  
15 area of Maui if we took the road from Wailea up to Ulupalakua  
16 because you would have the Tedeschi Winery, the strawberry farm  
17 of Roy Hamamura and others. Thank you very much.

18           MR. TSUZUKI: Thank you. Does anybody else have any  
19 further comments or questions or whatever? If not, I want to  
20 thank all of you who have remained this late, and I want to  
21 thank you all for your comments. We definitely are going to  
22 consider all of them. It's going to be a tough job to decide  
23 what we're going to do about this highway. I want to thank you  
24 again on behalf of the Department of Transportation.

25           UNIDENTIFIED SPEAKER: When is the last time we can

1 submit --

2 MR. TSUZUKI: October 28th. Also as a reminder, we  
3 do have these sheets that you can take with you. In case you  
4 have any comments or ideas or whatever that may come up after  
5 this meeting, you have until October 28th to submit those to  
6 us. So those forms should be out in the back of the room.  
7 Thank you again and I will now officially close this public  
8 hearing. Thank you.

9 (The hearing ended at 9:50 p.m.)

## C E R T I F I C A T I O N

I, Rachelle Primeaux, Notary Public for the State of Hawaii, certify:

That on the aforementioned date and time the proceedings contained herein were had;

That the proceedings were taken by me in machine shorthand and were thereafter produced in transcript form under my supervision;

That the foregoing represents, to the best of my ability, a true and accurate transcript of the proceedings had in the foregoing matter.

I further certify that I am neither attorney for any of the parties hereto nor in any way concerned with the cause.

Dated this 29<sup>th</sup> day of October, 1999.

Notary Public, State of Hawaii

## PUBLIC HEARING

## TRANSCRIPT OF PROCEEDINGS

1  
2  
3  
4 MR. ANDERSON: My name is Steven B. Anderson with a  
5 V, 749-B Pulehuiki, P U L E H U I K I, Road. That's in Kula,  
6 96790.

7 I am currently a researcher here on the island  
8 getting my Ph.D. from the University of California Davis and I  
9 have spent two and a half years researching axis deer on Maui  
10 from Makena through to upcountry. I am a temporary Kula  
11 resident who will be leaving here in six months. And I'm  
12 speaking entirely from a safety perspective with regard to axis  
13 deer vehicle collisions.

14 The Environmental Impact Statement made a short  
15 mention that road kill will be increased as a result of this  
16 highway. Unfortunately, I think the road kill will all but  
17 certainly include humans. Several mitigation measures can be  
18 proposed to help address deer vehicle collisions on this  
19 highway. First, I would suggest that the maximum speed limit  
20 of the highway throughout be 45 miles per hour. If that is not  
21 doable, then perhaps a day/night speed limit like on the  
22 mainland could be used, 55 daytime, 45 nighttime.

23 Most deer vehicle collisions will occur at dusk and  
24 dawn and late throughout the dark of the night. I would also  
25 recommend that the highway be frequently signed for deer

1 crossing. Studies have shown that signs that say "Deer  
2 Crossing Next 10 Miles" are ineffective. And drivers should be  
3 reminded each 3 miles of deer crossing and danger potential.

4 . Also, I don't know if the Department of  
5 Transportation can accommodate this, but the unfortunate fact  
6 that reflectors used on the highway are yellow is a real  
7 problem with regard to axis deer because their eyes shine back  
8 yellow at night. It's all too easy to pass up axis deer eyes  
9 in the sea of yellow reflectors up the road, so if there's any  
10 way to change reflector colors away from yellow, that would be  
11 very beneficial.

12 Finally, from strictly a deer perspective, I would  
13 argue that the routing most preferable with regard to deer is  
14 to avoid areas of high deer density. Deer density is generally  
15 greatest in ranch lands and reduced in agricultural lands such  
16 as HC&S sugar areas. As a result, the preferred routing from a  
17 deer perspective would be picking the northernmost route as  
18 deer density is at the southern portion of the island toward  
19 Makena and Wailea and moving northward from there, so that  
20 would lead to a K1-U1 positioning for the highway.

21 Finally, my last comment is that unfortunately we  
22 don't have very good data on deer vehicle collisions currently  
23 occurring on Maui. I've spoken with the Police Department  
24 trying to get those records more clearly defined. Basically,  
25 animal vehicle incidents are recorded and it could be a

1 mongoose or a cat or a deer, and we can't search for deer  
2 vehicle collisions. This is a critical element of population  
3 monitoring for scientists. It's a random sample of deer  
4 vehicle collisions, and as population goes up, deer vehicle  
5 collisions go up. And it would be a very important marker for  
6 the next 20 years on Maui. That's it.

7 (End of comments.)

IN REPLY REFER TO:

HWY-PA  
2.4849

December 17, 2001

Aloha,

Subject: Kihei-Upcountry Maui Highway

Thank you for your comments on the Draft Environmental Impact Statement (EIS) for the proposed Kihei-Upcountry Maui Highway project. We appreciate your time and effort in providing these comments. We entered the planning process for this project in an open fashion and the amount of civic involvement has been truly overwhelming.

We have identified the U1, K1 alignment as the preferred alternative. The Upcountry terminus of this alignment would be at the intersection of Haleakala Highway/Haliimaile Road, and the Kihei terminus would be at the intersection of Piilani Highway/Kaonoulu Street. This decision was reached after full consideration of the project's transportation benefits (e.g., travel time savings, travel markets served), prior community planning processes, environmental and social impacts, construction cost, and the hundreds of comments generated through an extensive public review process.

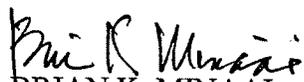

The next step in the project development process is to begin the design phase. Several aspects of the U1, K1 alternative will receive more attention in the next phase of project planning, including mitigation to lessen the impact on agricultural areas, and other particulars, such as details on future intersections.

This letter transmits our responses to your comments on the Draft EIS whether they were provided in letters, pre-printed comment forms and/or oral comments at one or more of the project's three public hearings. Copies of your written statements are attached, and specific comments numbered. Responses to these comments are numbered to match the comment. If oral comments were provided, your comments were paraphrased for brevity. These comments are immediately followed by responses.

We will distribute the Final EIS for the project upon approval by the Federal Highway Administration. Copies of all Draft EIS comments will be part of the Final EIS, including transcripts of the oral comments provided at the public hearings.

Again, thank you for participating in our environmental review process. If you have any questions, please contact Wayne Kawahara of our Highways Planning Branch, Advance Planning Section at (808) 587-6357 or you can contact him using Maui's toll-free voice access number at 984-2400, extension 76357.

Very truly yours,

  
BRIAN K. MINAAI

Director of Transportation

Dear Mr. Wong:

Subject: FHWA-HI-EIS-99-01-D - Draft Environmental Impact Statement (DEIS) -  
Kihei-Upcountry Maui Highway, County of Maui, Hawaii

We have reviewed the above-mentioned document and have the following comments to offer:

- 1 With regards to the alternatives, you will be removing portions of prime farm land. Highly undesirable are those alternatives which dissect sugarcane lands. This makes it difficult for HC&S to operate since it affects their road systems, irrigation systems, major water distribution systems as well as agricultural practices.
- 2 None of the alternatives will have physical interaction with the Upcountry Maui Watershed; however, the U3 alternatives may have some interaction with yet-to-be planned Lower Kula projects.

Thank you for the opportunity to review this document.

Sincerely,

*Kenneth M. Kaneshiro* Acting

KENNETH M. KANESHIRO  
State Conservationist

U.S. Department of Agriculture  
Natural Resources Conservation Service  
P.O. Box 50004  
Honolulu, HI 96850

1. Of the four Upcountry termini options considered, the U1 alternatives would convert the most prime agricultural land to a roadway. Although the preservation of farmland and minimizing disturbance to agricultural practices are important to the State, a U1,K1 alignment was identified as the preferred alternative for reasons stated in Section 2.2.4 of the Final EIS. As described in Section 4.2.4, mitigation measures to maintain the productivity of the agricultural fields adjacent to the Kihei-Upcountry Maui Highway will be developed in coordination with Hawaiian Commercial and Sugar Company.
2. Thank you for this information. A U3 alternative was not identified as the preferred alternative.

## Section 4(f) Evaluation Comments

### Park and Recreation Resources

The DEIS indicates that there are no publicly-owned parks or recreational facilities, or wildlife refuges within the path of any of the alternative alignments. The Section 4(f) resource nearest to any of the proposed alignment alternatives is the proposed Kihei Regional Park. The DEIS indicates that the K2 Alternative with a terminus at the Ke Alii Alanui Street/Piilani Highway intersection would facilitate access to the future regional park for Upcountry residents. The DEIS also indicates that the K2 Alternative is predicted to have a noise impact at the future park because there would be a "substantial" increase in noise from its present level. The DEIS concludes that a "constructive use" of the park would not occur because the Hawaii DOT (Division of Highways) would work with Maui County to ensure that noise impacts are mitigated by the construction of buffer zones or berms. However, the DEIS does not make clear why the use of buffers or berms would be the most appropriate measure to minimize harm to the park. The K1 Alternative would not affect the future park and would appear to be the most prudent and feasible alternative.

Federal funding for the planning of this project was appropriated because of the national interest in an improved mobility between defense-related activities at the Maui R & R Park in Kihei and Science City at the summit of Haleakala volcano. The Maui R & T Park, currently at about eight percent build-out, houses facilities of the U.S. Air Force, the Pacific disaster Center, Lockheed Martin, the University of Hawaii and the University of New Mexico. Science City is a Federal facility used for space and defense related research and development. It is located next to Haleakala National Park.

- 3 The stated "improved mobility" between the defense-related activities at the Maui R & T Park and Science City needs further clarification with regard to possible impacts on Haleakala National Park. Access to Science City is via the Haleakala Highway, the last ten miles of which is within the boundaries of the national park. What additional traffic load, if any, would be put on this national park road as a result of the proposed highway?

#### Historic and Archeological Resources

Archeological reconnaissance surveys have been performed for all of the alternative alignments. Construction activities connected with implementation of any of the alternative alignments would adversely impact archeological sites. However, according to the draft, these sites are important only for data recovery and do not require preservation. None of the alternative alignments would affect National Register properties. Based on the findings of the reconnaissance surveys, two alternative alignments were developed to avoid four sites identified and judged to be significant under National Register criteria and required preservation.

- 4 The DEIS indicates that an archeological "inventory survey" would be performed on the Preferred Alternative to be identified after the issuance of the DEIS. If the inventory survey indicates that archeological resources would be affected by the Preferred Alternative, preparation of a Memorandum of Agreement (MOA) in cooperation and coordination with the State Historic Preservation Officer may be necessary, in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended. A signed copy of the MOA should be included in the Final Section 4(f) Evaluation if one is prepared.

#### **Environmental Statement Comments**

##### Invasive Alien Species

Overall, the DEIS adequately describes the proposed project and the potential environmental consequences. However, the DEIS does not address the project's potential effects on the movement of invasive alien species. These effects and the measures required to mitigate them need to be fully addressed. Hawaii's biota has a very high rate of endemism and is highly vulnerable to biological invasions. Over one-third of the federally endangered species are found here and alien species provide the primary threat to most of them. We believe that the project has great potential to facilitate the spread of alien species on Maui.

- 5 In 1994, the Hawaii Department of Land and Natural Resources noted an expanding infestation of fireweed (*Senecio madagascariensis*) in the Pukalani-Makawao area. It is believed that this weed, which is a major pest in Australia, was the major seed source used in hydromulching along the steep roadcuts in connection with the 1990-1992 construction of the Pukalani Bypass which is located at the Upcountry terminus of two of the alignment alternatives. Fireweed is highly poisonous to horses and cattle and the State Department of Agriculture recently elevated this species on its list of priority weeds. Nearby, Haleakala National Park has documented considerable evidence that the appearance of approximately 30 new weed species in the national park along the Crater Road was connected with a major road improvement project carried out in

5 the mid-1970s to early 1980s. There is also evidence that the Argentine ant is a threat to all endemic arthropods found in the national park. There is additional evidence on Maui as well as on the islands of Oahu and Kauai that the seeds of invasive alien plants such as fireweed and cat's claw (*Caesalpinia decapetala*) are spread by heavy road equipment. The same problem exists on the mainland. The U.S. Department of Agriculture's Witchwood Eradication Program in the eastern Carolinas found that road building is a very potent vector for spreading of invasive plants. Construction equipment contaminated with soil was the main culprit.

6 Suggested mitigation measures would be to apply the standards agreed to by the U.S. Air Force and Haleakala National Park in connection with the recent installation of a telescope at Science City. These standards include inspection of all construction equipment used on the project to ensure sterile supplies and materials coming to Maui. Included also would be inspections of containers and crates at their initial storage areas, inspections of all raw material sources prior to acceptance for the project, as well as inspection of all trucks used to haul materials. All local prefabrication sites on Maui also should be inspected. New supplies, materials and equipment should be powerwashed.

7 Suggested additional mitigation would be for the project to support a Hawaii Department of Transportation (DOT) employee with the responsibility for ensuring that all proper precautions are taken with regard to alien species concerns. The project should also support a Hawaii Department of Agriculture employee responsible for monitoring operations for adherence to all inspection measures, including crates, shipping containers, equipment, supplies, and raw materials. That employee would also be responsible for preventing the use of improper seed.

### Fish and Wildlife Resources

The U.S. Fish and Wildlife Service (FWS) has completed its review of the draft and believes that it adequately describes the primary fish and wildlife resources present in the proposed project area. By letter, dated December 24, 1997, the FWS had earlier concurred that the proposed project is not likely to adversely affect any endangered or threatened species, thereby satisfying Section 7 consultation requirement of the Endangered Species Act.

7 The FWS advises that the DEIS is deficient in its assessment of potential project-related impacts and in the identification of measures to avoid or minimize these impacts on important resources. Specifically, secondary resource impacts related to human-caused fire are not fully addressed in Section 4.8 Ecosystems. While the DEIS does mention that the project may increase the potential for human-caused fire adjacent to the road, it neither assesses the potential impact of wildfire on existing, rare native dry land forested habitat, nor proposes mitigation beyond the provision of warning signs for motorists.

The FWS believes that the K1 alternative, in combination with either the U1, U2-A, or U2-B alternatives should be considered as the Preferred Alternative since these routes place the road alignment the farthest distance from the dryland forest habitats of Puu o Kali and adjacent areas. Moreover, since alternatives U1, U2-A, and U2-B are located in areas currently being used for agriculture, it would be much easier for fire-fighting crews not only to access adjacent wildfires, but also to access sources of water to contain fires. The FWS believes that a road alignment

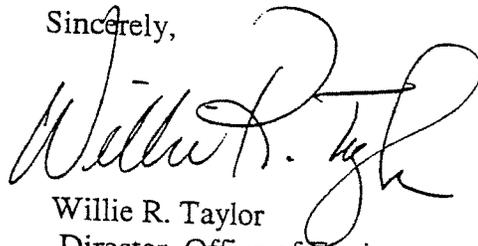

7 | comprised of either the U3 or K2 alternatives would pose a greater threat to wildlife resources from fire since these alternatives are closer to the dryland forest habitats and would have logistical disadvantages for fire-fighters. The FWS recommends that the shoulders of the Preferred Alignment be maintained to minimize the growth of weeds to reduce the risk of human-caused fires.

### Summary Comments

The Department of the Interior may have further comments on the Section 4(f) aspects of this project when the results of the archeological "inventory survey" is performed on the Preferred Alternative and addressed in the Final Environmental Impact Statement.

We appreciate the opportunity to provide these comments.

Sincerely,

Willie R. Taylor  
Director, Office of Environmental  
Policy and Compliance

cc:

Mr. Kazu Hayashida  
Director of Transportation  
State of Hawaii Department  
of Transportation

Honolulu, Hawaii 96813

Mr. Willie R. Taylor  
Director, Office of Environmental Policy and Compliance  
U.S. Department of the Interior  
Office of the Secretary  
Washington, D.C. 20240

1. As described in Section 4.6.3, some of the planned uses of the future Kihei Regional Park would not be noise-sensitive. For example, ball fields are not noise sensitive, and could be used as buffers to protect noise-sensitive uses, such as camp grounds. If buffers cannot be provided, berms would be the first choice to physically block traffic noise. Noise walls would probably not be preferable because they would cause an adverse visual impact in a park setting.
2. The U1,K1 alignment was identified as the preferred alternative.
3. Over one million people visit the summit of the volcano in Haleakala National Park annually. In comparison, the number of persons traveling for business purposes between the Maui R&T Park and Science City would be quite small in comparison to the volume of tourist travelers. As described in Section 4.11, the health of Maui's visitor industry is the fundamental factor affecting the traffic volume to Haleakala. Roadway capacity does not constrain the number of visitors. Therefore, the additional traffic load on the National Park roadways that would be generated by the proposed highway would be minimal.
4. Thank you for this information. Based on the results of the inventory survey of the U1,K1 alignment, the preferred alternative, the project would have an "adverse effect" on three sites identified along the preferred alignment. The State Historic Preservation Officer concurred with this determination. Since none of the three sites require preservation in place, they are not considered Section 4(f) resources. A Memorandum of Agreement was signed, which completed the Section 106 process. A Final Section 4(f) Evaluation was not prepared because no Section 4(f) resources are being affected.
5. The potential that the proposed project would cause alien species invasion is now described in Section 4.8 of the Final EIS.
6. Mitigation measures to prevent alien species invasion are now described in Section 4.8 of the Final EIS. The Department of Transportation does not believe that all of the mitigation

measures agreed to by the U.S. Air Force and Haleakala National Park for the Science City installation would be appropriate for this project. Science City is directly adjacent to the National Park, and therefore a very high degree of mitigation is appropriate. In contrast, the proposed highway will be several miles from the National Park, terminating near suburban neighborhoods of Pukalani and Makawao. Furthermore, because of current and prior agricultural activities in the region, the area affected by the new highway does not support native species (see Section 3.8.1 of the EIS). Therefore, the Department believes that the mitigation measures described in Section 4.8 of the Final EIS are appropriate for this project.

7. The U1,K1 alignment was identified as the preferred alternative, which conforms to the recommendation of the Department of Interior, as stated in the comment letter. This alternative is the furthest from the dryland forest habitats of Puu o Kali and adjacent areas. This alternative also traverses agricultural fields and, therefore, has easier access to water for fire control than the other alternatives. Finally, in addition to signage that would alert motorists of the danger of human-caused fires, the Department of Transportation will conduct regular maintenance to control weed growth along highway shoulders, as recommended by the Department of the Interior.

To whom it may concern:

Aloha no. Let me introduce myself. I am Art Medeiros, biologist on Maui since 1981, first with the research division for Haleakala National Park, and currently with the Maui field office of the Biological Resources Division of the U.S. Geological Survey.

I am writing you to provide input on the proposed Kihei-Makena/upcountry highway project and specifically to inform you of the proximity of the project with what is considered to be one of the finest lowland dryland forests in the state and the finest remaining example of this forest type in the world - the Pu'u-o-kali dryland *wiliwili* forests.

The Pu'u-o-kali dryland forests occur on lands owned by the Department of Hawaiian Home Lands (DHHL) and Haleakala Ranch. They are located on the lower southwest flank of Haleakala, between the towns of Keokea and Kihei from 600 to 1200 feet elevation. *Wiliwili* (*Erythrina sandwicensis*) forests of the Pu'u-o-kali area are described in a Nature Conservancy report as "the best remaining stand of this forest type in the world".

Recently, we became aware that this unique Hawaiian ecosystem is being rapidly degraded by browsing and trampling by wild axis deer. I spoke of this problem at the recent 1999 Conservation Conference and have been working with the two landowners and numerous funding sources and currently there is much hope for a positive solution with a coordinated interagency effort.

Axis deer have been present in the area since the 1960s. By the early 1990s, deer had become much more numerous on Maui and began to use native plants on the Pu'u-o-kali flow as food during the hot summer when range grasses disappear. The native vegetation of many special areas was decimated. I estimate about 60% of the *Achyranthes* shrub (rare throughout the islands and found nowhere else on Haleakala volcano) were killed last year. The Endangered yellow hibiscus (*Hibiscus brackenridgei*), our state flower, has been nearly wiped out, though genetic material still exists for possible reintroduction.

Seven native Hawaiian plant species worthy of concern by the U.S. Fish and Wildlife Service are currently found in the Pu'u-o-kali area. Four of these are listed as Endangered and three other plant species as species of concern (SOC). The Pu'u-o-kali forest supports the largest known occurrences in the world of three taxa of concern Abutilon menziesii (E), Hibiscus brackenridgei ssp. brackenridgei (E), and Canavalia pubescens (SOC).

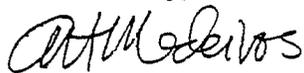

Two rare native Hawaiian animals also occur in the Pu'u-o-kali forests: the 'ope'ape'a or Hawaiian hoary bat, listed as Endangered by the USFWS, has been seen in the area, as well as the proposed Endangered Blackburn's sphinx moth (Manduca blackburni). This last taxa presents a more direct issue to the proposed project as its larvae often utilize non-native tree tobacco (Nicotiana glauca) as one of its few host plants. Populations of this plant occur in weedy areas and may well be present along the currently proposed highway route.

The landowners recognize the importance of these forests, agree to their long-term protection but lack the funding to accomplish it. I predict that in literally a few more summers of deer browsing, the degradation of the area will have reached the point where everything now worth protecting will be gone. A consortium of concerned individuals and agencies are working at acquiring funding (estimated at 250K, half already secured) to construct a 250 acre deer-proof fenced enclosure at Pu'u-o-kali. I have been involved in conservation on Maui for two decades and cannot recall a more catastrophic yet resolvable situation.

1 In its current proposed routing, the highway passes near but not directly through Pu'u-o-kali forest. However, the proposed highway project, potentially, has serious negative indirect impacts on this unique forest, especially proximity introductions of invasive non-native species. As you probably know, non-native species constitute the greatest threat to the long-term survival of native Hawaiian biota. Despite problems with axis deer, one site attribute of Pu'u-o-kali forest critical to its conservation potential is its relatively weed free status. Even the introduction of a single non-native species, such as fountain grass, native to Africa, and locally introduced with project construction would have a devastating effect at Pu'u-o-kali.

Native Hawaiian ecosystems are one of our countries greatest natural resources. The Pu'u-o-kali dryland forests are without equal as superlative examples of this otherwise dramatically modified forest type. I am presenting these issues to you so that we mutually arrive at the best plan of action for Maui, her people, as well as her unique natural heritage. Please feel free to contact me at anytime (572-4471, artmedeiros@juno.com). I am always happy to work towards proactive positive solutions to our complex land use issues. Thank you for your attention.

Very sincerely,

Art Medeiros, Research biologist

Pacific Island Ecosystems Research Center, Haleakala Field Station  
P.O. Box 369  
Makawao, Maui, HI 96768

1. Thank you for your comments regarding the lowland dryland forests around Puu o Kali and the various threatened and endangered species present in this area. Avoidance of this valuable resource was considered in the evaluation of the EIS alternatives. The U1,K1 alignment, which was identified as the preferred alternative, is located the furthest from this forest.

HAWAII DIVISION

Mr. Abraham Wong  
Federal Highway Administration  
300 Ala Moana Boulevard  
P.O. Box 50206  
Honolulu, Hawaii 96850

Dear Mr Wong:

In response to your transmittal, received August 11, 1999, I am providing the following comments on the Draft Environmental Impact Statement (DEIS) for the proposed Kihei-Upcountry Maui Highway.

1 During recent highway construction on Oahu, stream sediment loads increased by as much as four times above pre-construction sediment loads, and state water-quality standards for suspended solids were frequently exceeded (U.S. Geological Survey Water Resources Investigations Report 96-4259, prepared in cooperation with the State of Hawaii Department of Transportation, 1996). Sediment loads increased during construction despite the use of erosion-control measures such as those described on pages 4-69 and 4-70 of the DEIS. Given the importance of water quality in Maalaea Bay, the receiving waters for streams draining most of the project area, I suggest that the adequacy of planned erosion-control measures be carefully evaluated in the Final Environmental Impact Statement.

Thank you for the opportunity to comment. If you have any questions concerning our comments, please contact Barry Hill of my staff at 522-8290.

Sincerely,

Gordon Tribble  
Acting District Chief

Mr. Gordon Tribble  
District Chief  
U.S. Department of the Interior  
U.S. Geological Survey, Water Resources Division  
677 Ala Moana Blvd., Suite 415  
Honolulu, HI 96813

1. The erosion-control measures listed in Section 4.17.4 of the EIS are typical Best Management Practices (BMPs) employed during roadway construction. The Department of Transportation acknowledges that standard BMP measures are sometimes insufficient. However, the Department is committed to ensuring that construction of Kihei-Upcountry Maui Highway does not adversely affect the quality of nearby water bodies, such as Maalaea Bay. For this project, specific BMPs cannot be developed during the current phase of project planning because detailed design has not been prepared. Specific BMPs will be developed during the design phase of the project in coordination with the State of Hawaii Department of Health during the application process for a National Pollution Discharge Elimination System (NPDES) permit.

PO Box 50206  
Honolulu, Hawaii 96850

RECEIVED  
STATE DEPARTMENT  
OF TRANSPORTATION  
OCT 22 11 35 AM '99  
HIGHWAYS DIVISION  
PLANNING BRANCH

Dear Mr. Wong:

The U.S. Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (DEIS) for the **KIHEI UPCOUNTRY MAUI HIGHWAY, County of Maui, Hawaii**. Our comments on the DEIS are provided pursuant to the National Environmental Policy Act (NEPA), Section 309 of the Clean Air Act, and the Council on Environmental Quality's NEPA Implementing Regulations (40 CFR 1500-1508). The DEIS addresses the environmental impacts associated with a proposed two-lane limited-access rural highway from Kihei, a village on the southern coast of Maui, to Upcountry, a region on the western flank of Haleakala Volcano. Eight build alternatives and No Action are addressed in the DEIS. The eight alignments consist of combinations of two Kihei and four Upcountry terminus options. A preferred alternative was not identified in the DEIS. Instead, page S-8 indicates that the project's preferred alternative will be identified at the Final EIS (FEIS) stage after considering agency and public comments on the DEIS.

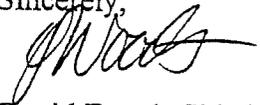

Because the DEIS does not identify a preferred action alternative, we have rated each of the action alternatives, and the overall DEIS, as **Category EC-2, Environmental Concerns - Insufficient Information**. We have rated the No Action (No Build) Alternative as Category LO, Lack of Objections. Please refer to the attached "*Summary of Rating Definitions and Follow-Up Action*" for a detailed explanation of EPA's rating system. In terms of the proposed project's environmental impacts, we are particularly concerned with potential impacts to water quality and associated resources (e.g., wetlands) due to construction and operation of the proposed transportation facility. We note that the DEIS indicates that the roadway would cause run-off and pollutants to drain into previously pollutant-free areas. However, the DEIS indicates that no mitigation measures to protect water resources are needed.

1

1 We believe that the Federal Highway Administration (FHWA) and the Hawaii Department of  
Transportation (HDOT) have an affirmative obligation under the Federal Clean Water Act to  
satisfactorily protect water quality and designated uses for such waters. Accordingly, we  
strongly urge FHWA and HDOT to design, construct and operate the project so that adverse  
impacts to water resources are avoided and minimized to the fullest extent practicable. On a  
2 related matter, the DEIS should address whether the proposal is, and will be, consistent with  
State-adopted, EPA-approved water quality standards, absent mitigation measures to protect  
water resources. Please refer to our detailed comments (attached) for a more detailed explanation  
of our concerns.

We appreciate the opportunity to comment and trust that FHWA and HDOT will satisfactorily  
address EPA's concerns in the Final EIS (FEIS). Please send one copy of the FEIS to me at the  
letterhead address (mailcode: CMD-2) when it is filed with EPA's Washington, D.C. office. Any  
questions which the FHWA may have regarding EPA's comments can be directed to David  
Tomsovic of my staff at 415-744-1575.

Sincerely,

 FOR  
David Farrel, Chief  
Federal Activities Office

# SUMMARY OF EPA RATING DEFINITIONS

This rating system was developed as a means to summarize EPA's level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the EIS.

## ENVIRONMENTAL IMPACT OF THE ACTION

### *"LO" (Lack of Objections)*

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

### *"EC" (Environmental Concerns)*

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

### *"EO" (Environmental Objections)*

The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

### *"EU" (Environmentally Unsatisfactory)*

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

## ADEQUACY OF THE IMPACT STATEMENT

### *Category 1" (Adequate)*

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

### *"Category 2" (Insufficient Information)*

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

### *"Category 3" (Inadequate)*

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

\*From EPA Manual 1640, "Policy and Procedures for the Review of Federal Actions Impacting the Environment."

## WATER QUALITY

### Surface Waters

The DEIS (page 2-10) states that, for both the project's rural design and its urban design, roadway runoff would be discharged to the nearest gulch. The DEIS (3.7.1) briefly describes the surface water resources in the project area, which primarily consist of intermittent streams or gulches. Ten prominent gulches are mentioned (pp. 3-41 and 3-42). According to page 3-42, these gulches are considered to be "waters of the United States," thus subject to the jurisdiction and protections afforded by the Federal Clean Water Act (CWA). The DEIS also indicates that no wetlands are in the project area, the nearest wetlands being at Kealia Pond and along the Kihei-Makena coastline..

3 In terms of water quality impacts associated with the project, page 4-42 states that roadway runoff would be expected to contain roadway-related pollutants (petroleum products, metals, rubber, etc) and that such runoff would drain "into previously pollutant-free areas." However, there is no discussion or analysis in the DEIS about the effects (impacts) of such runoff on water quality or the waters' uses, which need to be protected under the CWA, nor of planned mitigation measures. Protected uses which can be adversely affected by increased pollutant loading include the propagation of fish, shellfish and aquatic life, and domestic water supply. Although page 3-42 informs us that the gulches are "usually dry," there is no confirmation for agencies and the public that there would be no adverse effect from discharging pollutants into areas now free of such pollution.

### Coastal Waters

4 Page 3-42 states that gulches "collect rainfall and direct flows toward the ocean," with page 4-42 indicating that, during heavy rainfall, polluted run-off "could enter coastal waters," which can adversely affect coastal water quality. Again, there is no discussion or analysis in the DEIS as to whether increased water pollution from the project may adversely affect coastal waters. In terms of protecting the quality of marine waters, Hawaii's Water Quality Standards establish two classes - class AA and class A. Class AA is a more protective category, whose waters shall "remain in their natural pristine state as nearly as possible with an absolute minimum of pollution or alteration of water quality from any human-caused source or actions." Although the protections afforded class A marine waters are less stringent than those afforded to class AA marine waters, they are nonetheless quite stringent. According to Hawaii's Water Quality Standards, it is the objective of class A waters that their use for recreational purposes and aesthetic enjoyment be protected. Additionally, any use of these waters shall be permitted as long as it is compatible with the protection and propagation of fish, shellfish, and wildlife. Lastly, class A waters "shall not act as receiving waters for any discharge which has not received the best degree of treatment or control...." (underline added). The phrase "[a]ny discharge" may be interpreted to include discharges from point and nonpoint sources (runoff of pollutants).

### Wetlands

5 For purposes of the CWA, wetlands are considered to be "waters of the United States" as well as a "special aquatic site" under EPA's regulations governing the discharge of dredged or fill material into waters of the United States at 40 CFR Part 230. Page 4-43 indicates that wetlands along the Kihei-Makena coastline would be unaffected by the proposed project. However, the previous page indicates that polluted run-off "could enter coastal waters during heavy rain," which may be hydrologically connected to any coastal wetlands. It thus appears that polluted runoff may have the potential to adversely affect coastal wetlands. This should be addressed in the FEIS and, as necessary, reasonable and appropriate mitigation measures presented.

### Water Quality Mitigation Measures

6 We are very seriously concerned about the absence of mitigation to adequately address potential and projected adverse impacts to water quality, both to surface waters such as the gulches and receiving coastal waters.. Page 4-44 states that, except for immediate containment and clean-up of hazardous material spills, "[n]o additional measures to minimize potential impacts to water resources is (sic) needed." We believe that FHWA and HDOT should identify all reasonable and feasible measures to control polluted runoff from the project's construction and operation. Appropriate commitments to satisfactorily protect water quality should be reflected in the FEIS and Record of Decision (ROD).

### CWA Section 313

7 Section 313 of the CWA provides that each department of the Federal Government "engaged in any activity resulting, or which may result, in the discharge or runoff of pollutants....shall be subject to, and comply with, all Federal, State...and local requirements...respecting the control and abatement of water pollution in the same manner, and to the same extent as any nongovernmental entity...." The control and abatement of contaminated runoff from the project to gulches (waters of the United States), and thence to coastal waters, is the type of activity contemplated under CWA Section 313. The FEIS and ROD should clearly address FHWA's obligations under CWA Section 313 to protect water quality from the project.

### Storm Water Permit

8 Section S.7 briefly discusses approvals and permits required prior to construction of the project. Page S-25 references the need for a permit to control storm water from the construction site, as required by the Hawaii Department of Health. Additional information regarding this storm water permit should be provided in the FEIS, including any Best Management Practices (mitigation) to protect water quality and aquatic resources. The FEIS should address whether the Best Management Practices in the storm water permit may be improved and strengthened to protect water quality not only during the construction phase, but be reflected in the permit for post-construction traffic operations as well.

### Consistency with FHWA's Technical Advisory

9 FHWA's 1987 technical advisory (p. 28) provides that, for each alternative under detailed study, the DEIS should have exhibits and discussion identifying the extent and location of water body modifications. It should identify the use of any water body for recreation, water supply or other purposes. It should identify impacts to fish and wildlife resulting from a project. Other than a few brief references to water quality impacts (e.g., page 4-42), the DEIS does not provide the level of analysis contemplated by FHWA's technical advisory. We recommend that the water quality discussion (in the sections on affected environment and environmental consequences) be substantially improved at the FEIS stage, consistent with the technical advisory. This would need to address the ten intermittent streams or gulches identified on pages 3-41 and 3-42, the wetlands at Kealia Pond and along the Kihei-Makena coastline mentioned on page 4-43 (to the extent that polluted runoff may affect wetlands), and coastal waters (again, to the extent that polluted runoff may adversely affect coastal waters and aquatic resources susceptible to pollution such as coral, fisheries, turtles and other species).

### POLLUTION PREVENTION

10 The DEIS does not reflect the Council on Environmental Quality (CEQ) memorandum to Federal agencies on integrating pollution prevention features in Federal projects under NEPA (see 1/29/93 *Federal Register*, pp. 6478-6481). The notable absence of water quality protection measures is a clear example of failing to integrate pollution prevention measures into the project. CEQ encourages Federal agencies to incorporate pollution prevention techniques and mechanisms into NEPA planning and decision-making. We encourage FHWA and the Hawaii Department of Transportation to incorporate a wide range of pollution prevention measures into the project's design, construction, and operation. For your reference we have attached a pollution prevention checklist (developed by EPA HQ) to reduce and avoid adverse environmental impacts associated with highway and bridge projects. FHWA should include, to the fullest extent, appropriate and reasonable pollution prevention features in the project's design, construction and operation.

### SOLID WASTE

11 We recommend that the FEIS discuss potential opportunities for waste reduction as a component of the proposed project. Specific measures could include:

- (A) reuse and recycle demolition waste,
- (B) reduce and recycle construction-related waste; and
- (C) recycle other facility wastes associated with the proposed project.

## POLLUTION PREVENTION/ENVIRONMENTAL IMPACT REDUCTION CHECKLIST FOR HIGHWAYS AND BRIDGES

### How Can Highways And Bridges Affect the Environment?

The planning, design, construction, and operation/maintenance of highways and bridges can have a variety of effects on the environment. They include the destruction or alteration of wildlife habitats, erosion, sedimentation, soil compaction, chemical pollution resulting from deicing activities, gaseous and particulate emissions from vehicles, contaminated roadway runoff, the generation of waste construction materials (including asphalt, concrete, metals, and wood), material from worn brake lining, and scrap rubber tires, as well as litter and other debris.

Also see checklists on Ecosystem Preservation and Protection, Vehicle Maintenance, Siting, Landscaping, and Pest Management.

### What Questions Should Be Asked To Ensure That These Effects Are Minimized or Eliminated?

Ecosystem Concerns... Highways and bridges can have significant effects on the ecosystems in which they are built. These impacts can include fragmentation and degradation of wildlife habitats, contamination of surface water and groundwater, and soil contamination, erosion, and sedimentation. Techniques can help to mitigate/reduce these effects, however.

- Have other transportation options or pricing structures (i.e., mass transit or improved traffic management) been considered as alternatives to constructing a new highway or bridge?
- Have all environmentally sensitive areas been characterized? Have attempts been made to avoid construction in environmentally sensitive areas? Construction footprints in such areas as floodplains and wetlands should be avoided whenever possible.
- Does the project minimize construction parallel to rivers or streams to reduce the potential for direct runoff discharge from the roadway?
- Does the project make use of existing roadway alignments (if possible) to reduce the amount of waste generated as a result of clearing and construction activities?
- Does the project include provisions for curb design and catchment basins to reduce pollution impacts associated with runoff and debris from the roadway?
- Has the project incorporated mitigation measures to reduce the impact of pollution runoff from the roadway? These measures may include stabilizing cut and fill slopes, shoulders, and medians with perennial vegetation and non-erosive materials, such as rip-rap or geotextiles, or establishing permanently controlled discharge points for stormwater.
- Does the construction plan provide for erosion and sediment control during and after construction? This may include the installation of mitigation measures, such as erosion curtains and/or settling ponds.

- Will stream crossings be designed to enable fish passage and to maintain natural in-stream structures, such as large culverts? \*
- Does the plan include native plant revegetation of areas disturbed by construction to minimize erosion and sedimentation?
- Have safe wildlife crossing structures and appropriate fencing been incorporated into the project to accommodate the movements and needs of resident wildlife and to mitigate habitat fragmentation? Have bridge structures been designed to accommodate wildlife passage, thereby providing a dual purpose? \*
- Does the project include the use of noise walls or other techniques to reduce the impacts of noise pollution? \*
- Does the project include the planting and maintenance of grass covers or other indigenous plant material to reduce pollutant concentrations in roadway runoff?
- Does the project provide for regular preventive maintenance of the highway or bridge to reduce the potential amount of waste generated by reconstructing portions of the roadway? \*
- Can existing roadways or bridges be closed and reclaimed as a result of the construction and opening of the new project? \*

Hazardous Material Concerns. The construction of highways and bridges can involve the use of hazardous materials. The use of these materials can affect the environment through improper storage, air emissions of volatile chemicals, and spills and other uncontrolled releases, as well as the potential for the generation of toxic waste materials.

- Are there opportunities to reduce the amount of hazardous and toxic materials used as part of the project? For example, will the least toxic paints and deicing chemicals be used?
- Are there provisions for reducing any potential spills of hazardous materials? Is there a spill prevention and control plan?
- Is there a plan for properly managing the storage, handling, and application of deicing chemicals, salts, and sand?
- Is there an Integrated Pest Management (IPM) plan to reduce the use of chemical pesticides and to minimize human and wildlife exposure?

Procurement Concerns. Purchasing decisions are an important element of pollution prevention. Making environmentally sound purchasing decisions can help reduce the amount of waste generated by a highway or bridge project. In addition, the purchasing of recycled-content material helps support markets for materials collected for recycling.

---

\* Indicates an environmental impact reduction opportunity.

*Executive Order 12873 directs all Federal agencies to review and revise their specifications, product descriptions, and standards to increase their purchase of environmentally preferable and recycled products.*

- Are there provisions for the proper storage of construction materials to reduce the amount of waste generated by damage or exposure to the elements?
- Will perishable construction materials, such as paints, be purchased incrementally to ensure reduced spoilage of unused materials?
- Will the project include the use of durable, long-lasting materials that will not need to be replaced as often, thus reducing the amount of construction waste generated over time?
- Will the project use construction materials containing recycled content when possible and in accordance with accepted standards? Examples of recycled-content materials include concrete containing fly ash, as well as asphalt containing "waste" asphalt, glass, roofing materials, or recovered scrap tires.

Reuse and Recycling. Many of the waste materials generated as a result of highway and bridge projects can be reused or recycled into usable products. The benefit of reuse and recycling is that it removes materials that would otherwise be disposed of from the waste stream.

- Does the construction contract specify that construction materials not used in this project be reused in other projects rather than be disposed of?
- Will trees cut down during construction activities be used or sold for lumber or compost?
- Will any metal, wood, or packaging wastes generated as a result of construction activities be collected for recycling into other usable products?
- If the project is a repair of an existing highway or bridge, are there provisions for the reuse or recycling of "waste" materials?

• Indicates an environmental impact reduction opportunity.

Mr. David Farrel  
Chief, Federal Activities Office  
U.S. Environmental Protection Agency  
Region IX  
75 Hawthorne Street  
San Francisco, CA 94105-3901

1. The Department of Transportation appreciates EPA's concerns about potential impacts to water quality and associated water resources due to construction and operation of Kihei-Upcountry Maui Highway, and understands its obligation under the Clean Water Act. During construction, Best Management Practices (BMPs) will be implemented to prevent erosion and maintain water quality. A NPDES permit will be required prior to the initiation of construction, and the scope of review of the permit application will include sufficiency of the proposed BMPs to maintain water quality standards.
2. The Department of Transportation believes that the proposed project is consistent with the State water quality standards since the project would decrease the generation of roadway pollutants on a regional basis, in comparison to the No Build condition.
3. The gulches in the project area, which are usually dry throughout the year, are not suitable for the propagation of fish, shellfish, and aquatic life. Storm events typically occur during Kona weather conditions. At these times of short duration, high intensity storms, storm water containing roadway pollutants would flow into the gulches, but be substantially diluted by the large runoff volume created during these high-intensity rains. As stated in Section 4.7.1 of the EIS, under most cases, storm water would percolate into the ground because of the high permeability of the soils. Therefore, only during extreme rainfall conditions would roadway pollutants reach the ocean, at which point they would be highly diluted. Of more concern during such an event would be the non-point source turbidity that would be generated. Additionally, Section 4.7.1 of the Draft EIS was not accurate in stating "previously pollutant-free areas" since the project area has and is currently being used for agriculture and ranching. These activities also generate pollutants. This statement will be corrected in the Final EIS.
4. Section 4.7.1 of the EIS states that because Kihei-Upcountry Maui Highway would reduce regional vehicles miles traveled (VMT) through the reduction of trip lengths, pollutant loading of coastal waters from roadway runoff will be less than under the No Build

condition. As stated in Section 4.15 on Cumulative Impacts, the level of roadway-generated pollution in the coastal waters of Maui is not well documented, but does not appear to be a substantial problem.

5. If coastal wetlands, such as Kealia Pond, are being affected by roadway-related pollutants, construction of the Kihei-Upcountry Maui Highway will lessen these impacts because it will reduce regional VMT, and therefore the generation of roadway pollutants, in comparison to the No Build condition.
6. During construction, BMPs will be implemented to prevent erosion and minimize or prevent adverse impacts to State waters (see Section 4.17.4). The State of Hawaii Department of Health (SDOH) will require such BMPs when they issue a National Pollutant Discharge Elimination System (NPDES) permit and when they provide Water Quality Certification under Section 401 of the Clean Water Act. Operationally, Kihei-Upcountry Maui Highway will cause a reduction in regional VMT in comparison to the No Build condition. Therefore, pollutant loading of surface waters would be less with the new highway. The Department of Transportation does not construct special drainage collection and treatment facilities for its highway facilities unless there is the possibility that a specific surface or ground water resource that requires special protection (e.g., sole source aquifer) could be adversely affected by the facility.
7. The construction of Kihei-Upcountry Maui Highway will comply with all federal, State, and local requirements relating to the discharge of water pollutants.
8. BMPs will be implemented in compliance with a NPDES permit, which is required for the construction of Kihei-Upcountry Maui Highway. The erosion-control measures listed in Section 4.17.4 of the EIS are typical BMPs employed during roadway construction. Specific BMPs cannot be developed during the current phase of project planning because detailed design has not been prepared. Specific BMPs will be developed during the design phase of the project in coordination with the SDOH during the application process for a NPDES permit. A NPDES permit is not required for the operation of the highway.
9. The discussion provided in the EIS is consistent with the requirements of the FHWA Technical Advisory (TA). The proposed project will not modify any water body, as defined in the TA, which is the reason there is no such discussion in the EIS. The use of water

resources will be limited to the construction of bridges and embankments at the Haleakala gulches that the highway will bisect. As stated in Section 2.1.1, the decision to use a bridge or culvert would depend on the estimated storm water flow in the affected gulch. These impacts will not affect any fish or wildlife.

10. Thank you for providing the "Pollution Prevention/Environmental Impact Reduction Checklist for Highways and Bridges". We have reviewed this list and believe that we fully comply with all applicable items. The project is incorporating pollution prevention features that are appropriate and reasonable to the fullest extent.
11. Thank you. A discussion of solid waste management is provided in Section 4.17.5 of the EIS.

BENJAMIN J. CAYETANO  
GOVERNOR

MAJOR GENERAL EDWARD V. RICHARDSON  
DIRECTOR OF CIVIL DEFENSE

ROY C. PRICE, SR.  
VICE DIRECTOR OF CIVIL DEFENSE

ATTN: Mr. Abraham Wong

FROM: Roy C. Price, Sr.  
Vice Director of Civil Defense

SUBJECT: DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) FOR THE  
KIHEI-UPCOUNTRY MAUI HIGHWAY, ISLAND OF MAUI, STATE OF  
HAWAII

We appreciate the opportunity to comment on the DEIS from the Federal Highway Administration/State of Hawaii, Department of Transportation, Kihei-Upcountry Maui Highway, County of Maui, State of Hawaii.

1 | While State Civil Defense (SCD) does not have negative comments specifically directed  
2 | at this draft, we do have a proposal that, whichever route is chosen, the installation of a  
3 | four-inch telecommunications conduit with adequate number of hand holes be installed  
along one shoulder. The petition area is vulnerable to natural hazards such as earth-  
quakes, volcanic activity, and the threat of wind and torrential rainfall associated with  
tropical cyclones/hurricanes. Another proposal entails that any future developers pur-  
chase and install outdoor warning sirens and that siting, design and construction of  
structures within the petition area address the types of natural hazards that present a  
threat to the lives and property of future residents/occupants of the area. Also, trans-  
portation engineers must design and construct this roadway for use as a possible  
emergency evacuation route.

Federal Highway Administration  
August 30, 1999  
Page 2

Just as parks, schools, fire hydrants, underground/overhead utilities and sidewalks are a planned, integral part of subdivisions and industrial areas, so must mitigation measures such as early warning and emergency warning systems and evacuation routes be planned for the safety of communities.

Our State Civil Defense planners and technicians are available to discuss this further if there is a requirement. Please have your staff call Mr. Norman Ogasawara of my staff at 733-4300.

2145 Wells Street, Suite 403  
Wailuku, Hawaii 96793

Mr. Roy C. Price, Sr.  
State of Hawaii  
Department of Defense  
Office of the Director of Civil Defense  
3949 Diamond Head Road  
Honolulu, HI 96816-4495

1. The right-of-way for Kihei-Upcountry Maui Highway will be available for other infrastructure, such as telecommunication conduits. Please coordinate with the Department of Transportation during the project's design phase so that your specific requirements may be accommodated.
2. The suggestions to install outdoor warning sirens and to consider other location, design, and construction issues for structures in the project area are all worthwhile but beyond the enforcement ability of the Department of Transportation.
3. One of the purposes of the project is to provide additional evacuation capacity from South Maui. Kihei-Upcountry Maui Highway will be designed for use as an evacuation route.

BENJAMIN J. CAYETANO  
GOVERNOR OF HAWAII

BRUCE S. ANDERSON, Ph.D., M.P.H.  
DIRECTOR OF HEALTH

STATE OF HAWAII

OCT - 5 1999

HAWAII DIVISION

Mr. Abraham Wong  
Federal Highway Administration  
300 Ala Moana Boulevard  
P. O. Box 50206  
Honolulu, Hawaii 96850

Dear Mr. Wong:

Subject: Draft Environmental Impact Statement (DEIS)  
Kihei - Upcountry Maui Highway  
TMK: 2-2-2: 1, 3, 4, etc.

Thank you for allowing us to review and comment on the project. We have the following comments to offer:

Control of Fugitive Dust

Due to the characteristics of the soil in the area, there is a significant potential for fugitive dust to be generated during grading, excavation and construction activities for this project. The arid climatic conditions and the close proximity of residential subdivisions only adds to the potential dust problems. Implementation of adequate dust control measures during all phases of construction is necessary. Construction activities must comply with the provisions of Chapter 11-60.1, Hawaii Administrative Rules, "Air Pollution Control" section 11-60.1-33 on Fugitive Dust.

The contractor should provide adequate measures to control dust from road areas and during the various phases of construction activities. These measures include, but are not limited to:

- a. planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing material transfer points and on-site vehicular traffic routes, and locating potentially dusty equipment in areas of the least impact;

RECEIVED  
STATE DEPARTMENT  
OF TRANSPORTATION  
OCT 22 11 34 AM '99  
HIGHWAY'S DIVISION  
PLANNING BRANCH

1

- b. providing an adequate water source at site prior to start-up of construction activities;
- c. landscaping and rapid covering of bare areas, including slopes, starting from the initial grading phase;
- d. controlling of dust from shoulders, project entrances, and access roads; and
- e. providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities.

If you have any questions regarding fugitive dust, please contact Ms. Jill Stensrud of the Clean Air Branch at 586-4200.

#### Water Pollution

1. Section 401 Water Quality Certification (WQC)
  - a. In a letter dated February 26, 1999, the U. S. Army Corps of Engineers (COE) indicated that based on the Environmental Assessment and a February 9, 1999 meeting, a Department of the Army permit would be required for the proposed project. The COE letter stated that the proposed project, assigned File No. 990000206, "could possibly be authorized under Nationwide Permit #14, Road Crossing."
  - b. The Clean Water Branch (CWB) of the Department of Health will process the Section 401 WQC under the April 15, 1998 blanket certification procedures (File No. WQC 0000335) if the project meets all of the blanket certification requirements. The applicant would be required to submit a site-specific Best Management Practices Plan and an Applicable Monitoring and Assessment Plan for the road crossings in the proposed project.
2. A National Pollutant Discharge Elimination System (NPDES) General permit coverage is required for each of the following activities which discharge into State waters:
  - 3 a. Discharge of storm water runoff associated with construction activities, including clearing, grading, and excavation that result in the disturbance of equal to or greater than five (5) acres of total land area;

- 3 | b. Discharge of hydrotesting water; and
- 3 | c. Discharge associated with construction activity dewatering.
- 4 | 3. The applicant may be required to apply for an Individual NPDES Permit if there is any type of process wastewater discharge from the project into State waters.

The application form(s) for those discharges which need to obtain a certification, coverage, and/or permit will be provided upon request.

If you have any questions on this matter, please contact Ms. Joanna L. Seto, P.E., Engineering Section of the Clean Water Branch at 586-4309.

#### Noise Concerns

- 5 | Activities associated with the construction phase of the project must comply with the Department of Health's Administrative Rules, Chapter 11-46, "Community Noise Control."
  - a. The contractor must obtain a noise permit if the noise levels from the construction activities are expected to exceed the allowable levels of the rules as stated in Section 11-46-6(a).
  - b. Construction equipment and on-site vehicles requiring an exhaust of gas or air must be equipped with mufflers as stated in Section 11-46-6(b)(1)(A).
  - c. The contractor must comply with the requirements - pertaining to construction activities as specified in the rules and the conditions issued with the permit as stated in Section 11-46-7(d)(4).

Should there be any questions on this matter, please call Mr. Jerry Haruno, Environmental Health Program Manager of the Noise, Radiation and Indoor Air Quality Branch at 586-4701.

#### Polluted Runoff Control

- 6 | Proper planning, design and use of erosion control measures and management practices will substantially reduce the total volume of runoff and limit the potential impact to the coastal waters from polluted runoff. Please refer to the *Hawaii's Coastal Nonpoint Source Control Plan*, pages III-117 to III-119 for guidance on these management measures and practices for

6 | specific project activities. To inquire about receiving a copy of this plan, please call the Coastal Zone Management Program in the Planning Office of the Department of Business and Economic Development and Tourism at 587-2877 on Oahu.

The following practices are suggested to minimize erosion during construction activities:

1. Conduct grubbing and grading activities during the low rainfall months (minimum erosion potential).
2. Clear only areas essential for construction and in phases.
3. Locate potential nonpoint pollutant sources away from steep slopes, water bodies, and critical areas.
4. Protect natural vegetation with fencing, tree armoring, and retaining walls or tree wells.
5. Cover or stabilize topsoil stockpiles.
6. Intercept runoff above disturbed slopes and convey it to a permanent channel or storm drain.
7. On long or steep slopes, construct benches, terraces, or ditches at regular intervals to intercept runoff.
8. Protect areas that provide important water quality benefits and/or are environmentally sensitive ecosystems.
9. Protect water bodies and natural drainage systems by establishing streamside buffers.
10. Minimize the amount of construction time spent in any stream bed.
11. Properly dispose of sediment and debris from construction activities.
12. Replant or cover bare areas as soon as grading or construction is completed. New plantings will require soil amendments, fertilizers and temporary irrigation to become established. Use high planting and/or seeding rates to ensure rapid stand establishment. Use seeding and mulch/mats. Sodding is an alternative.

7 | The following practices are suggested to remove solids and associated pollutants in runoff during and after heavy rains and/or wind:

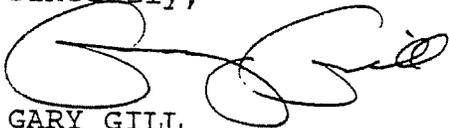

Mr. Abraham Wong  
September 28, 1999  
Page 5

99-183/epo

1. Sediment basins.
2. Sediment traps.
3. Fabric filter fences.
4. Straw bale barriers.
5. Vegetative filter strips.

Any questions regarding these matters should be directed to the Polluted Runoff Control Program in the Clean Water Branch at 586-4309.

Sincerely,

GARY GILL  
Deputy Director for  
Environmental Health

Warren S. Unemori Engineering, Inc.

Mr. Gary Gill  
State of Hawaii  
Department of Health  
P.O. Box 3378  
Honolulu, HI 96801

1. Fugitive dust will be generated by construction activities as stated in Section 4.17.2 of the EIS. Appropriate dust control measures will be implemented, as described in Section 4.17.2 and your letter. The level of dust control will be most stringent near residential areas and less stringent in agricultural areas far from homes and commercial areas.
2. Thank you for this information. The project will comply with all requirements of the Clean Water Act.
3. Thank you for this information. A NPDES permit will be obtained prior to the construction of Kihei-Upcountry Maui Highway.
4. The project will not generate process wastewater. An Individual NPDES Permit will not be necessary.
5. Potential noise impacts during construction are described Section 4.17.3. Since construction would normally occur during daylight hours, and since most construction will occur in isolated areas away from noise sensitive land uses, extended noise disruptions are not anticipated. A noise permit would be obtained if needed.
6. Thank you for your suggestions. The project will minimize erosion during construction by implementing Best Management Practices as approved in the NPDES permit. The suggestions provided will be considered.
7. Thank you for your suggestions for controlling runoff pollution. The Department of Health will have an opportunity to review the specific BMPs proposed during your review of the NPDES permit application.

Dear Mr. Wong:

Subject: Draft Environmental Impact Statement for the Kihei-Upcountry  
Maui Highway, Makawao, Maui, Hawaii.

We have reviewed the above referenced draft EIS and provide the following comments:

- 1) Although the draft reports the presence of axis deer in the study area (sec. 3.8.2) and anticipates "The highway would increase the number of road kills, however" (sec. 4.8.2) . . . there are no measures offered to mitigate these hazards in the draft EIS.
- 2) The proposed highway alignment goes through prime axis deer habitat and we anticipate an increase of deer/vehicle strikes. State highways will need to consider appropriate means to alert drivers of deer in the area and be responsible for the recovery and disposal of all injured or dead axis deer along the highway.
- 3) It is also recommended that State highways seek a preliminary legal opinion on the matter of liability concerning deer/vehicle incidents to prepare for litigation actions which will arise.

Thank you for allowing us to comment on this proposed project. We look forward to future participation and comments of the project. Please call our Maui Branch Office, Wildlife Section at (808) 984-8100, if you have questions.

Sincerely yours,

**MEMORANDUM**

TO: Nelson L. Ayers, DOFAW Administration

FROM: John Cumming, Wildlife Biologist, Maui

A review of the Kihei Upcountry Maui Highway Draft EIS has generated the following concern.

Although the draft acknowledges the presence of Axis deer in the study area (sec. 3.8.2) and anticipates "The highway would increase the number of road kills, however" (sec. 4.8.2) no mention is made of measures to mitigate the hazard.

As all the proposed highway alternatives pass through prime Axis deer habitat there will be a dramatic increase in deer/vehicle strikes.

It is our recommendation that SDOT consider and implement all appropriate means to alert drivers of the potential of deer on the highway. SDOT must become responsible for the recovery and disposal of all injured or dead Axis deer along the highway.

It is also recommended that SDOT seek a preliminary legal opinion on the matter of liability concerning deer/vehicle incidents in preparation for defense against the inevitable claims which will arise.

Mr. Michael G. Buck  
State of Hawaii  
Department of Land and Natural Resources  
Division of Forestry and Wildlife  
1151 Punchbowl Street  
Honolulu, HI 96813

1. Section 4.8.4 of the Final EIS includes mitigation measures to lower the chance of vehicle-deer collisions. The Department of Transportation is responsible for collecting and disposing of injured or dead animals on its highways.
2. Thank you for your suggestion. A preliminary legal opinion will be sought.

Honolulu, Hawaii 96813

Dear Mr. Hayashida:

Subject: Draft EIS for the Kihei-Upcountry Maui Highway

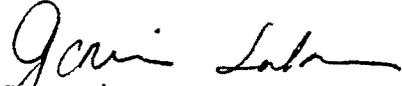

Thank you for the opportunity to review the subject document. We have the following comments.

1. Please evaluate whether traditional and customary gathering rights of native Hawaiians will be impacted by the project. For guidance, please refer to the attached Guidelines for Assessing Cultural Impacts prepared by the Environmental Council.
2. This project will increase the number of road kills. Please discuss and propose mitigation measures to minimize the number of roadkills.
3. To minimize visual impact, please ensure that final cut and fill slope faces will be made to blend with the surrounding landscape.
4. Please discuss the probability of encountering caves or lava tubes in the construction corridor. Please consult with the Hawaii Speleological Society on this matter.
5. Please describe mitigation measures to minimize the potential spread of alien organisms.
6. Please develop a program to increase the environmental awareness of all construction workers who will be working on this project.
7. Please evaluate all the mitigation measures described in the 1999 Final EIS for Saddle Road Improvement, Island of Hawaii and include the appropriate measures in this study.

Mr. Hayashida

# GUIDELINES FOR ASSESSING CULTURAL IMPACTS

Adopted by the Environmental Council, State of Hawaii

November 19, 1997

## I. INTRODUCTION

It is the policy of the State of Hawaii under Chapter 343, HRS, to alert decision makers, through the environmental assessment process, about significant environmental effects which may result from the implementation of certain actions. An environmental assessment of cultural impacts gathers information about cultural practices and cultural features that may be affected by actions subject to Chapter 343, and promotes responsible decision making. Articles IX and XII of the State Constitution, other state laws, and the courts of the state require government agencies to promote and preserve cultural beliefs, practices, and resources of native Hawaiians and other ethnic groups. Chapter 343 also requires environmental assessment of cultural resources, in determining the significance of a proposed project.

The Environmental Council encourages preparers of environmental assessments and environmental impact statements to analyze the impact of a proposed action on cultural practices and features associated with the project area. The Council provides the following methodology and content protocol as guidance for any assessment of a project that may significantly affect cultural resources.

## II. CULTURAL IMPACT ASSESSMENT METHODOLOGY

Cultural impacts differ from other types of impacts assessed in environmental assessments or environmental impact statements. A cultural impact assessment includes information relating to the practices and beliefs of a particular cultural or ethnic group or groups.

Such information may be obtained through scoping, community meetings, ethnographic interviews and oral histories. Information provided by knowledgeable informants, including traditional cultural practitioners, can be applied to the analysis of cultural impacts in conjunction with information concerning cultural practices and features obtained through consultation and from documentary research.

In scoping the cultural portion of an environmental assessment, the geographical extent of the inquiry should, in most instances, be greater than the area over which the proposed action will take place. This is to ensure that cultural practices which may not occur within the boundaries of the project area, but which may nonetheless be affected, are included in the assessment. Thus, for example, a proposed action that may not physically alter gathering practices, but may affect access to gathering areas would be included in the assessment. An ahupua'a is usually the appropriate geographical unit to begin an assessment of cultural impacts of a proposed action, particularly if it includes all of the types of cultural practices associated with the project area. In some cases, cultural practices are likely to extend beyond the ahupua'a and the geographical extent of the study area should take into account those cultural practices.

## Guidelines for Accessing Cultural Impacts

November 19, 1997

Page 2 of 4

The historical period studied in a cultural impact assessment should commence with the initial presence in the area of the particular group whose cultural practices and features are being assessed. The types of cultural practices and beliefs subject to assessment may include subsistence, commercial, residential, agricultural, access-related, recreational, and religious and spiritual customs.

The types of cultural resources subject to assessment may include traditional cultural properties or other types of historic sites, both man made and natural, including submerged cultural resources, which support such cultural practices and beliefs.

The Environmental Council recommends that preparers of assessments analyzing cultural impacts adopt the following protocol:

- (1) identify and consult with individuals and organizations with expertise concerning the types of cultural resources, practices and beliefs found within the broad geographical area, e.g., district or ahupua'a;
- (2) identify and consult with individuals and organizations with knowledge of the area potentially affected by the proposed action;
- (3) receive information from or conduct ethnographic interviews and oral histories with persons having knowledge of the potentially affected area;
- (4) conduct ethnographic, historical, anthropological, sociological, and other culturally related documentary research;
- (5) identify and describe the cultural resources, practices and beliefs located within the potentially affected area; and
- (6) assess the impact of the proposed action, alternatives to the proposed action, and mitigation measures, on the cultural resources, practices and beliefs identified.

Interviews and oral histories with knowledgeable individuals may be recorded, if consent is given, and field visits by preparers accompanied by informants are encouraged. Persons interviewed should be afforded an opportunity to review the record of the interview, and consent to publish the record should be obtained whenever possible. For example, the precise location of human burials are likely to be withheld from a cultural impact assessment, but it is important that the document identify the impact a project would have on the burials. At times an informant may provide information only on the condition that it remain in confidence. The wishes of the informant should be respected.

Primary source materials reviewed and analyzed may include, as appropriate: Mahele, land court, census and tax records, including testimonies; vital statistics records; family histories and genealogies; previously published or recorded ethnographic interviews and oral histories; community studies, old maps and photographs; and other archival documents, including correspondence, newspaper or almanac articles, and visitor journals. Secondary source materials such as historical, sociological, and anthropological texts, manuscripts, and similar materials, published and unpublished, should also be consulted. Other materials which should be examined include prior land use proposals, decisions, and rulings which pertain to the study area.

### III. CULTURAL IMPACT ASSESSMENT CONTENTS

In addition to the content requirements for environmental assessments and environmental impact statements, which are set out in HAR §§ 11-200-10 and 16 through 18, the portion of the assessment concerning cultural impacts should address, but not necessarily be limited to, the following matters:

1. A discussion of the methods applied and results of consultation with individuals and organizations identified by the preparer as being familiar with cultural practices and features associated with the project area, including any constraints or limitations which might have affected the quality of the information obtained.
2. A description of methods adopted by the preparer to identify, locate, and select the persons interviewed, including a discussion of the level of effort undertaken.
3. Ethnographic and oral history interview procedures, including the circumstances under which the interviews were conducted, and any constraints or limitations which might have affected the quality of the information obtained.
4. Biographical information concerning the individuals and organizations consulted, their particular expertise, and their historical and genealogical relationship to the project area, as well as information concerning the persons submitting information or interviewed, their particular knowledge and cultural expertise, if any, and their historical and genealogical relationship to the project area.
5. A discussion concerning historical and cultural source materials consulted, the institutions and repositories searched, and the level of effort undertaken. This discussion should include, if appropriate, the particular perspective of the authors, any opposing views, and any other relevant constraints, limitations or biases.

Guidelines for Accessing Cultural Impacts

November 19, 1997

Page 4 of 4

6. A discussion concerning the cultural resources, practices and beliefs identified, and, for resources and practices, their location within the broad geographical area in which the proposed action is located, as well as their direct or indirect significance or connection to the project site.
7. A discussion concerning the nature of the cultural practices and beliefs, and the significance of the cultural resources within the project area, affected directly or indirectly by the proposed project.
8. An explanation of confidential information that has been withheld from public disclosure in the assessment.
9. A discussion concerning any conflicting information in regard to identified cultural resources, practices and beliefs.
10. An analysis of the potential effect of any proposed physical alteration on cultural resources, practices or beliefs; the potential of the proposed action to isolate cultural resources, practices or beliefs from their setting; and the potential of the proposed action to introduce elements which may alter the setting in which cultural practices take place.
11. A bibliography of references, and attached records of interviews which were allowed to be disclosed.

The inclusion of this information will help make environmental assessments and environmental impact statements complete and meet the requirements of Chapter 343, HRS. If you have any questions, please call us at 586-4185.

Ms. Genevieve Salmonson, Director  
State of Hawaii  
Office of Environmental Quality Control  
235 South Beretania Street, Suite 702  
Honolulu, HI 96813

1. The project will not affect traditional or customary gathering rights of native Hawaiians. Because of the uncertainty regarding the cultural impacts of the project, a cultural impacts study was prepared after the Draft EIS (see Appendix I). The results are summarized in Section 4.10.
2. Section 4.8.4 of the Final EIS includes measures to minimize the chance of vehicle-deer collisions.
3. Details of the slope faces will be developed in the next phase of project planning. However, the design intent is for the highway to blend in with the surrounding landscape as effectively as possible.
4. Caves were encountered in the vicinity of an early U2-A alignment during the archaeological reconnaissance survey. In addition, comments have been received on the existence of caves in the vicinity of the U2-A and U2-B alignments in Kulamalu. The archaeological inventory survey of the U1,K1 alignment, the preferred alternative, did not identify any caves along this alignment.
5. Measures to control the spread alien species are now described in Section 4.8 of the Final EIS.
6. Project specifications will include environmental protection measures. The contractor, who is responsible for the actions of its workers, will be required to follow the specifications. The workers will receive training on the project's environmental protection measures.
7. Thank you for this suggestion. The mitigation measures of the Saddle Road Improvement project were reviewed and considered.

**WARREN S. UNEMORI ENGINEERING, INC.**

(EIS #334)

Re: Kihei-Upcountry Maui Highway  
Draft Environmental Impact Statement

Dear Mr. Wong,

Thank you for the opportunity to comment on the Kihei-Upcountry Maui Highway Draft Environmental Impact Statement (Draft EIS). The proposed project is being designed to satisfy the following six purposes and needs:

- ◆ improve roadway system linkage;
- ◆ support economic development;
- ◆ address existing intersection capacity deficiencies;
- ◆ satisfy increased transportation demand;
- ◆ promote the National interest as expressed through legislative directive; and
- ◆ increase coastal evacuation capacity.

According to the Draft EIS, a total of eight (8) combinations of two (2) Kihei and four (4) Upcountry terminus options are being considered as alternatives. All of the alternative alignments, combined, could potentially destroy 15 prehistoric and post contact archaeological sites because they are within the alignments' 120 m (400 feet) archaeological analysis area.

Mr. Abraham Wong  
Federal Highway Administration  
September 15, 1999  
PAGE TWO

Also, the U.S. Fish and Wildlife Service (Service) noted alternatives using the K2 segment pass within 1.5 km (1 mile) of Pu'u o Kali, one of the few remaining examples of dryland forest in the State, which may contain three federally endangered plants and rare plant species.

The service also reported that the alternatives that use the U2-A, B segment pass near a reservoir which may be used by migratory or endangered waterbirds.

In addition, the botanical field surveys conducted on January, February and September of 1997, identified three small clusters of the endangered Ko'oloa'ula that were found between the 210 m and 230 m of the U2-A, B segment pass.

As stated in the draft EIS, "Implementing the Kihei-Upcountry Maui Highway project would require an irreversible commitment of natural, physical, human, and fiscal; resources, as follows:

- ◆ archaeological resources would be damaged, destroyed or lost in constructing the project."

It also mentions that the commitment of these resources would be appropriate because the benefits from the completed Kihei-Upcountry Maui Highway are anticipated to outweigh the commitment of the resources.

1 | OHA is opposed to any potential damage to the prehistoric archaeological sites, natural resources, and endangered and rare plant species that the construction of the proposed highway will create.

According to OHA's Master Plan, OHA is mandated, "To assist and encourage the conservation and culturally responsive management of historic and culturally significant Hawaiian sites and natural resources to prevent further destruction."

2 | Moreover, we suggest that you require the preparation of a cultural impact statement for the proposed project area. We further suggest that the cultural expert chosen to work on the statement be someone recognized within the Hawaiian community for his/her cultural expertise. The concerns of the community will not be addressed if the cultural impact statement contains information and analysis provided solely by a person whose knowledge of Hawaiian culture is limited to a study of archaeology or anthropology.

Mr. Abraham Wong  
Federal Highway Administration  
September 15, 1999  
PAGE THREE

3 | Finally, we request that OHA be a required consultant to the project, pursuant to Section 106 of the National Historic Preservation Act.

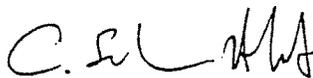

OHA anticipates the Final EIS for our review and further comment on the Preferred Alternative of the project.

If you have any questions, please call Mark A. Mararagan – Policy Analyst at 594-1945.

Sincerely,

Colin Kippen  
Deputy Administrator

C. Sebastian Aloit  
Hawaiian Rights Division Director

Maui CRS  
Mr. Warren S. Unemori

Mr. Colin Kippen  
Deputy Administrator  
Office of Hawaiian Affairs  
711 Kapiolani Blvd., Suite 500  
Honolulu, HI 96813

1. The U1,K1 alignment, the preferred alternative, will result in an "adverse effect" on three temporary habitation sites. A memorandum of agreement (MOA), pursuant to Section 106 of the National Historic Preservation Act, has been prepared, and will specify data recovery measures for these sites. The Office of Hawaiian Affairs was asked to participate in the MOA process. The project will not result in the damage, destruction, or loss of unique or valuable natural resources, or any threatened, endangered or rare species.
2. Because of the uncertainty regarding the cultural impacts of the project, a cultural impacts study was prepared after the Draft EIS (see Appendix I). The results are summarized in Section 4.10.
3. The Office of Hawaiian Affairs has been consulted in accordance with the Section 106 regulations throughout the planning phase of this project.

Dear Gentlemen,

### Draft Environmental Impact Assessment Kihei-Upcountry Maui Highway County of Maui, Hawaii

The referenced project proposes construction of a 2-lane limited access highway linking the Kihei-Makena area with Upcountry Maui. Project goals include: (1) to improve the roadway system linkages between the two areas and thus reduce distance, travel time and fuel consumption; (2) to stimulate economic development by providing greater accessibility between science and technology centers, between tourist accommodations and visitor attractions, and by funneling federal funds into the local economy through highway construction; (3) to address existing intersection capacity deficiencies by relieving traffic; (4) to satisfy a projected increased traffic demand; (5) to promote national interest as expressed through legislative directive by improving the connection between defense related activities in Kihei and Science City on Haleakala; and (6) to increase the coastal evacuation capacity by providing an alternate route out of Kihei in the event of an emergency. The Draft Environmental Impact Statement (DEIS) examines eight possible alignments, some of which will run through agricultural lands and/or affect traffic patterns at the termini and represent issues to be considered carefully. This review was prepared with the assistance of Linda Cox, Agricultural and Resource Economics; Richard Mayer, Geography and Economics, Maui Community College; and Sherri Hiraoka, Environmental Center.

**General Comments**

In general, our reviewers found the Draft EIS to be fairly complete and systematic in its approach, although at times, the style seemed biased towards support of the project. Several specific issues were brought up that we believe deserve your further consideration.

**Relationship of the Proposed Action to Governmental Plans, Policies and Controls**

1 **Hawaii State Plan.** The DEIS states that "The No Build alternative would not support the goals and objectives of the Hawaii State Plan." (page 4-6) but there is no reference as to how the No Build alternative would violate the State Plan.

2 **County of Maui General Plan.** The DEIS fails to take into account the County of Maui General Plan 1990 (as amended by Ordinance No. 2234 on April 23, 1993) which states as transportation objective #3: "To develop...land use planning that is less dependent on the automobile as its primary mode of moving people." Policies offered to reach this objective include:

"c. Direct economic development toward existing communities in order to minimize employee commuting and foster a healthy job/housing balance."

"f. Support and expand programs to reduce automobile dependent employee commuting for hotel, commercial and industrial projects."

The project does not appear to comply with these policies and objectives.

3 **Community Plans.** Land use descriptions in the DEIS noted that unplanned development in the Upcountry area is not expected due to the lack of water resources (page 4-3). There are also no expectations for improvements in the near future to accommodate unplanned development due to high cost (page 4-4). The Maui County Board of Water Supply is required to follow community plans, which in this case designates very little additional growth. However, it is likely that the proposed highway will make development in the Upcountry area more attractive. This will inevitably increase pressure to modify the Community Plans to allow for such growth, and make the higher cost of water provisions in the area less of a deterrent. The Final EIS should acknowledge the long-term development stimulation, which is a likely indirect impact of the proposed highway, and address the changes needed in the Plans as well as any mechanisms necessary for such changes.

**Farmland**

4 The Final EIS should provide specific information such as the total acreage of each  
5 alignment, as well as the amount of agricultural land that would be removed from production  
6 within the 162-foot minimum right of way (page 2-9) and at the intersections. Land Quality  
ratings should also be included for those lands used for sugar, pineapple, or vegetable crops.  
Also, disruptions to the daily activities of the farms that would be affected by each alternative  
should be discussed and specific mitigative measures suggested.

**Socioeconomic**

7 **Public Facilities and Services.** Alternate U-2A is in close proximity to King Kekaulike High School which could result in safety concerns through increased traffic in an area where many students walk to school. The Final EIS should consider this problem of school-related traffic and safety and offer mitigation measures.

- 8 | Crime. There is community concern that the high crime rates of Kihei will spread to Upcountry due to the accessibility provided by the proposed highway. Differing crime rates are noted on page 3-24, but no mention of the possible effect on crime rates is made.

Infrastructure

- 9 | Traffic Patterns. The DEIS discusses relief of traffic feeding into the proposed highway from various roads and highways including Dairy Road (page 4-24). It has been suggested that Dairy Road is not a common route taken by those traveling between Upcountry and Kihei, as Hansen Road is shorter and faster. Hansen Road will be realigned in the near future as indicated by the Kahului Airport Final EIS.

- 10 | One of the purposes of the project is to promote the "national interest" by "providing an improved connection between defense-related activities at the Maui Research and Technology (R & T) Park in Kihei and Science City at the Haleakala summit." (page S-5) There is a lack of daily traffic volume figures specifically between the Maui R & T Park and the summit observatories to allow for evaluation of the need for these improvements.

- 11 | The final EIS should discuss the impact on traffic that each of the intersections and turn-  
12 | offs will have along the various alignments. Traffic lights, potential grade separations, acceleration and deceleration lanes, and other traffic control elements should also be considered.

- 13 | The summary of the proposed action states posted speed limits in urban areas will be 70 km/h (45 mph) (page S-8). This was seen as unsafe in areas that pass near schools, parks and shopping centers. The use of the 45 mph speed also exaggerates the time that would be saved by implementation of the proposed highway.

- 14 | Our reviewers considered the dismissal of the "enhanced widening" alternative during the tier 1 screening a poor decision. Enhanced widening was rejected as it "would not establish a roadway linkage between Kihei and the Upcountry area." (page 2-28) However it was noted that "establish a roadway linkage" was not one of the purposes of the project. It seems that enhanced widening would serve one of the purposes of the project: "improve roadway system linkage" (page S-3).

- 15 | The additional dismissal of the Transportation Systems Management (TSM) alternative was seen as another poor decision. "Non-satisfaction with project goals" (page 2-28) was given as justification for elimination of TSM as an alternative, as it did not meet the goal of establishing a roadway linkage between Kihei and Upcountry Maui. However, the Federal Government requires that TSM be investigated as an alternative to a highway and not be eliminated in the screening because it is not a highway.

- 16 | Our reviewers noted high accident statistics for the present two-lane, undivided Mokolule Highway and for Dairy Road (page 3-30), and they expressed concern over the similarity in design of the proposed highway with these roads. To avoid the dangers associated with an undivided highway, we suggest that the Final EIS evaluate a divided highway with one lane on each side of the divide with the provision for future additional lanes. Failure to consider a divided highway should lead to the inclusion of a comparison of the probable accident statistics

16 | of an undivided highway with a divided highway in the "no build", enhanced widening alternative, and accident costs included in a cost-benefit analysis.

17 | Our reviewers expressed concern over increased traffic hazards for areas near the alignment termini due to additional vehicles taking shortcuts to and from Haleakala Crater using Pulehuiki Road, Kimo Drive, Lower Kula Road, Iolopuni, Pulehu, and Omaopio roads. These streets are of concern as they are narrow, winding, and steep, and will be traversed after vehicles have already descended 22 miles down Crater Road when returning from Haleakala Crater. Of particular concern is Pulehuiki Road and/or Kimo Drive because of steep, sharp turns which provide little warning for oncoming traffic. The use of signs (page 4-32) is not likely to be an adequate mitigation measure of the U-3 terminus.

18 | Bicycle and Pedestrian Facilities The DEIS suggests the possibility of bicycle tour companies modifying their routes to utilize the proposed highway (page 4-28). If this were to occur, the effect on road traffic to and from the highway may be affected, especially considering that the bicycle tours operate during school traffic. It is also the procedure of bicycle tours to use a wide van to trail the cyclists and thus protect them by blocking traffic, rather than use a bike lane as suggested by the DEIS. These issues should be addressed in the Final EIS.

Noise

19 | Noise levels at the U-2B alternative were not discussed (page 4-38). It was suggested that the U-2B alternative will increase noise levels near Kamchamcha schools, a proposed park, a proposed shopping center, and a proposed elderly housing project. These noise levels are expected to be disruptive, since it is likely that tour buses will be making these trips between 3:30 AM and 5:00 AM to view the Haleakala sunrise. Application of air brakes on the return trip is also expected to increase noise levels.

Ecosystems

20 | Flora The use of signs to warn against fires is not seen as a sufficient mitigation measure to the increased fire potential brought on by the project (page 4-47). Inaccessibility and lack of water resources could pose great risk to the area. This problem should be further addressed in the Final EIS.

Cost-Benefit Analysis

21 | This section should have contained a cost-benefit analysis which included information on the methodology, assumptions, and data used, as well as a comparison of the alternatives to the "enhanced widening" (EWR) alternative. A trip analysis including the number, origin, and direction of trips being generated for all alternatives should also be included. Also, a discussion of the "short term losses and approaches for minimizing adverse impacts" would be useful in evaluating costs.

24 | The DEIS references traffic only at the at the various highway termini without discussing the design of these intersections. The Final EIS should include an assessment of the total costs of the various alignments, including intersections, street lights, and traffic mitigation measures to validate the selection of the preferred alignment.

Mr. Abraham Wong  
Mr. Kazu Hayashida  
October 28, 1999  
Page 5

- Several questions were raised as to the funding of the project:
- 25 | (1) Will the State build or improve highways with its contribution should the "no build" scenario be adopted, and if so, which projects would be considered?
  - 26 | (2) Will the State or the Federal Government be responsible for any cost-overruns?
  - 27 | (3) Who will be responsible for the highway's maintenance?

**Cumulative Impacts**

28 | A more comprehensive discussion of the cumulative impacts of the project should be included. The acreage, quality and effects of removing prime agricultural lands from productive use as well as for other potential projects should be included.

**Summary and Recommendations**

29 | This DEIS provides valuable information towards making an informed selection of the most favorable alternative. However, the inadequacies that are outlined above indicate that a draft final EIS should be prepared once the preferred route is selected and the exact locations and right-of-ways are determined to correct the deficiencies noted.

Thank you for the opportunity to comment on this Draft EIS

Sincerely,  
  
John T. Harrison  
Environmental Coordinator

1. The State Plan includes objectives and policies that seek to enhance the public welfare and economic development by providing needed infrastructure, such as good transportation systems, while still protecting the natural and social environment. It is possible for the No Build alternative to not support these objectives, while not specifically violating them. The EIS does not state that the No Build alternative would violate the State Plan.
2. The three transportation objectives of the County of Maui General Plan are now described in Section 3.1.4.2a of the Final EIS. In general, the Department of Transportation supports the General Plan's transportation objective to use land use planning to reduce dependence on the automobile although this specific project may not be consistent with this objective. However, the Department believes this objective is not intended to be a moratorium on new roadway construction. In addition, the proposed project is consistent with the other two objectives (see Section 4.1.4.2a of the Final EIS). Kihei-Upcountry Maui Highway could be used as a transit link between Kihei and Upcountry if one is established.
3. The amount and pace of residential development in Upcountry will continue to be controlled by water availability, not transportation infrastructure. The EIS acknowledges (see Section 4.1.1) that highway projects can catalyze urban development because they often remove an impediment to growth, access or insufficient transportation capacity. In this specific case, however, the urban growth potential of Upcountry is not limited by transportation factors, with or without the project. Despite the recent development of a well in Haiku, which is being partially used for the Kulamalu development, Upcountry will continue to rely on surface water resources that are highly vulnerable to drought conditions. Therefore, as stated in current planning documents, the County is unlikely to allow substantial urban development in Upcountry despite the existence of Kihei-Upcountry Maui Highway.

4. Section 2.1.2 contains information on the real estate requirements of each alternative. Section 4.2.1 of the Final EIS now includes information on the estimated acreage taken from active agricultural fields.
5. If the comment is referring to the Land Evaluation and Site Assessment scores, which are required under the Farmland Protection Policy Act, such scores are not disaggregated by type of crop. However, the Natural Resources Conservation Service considers the agricultural value of the land when they provide "total site assessment points", Part V of Form AD-1006. The completed Form AD-1006 for all alternative alignments is in Appendix C of the EIS.
6. Section 4.2.1 of the EIS includes discussion of potential interference with farming activities, and Section 4.2.4 contains measures to mitigate such impacts.
7. The U2-A terminus is not included in the preferred alternative. However, if a U2-A alternative had been identified as the preferred alternative, the Five Trees intersection would be modified to include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
8. As described in Section 4.3.3 of the EIS, the Upcountry police officers could not speculate on whether the proposed highway would cause an increase in crime rates. Absent an opinion from the police, it is difficult to provide an objective analysis of this concern.
9. There are no plans to realign Hansen Road. The planned airport road would be a new road running parallel to Dairy Road with an interchange on Hana Highway.
10. The present traffic volumes between the Maui R&T Park and Science City are relatively small, but these volumes could increase as both facilities are developed. Nonetheless, there are other purposes and needs for the project beyond the legislative directive to provide improved mobility between defense-related activities at the Maui R&T Park and Science, as described in detail in Chapter 2.
11. Section 4.4.1.2 of the EIS provides a "level of service" analysis disclosing expected traffic conditions for each alternative.

12. The termini intersections will likely warrant traffic signals, and will include turning, acceleration and deceleration lanes. Several concepts for grade-separated intersections (i.e., interchanges) were considered for the U1 terminus, as described in Section 2.1.2 of the Final EIS. However, based on presently projected traffic volumes, the costs of these options are not justified considering their marginal benefits in relation to a signalized intersection, which costs substantially less.
13. The planned urban 70 km/h (45 mph) speed limit is normal for a limited access facility in urban areas. Most of the highway will have a speed limit of 90 km/h (55 mph). Therefore, the estimated time savings provided in the EIS is not an exaggeration. Adjustments to the speed limits may be made during the design phase if more detailed study shows that changes are warranted.
14. The Enhanced Widening of Existing Roadways (EWR) alternative was eliminated from further study because it would require construction over a 32 km (20 miles) distance, and was estimated to cost \$78 million. This could not be justified when a highway directly linking Upcountry and Kihei would only be 15 to 18 km (9 to 11 miles) long, and would cost roughly the same, but would perform substantially better in addressing the system linkage and other purposes and needs.
15. The main purpose of the project is to establish a roadway link between Kihei and Upcountry Maui. Considering an alternative that would not address this purpose at an EIS-level of detail would not be an appropriate use of time and resources. The EIS process allows for the early screening of alternatives that do not satisfy the purposes of the project.
16. Kihei-Upcountry Maui Highway, in its initial two-lane undivided configuration, would be more similar to Haleakala or Hana Highway rather than Dairy Road or the present Mokulele Highway. (Mokulele Highway will be changed to a four-lane divided configuration, which will substantially reduce the number of incidents on this roadway.) The number of incidents on Haleakala and Hana Highways is not high considering their relatively high traffic volumes (see Section 3.4.1.2). Kihei-Upcountry Maui Highway will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards.

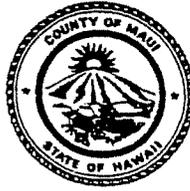

17. A U3 terminus is not included in the preferred alternative. Therefore, the inappropriate use (i.e., shortcuts to and from Haleakala Crater) of Pulehuiki Road, Kimo Drive, and Lower Kula Road will not occur. However, since the U1,K1 Alternative was identified as the preferred alternative, the EIS acknowledges that some motorists will use Holopuni, Pulehu and Omaopio Roads inappropriately as shortcuts because of the distance between Kula and the U1 terminus (see Section 4.4.1). Closing access between these roads and Kihei-Upcountry Maui Highway is not an option because of the burden this would place on farmers.
18. Kihei-Upcountry Maui Highway will have adequate shoulders for bicyclists. Bicycle tour operators will not be allowed to conduct their tours on Kihei-Upcountry Maui Highway in the manner described in the comment because it is unlikely that the van protecting the cyclists would be able to maintain the minimum speed required to use the highway.
19. A U2-B terminus is not included in the preferred alternative. Noise impacts, as defined by the Department of Transportation Noise Analysis and Abatement Policy (June 1997), were not predicted at the Kamehameha High School site under the U2-B alternative. Therefore, even if this alternative were to have been identified as the preferred alternative, noise mitigation would not have to be considered because of the absence of a noise impact.
20. In addition to signage warning motorists of fire hazards, the Department of Transportation will conduct regular maintenance to control weed growth along highway shoulders. While the Kihei-Upcountry Maui Highway will increase access to the area, such that the risk of man-made hazards may increase, the highway would simultaneously decrease the damage from fires because it would improve the accessibility of water and fire-fighting resources to the dry forest areas. The preferred alternative, the U1,K1 alignment, traverses agricultural fields, and therefore, has access to water.
21. Information about the methodology, assumptions and data used for the benefit-cost (BC) analysis is now provided in the appendix of the "Alternatives Analysis Report" (see Appendix E). As described in Section 2.2.1, all build alternatives that underwent the BC analysis were compared against the No Build alternative. For this analysis, it is not appropriate to compare the build alternatives with the "Enhanced Widening" (EWR) alternative, another build alternative. A build alternative is not an appropriate basis of

comparison for another build alternative in a BC analysis. The EWR alternative is estimated to cost \$78 million.

22. The information requested was not used in BC analysis for the screening of early alternatives because the intention of the screening was to eliminate alternatives that would be extremely unlikely to be identified as the preferred alternative, and therefore, should not be evaluated in detail in the Draft EIS. For this BC analysis, only a very low BC ratio would fail to pass this criterion.
23. Chapter four of the EIS contains information on the "short term losses and approaches for minimizing adverse impacts."
24. Section 2.1.2 states that the highway's termini intersections will be designed with adequate channelization (e.g., turning, deceleration, acceleration lanes) to handle projected traffic volumes. Detailed intersection designs will be prepared for each intersection during the design phase. The cost estimates of the alternatives include the elements listed above.
25. The State Department of Transportation will move ahead with other planned roadway projects on Maui, even if the No Build scenario were selected. For example, improvements to Haleakala and Mokulele Highways are already moving forward.
26. Financial responsibility for an overrun depends on the reason for the overrun. For some categories of overrun, the Department of Transportation and the Federal Highway Administration would share the burden.
27. The State Department of Transportation will be responsible for highway maintenance.
28. The level of detail in Section 4.15 of the EIS, Cumulative Impacts, is appropriate for this stage of decision-making. Additional detail would not change the conclusions of this section.
29. The commenter may be referring to a Supplemental Draft EIS, which would be appropriate if the alternatives or preferred alternative change substantially from those considered in the Draft EIS. A Supplemental Draft EIS may be warranted when a completely new alignment is considered. Since the preferred alternative (U1,K1) was considered in the Draft EIS, a Supplemental Draft EIS is not warranted. The additional information included in the Final

EIS addresses the comments sufficiently for decision-making purposes and this stage of project planning.

Mr. Abraham Wong  
Division Administrator  
Federal Highway Administration  
P. O. Box 50206  
300 Ala Moana Boulevard  
Honolulu, Hawaii 96850

Dear Mr. Wong:

RE: Kihei-Upcountry Maui Highway, County of Maui, Hawaii;  
Draft Environmental Impact Statement, July 1999;  
Department of Transportation, State of Hawaii and Federal  
Highway Administration, U.S. Department of  
Transportation

I am taking this means to comment on the subject Draft Environmental Impact Statement and to clarify any discrepancies as to the position of the Maui County Administration on the planned Kihei-Upcountry Highway Project. Please consider the technical comments provided independently by other County agencies. However, insofar as a preferred alignment, the Maui County Administration recommends that the alignment for the proposed highway be the Haliimaile Road/Haleakala Highway Junction to Ka Ono Ulu Street alternative (also referred to as Alignment U1 - K1).

1 This recommendation is supported by policies in the adopted community plans for the regions of Makawao-Pukalani-Kula and Kihei-Makena. These community plans prescribe planning goals, objectives, policies and implementation considerations to guide decision-making in the regions through the year 2010. The community plans were adopted into law and are the official County policy guidelines for long-range planning actions.

- The Makawao-Pukalani-Kula Community Plan (Ordinance No. 2510 effective on July 23, 1996) supports the Kihei-Upcountry Highway as follows:

"The proposed highway between Kihei and the Upcountry region is significant in terms of its land use and transportation impacts. The 'no-build' alternative is the preferred option, but it is recognized that the selection of an alignment must consider the growth inducing impacts to the region's agriculture, rural character and open spaces. The need to maintain the unique Upcountry ambiance is an essential parameter in analyzing alternative routing schemes. Recognizing that the evaluation of alternatives should weigh transportation costs and benefits as well as community and land use impacts it is recommended that, if built, the highway's Upcountry terminus intersect Haleakala Highway in the vicinity of Hali'imaile Road."

- The Kihei-Makena Community Plan (Ordinance No. 2641 effective on March 6, 1998) supports the Upcountry transportation connection as follows:

"The need to provide a transportation link to the Upcountry area has been identified for some time. This would result in saving valuable commuter time between the primarily residential area of Upcountry and job centers within the Kihei region. Choosing the optimal route for this link will involve consideration of positive and negative impacts to both regions. The focus should be on improving transportation services for island residents; thus the route should minimize travel times for the maximum number of island residents."

In addition to consistency with policies in the County's adopted community plans, the recommended Alignment U1 - K1 reduces impacts on private and public school facilities, meets preferred engineering criteria for slope, is less intrusive with respect to archaeological sites, and is at the lower end of the cost estimates in comparison with other alternative alignments.

Mr. Abraham Wong  
September 22, 1999  
Page 3

In conclusion, this highway is needed to improve traffic conditions and will benefit the residents of the Upcountry and South Maui regions of Maui and the community at large. The proposed highway would also provide an improved connection between defense-related activities at the Maui Research and Technology Park in Kihei and Science City at the summit of Mt. Haleakala.

We appreciate the opportunity to comment on this important project and respectfully request your consideration of our recommended alignment. Please be assured that we are strongly committed to advancing this project forward.

Should you have any questions, please contact either myself or Mr. Calvin Nemoto, Senior Executive Assistant. Again, thank you for your support and assistance.

Sincerely yours,

JAMES "KIMO" APANA  
Mayor, County of Maui

RE: **Kihei Upcountry Maui Highway  
Draft Environmental Impact Statement Comments**

Dear Mr. Wong:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement for the Kihei Upcountry Maui Highway. At this time we have no comment to offer regarding the overall intent of the Impact Statement.

- 1 However, contained in the DEIS are several minor inaccuracies or typographical errors. Chapter Three, Page 56, Paragraph 3.11 makes a statement about the Kihei Aquatic and Recreation Center. The County of Maui recently completed a Community Center and Aquatic Center at this location. A Recreation Center was not included in this development. Page 54, Chapter Four, Paragraph 4.11, also makes a statement about the new Kihei Aquatic and Recreation Center. On Page Three of
- 2 Chapter Seven, the Mayor of Maui County is listed as James Akana. It should read James Apana.

Thank you for your attention to these matters. Should you have any questions or need of further comment, please call me, or Patrick Matsui, Chief of Parks Planning and Development at 808-270-7387.

Sincerely,

TO : THOMAS PHILLIPS, CHIEF OF POLICE, COUNTY OF MAUI  
VIA : CHANNELS  
FROM : BRADNEY HICKLE, POLICE OFFICER III, KIHEI CPO'S  
SUBJECT : KIHEI/UPCOUNTRY HIGHWAY DRAFT

*Ac [Signature] 9/16/99*

*M 9/15/99*

Sirs, the following is my recommendations and comments regarding the proposed Kihei/Upcountry Highways.

One point of interest on the draft that I would like to address is item S.2.6 Coastal Evacuation Capacity, page S-6.

1 The Draft for the Environmental Impact Statement points out the Kihei-Makena urban areas are vulnerable to coastal hazards such as tsunami and tropical storms. It further states, the only routes out of these areas are North Kihei Road and Mokulele Highway. This statement is not entirely true. First of all it doesn't even mention the Wailea area which includes the Maui Meadows community. In the event of a tsunami or tropical storm we have observed in the past North Kihei Road being closed due to debris and the ocean washing out the roadway. In reality this leaves us with only one evacuation route, Mokulele Highway for the entire Kihei/Makena/Wailea areas.

2 We have also observed in the past unnatural disasters such as fire and fatal motor vehicle accidents which have closed Piilani Highway at various locations for hours causing the South Kihei/Makena and Wailea traffic to be rerouted to South Kihei Road. These areas will already be congested in the event of a natural or unnatural disaster. We have observed that traffic during these incidents have slowed to a crawl thus endangering many lives in the Southern most areas of Kihei as well as Wailea and Makena.

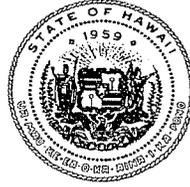

3 With this in mind, I would suggest that Wailea Iki Drive be extended to meet the Up-Country highway rather than Ke Alii Alanui road which already has it's share of traffic problems due to Kamalii Elementary School and Kananakui road. In the event of a disaster, parents will undoubtedly be rushing to the school to pick up their children which will add chaos to traffic flowing to this area. On the other hand, if Wailea Iki Drive (which is an existing four lane roadway) were to be extended up and around the east side of Maui Meadows. The Wailea, Makena and Maui Meadows residents as well as the hotel workers and island guests would have a clear route of evacuation to the Upcountry area without adding to existing or future problems involving traffic flow on South Kihei Road and Piilani Highway.

*Noted's  
Set from 2/9/99  
Refer address the  
Zone of evacuation the  
Traffic already addresses entire road  
highway issues, as stated by off. K. Dixon  
Makena CPO.*

Respectfully Submitted,  
Brad Hickle *[Signature]* E-9966  
09/13/99 1230 hours

Mr. Thomas M. Phillips  
Chief of Police  
Police Department  
County of Maui  
55 Mahalani Street  
Wailuku, HI 96793

1. Thank you for this information on the inadequacy of North Kihei Road as an evacuation route. There was no intention to ignore the evacuation needs of Wailea. When the EIS states "Kihei-Makena", it includes Wailea. The comment reinforces the need for South Maui to have increased evacuation capacity.
2. Thank you for this information. Depending on the location of the traffic incident or fire, Kihei-Upcountry Maui Highway would help mitigate the resulting traffic delays.
3. A Kihei terminus at Wailea Iki Drive was not considered. The suggested alternative is similar to Alternative 7 (see Section 2.2), which was eliminated because it had a poor benefit-cost ratio. Like Alternative 7, the suggested alternative's Kihei terminus would be located too far south to serve enough motorists to justify the cost of the highway under normal situations.

December 17, 2001

Aloha,

Subject: Kihei-Upcountry Maui Highway

Thank you for your comments on the Draft Environmental Impact Statement (EIS) for the proposed Kihei-Upcountry Maui Highway project. We appreciate your time and effort in providing these comments. We entered the planning process for this project in an open fashion and the amount of civic involvement has been truly overwhelming.

We have identified the U1, K1 alignment as the preferred alternative. The Upcountry terminus of this alignment would be at the intersection of Haleakala Highway/Haliimaile Road, and the Kihei terminus would be at the intersection of Piilani Highway/Kaonoulu Street. This decision was reached after full consideration of the project's transportation benefits (e.g., travel time savings, travel markets served), prior community planning processes, environmental and social impacts, construction cost, and the hundreds of comments generated through an extensive public review process.

The next step in the project development process is to begin the design phase. Several aspects of the U1, K1 alternative will receive more attention in the next phase of project planning, including mitigation to lessen the impact on agricultural areas, and other particulars, such as details on future intersections.

This letter transmits our responses to your comments on the Draft EIS whether they were provided in letters, pre-printed comment forms and/or oral comments at one or more of the project's three public hearings. Copies of your written statements are attached, and specific comments numbered. Responses to these comments are numbered to match the comment. If oral comments were provided, your comments were paraphrased for brevity. These comments are immediately followed by responses.

We will distribute the Final EIS for the project upon approval by the Federal Highway Administration. Copies of all Draft EIS comments will be part of the Final EIS, including transcripts of the oral comments provided at the public hearings. We will send you a CD-ROM copy of the Final EIS. If you prefer a hard copy of the Final EIS, please fill out the enclosed card and mail to:

Highways Planning Branch  
Advance Planning Section

Kihei Community Complex and Aquatics Center - September 29  
Mayor Hannibal Tavares Community Center - September 30  
by L. Douglas MacCluer**

Mr. Kazu Hayashida  
Director of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813

Dear Mr. Hayashida:

1

This is my written testimony regarding the Kihei-Upcountry Maui Highway Project. Since the original environmental impact statement was presented to the public, the new Kamehameha School has opened in the Upcountry area across the street from King Kekaulike High School. The King Kekaulike High School now has the twelfth grade added, which means that we have two schools that are growing and creating traffic problems in the Five-Tree area. When school starts in the morning, particularly on rainy days, traffic is terrible in the area proposed for U2-A and U2-B. These two proposed highway alignments will destroy much prime ag land, will create additional traffic problems, and provide few additional improvements over the U1 alignment. They should be discarded.

2

The alternative U1 terminates at Haliimaile Road. This gives us the opportunity to add a stop signal at this very dangerous intersection, and take traffic from Haliimaile Road and Upcountry to Kihei. Currently, it is almost impossible to make a left turn from Haliimaile Road in the morning. A&B is planning a subdivision in Haliimaile that will add to the traffic considerably. It is my opinion that the Kihei-Upcountry Highway should terminate at Haliimaile Road rather than at Five-Tree junction.

We appreciate your consideration.

Sincerely,

L. Douglas MacCluer  
Plantation Manager

Plantation Manager  
Maui Pineapple Company, Ltd.  
Haliimaile Division  
870 Haliimaile Road  
Haliimaile, HI 96768-9768

1. A U2-A or U2-B termini is not included in the preferred alternative. Nevertheless, the traffic volumes projected in the vicinity of the U2-A or U2-B termini were not anticipated to cause problems at the high school (see Section 4.4.1). Although these alternatives would have bisected two pineapple fields, in terms of total acreage take of active agricultural fields, they would have had less impact than the U1 alternatives.
2. The U1,K1 alignment was identified as the preferred alternative. Its Upcountry terminus at the Haleakala Highway / Haliimaile Road intersection will be signalized and include turning, acceleration, and deceleration lanes, which will enhance the safety of this intersection. The preferred alternative will enhance mobility for future residents of the A&B subdivision in Haliimaile.

**KAHU(REVERAND)CHARLES KAULUWEHI MAXWELL SR.  
157 ALEA PLACE PUKALANI, MAUI, Hawaii  
(808) 572-8038 Fax (808)572 0602 e-mail kale@maui.net**

**Aloha members of this committee,**

**My name is Kahu Charles Kauluwehi Maxwell Sr., a 37-year resident of Pukalani. I was born in Lahaina and raised in Kula. Was a past member of the Upcountry Community Advisory Committee and had addressed this issue of the placement for the upcountry road terminus.**

**My first preference was a highway that came up from Kihei that would enhance the drive to Upcountry and not "interrupt" the natural "vista" of the view plain that is enjoyed by motorist today. The road route should meander close by the Hawaiian Homes Project and terminate somewhere in close proximity to the Rice Park. The logic in using this route would be the fact that one would only have a hundred yards to excess the Kekaulike Highway. In doing so, the most direct route to Haleakala Crater would be achieved which is the actual intent of building the highway in the first place.**

**In our deliberations, the residents of Kekaulike Highway registered strong opposition to this recommendation because of the increase of traffic in their community.**

**The C.A.C. then came up with other suggestions on other routes for the upcountry terminus. Our first choice was "no build" and suggested that instead of building a new highway, Mokulele and Henson Road should be upgraded to improve traffic flow to Haleakala. After much deliberation, the Hali'imaile terminus was chosen.**

**After meeting several times with your committee, it is my understanding that "other upcountry terminus" has been selected.**

**First of all I would like to take issue with the archeological study that was submitted by the Cultural Survey Hawaii, on these additional**

routes. It really lacked spiritual and cultural information on very important burial caves, (sealed) and other archeological features that are contained in this area, which is rich in Pre-contact history and had they contacted the right people, the information would have been made available to them. I and others with intimate knowledge of information of this area were not contacted on the drafting of this report by anyone from Cultural Surveys Hawaii.

### ARCHEOLOGICAL INFORMATION ON THE UPCOUNTY ROAD TURMINUS

Before commenting on this very important aspect, I would like the committee to note the fact that the information that I am providing here will not be "exact site specific " but will have to be treated in somewhat a "general" description. There are people out there that are looking for burial sites to actually "steal its contents". Our records in the Maui/Lanai Burial Council have many incidents dealing with this type of desecration. These "grave robbers" are selling the artifacts and using our Iwi (bones) in their "crystal & Satanic New wave" rituals.

According to the late Dr, Kenneth Emory, this area of A'apueo, was most likely a place where the annual Makahiki were held. The time period would be the pre-contact (prior to 1778, Cook's arrival).

Having being raised in Pulehu (Kula area), the gulches in the, Oma'opio and A'apueo and its surrounding areas were our playground. The gulches in these areas were well known to contain many burial caves and numerous petroglyphs. We were always taught to respect what we saw and not to touch anything.

I would like to focus on the gulches in question that is the target of the proposed routes to be used as Upcountry terminus.

1 Both Kaluapulani and Kalialinui Gulches contain sealed burial caves, which are not even mentioned in the archaeological reports. I personally have information of 6 sealed burial caves in these gulches that are actually hidden by brush and rubble that have "gathered", affectivity hiding the entrances. The least problem I have is where the proposed highway crosses over the first gulch into Kula Malu as it relates to the location of the Burial caves on the bottom of the gulch.

1 | The highway route can be "placed" in an area that would not impact the burial caves.

2 | The biggest problem I have is where the proposed route "splits" from U-2-B and turns into U2-A which ends at the "5 "trees terminus. First of all when U2-A splits and enters Kalialinui Gulch, there are burial caves that are sealed and hidden. The proposed route then "passes" above the Heiau and that is a cultural and spiritual insult to have a highway impacting a sight such as this.

About 20 years ago, I was informed by Mrs. Lamadora (Kalani), who's family owned most of the property in the area, told me about the Heiau and burials within the area. She stated that her father informed her of the Heiau, which is in the back of her home. The people who lived in the area and passed by it respected the Heiau? When the Malama Group bought the property from the Phillips family, they were told that the "Heiau" was built by his grand father who "cleared" the area for farming. This fact was proved to be untrue when Mr. Joe Kennedy did an archeological survey and found that it was a bonafide Hawaiian Heiau and gave it a historical sight number, (State 50-50-10-2701).

In 1996 I was hired by Natalie Kiem, Vice-President of Malama Group to do further research work on the Heiau in question and see if a name could be ascertained for the Heiau. The name of \_\_\_\_\_ was found and according to documentation in the early 20's and 30's, it belonged to this site.

In 1997, I took Kahu David Kaalakea to the Heiau and after walking around the structure, his first comments were "Luakini". Meaning that it was a sacrificial Heiau. He noted that the 3 "pits" were used for offerings. It should be noted here that from all the types of Heiau that were constructed by our ancestors, the Luakini had the highest significance and stature among our ancestors.

Another incident that occurred in this area was the discovery of the only two wooden Ki'i (images) that were found in one of the gulches. The Ki'i are presently in special hermetically sealed display cases in the Bishop Museum.

The person who found the images had "donated" the images to the Bishop Museum on a "perpetual Loan" and when he passes away, they will know the cave that he obtain the images from. In relating his story on how he describes the finding of the images, it is very possible that it came from the area or corridors that we are talking about here.

The images that were found had its "private parts" intact, indicating that it had been carved before the missionaries arrived in Hawaii. It is very possible that it was hidden in the caves in the early 1800's when the ancient gods were defied and images were burnt. It appeared that the one of the images represented the pig god "Kamapua'a".

On page 3-54 of the CSH report, it mentions the fact that the site was surveyed and it is "no longer considered significant as a historic property". This is a perfect example of researchers who lack cultural sensitivity and spiritual awareness, and degrade the importance of a site which contain vast knowledge of the people that lived here a thousand years ago.

Having the full knowledge of the cultural importance this area contains; it would be a cultural insult to place a road or any structure close to this Heiau. It would be highly prized for preservation and restoration giving its history. Hui Ai Pohaku Inc., the Cultural Center located at Kula Malu has asked The Malama Group to acquire this Heiau for future restoration.

The burials, petroglyphs and other archaeological features in the surrounding area makes this Heiau a highly valuable pre-history site to our people, as an important link to our past. Should this committee chose this route that will encroach on the sanctity of the Heiau, be prepared for "MAUI'S H-3 HIGHWAY" protest. The route of U3 is also "studded" with numerous archaeological sites that are unregistered and have not been identified thus far. Based on known information and the fact that the "choice route" would be either U-2 A, U-2 B or U3. I would strongly recommend that U2 B be chosen because it would be the least encroachment on the existing sites in this entire area. The intersecting of the bridge or "crossing over the gulch" could be monitored by myself and personal that I work with who could consult with the engineers at the time the finale route is chosen. It is most important that special care be taken in an area such as this, which

contain special features that cannot be found on any other district on Maui. This area is called A'apueo, which is the name of a female goddess, an Aumakua (personal god), who still leaves and resides in this area. When we first went onto Hui Ai Pohaku (Hawaiian Cultural Center) located on Kula Malu, this owl appeared on the property in the early morning hours. For us as Kanaka Maoli, this is called Hoailono (the sign) and substantiates the fact our Kupuna (ancestors) exist on this land. No scientific method has been invented to document spiritual relevance of an area and that is what is lacking in the Cultural Survey Hawaii report.

Kahu Charles Kauluwehi Maxwell, Sr.  
157 Alea Place  
Pukalani, HI 96768

1. Thank you for informing us about the burial caves in Kaluapulani and Kalialinui Gulches in the vicinity of the U2-A and U2-B alignments. Neither a U2-A nor U2-B alternative was identified as the preferred alternative. Therefore, the burial caves you mention will not be affected by the project.
2. Thank you for sharing your knowledge about the heiau and burials in the vicinity of the Five Trees Intersection, and communicating your concern about how the U2-A alignment would adversely affect this very important archaeological and cultural resource. The U2-A alternative was not identified as the preferred alternative. Therefore, the heiau and burials in the vicinity of Five Trees will not be affected by the project.

DEPT. OF TRANSPORTATION  
HIGHWAYS DIVISION

SEP 30 10 40 AM '99

Dear Mr. Hayashida,

Re: Kihei to UpCountry Maui Highway - Pukalani Community Association

I would like to begin by thanking you and your staff, including the Maui office, for making available to the public, all the information concerning this Highway. At the last Pukalani Community Association meeting held at Pukalani Elementary School, Mr. Sariat was our guest speaker and gave us many insights as to what we might expect at each of the terminuses including topography, cost, anticipated problems, availability of traffic controls, some state and federal criteria concerning the steepness of grade for each of the terminuses, also commenting on the history and impacts of construction some of the terminuses and other projects past and upcoming (ie., the demise Ulupalakua Road to Makena, the demise of the first attempted 4<sup>th</sup> lane of Haleakala Highway, the resurrection of the 4<sup>th</sup> lane of Haleakala Highway and it's traffic control lights at Haliimaile, the intersections of this highway on Pulehu Road and Omapio Road, etc....). I think he did well, but there were many stumbling blocks or questions unanswered and that all seemed to be related to the absense of the Planning and Design people of this project, he said many times at this meeting, "I can't comment on that because planning takes care of that..."

1 Many comments by PCA members and guests that night seemed to center around the Planning an Design facets of this project. A guest at our meeting asked, "why aren't any of these terminuses designed to have overpasses or underpasses?" A member in the audience responded with, " look at what happened to to the Pukalani Bypass and Makawao Ave. Intersection" - that not until after 50 somewhat accidents including a fatality and amputation did the state finally put in traffic lights the public requested at the planning stages of that project. There are many concerns Mr. Hayashida we need your help.

2 There is another concern Mr. Hayashida, the planned DOT Hearing at the Mayor Hannibal Tavares Community Center in Pukalani is scheduled to be held on September 30<sup>th</sup>, this also the same date as the Maui County Fair and Grand Opening Parade. This was also the matter of much talk and comment at our meeting. Mr. Sariat did announce that this would be on the agenda at a meeting held in Honolulu, that the Department would probably not be able to cancel this September 30<sup>th</sup> meeting, but would schedule another Hearing and move up the October 14<sup>th</sup> deadline for final testimonies to the Final EIS, by at least a few weeks. Many of our families and children who belong to organizations will either be marching in the parade our manning the fundraising boothes. For example, Boy Scouts, 4-H groups, Kekaulike High School Band and Boosters, Sports Leagues, Womens Groups and many more. This would greatly improve the quality of information afforded to the residents of Pukalani. members of the Pukalani Community Association. and members of the Kula 200 Association(also part of Pukalani).

We predict a low attendance at this September 30<sup>th</sup> meeting. If the goals of these hearings are to inform the public, and to take testimonies from those who attend, then it is the best interests for all those concerned that the Pukalani Community Association requests another hearing to take additional testimonies and move the October 14<sup>th</sup> deadline for final testimonies for the final EIS.

The Pukalani Community Association requests a additional DOT Hearing and a rescheduling of the Final EIS October 14<sup>th</sup> deadline for testimony.

Your immediate attention is greatly appreciated.

Sincerely,

A handwritten signature in black ink, appearing to read "Aric Nakashima", followed by the date "9/27/99". The signature is written in a cursive style.

Aric Nakashima, President  
Pukalani Community Associaton  
151 Aulii Drive  
Pukalani, Maui Hi. 96768

ph. (808)572-1674

Mr. Aric Nakashima, President  
Pukalani Community Association  
151 Aulii Drive  
Pukalani, HI 96768

1. Several concepts for grade-separated intersections (i.e., interchanges) were considered for the U1 terminus, as described in Section 2.1.2 of the Final EIS. However, based on presently projected traffic volumes, the costs of these options are not justified considering their marginal benefits in relation to a signalized intersection, which costs substantially less. The U1 intersection will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards.
2. A third public hearing was held on October 13, 1999 because of community concern regarding the second public hearing's conflict with the County fair.

Mr. Aric Nakashima  
Pukalani Community Association, President  
151 Aulii Dr.  
Pukalani, HI 96768

Comment: Asks that the Department of Transportation address safety concerns regarding the intersection of Haleakala Highway and Pukalani Bypass in lower Pukalani.

Response: When Haleakala Highway is widened to four lanes, the Department will determine whether this intersection warrants a traffic signal.

Comment: Concerned about traffic impacts in Pukalani due to motorists accessing a U2-A or U2-B alignment through this neighborhood. Concerned that traffic accessing the highway would interfere with community cohesion.

Response: The U2-A or U2-B alternatives would not provide a direct connection between Kihei-Upcountry Maui Highway and Pukalani. Access to the highway would be from Haleakala or Kula Highways.

Comment: Concerned about the statement in Table S-1 of the EIS, "Implementation of community plans would affect existing communities by increasing population and traffic and have environmental impacts, such as agricultural encroachment," which the commentor believes to be an impact under the build alternatives.

Response: This potential impact is listed under the No Build alternative.

Comment: Requests grade-separated intersection to relieve traffic in Maui generally.

Response: Please see response to Comment #1 of your letter.

Comment: Will the intersection of Haleakala Highway and Haliimaile Road be signalized?

Response: The decision to place traffic signals at the terminus intersections will be made during the design phase, and would be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. For the U1,K1 Alternative, which was selected as the preferred alternative, both termini intersections will likely warrant traffic signals.

Comment: Concerned about safety at the lower intersection of the existing old Haleakala Highway and Pukalani Bypass, between U1 and U2-A.

Response: When Haleakala Highway is widened to four lanes, DOT will determine whether this intersection warrants a traffic signal.

Comment: Concerned about neighborhood safety if an access road is connected between Pukalani Terrace and the U2-A or U2-B alternative.

Response: If a U2-A or U2-B alternative were identified as the preferred alternative, there would have been no direct connection between Pukalani and the new highway on Liholani or any other street. Access onto the highway from Pukalani would be via Haleakala Highway, and Kula Highway under the U2-B alternatives. Private developers cannot connect to a State highway without permission, and Kihei-Upcountry Maui Highway is envisioned as a limited access roadway.

Re: Kihei-Upcountry Connector Highway

My family and I have lived in Makawao and Kula for 15 years. We feel very strongly that in considering the proposed highway the Department should honor and conform to the Kula, Makawao & Pukalani Community Plan ("Plan"), which was carefully wrought by the community, public boards and the County of Maui over many months of careful deliberation. The Plan is the law of Maui County and best reflects the wishes of its citizens. In other words, please improve existing roads, and if the connector must be built, terminate it at the Hali'imaile Road intersection (U-1).

A few vital considerations are:

A.) Safety of Maui People.

1. Choice of the Five Trees (U2-A) and Kulamalu (U2-B) termini would unnecessarily funnel much additional traffic from Olinda, Makawao, Haiku and Hali'imaile through the already overburdened Makawao Avenue and Five Trees intersections, and past King Kekaulike High School where 1400 kids walk and drive to school. Children will eventually get killed by an impatient driver. Hali'imaile will not create a safety problem.
2. We already have too many steep roads which promote excessive speed and accidents; take notice of the number of speed control humps which are installed upcountry. The Five Trees and Kulamalu termini will require slopes much greater than federal or state safety limits of 7% to 8% grade. Serious accidents will result if this hazardous condition is created. The Hali'imaile terminus, by contrast, will have a safe 4.5% slope.

Convenience.

4

1. The best point-to-point commuting link for the community will be Hali'imaile intersection because Pauwela, Haiku, Hali'imaile and Makawao residents can use three major streets -- Makawao Avenue, Makani Road and Hali'imaile Road -- to access Haleakala Highway and the new connector highway. With the Hali'imaile intersection improvements, all will be safe, convenient and direct routes. By contrast, the Five Trees and Kulamalu termini will force Pauwela, Haiku, Hali'imaile and Makawao residents to drive mauka to ultimately arrive makai. It will also force these people to drive needlessly through three to four crowded intersections at Hali'imaile, Makawao Avenue, Five Trees and Kulamalu to access the connector road.

5

2. Many Upcountry residents drop and pickup children, shop and get their daily household services from upcountry schools, merchants, doctors and commercial businesses. Much of the resulting traffic uses Lower Kula Highway and the Five Trees intersection. The Kulamalu and Five Trees termini will focus and funnel traffic through these already crowded intersections and 20-mph zones. This will needlessly create additional traffic jams and delays and will negatively impact the quality of life for upcountry residents.

B.) Cost.

6

1. Please consider the cost in human suffering, and personal and property damage to people of creating the unsafe conditions (see A1 and A2 above) of the Five Trees and Kulamalu alternatives. Remember when, as a cost saving measure, traffic lights were not installed on the bypass highway at Makawao Avenue. Nine major accidents happened in four months. The lights were only then installed. The analysis of costs of the alternative must include estimating the costs of accidents.

7

2. Also, should the Department choose the Five Trees or Kulamalu termini, legal challenges will likely be forthcoming because of the violation of the Community Plan and because of payoffs and commissions paid to state officials by Sports Shinko and/or Everett Dowling, and because of the State of Hawaii's liability for creating unsafe conditions (See A-1 and A-2 above). These costs should be taken into account.

In summary, the Plan which represents the carefully considered wishes of the community should be honored, and if the connector is built, it should terminate at Hali'imaile Road.

Thank you for your consideration.

Sincerely,

Paul J. Meyer

PJM:lt

Mr. Paul J. Meyer  
240 Hoopalua Drive  
Makawao, HI 96768

1. The recommendations contained in the Makawao-Pukalani-Kula Community Plan were heavily weighted in identifying the preferred alternative, U1,K1. However, other factors beyond conformance with the Community Plan were also considered, such as cost, environmental impacts, and transportation benefits.
2. The Upcountry terminus of the preferred alternative will be at the Haleakala Highway / Haliimaile Road intersection. Had a U2-A or U2-B terminus been identified as part of the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would have included crosswalks and sidewalks to the high school (see Section 4.4.4 of the Final EIS). Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
3. Only the U2-B alternatives would have exceeded the grade standards for a limited access highway. All of the other alternatives would have met accepted design standards.
4. As described in Section 4.4.1 of the EIS, and as you note in your letter, the U2-A and U2-B alternatives would cause the contra-flow of peak directional traffic in Upcountry. For example, Pauwela, Haiku, Haliimaile and Makawao residents would drive mauka to access either the U2-A or U2-B terminus. This traffic pattern change is in fact viewed as beneficial, not detrimental. Since commuter traffic tends to peak during certain times of the day (i.e., early morning and late afternoon), arterial roadways tend to be over-utilized in one direction and under-utilized in the other direction, with the pattern reversed during the other peak period. A benefit of the U2-A and U2-B alternatives, and to a lesser extent the U3 alternatives, is that they would cause the "directional split" of the traffic in Upcountry to be more even during peak conditions.
5. As described in Section 4.4.1 of the EIS, traffic at the U2-A or U2-B terminus, the Five Trees intersection, is projected to operate at a level of service B (delays in the range of 5 to 15 seconds per vehicle) during the morning and afternoon peak hours. This includes various trip purposes mentioned in the comment. Therefore, traffic jams and delays in this area are

not anticipated, even after accounting for the various types of trips mentioned in the comment.

6. A firm commitment to place traffic signals at the termini will be made during the design phase, based in part on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. Additionally, the experience of Pukalani Bypass will be considered.
7. The Department of Transportation is not under a legal obligation to select a U1 alternative simply because it is the preferred option in the Makawao-Pukalani-Kula Community Plan. The Department of Transportation treats community plans as advisory only, but in this case, the community plan was given substantial weight.

The Department of Transportation is unaware of payoffs and commissions paid to State officials by Sports Shinko and/or Everett Dowling. If the commenter has evidence that improprieties have occurred, these should be reported to the appropriate authorities. If these allegations are rumor only, they should not be spread within the context of the environmental review process.

Finally, the Kihei-Upcountry Maui Highway will not be an unsafe facility regardless of the alternative implemented. Multiple layers of review and oversight exist to ensure that the highway fully complies with applicable standards.

RE: Draft Environmental Impact Statement (DEIS) for the Kihei-Upcountry Maui Highway Project No. HDPS-9203(1)

Dear Mr. Hayashida:

Thank you for this opportunity to provide comments on the Draft Environmental Impact Statement for the Kihei-Upcountry Maui Highway Project No. HDPS-9203(1). My name is Stephen Holaday, General Manager of Hawaiian Commercial & Sugar Co., speaking on behalf of A&B. As you are aware, HC&S cultivates 38,000 acres of sugarcane and has been a major employer here on Maui for over 125 years, currently employing approximately 1,000 Maui residents, including our sister company Kahului Trucking & Storage which hauls HC&S sugar.

1 I would like to first summarize our position on the proposed roadway and then follow up on details of our analysis on the DEIS. A&B supports the idea of a Kihei-Upcountry road. However, if the Haliimaile route is chosen, there will need to be substantial initial, as well as ongoing mitigation to compensate HC&S for the impacts on its operations.

2 As you are aware, A&B has participated in the various informational processes provided by DOT since the inception of this project. Our comments and testimony relating to this proposed highway project since 1995 have consistently pointed out which alternatives will impact HC&S' operations and have highlighted the lack of information and recognition regarding mitigative measures for these impacts. We are pleased to see that the DEIS now recognizes the need for mitigative measures such as underpasses, modifications and reconstruction of existing irrigation and drainage systems, and the need to prepare a "Maintenance of Cropland and Ranching Activities Plan". However, we believe that it is necessary to prepare that plan prior to the design phase as we anticipate that many of the mitigative measures necessary to keep the agricultural entities "whole", will be significant, both in terms of logistics, cost, and compensation, thus having a far greater impact on alternatives and therefore, on the decision-making process.

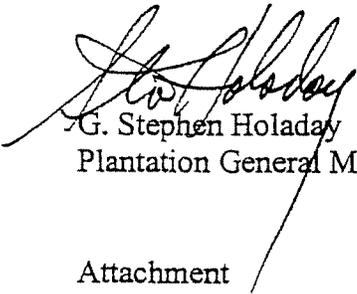

2 We request that, at a minimum, a draft "Maintenance of Cropland and Ranching Activities Plan" be prepared and be included as part of the DEIS. We would also request that HC&S again be consulted, as a resource on the type of mitigation that will be necessary to make HC&S whole for the various routing alternatives being considered. We offer Attachment 1 to this testimony as a summary of the kinds of impacts that should be addressed in the DEIS or the "Maintenance of Cropland and Ranching Activities Plan".

Again, if the community determines that it wants a road, then A&B will support the community. If the community determines that the Haliimaile route is the most desirable, then substantial initial and ongoing mitigation for the impacts on HC&S' operations must be built into the project. We would further hope for continued community understanding of the farming impacts, i.e. dust, ash, etc., should this road be sited amidst our canefields.

We look forward to continued discussions with DOT and its consultants on the proposed highway project. It is our belief that a roadway can be built which will benefit the people of Maui County, the State of Hawaii and serve the national interest.

Thank you for this opportunity to express our concerns on this issue.

Sincerely yours,

  
G. Stephen Holaday  
Plantation General Manager

Attachment

cc: M. J. Ching

Mr. G. Stephen Holaday  
Plantation General Manager  
Hawaiian Commercial & Sugar Company  
P.O. Box 266  
Puunene, HI 96784

1. Since U1,K1 Alternative was identified as the preferred alternative, HC&S will be compensated for right-of-way acquisition. Additionally, adverse impacts to agricultural operations are acknowledged, as described in Sections 4.2.1 of the EIS, and will be mitigated in coordination with HC&S as described in Section 4.2.4.
2. The Maintenance of Cropland and Ranching Activities Plan will be prepared during the design phase because the level of engineering needed to develop this plan has not yet occurred. The magnitude of the mitigation measures would be substantial, and the Department of Transportation is committed to working closely with HC&S during the development of the plan. However, funding for the design phase will not be available until the completion of the environmental process.

DIRECTOR'S OFFICE  
DEPT. OF  
TRANSPORTATION  
OCT 5 10 56 AM '99

Kazu Hayashida  
Director of Transportation  
DOT, Highway Division  
869 Punchbowl St.  
Honolulu, HI , 96813

Dear Mr. Hayashida:

We are expressing our concern about the Kihei/Upcountry route. We feel that any new highway on Maui must make provision for parking for car-poolers. We also feel that the Upcountry terminus, if made at Hailemaile, would actually encourage MORE car-pooling. It would be much more convenient for residents of Haiku, Makawao, and Pukalani than the other proposed routes.

1

Population is increasing at a rapid rate in the Upcountry Community. The primary benefit of sharing rides will be the lessening of traffic and provision of rides for those without transportation. The second benefit is a cleaner environment.

Currently there is no legal parking available upcountry for people who are involved with Sharing rides. A park and ride area in Hailemaile would really help the working people from the Upcountry area.

The decisions made at this time are really important and we request your consideration of these suggestions.

Sincerely,

Betty J. Syfers  
340 Liliuokalani St.

1. As a matter of policy, the Department of Transportation supports ride sharing because it leads to more efficient use of roadway facilities. Therefore, the Department appreciates your suggestion for a park-and-ride facility. Most of the programs to encourage ride-sharing are on Oahu. These programs include park-and-ride lots operated by the City and County of Honolulu for TheBus system, high occupancy vehicle lanes, the "zipper" lane on the H-1 Freeway and a vanpool program. Although the project definition does not at present include a park-and-ride facility, if the County of Maui or another entity is interested in developing such a facility, the Department would be glad to participate in the planning. In the meantime, the Department encourages you to contact County officials to express your views, as the County is the more likely implementing agency.

RE: Proposed new Kihei-Upcountry highway

Dear Sir:

1 Why do we need a new highway that will cut through the heart of Maui? I am opposed to this highway because I think the money could be better spent improving Haleakala Highway to four lanes, as well as Mokulele Road and Hansen Road. These three roads are all extremely dangerous and need to be improved as soon as possible. Can't we use this Federal money to improve these roads instead of building a new one? Getting to Kihei from upcountry is not really all that time-consuming. It's just dangerous.

Improving Haleakala Hwy, Mokulele, and Hansen Roads would solve most of the problems. Piilani Highway in Kihei also needs to be four lanes. Traffic would then run smoothly and we wouldn't need this new road.

I live in lower Kula and the traffic is already a nightmare due to the King Kekaulike High School and the new Dowling mess. Please do not compound all of this congestion and frustration by adding new danger to an already dangerous situation.

People live in Kula because it is quiet and rural. A new highway from Kihei right into the heart of our community will change all of that forever. Please listen the the people who live in this area and DO NOT even consider putting that road anywhere near lower Kula. If you have to build a new road, then Haliimaile is the only choice that makes sense.

LISTEN TO THE COMMUNITY, PLEASE!!!!

Sincerely,

Cindy H. Schenk

Ms. Cindy H. Schenk

Pukalani, HI 96768

1. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala and Mokulele Highways. However, as discussed in Chapter 1 of the EIS, these planned improvements would not address all of the project's purposes and needs.

RE: Alignment of new Kihei-Upcountry Highway

Dear Sir:

I am a resident of Pukalani and am gravely concerned about the location of the upcountry terminus of the proposed new highway. Traffic is already crowded and dangerous on Lower Kula Highway around King Kekaulike high school. Please do not add to this problem by bringing a major highway up to this area.

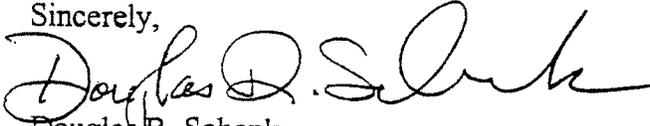

I STRONGLY URGE you to put the terminus at the Haliimaile intersection and install a traffic light. This will prevent further danger to the children of King Kekaulike High School and all of those who travel the lower Kula road every day.

Ending the highway at Haliimaile will also allow residents of East Maui to use the new road to get to Kihei. It makes no sense to route all of this traffic through lower Kula. It is a huge mistake to even consider it.

The majority of residents, through the Pukalani and Kula Community Associations have asked that the terminus be located at Haliimaile. It would be a major mistake and a huge underestimation of the upcountry residents' resolve for the State to ignore the voice of the people. This would bring disappointment, contempt, and traffic accidents.

I STRONGLY URGE YOU to LISTEN and put the upcountry terminus at HALIIMAILE.

Thank you .

Sincerely,  
  
Douglas R. Schenk

Mr. Douglas R. Schenk  
372 Hoopalua Drive  
Pukalani, HI 96768

1. The intersection of Haleakala Highway and Haliimaile Road is part of the project's preferred alternative as the Upcountry terminus. Most likely this intersection will warrant traffic signals.

RECEIVED  
OCT 7 1 29 PM '99  
DEPT. OF TRANSPORTATION  
HIGHWAYS DIVISION

Dear Mr. Hayashida:

We would like to stress the importance of putting in a highway to connect Kihei and Upcountry Maui. 1) For safety as an alternate evacuation route in case of fire or natural disaster; 2) to relieve traffic congestion; 3) to save natural resources; 4) to connect the Maui High Tech Park with Science City on Haleakala.

Kihei needs an alternate route in and out of this heavy traffic area. There are frequent accidents, and a bad accident can close the road in and out of Kihei. Traffic is often deadlocked from even a minor accident.

1 | If there was a more efficient route upcountry it would use gasoline resources more effectively. I would prefer a four lane road. If you put in a two lane road you will have commuters en route to work competing with, and passing, large slow trucks. This would create a hazardous situation. At minimum there will need to be slow traffic turn outs for large trucks and equipment headed up to Haleakala.

I do not support a route to Ha'ilemaile, or the route which would place traffic at the King Kekauleke High School intersection.

Maui is in desperate need of logical, planned roads designed by professional traffic planning engineers. Please support the road construction in any way you can. I hope we don't miss the opportunity to obtain federal funds to improve the traffic flow on Maui. Thank you for your consideration of our viewpoint.

Warmest Regards and Aloha,

1. Although right-of-way will be acquired for a four-lane highway, the initial construction of a two-lane highway is proposed because traffic projections indicate that two lanes will be sufficient to accommodate travel demand in the design year, 2020. During the design phase, measures to facilitate automobiles passing trucks, such as turn-outs or passing lanes, will be evaluated.

Re: Kihei to upcountry Highway

Dear Mr Hayashida:

Do NOT build the connecting road.

There is not adequate water to support the inevitable development that will occur in the upcountry if the road is built.

Dry spells and mandatory water rationing are already part of life in upcountry. A new road would quickly double the population and make a bad situation intolerable. Supporting evidence is included from the Honolulu Advertiser Newspaper.

By Edwin Tani  
ADVERTISER MAUI COUNTY BUREAU

**MAKAWAO, Maui** — Upcountry Maui continues to be one of the fastest-growing regions in Hawaii, even though periodic droughts force homeowners to cut back on use of water.

From 1970 to 1990, the population of the region nearly tripled, from 8,314 to 21,618. Dry spells are just one of the things you learn to live with.

Last week the Maui Board of Water Supply lifted a mandatory 25 percent cutback for Upcountry residents and businesses that had been in place since July.

"We kind of get used to it," said Kula teacher Judith Fukuda, of this summer's mandatory cutback.

The Upcountry surface water system depends on rainfall. When rains stop, so does the water flowing in streams across Haleakala's slopes from Waikamoi to the Hanawi natural area reserve.

With normal trade-wind conditions, Hanawi gets an average of 365 inches of rain a year. Some years, there is less. Garrett Hew, manager for the East Maui Irrigation Co., said rainfall appears to occur in cycles.

Reports since 1970 support this idea. In the years 1973-74, 1984-85, 1991-92, 1995-96 and 1998-99, consumers were ordered to cut water use. In 1984 and 1992,

cloth, chanted sutras with three  
priests from the Kyoto grand  
temple of Chion-in while incense  
was passed among the partici-  
pants. An attendant in a black  
robe fought the strong ocean  
breeze as he held a beach um-  
brella over Maki.

Some in attendance sat with  
eyes closed and palms pressed in  
prayer. Others used a plastic fan  
to shield their eyes from the sun.

Afterwards, the tank was car-

ried to the beach and the fish  
freed before a crowd of curious  
onlookers.

Gensho Hara, a minister at the  
Jodo Mission of Hawaii, said the  
act offering thanks to the sea  
symbolized "the importance of  
life."

Teruto Soma, 72, of Manoa,  
who attended the ceremony,  
called it unique. "The celebration  
makes people aware of the envi-  
ronment and nature," he said.

The Jodo sect also has mis-  
sions in Los Angeles and Brazil.

guide them. But Kawaharada said  
using the sea birds as a guide could  
pose a problem, as Rapa Nui's bird  
population has decreased after a  
hawk was introduced on the island  
to control rats.

Another challenge that Kawaharada mentioned is finding the  
11-mile-by-10-mile Rapa Nui  
where the highest elevation is  
about 1,700 feet. He said the canoe  
needs to be within about 20 to 40  
miles to spot the island, even on  
clear day.

About 2,000 people live on Rapa  
Nui. When Hokule'a spots it, 30  
Kamehameha Schools students  
hope to be there. The students will  
be traveling to Rapa Nui and Tahiti  
from Oct. 9 to 31 to conduct scien-  
tific research and greet the crew.

While at Rapa Nui, the students'  
activities will include performing  
at community venues, participa-  
ing in a reforestation program and  
telecommunication with Hokule'a.

## Water: Wells seen as one solution

FROM PAGE B1

the Hawaiian Commercial & Sugar  
Co. laid off field workers because  
there was no water for replanting  
sugar cane.

Maui Water Director David  
Craddick said the board needs to  
develop new sources to alleviate  
the inevitable dry spells. Putting in  
new wells in East Maui could solve  
the problem for about \$60 million,  
he said.

The board built a 100-million-  
gallon reservoir at Kahakapao in  
1994 that more than doubled stor-  
age capacity. But it's not enough  
for dry spells that stretch over four  
or five months, much less for  
droughts that stretch over years.

The three reservoir systems  
currently can store 180 million gal-

lons, only a 30-day supply even  
when users cut down to 6 million  
gallons a day.

Craddick is reviewing plans for  
another 100-million-gallon reser-  
voir, probably costing more than  
the \$10 million spent for Kahaka-  
pao.

But he really would like to devel-  
op more wells tapping ground  
water in the East Maui watershed.  
Studies indicate the entire water-  
shed could provide more than 200  
million gallons a day. The two  
nearest aquifers, in Haiku and  
Honopou, have an estimated  
capacity of 60 million gallons a  
day, and aquifers would supply  
water whether or not it's raining.

The Water Board this year  
received approval to use four wells  
in the Haiku area, including three

where the water was found to be  
contaminated with the pesticide  
DBCP.

This month the board agreed to  
a settlement with the chemi-  
cal companies that manufacture  
DBCP. The companies will cover  
the costs of cleaning the chemical  
out of the drinking water.

With the wells, Craddick said the  
Upcountry system has about 3.5  
million gallons a day available.

"Even if we didn't do anything  
else, we have half of the water we  
need for existing customers," he  
said.

He has plans for developing  
additional wells in the East Ma-  
ui watershed, although they are likely  
to face legal challenges because  
water would be taken from one  
region to another.

1. The amount and pace of residential development in Upcountry is controlled by water availability. Maui County will not allow substantial new urban development in Upcountry as long as water supply constraints persist, even though Upcountry is a popular residential area. Therefore, it is not expected that the project would induce urban growth in Upcountry in addition to growth that would occur without the project.

RE: Kihei-Upcountry Maui Highway project

Aloha:

The Kula 200 Community Association (by an almost unanimous vote) would like to go on record supporting the Haliimaile Road terminus (U1) as the connecting point for the proposed Kihei-Upcountry Maui Highway. We will not be making any comment on the Kihei terminus as we believe that should be decided by the Kihei community. We believe that it is the responsibility of each community to address the issues which affect them directly. So for us to address the Kihei end of the road would be most presumptuous.

We believe that if this road is to be built, then it should be where the most open space allows for the proper construction of this new highway. It should not be squeezed into an already crowded corridor, such as Five Trees or Kulamalu. Many of us travel the Kula Highway between our community and Five Trees during the school traffic and know just how congested this area is already. Bringing the additional traffic from Pukalani, Makawao, and Haiku up to this area would only serve to add to the hazards already in the area with the students, parents and tourists already mixing it up in this traffic. On a daily basis, we watch students darting between cars as they cross the highway on foot because their parents will not sit and wait for their chance to turn left into the King Kekaulike High School driveway. And, adding additional lanes is not the answer, as it would only increase the number of problems by creating a tremendous amount of lane crossing and left and right turns within this short stretch of road. This would create additional safety concerns for the drivers heading to/from work, students going to/from school, parents dropping off/picking up their keiki, and tourists driving up/down Haleakala and Kula Highways.

The other consideration would seem to be the infrastructure which already exists for traffic heading up and down Haleakala Highway from Kula, Pukalani, Makawao, and Haiku. There are feeder lanes from Pukalani, Makawao and Haiku which line up the traffic in a somewhat systematic fashion for the terminus at Haliimaile. We simply can't imagine all of this traffic merging into the half-mile corridor from Makawao Avenue to Five Trees or Kulamalu. This traffic would be joined by traffic from Kula which will be trying to make left hand turns as all of the other traffic is trying to turn right.

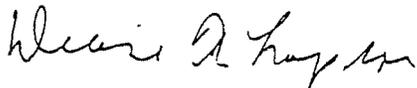

If all of the above is confusing, it may be because it is. And, this is just trying to describe the situation! You really have to live in our area and be a part of the congestion which has already been created here to see just what has happened to the peace and quiet of Upcountry we all sought when we moved here.

To recap:

- 1 | 1. We are concerned for the safety of our children, all drivers, and tourists as they must travel through the Five Trees intersection if the Upcountry terminus is anywhere other than Haliimaile.
- 2 | 2. We believe the open space of the Haliimaile terminus offers much more opportunity for the construction of a proper intersection given the amount of traffic which will be using this new highway from the various Upcountry communities.
- 3 | 3. A terminus at Haliimaile will allow for tourist traffic to go on to easily visit the tourist-related businesses in all Upcountry communities without making every vehicle go through the already congested Five Trees intersection to get to their connecting roads.
- 4 | 4. The traffic flow is already heading from all Upcountry communities to/from Haliimaile from the various feeder roads.

Attached please find the signatures of our members who wish to be counted as agreeing with the opinion of those who attended our recent meeting and discussed this matter in much detail.

Thank you for your consideration of our position regarding the proposed Upcountry terminus and its impact on our community and quality of life.

Diane T. Logsdon,  
President

cc: Senator Daniel Inouye  
attachments: signature pages from our members

RECEIVED  
STATE DEPARTMENT  
OF TRANSPORTATION  
OCT 18 11 41 AM '99  
HIGHWAYS DIVISION  
PLANNING BRANCH

Ms. Diane T. Logsdon  
President  
Kula 200 Community Association  
P.O. Box 880668  
Pukalani, HI 96788

1. The safety of an Upcountry terminus at the Five Trees intersection is less relevant now because of the identification of U1,K1 as the preferred alternative. However, even if the Five Trees intersection had been the proposed Upcountry terminus, the safety of students, drivers and tourists would not have been compromised because mitigation measures, such as crosswalks, sidewalks, traffic signals, and intersection channelization would be provided. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
2. All proposed termini assessed in detail in the Draft EIS (U1, U2-A, U2-B and U-3) would have enough open space to construct proper intersections.
3. Traffic conditions at the U2-A terminus, the Five Trees intersection, are projected to operate at a level of service B (delays in the range of 5 to 15 seconds per vehicle) during the morning and afternoon peak hours. Therefore, congestion at this intersection is not anticipated if a U2- A alternative were selected as the preferred alternative.
4. One of the benefits of the U2-A and U2-B alternatives and to a lesser extent the U3 alternatives would be that they would cause the contra-flow of peak directional traffic in Upcountry. For example, Haliimaile and Makawao residents would drive mauka to access either the U2-A or U2-B terminus if one of these alignments had been identified as the preferred alternative. Since commuter traffic tends to peak during certain times of the day (i.e., early morning and late afternoon), arterial roadways tend to be over-utilized in one direction and under-utilized in the other direction during the peak periods. The U2-A, U2-B or U3 alternatives would have caused the directional splits of the highways in Upcountry to be more even, thereby enhancing the efficiency of the roadway system.

Comment: Kihei-Upcountry Maui Highway would cause urban development in Upcountry, causing the loss of the Upcountry character.

Response: The amount and pace of residential development in Upcountry is controlled by water availability. Maui County will not allow substantial new urban development in Upcountry as long as water supply constraints persist, even though Upcountry is a popular residential area. Therefore, it is not expected that the project would induce urban growth in Upcountry in addition to growth that would occur without the project.

RE : Maui : Kihei/Upcountry Roadway

Dear Mr. Hayashida,

Thank you for consideration of building another road on the island of Maui. The Maui Hotel Association had asked each of its members to address this question with our employees. We pooled our employees and their concerns are not with a roadway from Kihei to Upcountry but another roadway out of Lahaina. They wonder why the Lahaina bypass road is not completed. They wonder why Honoapiilani Highway has not been improved to add lanes. A by pass road was built in Kihei 10 years or more ago but Lahaina does not have one and Lahaina is a community that has been around paying taxes much longer than Kihei.

1 The chief complaint I hear from our employees and guest is the drive to and from Napili. The first topic of conversation in the barbershops is the traffic. Drugs, Crime, wars, and politics do not dominate the conversations. Everyone keeps track of how long it takes to get anywhere and why hasn't anything been done to make improvements.

Mr. Hayashida, please consider moving the priority of road improvements on the West Side of Maui. Last night it took my employees between four to six hours to get home. Guests were stranded on both sides of the island. We need attention and help.

Sincerely,

Steve Wendel, CHA  
General Manager

1. The Department of Transportation is aware of the transportation problems in West Maui. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department is planning to widen certain sections of Honoapiilani Highway and construct a Lahaina bypass road, as indicated in the latest Maui Long-Range Land Transportation Plan (February 1997). The West Maui projects remain a top priority for the Department.

Kazu Hayashida  
Director Of Transportation  
DOT, Highways Division  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida,

We are writing to express our distress over the possibility of a Kihei-Upcountry bypass road. We are Kula residents and like the majority of the residents up here we have moved here because we like the rural setting. We like the quiet and relatively safe environment that we live in here and feel that the bypass road will drastically affect our quality of life. We are strongly against the development of this bypass road.

Unfortunately, we think that the people who are for the bypass road either don't care or are unaware of the long term effects that this road will cause. Those who live upcountry but want to shave off a few minutes of commute time to work on the south side aren't considering that the road will greatly increase the traffic and congestion in their home area. As it is, we don't have adequate water to supply our existing upcountry population. We were on mandatory water restriction for 4 months this summer (that's 1/3<sup>rd</sup> of the entire year). Kihei is a tourist area which is urbanized. It has many restaurants and bars and a higher incidence of drugs and crime. By putting in a bypass road you will be making a direct pathway for these things to invade our community. Kula's crime rate is very low and we would like to keep it that way.

Even if someone was to offer to put in the road for free we would still be against it. If our state/fed government considers any kind of highway building/improvements, it should be on the existing roads which are inadequate and unsafe.

We beseech you to stop pursuing the upcountry bypass road and focus on the more immediate concern of making the existing roads safer.

Sincerely,

Alan and Malia Song

Mr. and Mrs. Alan and Malia Song  
535 Lower Kimo Drive  
Kula, HI 96790

1. As described in Section 4.3.3 of the EIS, the Upcountry police officers could not speculate whether the proposed highway would cause an increase in crime rates. Absent an opinion from the police, it is difficult to provide an objective analysis of this concern.

Re: Kihei-Upcountry Highway, Maui, Hawaii

Dear Mr. Hayshida:

I am in agreement with the Kula Community Association Board of Directors which opposes the Pulehu, Kulamalu and "5 Trees" termini of the proposed Kihei to Upcountry Maui highway. I support the upgrading and improving of the existing roads connecting Kihei to Upcountry, Maui being Piilani Highway, Mokulele Highway, Hansen Road and Haleakala Highway to alleviate growing traffic concerns. If a Kihei to Upcountry, Maui must be built then the Haliimaile terminus is the best possible option as it will facilitate transportation between the Haiku region as well as the Kula region and Kihei.

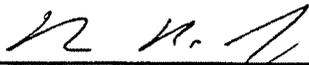

1 | The less than half mile stretch between the Kulamalu and "5-Trees" termini are patently bad engineering choices as that location is already congested and will become more so in the future. There is one public high school, King Kekaulike, that has its access at that location which has not even been fully built out at this time. There are the new Kamehameha Elementary and High Schools that are under construction that will use that location for their access. There is the unbuilt Kulamalu Subdivision that will use that location for its access with in excess of 400 new homes and that location is already the intersection for the upper and lower Kula roads as well as the Old Haleakala Highway. To even consider having yet another major road terminating at that location is almost unbelievable.

2 | It also seems to be the height of governmental arrogance to consider these termini in the face of the opposition of the Kula Community Association which developed its position based on surveys of the

Kula Community Association

Mr. Brian Jenkins  
221 Ululani Road  
Kula, HI 96790

1. As indicated in Section 4.4.1 of the EIS, congestion would not be anticipated at the U2-A or U2-B terminus despite the development indicated in the letter, which was included in the analysis of travel demand. A U2 (A or B) alternative was not identified as the preferred alternative.
2. Consideration of different alternatives is required under the National Environmental Policy Act and Chapter 343 of the Hawaii Revised Statutes (the State EIS law). These laws require the assessment of all reasonable alternatives. While community sentiment is an important consideration, community opposition alone is not a sufficient reason to exclude an alternative from consideration. The eight alternatives studied in the Draft EIS were all viable alternatives because they would address the project's purposes and needs without substantial environmental impacts. The alternatives are different, however, in terms of their cost, transportation performance, environmental impacts, and public acceptance. These four factors were among those considered in identifying the preferred alternative, the U1,K1 alignment.

Kazu Hayashida, Director  
State of Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813

Dear Mr. Hayashida:

**Subject: Kihei-Upcountry Highway Draft Environmental Impact Statement (EIS)**

I would like my comments on the Draft EIS to be of two kinds:

- a) three general comments; and
- b) specific comments on the document itself.

I expect that the Final EIS will address both my concerns and questions.

**GENERAL COMMENTS ABOUT THE EIS**

1. For a major highway project, the Final EIS should reflect and respect the legally adopted County of Maui General Plan 1990 (as amended by Ordinance No. 2234 on April 23, 1993). Specifically, I urge the Federal and State DOT to note the following provisions:

With regard to transportation, the County of Maui's General Plan clearly states as Transportation objective #3:

"To develop a Maui County transportation system linked to land use planning that is **less dependent on the automobile** as its primary mode of moving people." Note: **Bold** is mine.

To achieve this objective the Plan offers the following policies:

"c. Direct economic development toward existing communities in order to **minimize employee commuting** and foster a healthy job/housing balance."

"f. Support and expand programs to **reduce automobile dependent employee commuting** for hotel, commercial and industrial projects." Note: **Bold** is mine.

The Draft EIS improperly ignored this portion of the County of Maui General Plan 1990.

2. In the Final EIS the Federal and State Departments of Transportation should also reflect and respect the legally adopted (July, 1996) Makawao-Pukalani-Kula Community Plan. Specifically, I urge the DOT to note the following Community Plan provisions:

2

Page 31 “Transportation Objectives and Policies

2 *“Give priority consideration to the **“no-build”** alternative of the proposed Upcountry-Kihei connector highway, and give secondary consideration to the alternative routes with the least negative impact to the Upcountry lifestyle and character by locating the Upcountry terminus in the vicinity of the intersection of Hali’imaile Road and Haleakala Highway.”* Note: **Bold** is mine.

Page 13 “Interregional Issues

3 *“Kihei-Upcountry Highway: The proposed highway between Kihei and the Upcountry region is significant in terms of its land use and transportation impacts. **The “no-build” alternative is the preferred option**, but it is recognized that the selection of an alignment must consider the growth inducing impacts to the region’s agriculture, rural character and open spaces. **The need to maintain the unique Upcountry ambience is an essential parameter in analyzing alternative routing schemes**. Recognizing that the evaluation of alternatives should weigh transportation costs and benefits as well as community and land use impacts, it is recommended that, if built the Highway’s Upcountry terminus intersect Haleakala Highway in the vicinity of Hali’imaile Road.”* Note: **Bold** is mine.

Page 18 In the Land Use section, the Plan states in Objectives and Policies #4

4 *“Encourage land use patterns which will maintain a separation of character between the Upcountry and the Kihei-Makena regions.”*

3. At the upcountry end of the proposed highway lies Kula. The long-standing position of the Kula Community Association (of which I am a member) clearly **prefers the upgrading of the present highway/road network** connecting upcountry Maui to Kihei. They and I **support improvements to the existing highways as a means of solving present and future transportation problems**. The exact wording of their position is as follows:

5 *The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board **supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway** - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.*

**MY SPECIFIC COMMENTS ABOUT THE Draft EIS**

6 4. I am concerned with the manner in which the “enhanced widening” alternative (EWR) was dismissed during the Tier 1 screening. The Draft EIS indicated that “Non-satisfaction of project goals eliminated the enhanced widening of existing roadways” (on Page 2-28). The Draft EIS said “enhanced widening” had a “fatal flaw” because it “would not establish a

roadway linkage between Kihei and the Upcountry area." Please note that "establish a roadway linkage" is NOT a purpose of the project (See Page 1-5). Rather, "improve roadway system linkage" is a listed purpose. This purpose clearly means that the six proposed alternatives do NOT meet the project purpose because they would "establish" a new roadway linkage!! The "enhanced widening" is an improvement and meets the purpose.

6 Elimination at the Tier 1 stage is not merely an error. However, I believe it is a deceptive means of avoiding a closer look at the preferred option stated in Maui County's ordinance (See #2 above). I feel that as the many, proposed highway widening projects (Piilani, Mokulele, Haleakala highways) are completed, there will be a series of newly designed, signalized intersections and a four lane highway from/to Upcountry to/from Kihei. The "enhanced widening" alternative needs to be given consideration in the Tier 2 analysis because it will cost effectively solve the traffic problems that the Upcountry-Kihei Highway is supposed to solve.

After being rejected as a viable option, the "enhanced widening" (EWR) alternative subsequently seems to have been superficially evaluated as the base-case, "no build" position.

5. In a similar manner, I am concerned with the manner in which the "TSM" alternative was dismissed during the Tier 1 screening. (Please see Page 2-22 top for a clarification of TSM and the need to investigate it.)

7 The Draft EIS indicated that "Non-satisfaction of project goals eliminated the TSM (on Page 2-28). The Draft EIS said TSM had a "fatal flaw" because it would not meet this goal (would not establish a roadway linkage between Kihei and the Upcountry area). That logic is convoluted and incorrect. Of course, a TSM would not provide a highway link; the Federal government requires that it be investigated as an alternative to a highway and should not be eliminated in the screening because it is not a highway.

As in #4 above, TSM elimination at the Tier 1 stage is not merely an error. I believe it is again a deceptive means of avoiding a closer look at the preferred option stated in Maui County's ordinance (See #2 above). The TSM alternative needs to be given consideration in the Tier 2 analysis because it may cost effectively solve the traffic problems that the Upcountry-Kihei Highway is supposed to solve.

8 6. The Final EIS should **present a complete benefit-cost analysis**. The analysis should include adequate information on the methodology, assumptions, and data used, so that others can determine the accuracy of the calculated benefit-cost ratios. The alternatives should be compared to the completed "enhanced widening" (EWR) alternative.

10 7. There is no **trip analysis**. The Draft EIS is totally inadequate in indicating the number, origin, and direction of trips being generated. This information must be included for each of

10 the alternatives as well as for the completed "enhanced widening" alternative. I suspect that a trip analysis was avoided because it would show that the proposed highway would have greater costs than benefits.

11 8. Since the proposed highway is being supported by the Federal government with the justification that it is part of our "national security", there should be an accounting from the official Air Force Log at the summit of the number of actual daily trips between KRTP and the summit observatories. Does the **volume of trips justify the expenditure of \$50,000,000+** of our tax dollars?

12 9. The Draft EIS references traffic only at the various highway termini. Because the design of these intersections has not been specified, the EIS seemingly lacks the ability to present the actual total cost of each alternative. I ask that the Final EIS address **the total cost of each alternative, including the intersections, street lights and various mitigation measures.** The relative costs are needed to make a decision among the alternatives and for the benefit-cost calculations.

13 10. The Final EIS should correct an error in the main traffic route between Upcountry and Kihei. The Draft EIS mistakenly selected the busy Dairy Road as part of the route. Few traveling between the two areas would utilize that road. Instead, **traffic goes via Hansen Road, a shorter and faster route.** According to the Kahului Airport Improvement Final EIS, Hansen Road will be realigned in the near future.

14 11. I note (on Page 3-30) the very **high accident statistics** in the Draft EIS for the present two-lane, undivided Mokulele Highway and for Dairy Road. The Draft EIS proposes that the new Kihei-Upcountry Highway be built in a similar fashion to the present Mokulele Highway. I suggest that the Final EIS **evaluate a divided highway with one lane on each side** of the divide. The dangers of Mokulele & Dairy Road need not be repeated by even considering or eventually building two lanes with the provision for two additional future lanes on the other side of a divide.

15 If the Final EIS doesn't consider a divided highway from the beginning, then it must include the probable accidents on a two lane, undivided highway as compared to the safer, four lane, divided highway in the "no build", enhanced widening alternative. Those accident costs should be a part of the benefit-cost analysis.

16 12. The Final EIS needs to address in detail the **impact on traffic of each of the numerous intersections and turn-offs along the different routes: cane haul roads, Maui Ag Park, Omaopio Road, Pulehu Road, the Kamehameha School, the Kulamalu shopping center, proposed gas station, recreational park, elderly housing, etc.** The costs of traffic lights, potential grade separations, acceleration lanes and deceleration lanes, and other traffic control elements need to be added to the cost of the highway alternatives.

18 13. The Draft EIS describes the probability of the **Haleakala bike tours** utilizing a more direct route to Kihei. Unfortunately, the EIS makes no mention of **the effect on local Kula road traffic** if the bicyclists are diverted onto such totally inadequate residential streets such as Kimo Drive and Pulehuiki Road. The problem is particularly relevant because these bike tours pass through Kula during the hours when **school busses** are negotiating these narrow streets.

19 Compounding the problem and also not addressed in the Draft EIS is the fact that **bike tours do NOT use a single lane of traffic**. Rather, they have a wide van that trails the cyclists and intentionally protects the cyclists by blocking traffic for long periods. This problem needs to be addressed in the Final EIS; both for bike tours using the various highway alternatives; and for the bike tours passing through the residential streets of Kula.

20 Even if the bike tours do not use the streets mentioned above, they certainly will be passing King Kekaulike High School and interacting with hundreds of young drivers beginning the school day.

14. In a similar manner, many additional **cars will be taking shortcuts** up and down to/from the Haleakala Crater using Pulehuiki RD., Kimo DR., Lower Kula RD., Holupuni, Pulehu and Omaopio roads. They will be **descending on those narrow, winding and steep Kula residential streets** after their brakes will have been overheated, having descended twenty-two miles down Crater Rd.

21 In particular, as drivers traverse Pulehuiki Rd. and/or Kimo Drive there is a likelihood of additional fatal accidents to drivers and or pedestrians because of the steep sharp turns that both of these roads provide; there is little warning for the uninitiated. Is the DOT willing to accept the responsibility for the lawsuits that will result from these accidents?

The discussed mitigation measure (i.e. utilizing signage) (See Page 4-32.) will not adequately deter local drivers, scientists, or even tourists. The Draft EIS fails to properly address this issue or to suggest meaningful mitigation measures. In fact, I believe that the dangerous situations that will occur on Kula's residential streets are a **"fatal flaw"** in the EIS consideration and eventual use of the U-3 terminus.

22 15. Very specific concerns that indicate "fatal flaws" with several alternatives, and thus should mean that **the Final EIS will not consider these highway segments or termini:**

**U-3** cuts through: the Maui County Ag Park (See Page 4-12); Maui Land and Pine pineapple fields (See Page 4-13); and close enough to minority-owned, Kula vegetable farms (that have been farmed by local families for generations) to disrupt their travel patterns (See Page 4-21). See also #13. & #14. above which should eliminate U-3.

23 **U-2B** has a severe 10% grade in the neighborhood of the recently opened Kamehameha School and the proposed elderly housing project. There will be loud and disruptive noise from trucks and tour buses going up the mountain and from the application of (air) brakes as those same vehicles descend. Many of the tour buses will pass the elderly housing project between 3:30AM and 5AM on their way to the Haleakala summit

sunrise. Furthermore, this 10% segment lies between Kamehameha School, the proposed park and the proposed large shopping center; I fear for the children who will be walking along the highway.

24 U-2A is in the immediate proximity to Kekaulike HS, resulting in a number of potential problems: a) many students now walk (without sidewalks) along the highway, since bus service is provided only for students living over one mile from the campus; b) many tourists as they descend from the sunrise will be meeting the high school's arriving students about 7:30AM; and c) there already have been a number of accidents at the "five trees" intersection.

25 As a matter of public safety, this **highway should not be in the proximity of any of the upcountry schools.**

26 16 According to the Draft EIS the **danger of fires** started along the highway and being spread uphill by ascending daytime winds is to be mitigated only by signs. There is no water in the area for fire-fighting or even for a landscaped green-belt on the mauka (residential) side of the highway. Because of the area's inaccessibility, a fire could develop a broad front as it moves uphill into the Kula residential community. This danger applies to all the alternatives and needs to be better addressed in the Final EIS..

27 17. With regard to **funding**, I understand that the highway will be financed 80% - 20% by the Federal and State governments respectively. I suspect that the highway, the **intersections, the mitigation measures, etc. will be much more expensive** than the figures in the Draft EIS.

28 Already the projected costs have risen from an earlier figure of about \$35 million (during a time when the inflation rate was low and housing costs actually decreased on Maui).  
29 Consequently, if the "no build" scenario is adopted, I wish to know which of the several, much  
30 needed highways could be built or improved with the State portion of the funds?. Also, the  
Final EIS should be explicit on who will be responsible for **probable cost-overruns**? State?  
Federal government? or 80%/20%? Finally, who will be responsible for the **highway's maintenance**?

31 18. The Maui County **Board of Water Supply** is required by law to follow the community plans (See #2 above.). Since this proposed highway will violate the Upcountry Community Plan and will potentially result in unplanned developments, the Final EIS must address the changes needed in the Plan and suggest the mechanism to change the Plan.

32 19. The 45 MPH in an urban area is unrealistic and unsafe. Using this figure exaggerates the time saved by the highway. (Summary Page S-8, Line 8)

33 20. The Highway will connect two areas with vastly different **crime rates** (Page 3-26 and Appendix H). Numerous residents are very concerned that the high crime rates of Kihei will spread to the bedroom communities upcountry.

- 34 21. The Draft EIS states (Page 4-6) that the "No-Build alternative would not support the goals and objectives of the Hawaii State Plan". There is no reference for or example of this assertion
- 35 22. The Final EIS needs to give the **total acreage** of each alignment, and specifically the **amount of agricultural land** that will be removed from production within the 162' minimum right of way (Page 2-9) and at the intersections. Also, since sugar/pineapple/vegetable crops will be affected, the Final EIS should describe the **Land Quality rating** of the lands being used for each alignment.
- 36
- 37 There will be a significant **impact on the daily operations of all of these farming activities**. The Final EIS must address these disruptions and suggest the exact mitigative measures.
- 38 23. **Cumulative impacts** (Page 4-59) have only been superficially explored. Lacking is a full discussion (acreage, quality and effects) resulting from **the sizeable removal of prime agricultural lands from productive use**. The Highway's land removal will be **in addition to the removal of prime agricultural lands** for other projects: Haliimaile housing, Sprecklesville housing and golf course, Kahului Airport, Kahului Airport Access Road, the new Maui Electric Power Plant, widening of Haleakala Highway, widening of Mokulele Highway, Kulamalu development, King Kekaulike High School, massive housing developments below Wailuku Heights and immediately south of Wailuku town, Kahului expansion into Maui Lani, etc.

Thank you for considering my comments in preparing the Upcountry-Kihei Highway Final EIS.

Sincerely,

Dick Mayer

**CC: Mr. Abraham Wong, Division Administrator, Federal Highway Administration**

Mr. Dick Mayer  
RR 1 Box 518 Lower Kimo Drive  
Kula, HI 96790

1. More detail on the transportation objectives of the County of Maui General Plan that you cite is now provided in Section 3.1.2.2a of the Final EIS. In general, the Department of Transportation supports the General Plan's transportation objective to use land use planning to reduce dependence on the automobile although this specific project may not be consistent with this objective. However, the Department believes this objective is not intended to be a moratorium on new roadway construction. In addition, the proposed project is consistent with the other two objectives (see Section 4.1.4.2a of the Final EIS). Kihei-Upcountry Maui Highway could be used as a transit link between Kihei and Upcountry if one is established.
2. The Department of Transportation respects the views of the public, such as those expressed in the Community Plans including the Makawao-Pukalani-Kula Community Plan (July 1996). However, the Department considers Community Plans as advisory, and this input is balanced with other factors, such as cost, transportation performance, and environmental impacts.
3. The potential for urban growth inducement in Upcountry was analyzed in the Draft EIS. It was determined that the amount and pace of residential development in Upcountry will continue to be controlled by water availability, not transportation infrastructure. The Department of Transportation recognizes that an important characteristic of the Upcountry "ambience" is its relatively low population density. However, it is not Kihei-Upcountry Maui Highway that would affect this aspect of Upcountry ambience, but the availability of water, which is needed for development.
4. Thank you for this information. Kihei-Upcountry Maui Highway is not inconsistent with this land use objective. Land use controls will continue to maintain this separation of character.
5. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway and Piilani Highway.

6. The stated purpose in Section 1.2.1 (Roadway System Linkage) is to provide a linkage between Kihei-Makena and Upcountry and between the Maui R&T Park and Science City on the summit of Haleakala. The Enhanced Widening of Existing Roadways (EWR) alternative was eliminated from further study because it would require construction over a 32 km (20 miles) distance, and was estimated to cost \$78 million. This could not be justified when a highway directly linking Upcountry and Kihei would only be 15 to 18 km (9 to 11 miles) long, and would cost roughly the same, but would perform substantially better in addressing the system linkage and other purposes and needs.

The EWR alternative is not the same as the No Build alternative. As stated in Section 2.2.1, the EWR alternative would provide an additional lane in each direction beyond the widening improvements already proposed in the Maui Long-Range Land Transportation Plan (February 1996). The No Build alternative includes only the widening improvements in the Long-Range Plan.

7. The description of transportation system management (TSM) alternative that is applicable to this project has been enhanced in the Final EIS. However, even with its description improved, the result remains (see Section 2.2.1) that the TSM alternative does not address the project's purposes and needs. Therefore, it was eliminated from consideration. FHWA does not require that a TSM alternative be considered as a viable alternative in the EIS if it would not address the purposes and needs of the project.
8. The requested information is provided in Appendix E, "Alternatives Analysis Report".
9. As described in Section 2.2.1, all build alternatives that underwent the BC analysis were compared against the No Build alternative. For this analysis, it is not appropriate to compare the build alternatives with the "Enhanced Widening" (EWR) alternative, another build alternative. A build alternative is not an appropriate basis of comparison for another build alternative in a BC analysis. The EWR alternative is estimated to cost \$78 million.
10. An origin-destination (O-D) study (i.e., "trip analysis") was performed during the preparation of the most recent Maui Long Range Land Transportation Plan. It was used to estimate the traffic volumes on the Kihei-Upcountry Maui Highway (see Section 4.4.1.2). Separate volume projections were developed for each alternative. Depending on the alternative, these volumes would vary. In general, the U3 and K2 alternatives would convey

lower volumes, while the U1, U2-A, U2-B, and K1 alternatives would convey higher volumes.

11. The present traffic volumes between the Maui R&T Park and Science City are relatively small, but these volumes could increase as both facilities are developed. Nonetheless, there are other purposes and needs for the project beyond the legislative directive to provide improved mobility between defense-related activities at the Maui R&T Park and Science, as described in detail in Chapter 2.
12. Section 2.1.2 states that the highway's termini intersections will be designed with adequate channelization (e.g., turning, deceleration, acceleration lanes) to handle projected traffic volumes. Detailed intersection designs will be prepared for each intersection during the design phase. The cost estimates of the alternatives include the elements listed above.
13. The traffic route between Kihei and Upcountry Maui has been amended in the Final EIS to include Hansen Road. There are no plans to realign Hansen Road. What is being planned is the realignment of Mokulele Highway and Puunene Avenue, which would allow a short extension of Hansen Road, and the installation of traffic signals at its intersection with Puunene Avenue. The planned airport road would be a new road running parallel to Dairy Road with an interchange on Hana Highway.
14. Kihei-Upcountry Maui Highway, in its initial two-lane undivided configuration, would be more similar to Haleakala or Hana Highway rather than Dairy Road or the present Mokulele Highway. (Mokulele Highway will be changed to a four-lane divided configuration, which will substantially reduce the number of incidents on this roadway.) The number of incidents on Haleakala and Hana Highways is not high considering their relatively high traffic volumes (see Section 3.4.1.2). Kihei-Upcountry Maui Highway will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards.
15. The benefit-cost analysis was used as early screening tool to compare the alternatives based on travel time savings between Kihei and in Upcountry.
16. Section 4.4.1.2 contains the analysis of traffic conditions at the terminus options for each alternative. The U1,K1 alignment, which was identified as the preferred alternative, would

cross cane haul roads and Omaopio and Pulehu Roads. Two underpasses will be constructed for cane haul routes. The impact of the U1,K1 alignment crossing Omaopio and Pulehu Road is described in Section 4.4.1.1.

17. The elements described are included in the estimated costs of the alternatives.
18. As requested, Section 4.4.1.3 will be modified in the Final EIS to describe the potential that bike tour operators would use local Kula roads should a U3 alternative be selected.
19. Kihei-Upcountry Maui Highway will have adequate shoulders for bicyclists. Bicycle tour operators will not be allowed to conduct their tours on Kihei-Upcountry Maui Highway in the manner described in the comment because it is unlikely that the van protecting the cyclists would be able to maintain the minimum speed required to use the highway.
20. As requested, Section 4.4.1.3 of the Final EIS has been modified to identify the potential impact of bicyclists interacting with the high school traffic.
21. A U3 terminus is not included in the preferred alternative. Therefore, the inappropriate use (i.e., shortcuts to and from Haleakala Crater) of Pulehuiki Road, Kimo Drive, and Lower Kula Road will not occur. However, since the U1,K1 Alternative was identified as the preferred alternative, the EIS acknowledges that some motorists will use Holopuni, Pulehu and Omaopio Roads inappropriately as shortcuts because of the distance between Kula and the U1 terminus (see Section 4.4.1). Closing access between these roads and Kihei-Upcountry Maui Highway is not an option because of the burden this would place on farmers.
22. If a U3 alternative had been identified as the preferred alternative, parcels of the Kula Agricultural Park and pineapple fields cultivated by Maui Pineapple Company would be converted to roadway infrastructure. The landowners would be compensated, and agricultural infrastructure would be modified and reconstructed. No other farmers would have been affected by the U3 alternative. A U3 alternative was not identified as the preferred alternative because it would not address the range of travel markets as well as the other alternatives.
23. If a U2-B alternative were identified as the preferred alternative, any noise impacts (see Section 4.6 for a definition of a noise impact) would be mitigated in accordance with the

Department of Transportation Noise Analysis and Abatement Policy. In the vicinity of Kamehameha School and the future shopping center, an urban design would have been used, which includes sidewalks. In addition, the speed limit would be lower in this area than areas with little or no human activities. A U2-B alternative was not identified as the preferred alternative.

24. If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection would have included crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
25. Please see Response #24. The highway would not affect public safety at schools even if the Upcountry terminus were located at U2-A.
26. In addition to signage warning motorists of fire hazards, the Department of Transportation will conduct regular maintenance to control weed growth along highway shoulders. While the Kihei-Upcountry Maui Highway will increase access to the area, such that the risk of man-made hazards may increase, the highway would simultaneously decrease the damage from fires because it would improve the accessibility of water and fire-fighting resources to the dry forest areas. The preferred alternative, the U1,K1 alignment, traverses agricultural fields, and therefore, has access to water.
27. See response #12.
28. The State's share of the cost to construct Kihei-Upcountry Maui Highway, which may be about \$13 million (in 1997 dollars) for the U1,K1 alternative, has not been secured. If, for example, the U1,K1 alternative is selected in the project's Record of Decision, the State Legislature would be asked to fund the State share.
29. Financial responsibility for an overrun depends on the reason for the overrun. For some categories of overrun, the Department of Transportation and the Federal Highway Administration would share the burden.
30. The State Department of Transportation will be responsible for maintenance of the highway.

31. The amount and pace of residential development in Upcountry will continue to be controlled by water availability, not transportation infrastructure. The EIS acknowledges (see Section 4.1.1) that highway projects can catalyze urban development because they often remove an impediment to growth, access or insufficient transportation capacity. In this specific case, however, the urban growth potential of Upcountry is not limited by transportation factors, with or without the project. Despite the recent development of a well in Haiku, which is being partially used for the Kulamalu development, Upcountry will continue to rely on surface water resources that are highly vulnerable to drought conditions. Therefore, as stated in current planning documents, the County is unlikely to allow substantial urban development in Upcountry despite the existence of Kihei-Upcountry Maui Highway.
32. The planned urban 70 km/h (45 mph) speed limit is normal for a limited access facility in urban areas. Most of the highway will have a speed limit of 90 km/h (55 mph). Therefore, the estimated time savings provided in the EIS is not an exaggeration. Adjustments to the speed limits may be made during the design phase if more detailed study shows that changes are warranted.
33. As described in Section 4.3.3 of the EIS, the Upcountry police officers could not speculate on whether the proposed highway would cause an increase in crime rates. Absent an opinion from the police, it is difficult to provide an objective analysis of this concern.
34. Section 4.1.2.1a of the Final EIS will be amended to state how the No Build alternatives does not support some of the relevant objectives and policies of the State Plan.
35. Section 2.1.2 contained information on the estimated total right-of-way requirements of each alternative. As requested, Section 4.2.1 of the Final EIS now includes information on the right-of-way taken from active agricultural fields.
36. If the comment is referring to the Land Evaluation and Site Assessment scores, which are required under the Farmland Protection Policy Act, such scores are not disaggregated by type of crop. However, the Natural Resources Conservation Service considers the agricultural value of the land when they provide "total site assessment points", Part V of Form AD-1006. The completed Form AD-1006 for all alternative alignments is in Appendix C.

37. Section 4.2.1 of the EIS includes discussion on potential disruptions to farming activities, and Section 4.2.4 contains measures to mitigate such impacts.
38. The level of detail in Section 4.15 of the EIS, Cumulative Impacts, is appropriate for this stage of decision-making. Additional detail would not change the conclusions of this section.

Mr. Richard D. Mayer  
RR1, Box 518  
Kula, HI 96790

Comment: Criticized the public hearing because the No Build alternative was not specifically identified as a viable alternative in the displays.

Response: The Draft EIS identifies the No-Build alternative as a viable alternative. There was no intention to mislead the public at the hearings into believing that the No Build alternative is not an option. The video that was played at the entrance to the display area stated that the No-Build Alternative was being carried forward, as required by the EIS process.

Comment: The project is proceeding, even though it is contrary to the wishes of the community as communicated in the Makawao-Pukalani-Kula Community Plan.

Response: The Department of Transportation respects the views of the public as stated in the Makawao-Pukalani-Kula Community Plan. However, this consideration must be balanced with others, as well as considerations of cost, transportation performance, and environmental impacts.

Comment: The use of Hansen Road as a route between Upcountry to Kihei is ignored.

Response: The traffic route between Kihei and Upcountry Maui has been amended in the Final EIS to include Hansen Road.

Comment: The project ignores the use of Hansen Road as a viable alternative.

Response: The current Maui Long Range Land Transportation Plan, which guides investments in roadways, did not include improvements on Hansen Road.

Comment: Objects to the open house format of the public hearing because participants cannot hear what others have to say about the project. Therefore, there is no way to ascertain whether individual comments are being accurately transcribed.

Response: Members of the public are free to interact as they see fit at the public hearing, as long as they do not disrupt information gathering and comments by other participants. The commenter is free to ask others what they think of the project. They can also e-mail, write

letters, or arrange meetings to communicate amongst themselves. Oral comments are transcribed by professional court reporters who certify the accuracy of the transcripts to the best of their abilities.

Comment: The open house public hearings are probably illegal under the Sunshine Law. Those who want to speak publicly should be given the opportunity to do so.

Response: The format of the public hearing is not in violation of the State Sunshine Law. In addition, the Department of Transportation is not required to provide the opportunity for people to speak publicly (i.e., in front of an audience) at its hearings. Nevertheless, an additional meeting was conducted in Kahului where an open microphone was made available for those individuals desiring to speak in front of an audience.

Comment: Constructing Kihei-Upcountry Maui Highway is inconsistent with the Maui County General Plan transportation objective of using land use planning to reduce dependence on the automobile.

Response: Please see response to Comment #1 of your letter.

Comment: The selection of the preferred alternative should be fully consistent with the Makawao-Pukalani-Kula Community Plan.

Response: Please see response to Comment #2 of your letter.

Comment: Believes that the No-Build alternative was eliminated.

Response: The No Build alternative has not been eliminated from consideration. The No Build Alternative cannot be eliminated until the FHWA issues a Record of Decision. Even after that point, construction funding would still need to be obtained.

Comment: Believes that the Enhanced Widening of Existing Roadway (EWR) alternative should not have been eliminated in the alternatives screening.

Response: Please see response to Comment #6 of your letter.

Comment: The No Build alternative should have been given greater consideration.

Response: The No Build alternative is evaluated equally with other alternatives. The No Build alternative serves as the basis of comparison in determining the transportation and environmental impacts of the build alternatives. The No-Build alternative is not necessarily a "do-nothing" alternative.

Comment: Requests a benefit-cost (BC) analysis of the eight build alternatives and the No Build alternative that includes more factors, such as the cost of highway incidents, than those used in the BC analysis for the alternatives screening.

Response: A benefit-cost analysis is typically not used in the environmental evaluation of alternatives (*i.e.*, Chapter 4, Environmental Consequences, of the EIS) because of the difficulty of assigning monetary values to all of the benefits and costs of the project. Construction cost, however, is provided in the EIS.

Comment: Are planning and design costs included in the total project cost?

Response: The cost estimates provided in Section 2.1 of the EIS do not include the cost to conduct planning and design.

Comment: Military traffic between the Maui R&T Park and Science City is low and unlikely to grow.

Response: Please see response to Comment #11 of your letter.

Comment: Kihei-Upcountry Maui Highway, as a two-lane undivided highway, would be unsafe.

Response: Please see response to Comment #14 of your letter.

Comment: Have the added costs of the intersections and mitigation measures, such as the cane haul crossings, been included in the cost estimate for each alternative?

Response: Please see response to Comment #17 of your letter.

Comment: The EIS does not have a trip analysis. How many people will be commuting between the Maui R&T Park and Science City?

Response: Please see response to Comment #11 of your letter.

Comment: The trip analysis should not include Haiku and Paia residents.

Response: The question of how many Haiku and Paia residents who would use Kihei-Upcountry Maui Highway would depend on the alignment selected.

Comment: Why does the No Build alternative cost \$78 million?

Response: Please see response to Comment #6 of your letter.

Comment: The EIS does not state whether crime rates in Upcountry would increase because of the project.

Response: Please see response to Comment #33 of your letter.

Comment: The EIS does not adequately evaluate agricultural impacts because the total acreage of displaced agricultural land is not indicated, nor does it adequately disclose cumulative agricultural impacts. Also, the quality of the agricultural land affected needs to be indicated in the Final EIS.

Response: Please see response to Comment #35 of your letter.

Comment: The highway will jeopardize the safety of King Kekaulike High School and Kamehameha School students.

Response: Please see responses to Comments #23 and 24 of your letter.

Comment: What features will the terminus intersections provide? Are the costs of these features included in the overall cost estimates?

Response: Please see response to Comment #12 of your letter.

Comment: Will there be passing lanes on Kihei-Upcountry Maui Highway?

Response: Passing lanes will be studied in more detail in the design phase of the project.

Comment: Kihei-Upcountry Maui Highway would increase the risk of brush fires.

Response: Please see response to Comment #26 of your letter.

Comment: The U3 alternatives would disrupt minority-owned farms.

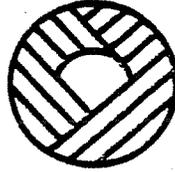

Response: Please see response to Comment #22 of your letter.

Comment: The U2-B alternatives would cause noise impacts to the school and a proposed elderly housing, due to trucks and tour buses traveling on a steeply graded road.

Response: Please see response to Comment #23 of your letter.

Comment: Suggests construction of an evacuation road utilizing cane roads, to be used only in the event of emergencies, instead of Kihei-Upcountry Maui Highway.

Response: The suggested alternative does not satisfy other purposes and needs that have been identified for this project.

DIRECTOR'S OFFICE  
STATE OF HAWAII  
HONOLULU, HAWAII

MAUI LAND & PINEAPPLE COMPANY, INC.

October 19, 1999

Mr. Kazu Hayashida, Director  
State of Hawaii  
Department of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida:

Subject: Kihei-Upcountry Maui Highway  
Draft Environmental Impact Statement  
Maui, Hawaii

RECEIVED  
OCT 21 1 30 PM '99  
DEPT. OF TRANSPORTATION  
HIGHWAYS DIVISION  
PLANNING BRANCH  
RECEIVED  
STATE DEPARTMENT  
OF TRANSPORTATION  
OCT 22 1 35 PM '99

Thank you for providing our company with a complete copy of the Draft EIS for the subject project for our review and comments. Pursuant to our review of the Draft EIS, we have the following comments to offer:

1 | Maui Land & Pineapple Company, Inc. (ML&P) lands and pineapple farming operations will be adversely affected by the proposed highway in varying degrees, depending on the various alignment alternatives. ML&P must be adequately compensated for land area lost, crop damages, severance damages, etc. and appropriate mitigation measures must be implemented.

2 | Table S-1, Summary of Environmental Impacts And Mitigation, summarizes the impacts of the proposed highway. The table also summarizes the mitigation measures for each adverse impact. Under "Land Use" impacts, it is our understanding that ML&P will be properly compensated for land area lost due to right-of-way requirements. Under "Farmland" impacts, all of the impacts listed, together with those listed in our November 6, 1995 letter and as discussed during our meeting of April 4, 1997 with the consultants for the proposed highway (copies of the letter and meeting minutes are enclosed for your review), must be adequately addressed in the "Maintenance of Agricultural and Ranching Activities Plan," which we understand will clearly define the mitigation measures required. The above plan must also address losses due to crop damages, severance damages, etc. ML&P's involvement in the development of the plan is critical. Under "Transportation" impacts, the "Maintenance of Traffic Plan" must

3 | adequately address the impacts on farm vehicle movement, not only along Omaopio and Pulehu Roads, but also along the proposed highway.

Mr. Kazu Hayashida, Director  
October 19, 1999  
Page 2

4 Section 4.2.4-Mitigation Measures of Chapter 4-Environmental Consequences, states that "If U-3 is selected, SDOT would purchase any unworkable remnant ML&P land based on....Kula Agricultural Park." Purchase of unworkable remnants of ML&P land should be a consideration; however, it should not be the only consideration when unworkable remnants of ML&P land are created. Proper evaluation should be conducted as part of the mitigation plan to determine appropriate action to be taken. As previously noted, ML&P must be involved in the development of the plan.

5 Section 5.2-Public Information Meetings of Chapter 5-Comments and Coordination, notes that a comment expressed at the second Upcountry meeting stated that "agricultural impacts (to sugar cane fields) are not critical because this industry is not important to the future of the island." It is not clear if the comment also refers to pineapple fields; however, even if it does not, ML&P disagrees with the comment expressed. ML&P strongly feels that agricultural impacts are very critical because this industry is very important to the future of this island.

We greatly appreciate the opportunity to provide our comments on the Draft EIS. If you have any questions or wish to discuss any of our comments, please do not hesitate to contact me.

Mahalo,

Warren A. Suzuki  
Vice President/Land Management & Development

Doug MacCluer w/encl.  
Paul Meyer w/encl.  
Doug Schenk w/encl.  
Don Young w/encl.

Mr. Warren A. Suzuki  
Vice President/Land Management & Development  
Maui Land & Pineapple Company, Inc.  
P.O. Box 187  
Kahului, HI 96733-6687

1. Maui Land & Pineapple Company, Inc. (ML&P) will be compensated for right-of-way acquisition, crop damage, and other impacts as described in Sections 4.1.4 and 4.2.4 of the EIS.
2. The Maintenance of Agricultural and Ranching Activities Plan, which will be prepared during the design phase, will include measures to mitigate or minimize impacts to agricultural activities during construction. It will also identify measures to ensure the long-term operation of affected agricultural areas. However, it will not attempt to estimate monetary losses due to crop and severance damages. ML&P would be entitled to compensation for these damages based on fair market valuations.
3. Section 4.4.1 will be revised to disclose that farm vehicles would be using Kihei-Upcountry Maui Highway. The Maintenance of Traffic Plan is only for construction-period impacts.
4. Since a U3 alternative was not identified as the preferred alternative, coordination with ML&P may not be necessary with regards to the creation of unworkable remnant parcels. The U1,K1 alternative, which was identified as the preferred alternative, will cross one ML&P field. Remnant parcels are not expected. If there were remnant parcels, ML&P would be entitled to fair market compensation.
5. The Department of Transportation has an obligation to report relevant comments made during public involvement activities, such as the public information meetings. Reporting such statements does not indicate Department concurrence.

HIGHWAYS DIVISION  
PLANNING BRANCH  
OCT 21 5 58 PM '99  
DEPT. OF TRANSPORTATION  
HONOLULU DIVISION

- I) The Hale'iwa Bypass Road (O'ahu) was designed to decrease traffic in Hale'iwa town. It did. But a secondary effect was that many businesses struggled as a direct result of this decrease in traffic. Bypass roads help some commuters who work in urban centers and live in rural centers. These bypass roads directly and very negatively impact local rural businesses that are cut-out of the business of catering to customers who drive by their stores. If the Upcountry Maui Highway is built, which rural business communities will see a drop in the number of cars passing their shops? How sharp will the drop be? Will the state and/or county offer tax breaks for the affected businesses?
- II) How does the statement: "1.2 Purpose and Need for the Project. The project ('the proposed project') is being designed to satisfy the following six purposes and needs: ... support economic development." (DEIS page 1-5) relate to Chapter 343, HRS and 11-200 HAR references to secondary and cumulative impacts? If, as you say, the road will lead to economic growth, aren't you saying that the road will created secondary and cumulative impacts which must, under law, be evaluated in the EIS process?
- III) How does the statement "the number of Maui visitors is expected to be close to four million by the year 2010, a daily average of over 66,000. In 1990, visitor arrivals numbered approximately 2.3 million, a daily average of 38,000. In other words, almost three out of ten persons, on a daily average, is a visitor." (DEIS page 1-7) relate to the fact that Maui residents feel that the tourism sector of the economy is either about right, or too high?

3 That is, most residents don't want the economy to be a one-sector entity, correct? Shouldn't economic growth through diversity be pushed (such as diversified agriculture, high technology, education, health), rather than placing all of one's eggs in one basket (visitor industry workers working in Kihei, living upcountry)?

4 IV) The following statement seems unsupported: "A Kihei-Upcountry Maui Highway would support economic development issues by ... providing improved transportation mobility between R&T Park and Science, which would support business and federal government personnel at the R&T Park and Science who provide technical assistance to Science City." (DEIS page 1-8) In answers to questions raised during the EISPN phase of this process, you stated you have no idea how many people commute between R&T Park and Science City. Nor did you dispute that the number is exceedingly low.

5 V) The statements: (1) "In 1990, daily average trip generation on the island exceeded 233,000 trips. According to the Maui Long-Range Transportation Plan (February 1996), daily trip generation is expected to increase to over 386,000 trips in the year 2020. ... Since Maui's population is expected to grow by over 60 percent from 1990 to 2020, home based work trips are projected to exceed 69,000 in 2020; 26,000 more than in 1990." (DEIS page 1-11 and 92) and (2) "Trip generation by visitors is projected to increase from over 35,000 in 1990 to close to 60,000 (approximately a 70% percent increase) in 2020 based on projections of visitor arrivals." seems incomplete.

home based trips	43	69
visitor trips	<u>35</u>	<u>60</u>
total	233	386

VI) The statement: "A Park official indicated that the number of visitors to the summit correlates with the number of visitors to the island, including seasonal variations (telephone conversation, December 8, 1997)" seems to imply

6 (a) that there is a park official who correlates visitors on island with visitors to the park. What awesome information. The State calculates visitor days spend on Neighbor Islands by the forms turned in by passengers arriving on airplanes from foreign and mainland destinations. The forms indicate visitors intention of visiting neighbor islands; not on their actual visit Neighbor Islands after arriving in the State. This park official could held DBEDT update their estimates!

(b) Residents are probably more likely to visit the summit when fewer tourists are visiting the summit. Therefore, hopefully, the park official has accounted for this.

(c) Since it is difficult to determine what percentage of summit visitors are tourists (even if one examined license plates) we would like to know how the park official determines who is a visitor and who is a resident.

7 (d) We would also like to know if there is a direct relationship between island visitors and summit visitors. (example: 1 out of 15). Thus, by knowing the added number of visitors expected due to the proposed increase in the size of Kahului Airport, we could know they corresponding rise in the impacts to the summit. This assumes that the proposed road will shorten the travel distance between the summit and the makai areas, but not increase the number of visitors who will drive to the summit. Is this a reasonable assumption?

VII) LOL examined the statement "Through a broad-based community participation program called Decisions Maui, the following five major themes were incorporated into the General Plan: protect Maui Country's agricultural land and rural diversity; prepare a directed and managed growth plan; protect Maui County's shoreline and limit visitor industry growth; maintain a viable economy that offers diverse employment opportunities for residents; and provide for needed resident housing." (DEIS page 3-9) with this proposal.

<u>General Plan</u>	<u>Proposed Highway</u>
protect Maui Country's agricultural land	build a road through prime ALISH ag lands
protect Maui Country's rural diversity	increase tourism/economy ratio
prepare a directed and managed growth plan	violate Makawao-Pukalani-Kula Community Plan
protect Maui County's shoreline	build a makai-mauka road
limit visitor industry growth	increase tourism/economy ratio
maintain a viable economy that offers diverse employment opportunities for residents	increase tourism/economy ratio decrease diversity/economic ratio
provide for needed resident housing	build a makai-mauka road

- 8 | How is the proposed road consistent with each part of the amended General Plan?
- 9 | VIII) "What would the impact be if the road were limited to bicyclists and the sidewalks to joggers?"
- 10 | IX) Please include in the Final EIS the transcribed comments and questions of all people who spoke at public hearings during the official comment period.
- 11 | X) The Upcountry Maui document refers to a desire to reduce air pollution, smog, etc., etc., caused by driving the current roundabout route and replacing it with a more direct route. Should we be moving toward greater use of mass transit OR greater use of cars OR be designing a system that has something for everything and has a huge price tag for our recession-based economy? "Road building and automobile use have a synergistic relationship that is ultimately unsustainable, since it leads to ever more road building, cars, congestion, and reduction in the quality of the environment. [O'ahu] Islandwide Mobility Concept Plan, Parsons Brinkerhoff (1999) page 10.
- 12 | XI) Which Travel Forecast models are used? Why? How dependent is the transportation model to the assumptions and data used? When the data is chosen, the assumptions are assumed and the model is used, a result will follow. But how will the result change under minimal alterations of the given? How sensitive are the models to changes in input? Which variables have the highest elasticity (smallest change in output, largest change in output, greatest chance the "desired plan" is the wrong plan)?
- 13 | XII) The Draft EIS needs a thorough Community Impact Assessment which includes supporting sustainable livable communities; promoting community values and thriving neighborhoods; contributing to general well-being; embracing the concerns of neighborhoods and communities.
- 14 | XIII) Will transmission lines ever be placed overhead along the proposed highway? If so, why?
- 15 | XIV) Does the amount of federal matching funds vary depending on the option chosen? Please elaborate.

- 16 | XV) What is the relationship between the military and the proposed road?
- 17 | XVI) Will sufficient land be acquired during the initial construction of the proposed highway to allow easy expansion of the road in the future?

Mahalo for this opportunity to testify.

Me ke aloha pumehana.

Henry Curtis  
Executive Director

Mr. Henry Curtis  
Executive Director  
Life of the Land  
76 North King Street, Suite 203  
Honolulu, HI 96817

1. As described in Section 4.3.2 of the EIS, Kihei-Upcountry Maui Highway will not function as a commercial district bypass, except for businesses in Kahului. Kahului is the main shopping district on the island.
2. Secondary and cumulative impacts are evaluated in the EIS. Although Section 4.16 is specifically about secondary impacts, discussions of secondary impacts are also found elsewhere. For example, depending on the alternative, the highway would cause an increase in the inappropriate use of Omaopio and Pulehu Roads as through routes (see Section 4.4.1.1). Section 4.15 includes disclosure of potential cumulative impacts of the proposed project, as well as other major projects and land use trends as reported in the community plans.
3. The EIS did not attempt to seek the opinions of residents on the appropriate level of tourism on the island. Section 1.2.2 uses projections prepared by Maui County and reported in the Maui Long-Range Land Transportation Plan (February 1997). These projections are furnished to support the statement that the level of tourism activity is expected to increase. The appropriateness of the size of the island's economic base is beyond the scope of this highway EIS.
4. Kihei-Upcountry Maui Highway will support development of the Maui R&T Park by improving transportation between the Park and Science City. However, the EIS acknowledges that the number of persons traveling between the Maui R&T Park and Science City using Kihei-Upcountry Maui Highway will be relatively small compared to other travel markets. It is acknowledged that the highway would provide more economic support to the visitor industry simply because it is much larger.
5. Other types of trips, such as shopping trips, etc., were not reported in Section 1.2.4.
6. The Haleakala Park official based the assessment on direct observation, i.e., noticing that the park is busier during peak visitor periods on the island, and did not develop statistical

data on the correlation between island and Park visitors. The park official was not asked about the percentage of park visitors who are residents. The information was provided simply to indicate the size of the travel market destined for the National Park, whether resident or visitor.

7. A statistical analysis could attempt to correlate the number of visitors to the island to the number of visitors to Haleakala National Park. However, the only question relevant to the proposed project is whether Kihei-Upcountry Maui Highway would have an effect on the number of park visitors. Since Haleakala National Park is a world-famous attraction, the highway would not have much influence in attracting visitors to the park, although it would make trips to the park more convenient.
8. Section 4.1.2.2a, which describes project consistency with the Maui County General Plan, as amended, does not include discussion of each of the General Plan themes listed. Instead, Section 4.1.2.2a focused on General Plan objectives relevant to the project.
9. If the project were to be used only by bicyclists and pedestrians, substantially less right-of-way would be needed and many other details would be different, with potentially less environmental and social impact. However, a Kihei-Upcountry Maui pedestrian/bike path would not achieve any of the project's key purposes, such as addressing existing intersection capacity deficiencies and satisfying increased transportation demand.
10. The transcripts of the public hearings, as well as all written comments received on the Draft EIS, are included in the Final EIS (see Volume 2: Draft EIS Comments and Responses).
11. The comment addresses overarching principles concerning the land transportation system on Maui. The most recent edition of the Maui Long-Range Land Transportation Plan (February 1997) addresses these concerns. Therefore, a response to this issue is beyond the scope of the EIS for this one highway project.
12. The forecast model used for the project was developed for the Maui Long-Range Land Transportation Plan (February 1997), and therefore, was calibrated to Maui transportation conditions. The model uses TRANPLAN, a travel demand forecasting software. Like any model, TRANPLAN is totally dependent on assumptions and input data. A major assumption used in travel demand forecast models is the distribution of person trips from

point A to point B to different modes (e.g., autos (single occupant or multi-occupant), transit, bicycling, walking, etc.). A major input data is the number of persons projected to travel between different areas of the island, which are called traffic analysis zones (TAZs). It should be noted that the forecasted person trips between TAZs and mode distributions remained constant (i.e., were not changed) to maintain consistency with other elements of the Long-Range Plan. Certainly changing an assumption or input data, such as those mentioned herein, would have substantial impact on results. The major factors that affected the forecasted use (number of vehicles using the roadway) of the different alternatives of Kihei-Upcountry Maui Highway were speed, capacity and distance. The model is most sensitive to speed and capacity. However, these two factors were held constant among the alternatives. The major factor that discriminated between alternatives was distance, which was the reason why the U3 alternatives (Upcountry terminus in less populated Kula) were forecasted to carry substantially fewer vehicles per day than the other alternatives, which are located closer to the more populated areas of Upcountry.

13. A community impact assessment was prepared for the project (see Appendix H).
14. There are no current plans for the Kihei-Upcountry Maui Highway to be used for overhead utility (electric and telephone) lines. However, if such a request is made, it will be considered, since roadway rights-of-way are often used as utility corridors. The proposal would need to undergo at least the State environmental review process. The Maui Board of Water Supply has indicated that the highway could be used for future water transmission lines.
15. The amount of federal matching funds is not affected by which alternative is identified as the preferred. Normally, the State and federal ratio is 20:80.
16. Military personnel and contractors would use the highway for travel between the Maui R&T Park and Science City.
17. Sufficient right-of-way will be acquired for a four-lane divided highway, even though only a two-lane roadway will be constructed initially.

Mr. Kazu Hayshida  
Director of Transportation  
State Department of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Mr. Hayshida,

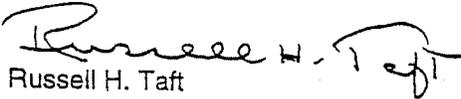

1 I wish to express my opposition to the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway on Maui. I support as a higher priority the upgrading and improvements to the existing roads connecting upcountry Maui and Kihei. These existing roads include the Mokulele Highway, which should be divided 4-lane highway otherwise it will remain hazardous. It includes Hansen road, which needs a traffic light or an overpass/underpass connection to the Mokulele Highway. Finally I suggest that the Haleakala Highway should also be a divided 4-lane highway. By divided in these cases I suggest and mean each side separated by a green strip divider, not some aesthetically unappealing concrete dividers which will serve to duplicate the ugliness of a Los Angeles Freeway.

2 I suggest that such improvements will alleviate growing traffic concerns for Maui commuters. I further suggest that the idea of connecting military installations in the Research and Technology Park in Kihei to facilities on Haleakala with such an Upcountry/Kihei highway is ridiculous and purely a politically motivated concept. These military facilities are already linked by wideband information highways in the form of fiber optic and microwave radio links that provide video teleconferencing, computer network connection, and voice links between these facilities. To suggest that personnel need a short cut between Upcountry and Kihei first of all would not save significant time with respect to the overall travel time and further more is not really required.

If an Upcountry/Kihei road is to be built I strongly recommend the Haliimaile terminus as the best option available. This location can most directly handle the bulk of traffic from Upcountry that originates in Pukalani/Makawao communities.

I appreciate your consideration of these thoughts in your decision making process.

Sincerely,

  
Russell H. Taft

HIGHWAY DIVISION  
PLANNING BRANCH

Mr. Russell H. Taft  
P.O. Box 240  
Puunene, HI 96784

1. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway, and Piilani Highway.
2. The EIS acknowledges that the number of persons traveling between the Maui R&T Park and Science City using Kihei-Upcountry Maui Highway will be relatively small compared to other travel markets. However, there are other important purposes and needs of the project, as described in Chapter 1 of the EIS.

Honolulu, HI. 96813

RE: Kihei Upcountry Maui Highway

Aloha Mr. Hayashida,

1 Thank you for the opportunity to comment on this project. The Nature Conservancy does not take a position on the Kihei Upcountry Maui Highway at this time. This project, however, will effect one of the world's last remaining Hawaiian dry land forests and I would like to point out a few issues that need to be addressed.

2 First, thank you for undertaking a botanical search of the proposed routes. My concern is that the nature of the native plants in the area is for them to be somewhat seasonal and therefore hard to detect at times. I do not think that two days of searching is enough to ensure that federally listed endangered species will not be affected by this project (not to mention the many rare plants found in the area). I would encourage you to conduct another more thorough search sometime after good rains have fallen.

3 Second, the potential for inadvertent introduction of unwanted pest species is high in this project. It is well documented that major construction companies in the state transport their heavy machinery and other tools between the islands. Without proper cleaning these machines and tools can transport unwanted plants and insects between islands. Of particular concern, but not the only concern, is fountain grass (*Pennisetum setaceum*) a fire prone grass which would easily establish itself in the proposed road areas. This species has been found to thrive in dry disturbed soil and has become a major concern on the Big Island. All tools and Machinery must be meticulously cleaned prior to beginning any work on this project.

4 Third, any proposed highway landscaping (now or in the future) should use native plant species that already exist in the area. This is not only a sound public relations

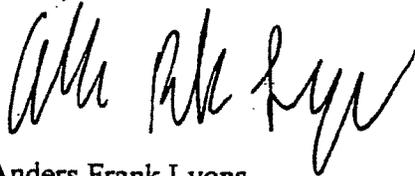

4 | move, but it also ensures the longevity of the native plants in the area. Planting non-native plants will only contribute to the demise of one of the last remaining Hawaiian dry land forests in the world. Native plants are available from several sources, and with enough advanced notice can be produced at competitive prices. I encourage you to sign a contract for native plant landscaping as soon as possible.

5 | Lastly, Axis deer are a direct and real threat to the motorists who will use this road. This non-native animal was introduced to the Pu'u 'O Kali area in late 1958 and early 1959 and numbers have dramatically increased since then. Current estimates put the population at somewhere between 2000 and 5000 animals island wide, with the vast majority of animals found within two miles of Pu'u 'O Kali. A growth rate of 20 to 30 percent has been determined to be quite realistic for these animals which would put the population at 25,000 in only ten years. Currently there are as many as five vehicular accidents involving deer every week. The potential for loss of human life due to a car/deer accident will only be increased by this project.

I propose two mitigating actions should the road be built. First, build fencing designed to deter deer on both sides of the road. This will keep large herds from using the road as a crossing point and reduce the possibility of cars hitting deer on that stretch. Second, contact and develop a control agreement with the local hunting community. Illegal poaching is already a problem in this area, and will only be controlled by having a legal deer removal program installed in the project area.

Thank you again for the opportunity to respond. I would like to offer myself as a resource to you. Please feel free to contact me should you have any questions or concerns.

Aloha,

Anders Frank Lyons  
Natural Resource Manager

cc: A. Wong

Mr. Anders Frank Lyons  
Natural Resource Manager  
The Nature Conservancy  
P.O. Box 1716  
Makawao, HI 96768

1. Of all of the build alternatives, U1,K1, the preferred alternative, is located the farthest from Puu o Kali. Also, none of the other alternatives are near this valuable dry land forest. The several-mile buffer between U1,K1 and the dryland forest will help insure that the forest is not be affected by the project.
2. The botanist who conducted the survey spent several days in the field inspecting the alternative alignments, and the U.S. Fish and Wildlife Service was satisfied with this effort. While there can never be a complete guarantee that a threatened, endangered or candidate plant species is not within any of the alternative alignments, the location of the alternatives through active agricultural areas lessens the possibility of encountering such species along any of the alignments. Even after the completion of the EIS, the provisions of the Endangered Species Act remain in force.
3. Construction vehicles and equipment needed for construction are already on Maui. If vehicles and equipment are brought in from another island, they will be cleaned prior to shipment to prevent the importation of alien species. Mitigation measures to prevent alien species invasion is described in Section 4.8 of the Final EIS.
4. As described in Section 4.13.2 of the EIS, details of the landscaping plan will be developed in the project's design phase. The Department of Transportation intends to use native plants to the maximum degree practicable.
5. Section 4.8.4 of the Final EIS includes measures to minimize the chance of vehicle-deer collisions. As recommended, fencing will be provided along the highway. The fencing will help prevent cattle from getting onto the highway. However, the fencing may not be completely effective regarding deer. The Department of Transportation is responsible for disposing of road kill, and will support a deer control program coordinated or operated by another agency, as long as roadway safety is maintained.

DEPT. OF  
TRANSPORTATION

OCT 27 10 16 AM '99

Steve Sutrov  
124 Ainakula Road  
Kula, Maui, HI. 96790

Mr. Abraham Wong, Division Administrator October 23, 1999  
Federal Highway Administration  
P.O. Box 50206  
300 Ala Moana Boulevard  
Honolulu, HI 96850

Dear Mr. Wong:

Subject: The Kihei-Upcountry Highway Draft Environmental Impact Statement (Draft EIS)

**MY GENERAL COMMENTS ABOUT THE DRAFT EIS**

1 I personally believe that the Upcountry/ Kihei Road project process has been skewed from the early stages of the Upcountry/ Kihei Task Force. The actual need for this new connection was in doubt and a major question at every meeting: Task Force, DOT public, and many informational community association meetings and surveys. The DOT and the Draft EIS has tried to paint a need for this new connection through weak, outdated, and unprofessional assumptions of our existing roadways, proposed improvements, and the proposed new alignments. Ignoring purposely the Community Plan of the majority of the proposed project region proves that this document is self-serving to the politicians and developers that are working hand in pocket with each other to push it forward. After we add up all the costs of a new highway, money and environmental, look honestly at the impacts of it compared to the benefits of improving the existing roadway system, the answer to this road plan should be a no-brainer.

**THE COMMUNITY PLANS**

- 2 1. Discuss in depth the scope and importance of the Community Plan process for the proper implication of planning in its given region. The many public meetings, its acceptance by the Maui County Planning Dept., Planning Commission, Maui County Council, and the Mayor show that the (July, 96) Makawao-Pukalani-Kula Community Plan was widely indorsed and should reflect as such in the final EIS.
- 3 2. An overlay figure should be supplied showing the proposed new highway project area with the two Community Plan regions affected, Kihei and Makawao-Pukalani-Kula. A percentage should be estimated to show if one region is vastly larger thus influencing the outcome of proper planning for the new highway project area.
- 4 3. Complete direct quotes from the **Makawao-Pukalani-Kula Community Plan** should be supplied in reference to the Kihei-Upcountry Highway listed in: "Transportation" and "Interregional Issues."

- 5
4. Supply current position statements from Upcountry Associations supporting the same or similar Makawao-Pukalani-Kula Community Plan directives on the Kihei-Upcountry Highway. Kula, Pukalani, Haiku Community Associations, and the Makawao Main Street Association have voiced support for or similar views to the Upcountry Community Plan position on this roadway. More than once in the past the Kihei Community Association has supported a new roadway but has voiced the fact that the road will be more of an impact and a benefit to Upcountry and Upcountry should decide its own fate on the highway. (State/County Joint Task Force Upcountry-Kihei Highway Final Report (Oct. 1993))

## ORIGIN / DESTINATION STUDIES

- 6
1. The June, 1994, roadside vehicle survey as described in **Maui Long Range Land Transportation Plan (Nov. 1995)** is the only attempt at supplying very important data on driving forecasting that could be relevant to prove a need or location for a new Kihei-Upcountry Highway. This survey is scarcely mentioned in the DEIS. I believe the surveys results must be a weak sampling, substantiating very little, or supplying support data for a politically less attractive alignment for the DOT engineers. **I believe the final EIS should include this past survey data.**
  - 7 2. In the Upcountry, where from, how many and how often would trips be generated with each highway alignment? With the Draft EIS we don't know. **A complete and current origin-destination study needs to be completed to address this.** Cost-Benefit comparisons could not be done without this information. Also I believe the **"enhanced widening of existing roadways"** should be included in this trip analysis being it would satisfy the listed project purpose **"To improve roadway system linkage"**
  - 8 3. Hansen Road has been left out of the Draft EIS as a primary roadway for the Upcountry to Kihei commute. This deletion seemed to be by design. Hansen Road knocks off a good 10 minutes, and when it is realigned with a new intersection at Puunene Av. maybe even more. **Hansen Road should be part of the OD studies and comparisons.**
  - 9 4. In the EIS future traffic 'LOS' and travel projections for the existing roadways should include not only the improvements stated in the Maui Long Range Land Transportation Plan but also detailed, safe and efficient intersections (grade separations etc.)  
Future traffic 'LOS' projections for ALL new proposed alignments must include the total number and location of intersections, type of intersections (stop signs, signal lights, etc.), the percent of grade at different elevations, and maximum speed limits as they change for schools, Urban districts etc.  
**The above information is essential to decipher costs, safety, and efficiency.**
  - 10 5. The Draft EIS states a possible 50% savings in time and fuel with a new highway alignment. Present evidence to prove this. Table 4-12 (page 4-58) shows distance comparisons; this means nothing without the full design of the roadway factored in.

11 6. A professional comparison on estimated travel times on each proposed alignment along with the same for the ' year 2020 No Build improvements,' Enhanced Widening alternative, Public Transit, and 'TSM', should be in the final EIS.

**THE PULIC TRANSIT AND (TSM) TRANSPORTATION SYSTEMS MANAGEMENT ALTERNATIVE**

12 1. The Public Transit and TSM Alternatives were incorrectly dropped during the 'Tier 1' screening; both should be considered and investigated throughout the alternative selection process. To eliminate it because it's not a road is wrong. TSM, Public Transit along with the 'enhanced widening' (EWR) could satisfy all project goals that a new highway alignment could. Please complete cost-benefit analysis on these alternatives also.

13 2. To assume that Maui County will not have a Public Transportation system within the next 20 years is wrong. To assume only more cars, private and rental, on more roads is a 'third world' answer and poor conservation planning. The public and visitor industry needs a public transportation system, the Maui County General Plan supports one, the EIS should assume we would have one operating by 2020, not otherwise.

14 3. The 'LOS' Level of Service rating given at all studied intersections for the year 2020 should take a Public Transportation System and TSM impact into its methodology. Taking many cars off the existing roadways would satisfy the project goals as listed in the Draft EIS.

**CONCERNS OF THE PROPOSED ALLIGNMENTS**

**U3**

- 1. U3 does not conform to the Community Plan of the majority of the project district
- 2. U3 should have never passed the 'fatal flaw' criteria. This alignment technically dead-ends on Kula Highway. A directional sign to aid the visitor's 2 miles out of their way to Haleakala Highway is absurd. Most will find their way through the steep, winding, neighborhood streets of Kimo Drive and Pulehuiki Rd. Others will get lost even deeper into rural Kula in the early morning. Buses, Bike tours, and others will cause safety and noise problems.
- 3. On the lower end it bisects the Maui County Ag Park, and impacts other truck farming operations close by.
- 4. What realistic mitigation measures would be used to lessen these impacts on the U3 connection?

**U2A**

**Substantial evidence to drop this connection option**

- 1. Non conformance to the Community Plan of the majority of the project district
- 2. The loss of prime agriculture resources and open space resources is a major concern
- 3. Counter productive traffic flows:
  - The main population base Upcountry must travel up the Pukalani By-Pass, intersect in front of the King Kekaulike High School, then down the mountain through proposed urban development lands with possible multiple intersections.

- Some Pukalani residential traffic would short cut through neighborhood streets impacting an Elementary School and quiet neighborhoods with safety and traffic concerns.

- 17
- Another new intersection would be created connecting Old Haleakala Highway with the Pukalani By-Pass, this would need to be signalized for traffic heading down the mountain to access Pukalani Town. This is another expense and safety concern.

**Please show a complete design of this intersection.**

- 17
4. The archaeological importance of many sites along this route would make this alignment like a land mine in a soccer field for the DOT. The Draft EIS admits some sites will be sacrificed.
  5. Bike Tours (many vans and bikes) will be using this new connector, changing their current tour routes. This new route will add thousands of defenseless visitors on bikes clashing with the many young drivers of the High Schools.

**U2B**

- 18
1. This alignment does not conform to the Community Plan of the majority of the project district.
  2. A severe 10% grade near the (K-12) Kamehameha School, elderly housing project, public park, shopping center, and a Hawaiian cultural center.

- 18
- There will be loud and disruptive noise from trucks, tour buses, and commercial supply vehicles going up the mountain and from the application of (air) brakes as those same vehicles head back down. **How will this be mitigated?**
  - Safety will be jeopardized with speeding, fully loaded trucks and buses, and adverse weather conditions on this very steep highway. The absence of a truck climbing lane or center divider will also entice accident situations. **How will this be mitigated?**
- With many new intersections, pedestrian and bike traffic, and more urban lands below to be developed, U2B can laughingly be called a limited access highway.

- 18
3. The Draft EIS contains many references to the Kulamalu Master Plan. **Please include in the final EIS a complete current site map of the Kulamalu project area. Also supply any current information or offers that Dowling Company or Kulamalu Limited Partnership has relayed to the DOT on the U2A or U2B alignments. Please also supply in the EIS communications from any State Representatives that has expressed support for this alignment.**
  4. As with the U2A and U3 connection, most Southside and some Westside Upcountry commuter traffic will travel up the By-Pass to reach this intersection. With U2B and U3 this traffic will pass the King Kekaulike High School and Kamehameha School front entrance while the kids are just arriving by bus, car, bike, and foot. At this same location throughout the day visitor, bus, car, and bike/van traffic will be going both up and down. **How will the obvious safety issues here be mitigated?**

18

- 5. Archaeological importance along this route would make this alignment more likely to cause damage. Some say its already been done. It might be wiser to steer clear of these highly sensitive areas and not risk the unknown.

U1

19

1. U1 does not conform to the first choice of the Community Plan of the majority of the project district, but if a highway is built, Hali'imaile is the only allowable route connection Upcountry.
2. The loss of prime agriculture resources and open space resources is a major concern
3. I would disagree that the Upcountry Community Plan supports **this** U1 alignment at all.
  - The original connections from Hali'imaile to Kihei seemed more acceptable. (Alt. 1) These lower alignments were at a much lower grade, were more direct, and only crossed Omaopio Road, not Pulehu Road as well. Although more creativity would be necessary to accommodate the cane operations, this lower road would be safer, quicker, and a better cost-benefit ratio.
  - I believe the upper alignment was selected to accommodate future urban land speculation below Pukalani and up to Kulamalu (a mile away). **Please elaborate the reasoning behind the new U1 alignment.**
  - Many times the Draft EIS says U1 will cause additional traffic on Pulehu and Omaopio Roads. **Do a complete Origin-destination study and prove this wrong. The main population base will use the improved 4 lane and the closer Haleakala Highway.**
  - The poor level of service rating given for the Haliimaile intersection for 2020 must be from a poor intersection design. **Try it again with a modest grade separation, overpass, or tunnel, and detail it in the EIS.**

### OTHER CONCERNS AND QUESTIONS

20

1. **Noise studies were incomplete and should be redone**
  - Many noise studies were preformed during the summer when schools were out and visitor counts are traditionally down.
  - Studies were preformed for the (K-12) Kamehameha School in a field before the school was built and the 10% inclined road was done. Morning Crater, Upcountry commuter, multiple school, and commercial retail traffic noise should all be combined to estimate the impacts on this U2B alignment in the future.
  - Studies were not done near the proposed Kulamalu park, elderly housing project, or amphitheater.
  - King Kekaulike High School was not in session.

21

2. The Department of Education was not asked to respond to this project because of the safety, noise, and other possible impacts on the King Kekaulike High School and Pukalani Elementary School. **The DOE should be asked to respond.**

22

3. The Maui County Water board should be asked for their input on future water improvements in the Upcountry area. Contrary to the Draft EIS, developments in Kula will boom with a

- 22 | new roadway and greater water storage. Supply the latest information on planned water  
improvements.
- 23 | 4. The old government right-of-way (Alt.8) should still be studied as a trade for any alignment  
that crosses the same-owned cane land. Please explain the "design" problem that dropped  
it out of consideration as a final alternative.
- 24 | 5. Please explain which alignment would serve Kihei best in the event of a coastal  
emergency, and why?  
It seems in the best interest of the Kihei Community that they have efficient access to and  
from the emergency services in town (Hospital, Fire response, Airport). To evacuate to  
Upcountry and away from these services would be a mistake. An emergency access road  
from the Kihei Regional Park area to Mokulele Highway should be designed.
- 25 | 6. To design the new highways without a center divide is avoiding doing it correctly the  
first time. Someone putting traffic traveling at high speeds in opposite directions with  
only a few feet of air between them should be working for the local undertaker.
- 26 | 7. In the final EIS, list the negative socioeconomic impacts that the loss of farm land, open  
space, rural country atmosphere, and cultural and historical resources could have on  
the visitor industry in Maui Country. There must be some studies on similar Island  
communities that have lost open space, became overbuilt, and lost the return visitor.
- 27 | 8. It also bothers me that a developer involved with this project has created very  
profitable opportunities for a couple of State Legislators. Should I have any reason to  
think there might be undue influence on any decision in this process?

I am very concerned about the truthful need of this project. Being an employee of the  
Wailea area and commuting from Upcountry for the past 23 years, I know the drive never  
takes very long. To say this highway is for the hotel employees living upcountry is  
misrepresenting us. Improving the existing roadways to 4 lanes would improve the driving  
time and be much safer with a center divided roadway. The difference in time is not worth  
the many losses to Maui County and our visitors.

Most Upcountry workers I know don't mind the drive and don't want to be any closer to  
work than they are. They love their Upcountry home. They don't want a developer's plan  
or a State/Fed plan; they want their own community's plan.

In the final EIS please respond to all of my concerns and questions in the above comments.

Sincerely,

Steve Sutrov

  
Member of:

State/County Joint Task Force Upcountry Highway  
Kula Community Association Board of Directors

Mr. Steve Sutrov  
124 Ainakula Road  
Kula, HI 96790

1. The purpose of an environmental review document, such as an EIS or an environmental assessment, is to identify and assess the environmental and social impacts that could result from the development of a project so that better decisions are made. The analyses presented in the Draft EIS for Kihei-Upcountry Maui Highway were based on the best available information at the time the document was prepared, which could be obtained within reason. The EIS reported the positions of the community plans as they relate to the proposed project. As it turned out, these plans were influential in the decision to identify the preferred alternative.
2. The community plan process is one avenue through which the public expresses its sentiments. The Department of Transportation views these plans as advisory, since the planning of transportation facilities is complex and involves the balancing of many factors, including environmental impact, cost and transportation performance, in addition to community preference. The Department is quite aware of the extensive effort invested in the community plans. For your information, the preference stated in the Makawao-Pukalani-Kula Community Plan was given a lot of weight.
3. The Department of Transportation does not see its role as adjudicating the relative strength of two adjacent community plans on Maui. Cases in which community plans conflict should be resolved at the county level. In any case, the apportionment of project area between two community plans is not a suitable basis upon which to evaluate the relative influence of the plans on project planning. Therefore, the requested figure is not needed or relevant to decision-making.
4. You do not indicate that the paraphrase supplied inaccurately states the Makawao-Pukalani-Kula Community Plan's position. Absent an error, paraphrasing is within the editorial discretion allowed. It is the understanding of the Department of Transportation that the Makawao-Pukalani-Kula Community Plan states a preference for the No-Build alternative, but, if the road is to be built, the favored Upcountry terminus is at the Haleakala Highway / Haliimaile Road intersection.

5. If statements were provided by the mentioned organizations in response to the Draft EIS, their statements have been included in the Final EIS. All of these organizations have been afforded full opportunity to participate in the environmental review process.
6. An origin-destination (O-D) study was conducted for the Maui Long Range Land Transportation Plan (Long Range Plan). The roadside vehicle survey mentioned was used as input to study. The final O-D results were used in the latest Long Range Plan, which is the planning document that programs roadway improvements on Maui. The plan recommends Kihei-Upcountry Maui Highway, but does not identify a specific alignment. Data used to prepare the Long Range Plan can be obtained from the Statewide Transportation Planning office of the Department of Transportation.
7. The origin-destination study completed for the Maui Long Range Land Transportation Plan was used to estimate the traffic volumes that would use Kihei-Upcountry Maui Highway (see Section 4.4.1.2 of the EIS). Depending on the alternative, these volumes would vary. In general, the U3 and K2 alternatives would convey lower volumes, and the U1, U2-A, U2-B, and K1 alternatives would convey higher volumes. The Enhanced Widening of Existing Roadways (EWR) alternative was eliminated from further study because it would require construction over a 32 kilometer (20 miles) distance, and was estimated to cost \$78 million. This could not be justified when a highway directly linking Upcountry and Kihei would only be 15 to 18 kilometers (9 to 11 miles) long, and would cost roughly the same but be substantially better in addressing the system linkage and other purposes and needs.
8. Hansen Road was included in the origin-destination study used for Long Range Plan. As stated in Response #6, the results of the study were used to estimate the volumes that would use Kihei-Upcountry Maui Highway, including traffic on Hansen Road.
9. The level-of-service (LOS) analyses presented in Section 4.4.1.2 assumes the Kihei-Upcountry Maui Highway terminus intersections are signalized with acceleration, deceleration, and left-turn lanes. The purpose of an LOS analysis is to estimate traffic conditions (i.e., vehicle delay), not cost, safety, or overall efficiency. These parameters are evaluated elsewhere in the EIS.
10. The travel time savings presented in Section 4.14 are possible because Kihei-Upcountry Maui will be a limited access facility, unlike the present route, which includes traffic signals

and local traffic. It is not necessary to fully design a project to estimate its potential transportation benefits.

11. The comparisons of travel time savings presented in Section 4.14 were made against the No Build alternative. Comparisons were not made against the EWR and TSM alternatives because they were eliminated from consideration in the screening analysis (see Section 2.2). However, if comparisons were made, the results would be similar because these alternatives would not decrease travel distance. The travel time analysis did not assume peak period conditions (i.e., congested conditions) for the No Build alternative, which would have lengthened travel times, and thus, would not have compared well against the build alternatives.
12. The TSM Alternative was dropped from consideration because it would not address the project's purposes and needs. However, the Department of Transportation would support any effort to provide public transit on Maui because it would provide residents with other transportation options. The EWR alternative was also eliminated from further study (see response to comment 6).
13. Benefit-cost (B-C) analyses of the TSM and EWR alternatives were not conducted because both failed to address the project's purposes and needs. The method of calculating the B-C ratios for the alternatives screening analysis (see Section 2.2.1) was based on travel time savings between Kihei and Upcountry that would be provided by the build alternatives, in comparison to the future No Build alternative. With no travel distance savings, and an estimated cost of \$78 million, the B-C ratio of the EWR alternative would be very small.
14. Based on generally accepted standard methods and guidance, as well as applicable federal procedures, the No Build Alternative is defined as the transportation system described in the appropriate transportation planning document (The Maui Long-Range Plan), without the proposed project (Kihei-Upcountry Maui Highway). The future No-Build Alternative cannot assume a public transit system that is not described in the Maui Long-Range Plan. The Department of Transportation would support efforts by others to enhance public transit on Maui. Transit vehicles would be able to use Kihei-Upcountry Maui Highway.

15. LOS analysis was not conducted on the TSM alternative because it was eliminated in the alternatives screening evaluation (see Response #12). While reducing vehicular traffic would address some of the project goals, such as transportation demand, public transit cannot be assumed in the year 2020 condition because no governmental or non-governmental entity has proposed such a system, and it is not included in the Maui Long-Range Plan.
16. The U3 alternatives were evaluated in the Draft EIS because they are the least cost alternatives that address the project's purposes and needs (Alternative U3,K1 has the lowest cost, and Alternative U3,K2 has the third lowest cost). The U3 alternatives would have environmental impacts as noted in the comments. However, if a U3 alternative were selected as the preferred alternative, these impacts would be mitigated as described throughout Chapter 4. A U3 alternative was not identified as the preferred alternative, in part because it would not address travel markets as well as the other alternatives.
17. Although the U2-A alternatives do not conform to the preference stated in the Makawao-Pukalani-Kula Community Plan, this was not the reason these alignments were not identified as the preferred alternative. In addition, the loss of agricultural resources and open space is a common impact of all the alternatives, and the modified Five Trees intersection would have included crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

As described in Section 4.4.1 of the EIS, the U2-A alternatives would cause a contra-flow of peak directional traffic in Upcountry. This contra-flow pattern is considered beneficial. Since commuter traffic tends to peak during certain times of the day (i.e., early morning and late afternoon), arterial roadways tend to be over-utilized in one direction during the peak period, and under-utilized in the other direction. The benefit of the U2-A and U2-B alternatives, and to a lesser extent the U3 alternatives, is that they would have caused the directional splits of the highways in Upcountry to be more even.

There would be no direct access to the U2-A alignment from the lower Pukalani neighborhood, so the neighborhood impacts described in the comment would not occur. The only access to the U2-A alignment would be at the Five Trees intersection. The new

intersection on Pukalani Bypass would be a T-intersection, and only right-turns would be allowed (right-turn in and right-turn out). This intersection would not likely require traffic signals.

Based on the information obtained or developed to date, a U2-A alternative would not have displaced any archaeological sites, including a heiau found in proximity to this alignment. Impacts on archeological sites are not necessarily sufficient reason to abandon an alternative.

Kihei-Upcountry Maui Highway would have included shoulders wide enough for bicyclists regardless of the alternative selected. Bicycle tour operators are allowed to use public roadways, but not in a manner that would be unsafe for their customers or others.

The issues raised above are addressed in more detail in Chapter 4 of the EIS.

18. Although the U2-B alternatives do not conform to the preference stated in the Makawao-Pukalani-Kula Community Plan, this was not the reason these alignments were not identified as the preferred alternative. One of the disadvantages of the U2-B alternative is its 10 percent grade near Kula Highway, which is normally not acceptable for a limited access highway facility. Limited access means that driveways are not allowed direct access to the roadway, but intersections are allowed.

If a U2-B alternative had been identified as the preferred alternative, any noise impacts (see Section 4.6 for a definition of a noise impact) would be mitigated in accordance with the Department of Transportation Noise Analysis and Abatement Policy. In the vicinity of Kamehameha School and the future shopping center, an urban design would have been used, which includes sidewalks.

Since a U2-B alignment was not identified as the preferred alternative, close coordination with the Kulamalu development will not be necessary. Therefore, a complete and current site map of this development is not needed in the Final EIS.

The U2-B terminus would be designed to accommodate pedestrians (walking students). Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Based on the information developed to date, the U2-B alignment does not contain archaeological sites that would have made this alignment unworkable.

19. The U1,K1 alignment was identified as the preferred alternative. The U1 terminus conforms to the preference as stated in the Makawao-Pukalani-Kula Community Plan, if a build alternative is implemented.

The U1 alternatives would displace the greatest amount of agricultural land in comparison to the other Upcountry terminus options. Mitigation measures will be implemented to maintain the productivity of fields not directly affected by the project.

Alternative 1 was eliminated during the alternatives screening because, based on coordination with Hawaiian Commercial & Sugar Company, it would have caused substantially greater impacts to agricultural practices and agricultural infrastructure than the upper alignment. Alternatives 2B (U1,K1) and 2C (U1,K2) were developed to avoid bisecting the Maui R&T Park, retain an option with an Upcountry terminus at the Haliimaile intersection, and minimize impacts to active sugarcane fields. The potential for future urban development was not a factor in developing the U1 alternatives.

The EIS discloses the potential impact that some motorists may choose to use Omaopio and Pulehu Roads to travel between the new highway and Kula because these roads would shorten their travel distance. This impact is expected to be greatest under a U1 alternative because of the greater distance between Kula and the U1 terminus. The basis for this assessment is that some motorists already use these roads instead of Kula, Haleakala and Hana Highways.

The predicted level-of-service at the U1 terminus is not poor, although it is not as good as the other Upcountry terminus options because more Upcountry traffic would use this intersection. With the other alternatives, a directional split of traffic volumes would occur (see Response #16). A study of several concepts for grade-separating the U1 intersection is provided in Section 2.1.2 of the Final EIS. However, based on presently projected traffic volumes, the costs of these options are not justified considering their marginal benefits in relation to a signalized intersection, which costs substantially less.

20. To predict future traffic noise levels at noise-sensitive locations (e.g., residences, schools, certain kinds of parks, etc.), noise monitoring is performed to calibrate the noise model. For sites near a major roadway, noise monitoring is conducted when traffic conditions generate the highest noise levels. Impacts of the project are determined based on this "worst-case" traffic condition. Traffic noise is highest when the road is conveying high volumes of high-speed traffic (i.e., the road is crowded, but not too crowded that speed is affected). Therefore, the fact that the high school was not in session during the monitoring does not factor into the analysis.

For noise-sensitive locations not presently near a highway, but near an alternative alignment, the monitoring could be done at any time during the day. Since noise monitoring was done at the Kamehameha School site, which would be adjacent to the highway if a U2-B alignment were identified as the preferred alternative, it is not necessary to monitor other proposed noise sensitive sites in the general area, such as the elderly housing project. Had a U2-B alternative had been identified as the preferred alternative, the Department of Transportation would work with the developer to ensure that no noise impacts would occur on the abutting properties, in accordance with the Department of Transportation's Noise Analysis and Abatement Policy.

21. The Department of Education (DOE) was sent a copy of the Draft EIS and was asked to review and comment on the document. The DOE responded, with a statement that they had no comments (see Volume 2: Draft EIS Comments and Responses).

22. The Maui Board of Water Supply was consulted during the preparation of the Draft EIS, and their input was used to evaluate the growth inducement potential of Kihei-Upcountry Maui Highway (see Sections 3.4.3 and 4.1.1). These sections are based on the latest information available from the Board of Water Supply.

23. Alternative 8 was dropped from consideration during the alternatives screening because it does not meet radius and grade standards for a modern highway. There could be liability issues associated with providing a highway facility that is not designed to current standards.

24. Coastal hazards are a major reason why South Maui needs evacuation capacity. Direct access to emergency services in Kahului, while important, is only one consideration. The

evacuation route you suggest could still be blocked by a coastal hazard or an incident in North Kihei.

25. Kihei-Upcountry Maui Highway, in its initial two-lane undivided configuration, would be similar to Haleakala or Hana Highway. The number of incidents on these highways is not high considering their traffic volumes. Kihei-Upcountry Maui Highway will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards.
26. The conversion of open space and agricultural lands to transportation infrastructure is not anticipated to affect the visitor industry on Maui. The preferred alternative, the U1,K1 alignment, will not affect significant archaeological or historic sites. The level of impact that the project will have on the "rural country atmosphere" and the potential effect on the visitor industry are debatable. The Department of Transportation recognizes that an important characteristic of the Upcountry's "rural country atmosphere" is its relatively low density. However, it is the availability of water, not transportation capacity constraints that would affect this aspect of Upcountry ambiance.
27. The criteria used to evaluate the build alternatives considered in the Draft EIS were based on cost, environmental, transportation, and community planning factors. There was no influence on the part of any developer or legislator with regards to the selection of the preferred alternative. If the commenter has evidence that improprieties have occurred, these should be reported to the appropriate authorities.

1. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala, Hana, Mokulele, and Piilani Highways. The preferred alternative is most consistent with the Makawao-Pukalani-Kula Community Plan.
2. The suggested alignment would be similar to Alternatives 6A and 6B, which were eliminated in the alternatives screening evaluation for their exceptionally poor benefit-cost ratios. Their poor ratios derive from the relatively small amount of traffic that would use these alignments.

Mr. Steve Sutrov  
124 Ainakoa Rd.  
Kula, HI 96790

Comment: The Construction of Kihei-Upcountry Maui Highway will encourage development in Upcountry.

Response: The potential for urban growth inducement in Upcountry was analyzed in Section 4.1.1 of the EIS. It was determined that the amount and pace of residential development in Upcountry will continue to be controlled by water availability, not transportation infrastructure.

Comment: Improve existing roads before building this new highway.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway and Piilani Highway.

Comment: Intersection level-of-service cannot be determined without detailed design work.

Response: Intersection level-of-service analyses can be conducted using conceptual engineering.

Comment: Requested details on the number and signalization of proposed intersections on Kihei-Upcountry Maui Highway, and other engineering details.

Response: This information is provided in Section 2.1 of the EIS. The Department of Transportation must approve all proposed future connections, and will maintain the roadway as a rural, limited access highway. Kihei-Upcountry Maui Highway would likely have only two signalized intersections located at the termini.

Comment: Requested a figure in the Final EIS showing the alternatives in relation to the areas of the two affected community plans. Since most of the project area would be within the Makawao-Pukalan-Kula planning district, this community plan should govern. Alternatives not contained in this community plan should not be considered.

Response: Since two community planning areas would be affected the project, both plans must be equally considered. The notion that the controlling community plan should be the one with the greatest proportion of the alignment is rejected. Therefore, the requested figure is not

needed. State highway projects are not required to conform to locations set forth in community plans. The Department of Transportation considers community plans to be important expressions of public sentiment, not regulatory documents. Nevertheless, the Makawao-Pukalani-Kula Community Plan was given substantial weight in the identification of the preferred alternative, the U1,K1 alignment.

Comment: The EIS should have considered the Haliimaile terminus alternative that crossed only Omaopio Road, not the current alternatives that cross both Omaopio and Pulehu Roads.

Response: The alignment suggested, Alternative 1, was eliminated during the alternatives screening because it would cause substantially greater impacts to active sugarcane fields when compared to the other alternatives. This alignment evolved into the current U1 alignment.

Comment: The EIS needs an origin-destination study.

Response: An origin-destination study was completed for the Maui Long Range Land Transportation Plan. This origin-destination study was used to estimate the volumes that would use Kihei-Upcountry Maui Highway (see Section 4.4.1.2).

Comment: The noise analysis of the impacts to Kamehameha School and King Kekaulike High School is not sufficient because of inadequate monitoring: Kamehameha School was not in existence and only two grades were in session at the high school.

Response: See the response to Comment #20 from your letter.

Comment: The U3 alternatives were included in the EIS to confuse the public.

Response: The U3 alternatives were evaluated in the Draft EIS because they are low-cost alternatives that address the project's purposes and needs. Alternative U3,K1 has the lowest cost, and Alternative U3,K2 has the third lowest cost. Therefore, they are reasonable alternatives, and were not presented to divide opposition to this project.

Comment: Kihei-Upcountry Maui Highway should be a divided roadway for safety reasons.

Response: A two-lane highway is proposed because projections indicate that two lanes would be sufficient to accommodate travel demand in the design year 2020. In its initial two-lane

undivided configuration, the highway would be similar to Haleakala or Hana Highway. Kihei-Upcountry Maui Highway will be designed in accordance with accepted standards.

Keep Upcountry Worth the Drive  
Testimony Against the Building of the Upcountry-Kihei Highway

I am opposed to the building of the Upcountry-Kihei Highway because every time we lose a part of Maui's natural beauty, residents and visitors alike lose something very special. The highway, its string of street lights, and its traffic will blight the mountainside. Upcountry must also be kept a rural environment. Growth is inevitable, but it must be controlled. There are plans to widen Haleakala Highway to four lanes. This will be enough. In the future, there is also the possibility of a highway to Kihei through Hawaiian Homeland's Waiakoa land. If Upcountry is not preserved, what will be the point to escape hot, sticky, touristy, and crowded Kihei to travel to Upcountry with its cool air, small farms and open pastures. What would be the point to live up here, far from the employing hotels in the first place?

Regarding the different possible Upcountry connections, if this highway must be built, Hailiimaile would be the best route.

1 | Any connection in Pukalani will create havoc with the schools there, King Kekaulike, and later, King Kamehameha as well. Many students would have to cross the new highway's traffic, added on top of the current congestion, to walk home from school. Do not let it take a student to be hit by a car for this route to be realized a mistake.

2 | I am opposed to the Omaopio Road connection because though this might be the most direct route to build, it is not easily reached by much of Upcountry's population. Also, if tourists from Kihei were to use that route to reach Haleakala National Park, which way would they take to reach the summit? There are no direct routes. I would like to see the rental car agencies send their customers into the Lower Kula Road and Kimo Drive neighborhoods.

The Hailiimaile connection is not in the middle of a town or schools and is still accessible from, and gives access to, all of Upcountry. Though Hailiimaile is the least of the evils, people there are also concerned about the traffic it will bring through their neighborhoods.

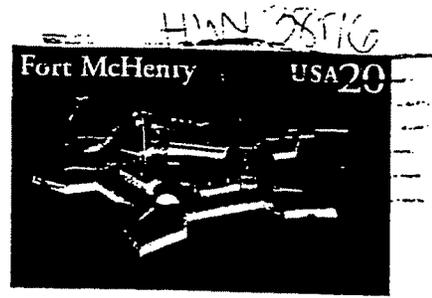

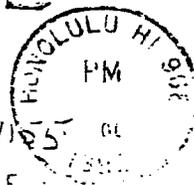

In conclusion, since there are already plans to expand the existing roadways connecting Down Country and Upcountry, the Upcountry-Kihei Highway should not be built. Let us preserve our beautiful and peaceful Upcountry, one of Maui's jewels. It will be worth the drive.

Margaret T. Sutrov

Ms. Margaret T. Sutrov

1. Had a U2-A or U2-B terminus been identified as part of the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would have included crosswalks and sidewalks to the high school (see Section 4.4.4 of the Final EIS). Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
2. The EIS discloses that one of the impacts of the U3 alternatives would have been that some motorists traveling to and from the summit may inappropriately choose to travel through the residential roads of Kula instead of staying on the main highways. A U3 alternative was not identified as the preferred alternative.

1. A "raised rail system" (rail transit) would not meet the purposes and needs of the proposed Kihei-Upcountry Maui Highway. In addition, given the present population size and land use pattern on Maui, it would be highly inefficient. For rail transit to work, higher population densities are required than currently occur on Maui. Should the people on Maui wish to pursue the development of a public transit system, a bus system would be a less expensive technology to start with.

Mr. Kazu Hayashida  
Director of Transportation  
State Department of transportation  
Highways Division  
869 Punchbowl Street  
Honolulu, HI 96813

Dear Sir:

I have been an Upcountry resident for over twenty years. I have been aware of the plans to build a highway to link Kula with Kihei for a long time and I still arrive at the same conclusion.

1 I feel the existing highways are inadequate and need to be upgraded. I would prefer seeing the Mokulele Highway become a four lane divided highway connecting to Hana Highway, a six lane highway that connects to a divided four lane Haleakala Highway. I believe we need to exhaust our present access routes first. I am afraid that the construction of a new highway will impede the upgrading of our already inferior road system.

If the government insists upon building a separate road, I feel that the U1 Haliimailli terminus is the only one to consider. U1 would serve a greater Upcountry population, diverting more traffic to Kihei from Hana Highway as the EIS states. It would also bring Kihei residents and tourists to where the Upcountry begins allowing a more broader access to where they may want to go. It also appears to be the safest and logical design solution. This route would serve the Kihei residents with a direct route to the emergency hub of the island (airport, Civil Defense, hospital, etc.). The Haliimailli intersection is a mere ten minutes to the airport.

The U2A connection is too unsafe. There is already a bottleneck there and traffic accidents happen too frequently.

The U2B connection is even more unsafe, exposing two schools to more traffic.

2 The U2A, U2B, and U3 pose too much safety risk because there will be too much traffic trying to go in all directions during rush hour.

There will be bike tours going down the mountain, service vehicles servicing the new commercial development and the two schools, tour busses going to the summit, school traffic going and coming from both high schools as well as going to Pukalani School, Kalama Intermediate, and Seabury Hall along with the community trying to get to work.

Combined with this congestion there will be high school students from three high schools in this area learning to drive.

There is already a problem in this area. Another road would make the situation worse.

I support the Pukalani-Makawao-Kula Community Plan. It was formulated by citizens from every corner of Upcountry who studied the options carefully. After much consideration they came to an unbiased and educated conclusion that they felt is in the best interest of the communities.

This plan was passed by the Maui County Council and signed into law by our Mayor. Thus it should be honored.

Sincerely,

Ms. Margaret J.B. Sutrov  
124 Ainakula Road  
Kula, HI 96790

1. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway, and Piilani Highway.
2. Had a U2-A or U2-B terminus been identified as part of the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would have included crosswalks and sidewalks to the high school (see Section 4.4.4 of the Final EIS). Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

As described in Section 4.4.1 of the EIS, the U2-A, U2-B, and U3 alternatives would cause the contra-flow of morning peak directional traffic in Upcountry. Since commuter traffic tends to peak during certain times of the day, arterial roadways tend to be over-utilized in one direction during the peak period, and under-utilized in the other direction. A benefit of the U2-A and U2-B alternatives, and to a lesser extent the U3 alternatives, is that they would cause the directional splits of the highways in Upcountry to be more even.

DEPT. OF  
TRANSPORTATION

OCT 26 1 13 PM '99

Dear Mr. Hayashida,

Please don't build any new Kīhei - UpCountry route.

- 1 | A new highway would adversely divide agricultural land and hurt farmers.
- 2 | A new highway would enable more development on agricultural lands, which would be detrimental, both to the land, and to the island water supply.
- 3 | Installations at the summit of Haleakala are too high to be suitable for a work site for many people. The few workers who travel there could be transported quicker and for less total cost if they were flown by helicopter.  
Communication between Kīhei + Haleakala should be done "HIGH TECH", electronically.
- 4 | Tourist industry employers should build more employee housing close by the jobs, and also support mass public transportation for workers living further away. A scheduled mass transport system could run between "car park areas" around the island.
- 5 | Kīhei DOES need an ESCAPE ROUTE. An inexpensive way to make it would be to maintain a simple road which was <sup>normally</sup> closed, except for times of emergency. Some existing road might do. I spent 10 working years driving from Fair to Lāhainā + Kīhei. But,  
Please don't build any new Kīhei - UpCountry highway.

Aloha,

October 20, 1999

Martha Martini

Martha Martini

P.O. BOX 296, PAIA, HI 96779

Ms. Martha Martin  
P.O. Box 296  
Paia, HI 96779

1. The project would adversely affect agricultural land. The preferred alternative, the U1,K1 alignment, will bisect sugarcane and pineapple fields. The impact on agricultural activities will need to be mitigated, as described in Section 4.2.4 of the EIS.
2. The potential for urban growth inducement in Upcountry was analyzed in the EIS. It was determined that the amount and pace of residential development in Upcountry will continue to be controlled by water availability, not transportation capacity.
3. The EIS acknowledges that the number of persons traveling between the Maui R&T Park and Science City using Kihei-Upcountry Maui Highway will be relatively small compared to other travel markets. However, there are other purposes for the project than providing improved mobility between the Maui R&T Park and Science City.
4. The Department of Transportation supports the concept of developing housing near workplaces. However, the Department is not a housing authority, and must plan for the travel demand generated by the current and forecasted land use patterns. The Department also supports public transit on Maui because it would provide residents with other transportation options. However, transit operations are typically a County responsibility.
5. The suggestion to maintain a simple road that is normally closed may help address the evacuation capacity goal of the project. However, there are other purposes of the project that this suggestion would not address.

Dear Sir:

Re: EIS Kihei-Upcountry Maui Highway

After reviewing the Draft Environmental Impact Statement for the Kihei Upcountry Upcountry Maui Highway and considering the cost benefit ratios of the various proposed routes, the "No Build" alternative is by far the best option.

1 | Most of the "No Build" projects are needed even if there is a Kihei-Upcountry Highway. However the "No Build" options would relieve enough of the traffic congestion that the Kihei-Upcountry highway might not be justified.

2 | There is no justification for a highway to link the Maui R & T Park with Science City other than a highly questionable legislative directive.

This project should be terminated in favor of addressing the existing improvements listed in the "No Build" option.

Sincerely,

C.P. Erdman  
CEO Ulupalakua Ranch, Inc.

Mr. C.P. Erdman  
CEO Ulupalakua Ranch, Inc.

Dear Abraham Wong,

1 I am writing to express my opinion regarding the proposed Kihei to Kula highway. I  
2 have studied the issues to a reasonable extent. Although a fear of Tsunami is a concern,  
the reality is less so. The need for people working at Maui research facilities to have  
convenient access is easily addressed. We have many helicopters on this island available  
for contract by these few travelers. Maui needs other roads improved (eg, Mokulele  
highway, Honoapiilani highway widened to 4 lanes, Haleakala highway widened to 4  
lanes) and so we should focus on what is needed most.

I am opposed to the building of the road. I drive every day on Maui. I do not see much  
benefit to the road. And I fear several possible negative aspects of the road being built.  
What we do need is to prioritize our spending. The money that the State of Hawaii could  
spend on this road should be returned to the University of Hawaii budget. And the  
money that our federal government could spend on this road should be returned to  
balance the federal budget.

Sincerely,

Robert Crook

1. Coastal areas should always take tsunami threats seriously as evidenced from recent history. As described in Section 3.9.3 of the EIS, much of Kihei is within a tsunami evacuation area. There are other purposes and needs of the project beyond improving mobility between the Maui R&T Park and Science City.
2. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway and Piilani Highway.

Re: Kihei-Upcountry Highway, Maui, Hawaii

Dear Mr. Hayshida:

I am in agreement with the Kula Community Association Board of Directors which opposes the Pulehu, Kulamalu and "5 Trees" termini of the proposed Kihei to Upcountry Maui highway. The Kula Community Association developed its position based on surveys of the residents of Upcountry Maui, and I feel that these residents have the right to decide what will happen to their community.

1

Other options are available to alleviate growing traffic concerns, such as upgrading existing roads. If a new road must be built, the Haliimaile terminus is the best option in terms of minimizing what is already severe traffic congestion.

Although I do not live in Hawaii, I have friends who do and I care a lot about it. I hope the government listens to the residents of Upcountry, Maui. Maui is a beautiful and unique place with a pace of life slower than that on the mainland. It deserves to be kept that way.

Sincerely,

Sara Backowski

OCT 28 10 53 AM '99

Dear Mr. Hayashida,

Thank you for the opportunity to comment on the proposed upcountry- Kihei highway. My concern with the current proposal is twofold.

1 The Environmental Impact Statement contains a suspicious absence of the full description of the proposed soil to be paved with the selection of any of the proposed upcountry termini. In the 1970 Soil Survey by the U.S.D.A Soil Conservation Service and University of Hawaii Agricultural Experiment Station, the Keahua Series of soil (to be paved with either Haliimaile, Pukalani, or Kulamalu termini) is described as "well-drained soils on the uplands on the island of Maui... annual rainfall 15- 25 inches... used for sugarcane, pasture, wildlife habitat... pineapple, truck crops, and home sites... the surface layer is dark reddish brown silty clay loam about 10 inches thick... the subsoil about 50 inches thick is dark reddish brown silty clay loam ... the soil is slightly acid in the surface layer and slightly acid to neutral in the subsoil... permeability is moderate... runoff is slow, and the erosion hazard is slight... the available water capacity is about 1.3 inches per foot of soil ... IN PLACES ROOTS PENETRATE TO A DEPTH OF 4 FEET OR MORE". This clearly describes some of the best soil in the state and probably the tropics. Thus, we have the logical opposition by both Maui Pineapple and H.C. & S. to any of the currently proposed upcountry termini. Please provide for everyone your staff's "TOP TEN REASONS " why we should pave our best soil.

2 Secondly, the road is to be funded by U.S. Military Defense funds. The failure to connect the defense facilities to the termini raises a strong suspicion of fraudulent misappropriation of those defense funds and lends greater credibility to the rumor and innuendo that the connection of the U2-K2 routing is shrouded in graft with criminal implications.

When Sen. Daniel Inouye first acquired the funds to do the route proposal he was clear it was to be for defense and did not want the process to deteriorate into "another H-3". Clearly, the current choice of termini sabotage and betray Sen. Inouye and his most honorable intentions.

Do we need a road? Yes, we have needed a road for 25 years. However, the currently proposed termini fail to directly connect the two defense facilities in an expeditious way.

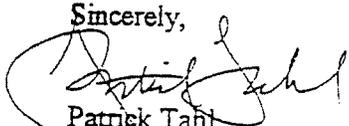

Originally, the route from Maui Research and Tech facility to Hawaiian Homes was discounted because the proposal included paving from MRT to Lower Kula Highway. Now, nearly 10 miles of roads are developed in Hawaiian Homelands lowering the proposed terminus to an elevation well within a possible federal highway percent grade approval or exemption.

3 If a terminus near Haliimaile becomes absolutely unavoidable, please consider an alignment much closer to the existing H.C. & S.'s Keahua Road and Upper Kihei Road. Please place a stronger emphasis on minimal disruption to their agricultural operations and provide a much better plan to handle any cross traffic.

4 The current rush hour congestion can easily be relieved with staggered work hours just like New York and Chicago, and widening existing roads.

I strongly urge you and your staff to reconsider the proposed termini and avoid protracting this highway project into "another H-3".

Sincerely,

  
Patrick Tani  
Kula

Mr. Patrick Tahl  
Kula, HI 96790

1. Thank you for the information about the soils found in the project area. Section 3.9.1 of the EIS contains information about these soils. As you point out, and as disclosed in the Final EIS, the proposed project would result in the loss of productive agricultural soils, in addition to affecting agricultural activities and open space. Mitigation measures will be incorporated into the project to help minimize adverse impacts on agricultural activities.
2. U.S. military defense funds will not be used. Construction of the project would be funded by a combination of State highway funds, and federal funds administered by the U.S. Department of Transportation, Federal Highway Administration. Enhancing mobility between the Maui Research and Technology Park and Science City is one of several project purposes. Alternatives do not need to directly terminate at these facilities in order to improve the connection between them.
3. The U1 alternatives were coordinated with HC&S, and HC&S has stated a willingness to work with the Department of Transportation to minimize adverse impacts on agricultural operations. Section 4.2.4 of the EIS describes the mitigation measures that would be employed for maintenance of agricultural activities.
4. The Department of Transportation would support staggered work hours program, or other transportation demand management strategies that would lead to a more efficient use of the Maui 's roadway system.

Director of Transportation  
State Department of Transportation  
Highways Division  
869 Punchbowl St.  
Honolulu, HI 96813

Dear Mr. Hayashida,

Please carefully consider the following comments on the proposed 'Kihei-Upcountry Highway' on the island of Maui. I offer the following comments as an objective professional concerned about a very significant, but rarely mentioned, public safety issue regarding this road: deer-vehicle related accidents.

I am a professional wildlife biologist, wrapping up 30 months of research on axis deer biology here on Maui in pursuit of my PhD in ecology for the University of California, Davis. Although, I currently reside in Kula, I am only a temporary Maui resident. As a result, I have no strong feelings regarding the ultimate outcome of this proposal. However, after spending more than two-years, full-time, studying the deer in this region, I would consider my comments to be the closest thing we have to 'expert testimony' regarding this particular issue. Throughout this region, my knowledge of current deer population sizes, future population trends, and deer habitat preferences leads me to have serious reservations about the proposal as it is currently presented. In this letter, I will give a general overview of the deer situation on Maui and then I will present a few suggested mitigation measures that should be seriously considered if this highway is to go forward and provide a safe route of travel for vehicular traffic. I have read the entire Draft Environmental Impact Statement (DEIS) for this project and some of my comments relate to this document.

Nine axis deer were first introduced to Maui in 1959 and 1960 just above Kihei on the Kaonoulu Ranch property. They have since grown tremendously in numbers, with hunting (both legal and 'poaching') becoming a significant source of mortality only in very recent years (1995 onwards). I currently estimate that there are over 3000 deer on the island. There could be as many as 5000. By the time the highway is expected to open in 2004 (DEIS p. 2-16) I project that Maui will have 8-10,000 deer.

1

Currently, deer numbers remain highest in the vicinity of the original release site on the western slopes of Haleakala from 'upcountry' to Makena, below about 3000 feet in elevation. This is the true 'heart' of the deer population on Maui at the moment. I expect that 75% or more of the population is found in this region. Unfortunately, the deer are also scattered widely throughout the island in smaller numbers. We know that there are currently deer in Hana, Kaupo, Kahakuloa, Kapalua/Lahaina, Ukumehame, Waikapu, Kanaha and Haiku. This is clearly an issue that will become increasingly bothersome to motorists throughout the island in the coming years.

I have enclosed a map of East Maui that provides a ROUGH indication of relative deer numbers throughout this region. As you can see, the proposed highway will bisect a significant portion of the high density deer area. As a result, I offer the following recommendations:

- 1) The population distribution of deer on Maui leads me to prefer the highway routing that begins at the northernmost Kihei terminus (K1) and ends at the Haliimaile terminus upcountry (U1). This will still provide an alternative escape route for Kihei residents and meet the traffic objectives of this project. From a deer (and safety) perspective this route is preferred because it is furthest from the Makena/Wailea area that holds the highest local numbers of deer. Further, this routing incorporates much more agricultural land, and much less 'ranch' land. This means that the highway is bisecting an area that will hold fewer deer. The deer clearly prefer 'ranch' land habitat (dry kiawe forests, buffelgrass...) as described in the DEIS (beginning on p. 3-44). Further, the DEIS states that "from a botanical perspective no alternative is more or less favorable" (p. 4-44). While this may be true when viewed through an 'endangered plants lens', this is not the case when viewed in terms of deer habitat and vehicular safety.
- 2) It is imperative that the proposed highway not only include 'fire danger' warning signs (DEIS p. 2-15), but that numerous 'deer xing' signs are included as well. I would suggest signs be placed no less frequently than every 2-3 miles. Research out of Cornell University has shown that signs stating "deer crossing next 5 (or 10) miles" are ineffective because drivers become complacent within several miles after passing the sign(s). Frequent signage has been shown to greatly increase driver awareness of deer activity.
- 3) I suggest that the project also re-consider the 55mph speed limit that has been proposed and, instead, consider a maximum speed limit of 45mph. The axiom that "speed kills" is especially true with regard to "deer-vehicle related accidents". This is the term that is most frequently used regarding deer issues, since close to one half of the incidents that occur involve people swerving into an accident to avoid hitting a deer. Thus, there is no actual "deer-vehicle collision", but an accident that was caused by deer in the road. If a 45mph speed limit is unacceptable to meet the "time savings" aspects of the project, then I strongly encourage a dual speed limit on this highway of 55mph during daylight hours and 45mph after nightfall. Most deer vehicle collisions should occur at night, but with less daylight in the winter season I expect deer to be frequently encountered during the peak traffic hours from 5am-8am and 5pm-8pm.
- 4) Finally, there is a significant potential problem regarding standard highway reflectors with regard to axis deer. It is an unfortunate coincidence that the yellow reflectors that are placed continuously along the roadways reflect exactly as do axis deer eyes in car headlights. I doubt that this is a project aspect that can be manipulated, but it is clear that with all of the yellow reflectors along Maui's roadways drivers rapidly become conditioned to this reflection. The result is a greatly reduced ability to detect deer in, or nearby, the road.

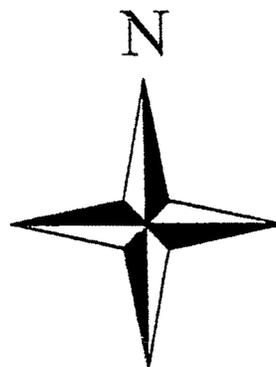

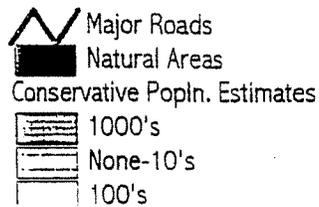

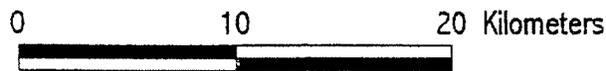

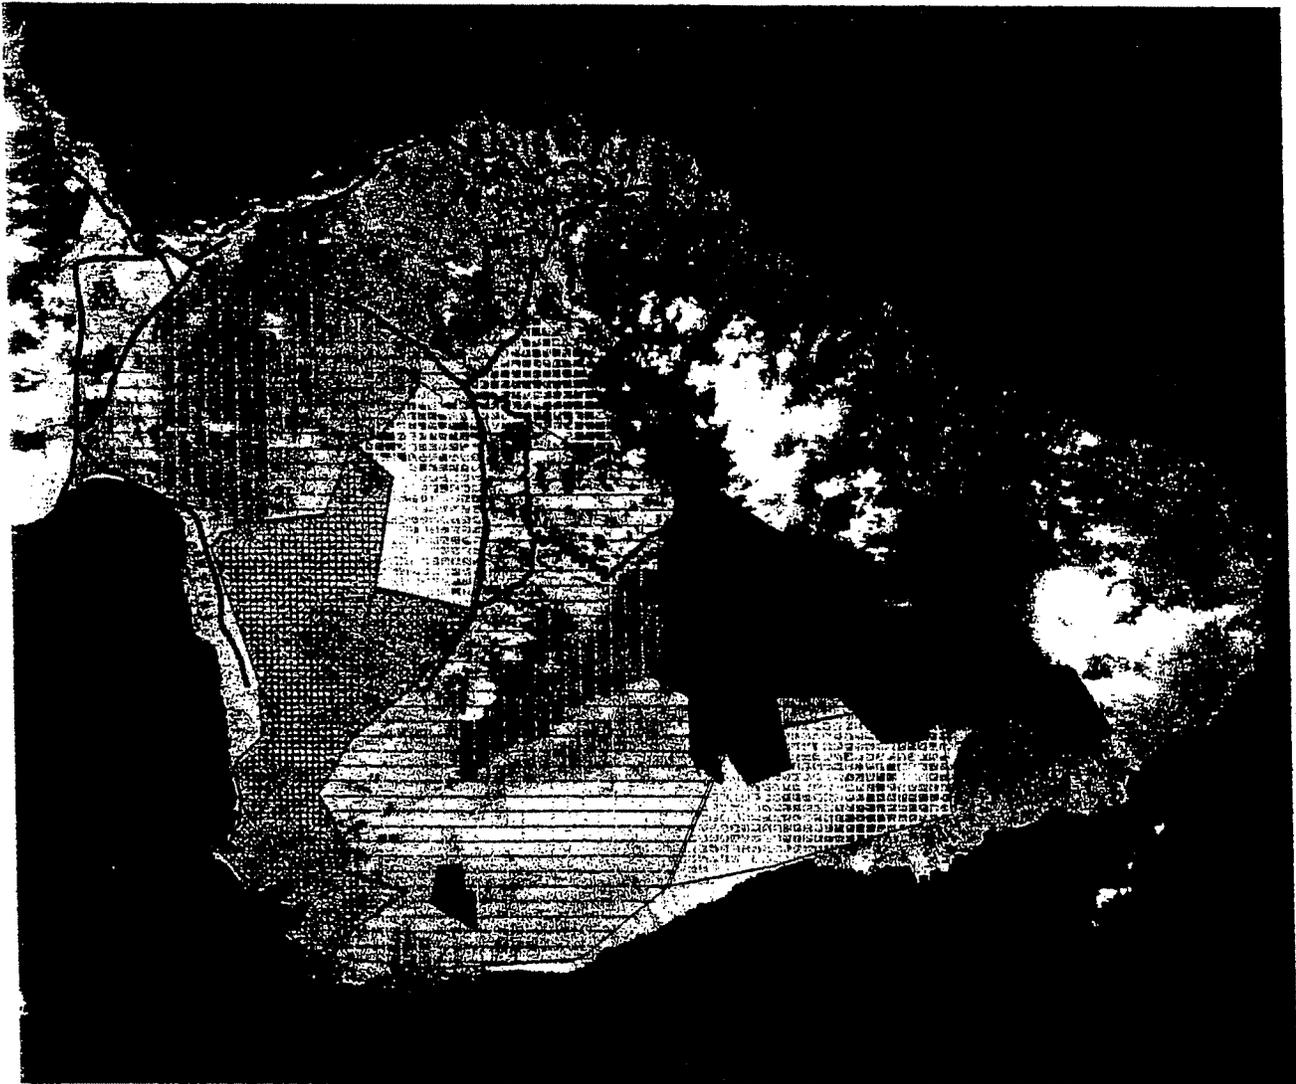

Please feel free to contact me with any questions or concerns regarding these issues. My principal role here on Maui has been to help devise deer management options and recommendations for a variety of different agencies and organizations that, to date, have included: Haleakala National Park, The Nature Conservancy, The Maui County Farm Bureau, Makena Resort and other golf courses, and all of the large ranches in this region. I would welcome the opportunity to discuss my comments further with you.

Thank you and Aloha,

Steven B. Anderson

# Regional Management

Mr. Steven B. Anderson  
749-B Pulehuiki Rd.  
Kula, HI 96790

1. Thank you for the additional information that you have provided. This information will be used in the Final EIS. The route that you identify as minimizing impacts on the deer population (U1,K1) is the route that has been identified as the preferred alternative.
2. Section 4.8.4 of the Final EIS includes measures proposed to minimize the incidence of vehicle-deer collisions. Your suggestion of frequent signage is noted, and is included on the list of mitigation measures.
3. Although the Kihei-Upcountry Maui Highway is currently planned with a 90 km/h (55 mph) posted speed limit in rural areas, this speed will be re-evaluated during the design phase, and the information you provided will be considered in this re-evaluation.
4. Thank you. The Final EIS will include this information. The color of the highway reflectors will be considered during the design phase of this project. It is possible to use reflectors that are not yellow.

Mr. Steven B. Anderson  
749-B Pulehuiki Road  
Kula, HI 96790

Comment: Concerned about axis deer-vehicle collisions. Proposes several mitigation measures to prevent vehicle-deer collisions.

Response: Please see responses to your letter.

RE: COMMENTS AND QUESTIONS ON DRAFT EIS FOR THE KIHEI-UPCOUNTRY  
MAUI HIGHWAY

Dear Sirs:

I would like to take this opportunity to comment on the aforementioned draft EIS and to ask questions which have been asked for many years but never answered.

1. In a letter dated October 9, 1994, John Harrison, environmental coordinator of the Environmental Center at UH Manoa stated: "In weighing the (then) seven alternatives our reviewers found 4 critical parameters necessary for evaluation:

- a. (number of projected) visitor trips
- b. (projected trips for) recreational use by residents
- c. (projected) transits to and from work

d. (projected) travel between the Kihei Industrial (R&T) Park and the Haleakala Summit

The pertinent points in optimizing the location of the road would be gas and time savings during the above mentioned operations.”

1 In his letter to you dated September 19, 1994 then Planning Director for Maui County, Brian Miskae asked “How many people commute from which areas of upcountry to which areas of Kihei-Makena? Which route would carry the most number of people?”

Please provide this data for each of the alternative routes. Five years have passed since the questions were asked by the reviewers at UH Manoa and Maui’s Planning director. The data should have been assembled. The distances of each proposed route do not answer these question. If 10 people save 10 miles driving the benefit is less than if 500 people save 2 miles driving. Cost benefit analysis cannot be done without estimating how many people will use each route.

2 2. In his letter dated November 21, 1994, Maui Water Department Director David Craddick informed you that there would not be water available to irrigate landscaping for the road project. Although he did not include concerns about water for fighting fires I would add that concern. Please address this issue. Where will the water come from for landscaping and fire fighting? What will be the impacts of each proposed water source?

3 3. Your draft EIS mentions the benefit of providing escape routes from coastal hazards for Kihei residents. However it fails to address the ever present danger of fire to Kihei residents. Since the EIS identifies increased fire hazard as a consequence of allowing extensive travel across the dry regions above Kihei, the issue of the increased hazard to Kihei must be addressed. Please identify the number of mauka area fires that have threatened Kihei in the past 25 years and explain how the increased risk of fire posed by the highway users will be addressed.

4 4. Several commentators including Planning Director Brian Miskae and the US Department of the Interior pointed out that “Road planners recognize that without stringent limited access rules, road development is the

purveyor of a sequence of growth.” “ The EIS should also address the growth inducement potential along the alignment and at the terminus.”

4 Instead your draft EIS says that other factors, like water availability, control growth. A relatively sophisticated middle school child understands that without a road to an area development is not possible and with a road it is very possible. Ergo the road has an important influence. Please address that potential for growth inducement and its consequences in detail. Include discussion of “stringent limited access rules”.

5 5. The Maui Farm Bureau, Maui Land and Pine, HC&S and small farmers have stated their serious concerns about the threats to agriculture posed by the highway in oral testimony and in writing. To quote Richard Cameron, president of HC&S, “This is a major threat to the future viability of HC&S and ultimately to the island of Maui.” Letter dated September 28, 1994. The draft EIS should specifically address each proposed mitigation measure for each proposed route and identify its cost. Also identify the impact on the agricultural pursuits in reduced yields and increased expenses remaining after mitigation measures.

6 6. The draft EIS identifies increased road kill as an impact but fails to identify that road kill as human. Hitting a deer or cow at 55 miles per hour is often fatal to both animal and vehicle occupant. Maui is now home to large herds of axis deer that will not be deterred by stock fencing. In any case, who will maintain the fences and at whose expense? Please address these questions in detail.

7 7. Does Haleakala National Park want more visitors and can they be accommodated. In response to the question of the impact on Haleakala National Park posed by Gary Gill you stated: “However the direct influence of the proposed project on the number of visitors who visit the summit would be less than the overall health of Maui’s visitor industry.” What does that sentence mean? Please address the impact to the park.

8 8. The response to the letter from R. Dougal and Ann Crowe dated November 9, 1995 states that it is understood that “the highway could have adverse effects on the rural-farm community of upcountry” but in the draft EIS these adverse effects are not discussed. Please specifically

- 8 discuss and quantify these adverse effects on upcountry's rural-farm community.
- 9 9. Since the projected benefits of the project include access to Lahaina, the Lahaina By Pass should be a part of the No Build alternative. Please address this issue. Describe in detail how much time and distance will be saved by all the new roads and highway improvements that are a part of the No Build alternative. Then compare the estimated savings in total miles travelled (including distance and projected number of vehicles) for each proposed route with the improved highway linkage provided by the no build alternative.
- 10 10. In a letter dated February 3, 1998 and included in the draft EIS, Mr. Kazu Hayashida, Director of DOT, expressed grave concern about the proposed route through Mr. Dowling's Kulamalu development. He was concerned about safety because of the steep grade and the need for trucks to brake above the elementary school with its pedestrians, he was concerned about the need for a truck climbing lane, he was concerned about the huge bridge requirement and he disagreed with the design speed. Please explain how those concerns were addressed and why Mr. Dowling's proposal survived tier analysis.
- 11 11. Please address in detail the impact of the Dowling route (U2B) on the businesses in Makawao. Mr. Dowling plans a shopping plaza which will divert the tourist dollars now spent in Makawao by visitors from Kihei to the Haleakala National Park. This impact should be addressed. The EA for Mr. Dowling's Kulamalu project includes a market assessment which states that his commercial project is not feasible unless the upcountry highway goes through or adjacent to his property. Makawao is promoted as one of Maui's small town jewels and the loss of its business district would have an impact on the tourist industry. Please assess the impacts.
- 12 13. What was the basis for determining that U2A-K2 results in a 50% trip reduction? For how many people, living where? Does this mean in time or distance. See p.S-21.
- 13 14. Please identify the tourist attractions that you are referring to in Section S-24.

- 14 | 15. Do residents and visitors typically travel on the roads between upcountry and Kihei in the same direction at the same peak times? Please explain. If they are using the roads at different times, then the use would be complementary and not cumulative, would it not? What are the levels of service at each of the intersections at non peak hours?
- 15 | 16. Please identify studies and or reports that would support your counter-intuitive conclusion that "the highway would have minimal influence on long term regional land use trends." at S-11
- 16 | 17. Upcountry residents travelling to Kihei use Hansen Road since this is the most direct road. Why does the draft EIS indicate that they use Dairy Road. Have any studies been conducted to determine this?
- 17 | 18. Do you expect Haiku residents to drive through Makawao to access the new road if it intersects the Kula highway. Please analyze the effect of this additional traffic on road conditions in Makawao town.
- 18 | 19. Please analyze the increased use of fuel and the increased commute time generated by those people who now live and work in Kihei but who will decide to move upcountry when the commute is shorter. Is it the policy of the DOT and the FHWA to encourage people to live in one area and commute to another for work? If so, why?
- 19 | 20. How many people living in North Pukalani work in Kihei?
- 20 | 21. Please discuss the effect of the burgeoning bed and breakfast businesses on the need for the highway from a tourist perspective.
- 21 | 22. Please discuss the effect of U2-A and the accompanying dead end of Pukalani Avenue on the numerous businesses located on Makawao Avenue between Pukalani Avenue and the Pukalani Bypass.
- 22 | 23. Please give the citations for the requirement that Transportation Systems Management must be considered because FHWA funds are involved. Since this is a requirement then please give detailed consideration to the alternative systems. Improving transportation

22 | options is a legitimate goal, building a road cannot be the goal but only one means to that end. Otherwise the requirement to consider alternatives would be meaningless.

23 | 24. What are the proposals to mitigate the potential for increased crime upcountry resulting from easier access from Kihei?

24 | 25. How will a road from Kula contribute to more infill development in Kihei?

25 | 26. In Section 4-2 the draft EIS refers to unplanned development. What does that mean? All development on Maui must go through the planning process.

26 | 27, What is the basis of the statement on page 4-24 that “the proposed project will divert most if not all trips..”

27 | 28. If U2A or U2B are chosen, a tourist looking at a map will conclude that the fastest way to the Crater road is up Kimo Drive. How will this be mitigated?

28 | 29. Aren't state highway projects required to conform to locations set forth in community plans. See for example HRS 226-57 and HRS 214-2? How do you plan to deal with the fact that the Maui County Council has already set forth its options in the community plan? Why did you feel that it was not appropriate to follow the Council directive to choose route U1 is a highway had to be built? This location survived tier review and so had no engineering concerns that render it infeasible. It was chosen on the advice of the Citizens's Advisory Committee, the Planning Director and the Planning Commission. Why was this public process deemed inadequate?

29 | The Kihei Community plan does not attempt to select an upcountry terminus and expresses concern about need and impacts. It is not inconsistent with the Upcountry Community Plan. Why does the EIS misquote the Kihei Community Plan? Please reassess the impact of the Community Plans using the correct language from the Plans.

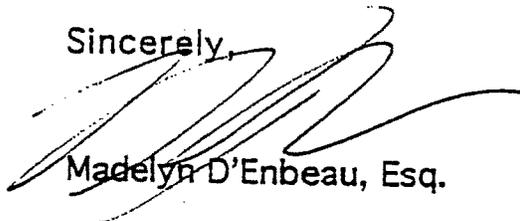

30 | 30. Please address the alternative of providing emergency evacuation

30 routes from Kihei by means of a limited access civil defense highway and/or cane haul or other agricultural roads.

31 31. The traffic study of intersections depicted in Figure 1-4 is not well identified. When was the study done and what time periods were studied. According to the data supplied, 1859 vehicles turned right from the Haleakala Highway onto the Hana Highway during the morning peak period. An additional 726 vehicles proceeded through the intersection continuing in the Kahului direction on the Hana Highway for a total of 2585 vehicles. When these vehicles reached the Hansen road intersection with the Hana Highway 223 turned left onto Hansen road and 1783 continued on Hana Highway. Where did the other 579 cars go?

I look forward to your responses to my questions and comments.

Sincerely,

Madelyn D'Enbeau, Esq.

1. The estimated traffic volumes that were used in the EIS analyses are provided in Section 4.4.1.2. The volumes would vary depending on alternative. In general, the U3 and K2 alternatives would experience lower volumes while the U1, U2-A, U2-B, and K1 alternatives would convey higher volumes. The reasons for these differences pertain the travel markets that would be served by the alignment alternatives.
2. Department of Transportation understands that the Maui Board of Water Supply will not provide water for landscaping. Section 4.13.2 of the EIS discusses the appropriate selection of landscaping materials for a xeriscape setting. A water delivery system for fire fighting will not be provided along the highway. Water sources are available in the agricultural areas, and water may be brought in by tanker truck. Further investigation of water sources will occur during the design phase of the project.
3. In addition to signage warning motorists of fire hazards, the Department of Transportation will conduct regular maintenance to control weed growth along highway shoulders. While the Kihei-Upcountry Maui Highway will increase access to the dry area between Kihei and Upcountry, such that the risk of man-made fires may increase, the highway would simultaneously decrease the damage from fires because it would improve emergency response. Although brush fires can threaten Kihei, this area has established fire protection infrastructure.
4. Both transportation and water supply infrastructure are important elements needed for development. However, for Upcountry specifically, coordination with the County Board of Water Supply and other stakeholders indicated that the amount and pace of residential development in Upcountry would continue to be controlled largely by water availability, not transportation constraints. If it were not for current water restrictions, the level of development in Upcountry would be much higher than it is today. For example, the Kulamalu development was only able to proceed after it secured a water supply by drilling a new well in Haiku. This development will proceed regardless of the Kihei-Upcountry Maui Highway.

The EIS reports that the U1 alternatives could have the greatest growth inducement influence because it would directly serve lower Pukalani and Haliimaile. These are areas designated for development in the Community Plan, and therefore, the Maui Board of Water Supply has indicated that it would supply water to this area.

"Stringent limited access rules" are typically applied to opening public lands to access. They do not appear to apply to this situation.

5. Adverse impacts to agriculture were disclosed in Section 4.2.1 of the EIS. The preferred alternative, the U1,K1 alignment, will displace more HC&S sugarcane land than any other alternative (U1,K2 had the same impact). However, HC&S has stated a willingness to work with the Department of Transportation to minimize impacts to their operations. The Department will implement mitigation measures as described in Section 4.2.4 of the EIS.
6. Section 4.8.4 of the Final EIS includes a discussion of measures to minimize vehicle-deer collisions. Frequent signage and fencing are the types of measures that would be implemented.
7. The sentence is attempting to say that the level of tourist activity on Maui is the best predictor of the number of visitors to Haleakala National Park. The attraction of the Park is sufficiently strong that the present level of transportation service is not a barrier constricting the number of visitors. Therefore, the Kihei-Upcountry Maui Highway is not anticipated to have a large influence on travel decisions regarding the Park.
8. Section 4.2.1 of the EIS describes the impacts to both large and small-scale farming. Only the U3 alternatives would affect small-scale farms by bisecting the Kula Agricultural Park. As described in Sections 4.1.3, 4.3.1 and 4.3.4, none of the alternatives will bisect an existing neighborhood, nor would any alternative require the relocation of a residence or business establishment.
9. The potential benefits to the West Maui region would extend only as far as north Kihei. The proposed project would offer no additional benefit closer to Lahaina. Therefore, a detailed treatment of the Lahaina bypass project would not add any information useful for the decision-making occurring at this point of project planning.

10. The U2-B alternatives were evaluated in the Draft EIS because this is the alignment most consistent with the Kulamalu master plan. The concerns expressed in the February 3, 1998 letter remain. However, a U2-B alignment was not identified as the preferred alternative, so resolution of the concerns was not pursued.
11. If a U2-B alignment were identified as the preferred alignment, visitor spending could shift away from Makawao because of enhanced access to the Kulamalu shopping center. This potential impact is disclosed in the Final EIS.
12. The reduction in trip distance of up to 50 percent would occur under the U2-A,K1 Alternative, not the U2-A,K2 Alternative. This figure was calculated by comparing travel distances from the Five Trees intersection to the Lipoa Street / Piilani Street intersection. Five Trees was considered a centroid of Upcountry population. The Kipoa Street / Piilani Street intersection approaches the center of Kihei population. The purpose of the analysis was to develop a general comparison of the alternatives' effect on fuel consumption.
13. The tourist attractions in Upcountry include Haleakala National Park, downtown Makawao, Kula Lodge, and Tedeshi Winery.
14. The level-of-service analysis presented in Section 4.4.1.2 of the EIS applies to the peak travel hours, when roadways are the most congested. The level-of-service at other times of the day would be better than that reported in the section. The analysis requested would not assist in decision-making.
15. The analysis of potential land use impacts is presented in Section 4.1.1 of the EIS and the Community Impact Assessment report in Appendix H. Please see Response # 4.
16. Motorists traveling between Upcountry and Kihei use both Dairy and Hansen Roads. This behavior will be indicated in the Final EIS.
17. Since the U1,K1 alignment was identified as the preferred alternative, Makawao's traffic patterns will not change.
18. It is very difficult to determine how many people would choose to move from Kihei-Makena to Upcountry because of the existence of Kihei-Upcountry Maui Highway. Transportation planning is based on Maui County projections of population and land use. Neither

Department of Transportation nor the Federal Highway Administration have issued policies to encourage people to live in one area and commute to another.

19. According to 1990 information used to prepare the Maui Long Range Land Transportation Plan, a little over 13 percent of all employment on the island was in Kihei-Makena. Roughly this same percentage would likely apply to those workers living in Pukalani.
20. Significant changes in the size of the bed and breakfast industry would affect traffic volumes. In general, economic activity increases travel demand.
21. Under the U2-A alternatives, the closure of the Haleakala Highway on the Pukalani side of the Five Trees intersection, and its conversion to a pedestrian path, would not affect businesses on Makawao Avenue because access along this street would not change. Traffic on Haleakala Highway will be rerouted onto a new roadway on the mauka side of Makawao Avenue.
22. The citation requested is 23 Code of Federal Regulations, Section 771.123(c), which states that "reasonable alternatives" be considered in the EIS. The alternatives screening (see Section 2.2.1) found that the TSM alternative would not address the project's purposes and needs. Therefore, it was eliminated from further consideration. The Federal Highway Administration does not require a TSM alternative to be considered viable if it would not address the purposes and needs of the project.
23. Enforcement of criminal laws is the responsibility of Maui Police Department and other law enforcement agencies. The Department of Transportation would support and provide assistance to these agencies if it is requested.
24. The proposed highway would enhance access where it terminates in Kihei, contributing to those factors that promote urban development. Unlike Upcountry, Kihei has other conditions conducive to growth, such as County objectives for urban development, water availability due to its low elevation, and developable land between South Kihei Road and Piilani Highway.
25. A development that is "unplanned" is one that does not appear in currently approved land use plans.

26. The statement points out that motorists typically choose the fastest route to their destination. The fastest route may be either the shortest or least-congested option. Kihei-Upcountry Maui Highway would provide travel time savings for certain travelers, and so this change in route selection is stated in terms of trip diversion from currently chosen routes.
27. Under a U2-A or U2-B alternative, visitors wishing to go to the crater would most likely stay on State highways. The potential impact identified in the comment is disclosed in the EIS, and may occur with a U3 alternative. If a U3 alternative had been identified as the preferred alternative, signage would need to be provided to direct motorists along the proper route to the crater.
28. State highway projects are not required to conform to locations set forth in community plans. The Department of Transportation considers community plans to be important expressions of public sentiment, not regulatory documents. Nevertheless, the Makawao-Pukalani-Kula Community Plan was given substantial weight in the identification of the preferred alternative, the U1,K1 alignment.
29. The Kihei-Makena Community Plan did not clearly communicate a preference for the Upcountry terminus. The Community Plan stated that the focus should be on minimizing travel times for the maximum number of island residents. This statement could be interpreted to mean that the Plan favors an Upcountry terminus near the population center of Pukalani and Makawao. The Department of Transportation does not believe that the EIS misrepresents the views of Kihei-Makena Community Plan. The EIS does not suggest that the Kihei Community Plan is inconsistent with the Makawao-Pukalani-Kula Community Plan.
30. The provision of an emergency access route for Kihei-Makena is just one purpose of the project. A reasonable alternative should address all of the project's purposes and needs. The options suggested would not address many of the project's purposes and needs.
31. The source of Figure 1-4 is shown on the bottom left corner the page, Parsons Brinckerhoff, June and August of 1996. Traffic counts are often conducted on different days, and therefore, do not necessarily match exactly. However, the vehicles per hour (vph) volume shown for the AM peak period Hana Highway through movement at Hansen Road was erroneously shown as 1783 in the Draft EIS. It should have been 2,383 vph, and will be corrected in the Final EIS. When 2,383 vph is added to the 223 vph shown turning left

from Kahului-bound Hana Highway to Puunene-bound Hansen Road, the total volume is 2,606 vph, which is very close to the 2,608 vph departing the Hana Highway/Haleakala Highway intersection in the Kahului-bound direction. The Department of Transportation believes the traffic volumes shown in Figure 1-4, as corrected, to be a reasonable representation of baseline traffic conditions.

Ms. Madelyn D'Enbeau  
Makawao Main Street Association  
P.O. Box 1869  
Makawao, HI 96768

Comment: The Department of Transportation cannot implement a project that is contradictory to the Makawao-Pukalani-Kula Community Plan. Therefore, why are alternatives being studied when the community plan has already stated an alignment preference?

Response: State highway projects are not required to conform to locations set forth in community plans. The environmental review process requires the study of all reasonable alternatives, and there are reasonable alternatives in addition to the recommended alignment in the Makawao-Pukalani-Kula Community Plan. The Department of Transportation considers community plans to be important expressions of public sentiment, not regulatory documents. Nevertheless, the Makawao-Pukalani-Kula Community Plan was given substantial weight in the identification of the preferred alternative, the U1,K1 alignment.

Comment: Requests citation of regulation requiring the State Department of Transportation and Federal Highway Administration to consider transportation system management (TSM) as an alternative. The TSM should have been considered as a viable alternative in the Draft EIS.

Response: The citation requested is 23 Code of Federal Regulations, Section 771.123(c), which states that "reasonable alternatives" be considered in the EIS. The alternatives screening (see Section 2.2.1) found that the TSM alternative would not address the project's purposes and needs. Therefore, it was eliminated from further consideration. The Federal Highway Administration does not require a TSM alternative to be considered viable if it would not address the purposes and needs of the project.

Comment: The Draft EIS states that there is a conflict between the Makawao-Pukalani-Kula Community Plan and the Kihei-Makena Community Plan.

Response: Section 3.1.4.2d of the EIS states that Makawao-Pukalani-Kula Community Plan prefers the No Build alternative, and the Kihei-Makena Community Plan recommends a transportation connection with Upcountry. These statements were written in the plans. No conclusion was made in the Draft EIS that the plans are conflicting.

Comment: Concerned that a U2-A, U2-B, and U3 alternative would increase traffic through the already congested Makawao town.

Response: A U-1 alternative was identified as the preferred Upcountry terminus, and not U2-A, U2-B or U3 alignment.

Comment: The Draft EIS did not address the impact of the project on Makawao businesses, especially since a large shopping center is being planned in Kulamalu, which would be adjacent to the U2-B alignment, and close to the U2-A and the U3 alignments.

Response: If a U2-B (or U2-A or U-3) alternative had been identified as the preferred alternative, visitor spending could be shifted away from Makawao because the road would have been adjacent to the future shopping center in Kulamalu. This potential impact will be disclosed in the Final EIS.

326 Pukalani St.  
Pukalani, Hi. 96768

Mr. Kazu Hayashida  
Hawaii State Director of Transportation  
869 Punchbowl St.  
Honolulu, Hi 96813

September 30, 1999

Dear Director Hayashida,

As a resident of Pukalani, I am offering the following comments on the proposed Kihei-Upcountry Maui highway.

In my view, the U2-A and U2-B alternatives are both unacceptable for three reasons:

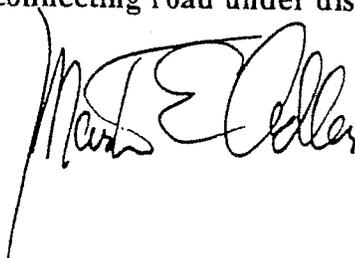

1. They would greatly disturb the Pukalani residential neighborhood with construction and traffic noise.
2. Both of these routes would produce a road with a very steep grade on the order of 10-12%, adding the risk of failed brakes and an out-of-control vehicle picking up speed through a densely populated residential area.
3. Both of these routes are too close to Kamehameha and King Kekaulike schools where a large number of children walking along the road going to and from school would be exposed to more and faster traffic.

My own preference would be to add a 4th lane to the Haleakala and Mokulele Highways, thereby alleviating the current congestion on the drive from Upcountry to Kihei, while not disturbing the rural nature of our Upcountry region. Another reasonable option would be to simply upgrade the crude dirt road that runs between Makena and Lower Kula Highway- certainly the shortest route and probably the cheapest. In the worst case, I would accept the U1 route that has Hailemaile as its terminus since this approach would provide an alternative route from Upcountry to Kihei, utilizing existing roads without disturbing residential neighborhoods.

In any case, let me make clear that I am totally opposed to the U2 and U2B routes which would destroy the tranquility and rural character of my neighborhood.

Thank you for your consideration of these comments in your department's decision if and where to build the connecting road under discussion.

Respectfully yours,  
Martin E. Adler

Mr. Martin E. Adler  
326 Pukalani Street  
Pukalani, HI 96768

1. The U2-A and U2-B alternatives are far enough from Pukalani for construction impacts to not be highly noticeable. Noise and dust control measures would be implemented. Section 4.17 of the EIS discusses construction-phase mitigation measures in more detail. Neither alternative would also not cause traffic noise impacts in Pukalani as described in Section 4.6.
2. Only the U2-B alignment has a maximum grade of 10 percent. The U2-A alignment's maximum grade is 6.8 percent.
3. Had a U2-A or U2-B alternative been identified as the preferred alternative, pedestrian facilities would be provided to the high school. Information regarding these measures is provided in Section 4.3.5 of the EIS. The amount of traffic projected at either of these intersections would not cause a safety problem. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

If a U2-B alternative were identified as the preferred alternative, an urban design with sidewalks would be used on the section of the highway adjacent to Kamehameha School.

4. Haleakala Highway and Mokulele Highway will be widened to four lanes regardless of whether Kihei-Upcountry Maui Highway is constructed. However, these improvements alone will not satisfy the purposes and needs that have been identified for the project.
5. The alternative being suggested is Alternative 7, which was eliminated from further consideration early on in the analysis because it would have very low traffic volumes not justifying its cost.

October 6, 1999

To Whom It May Concern:

As concerned homeowners in Kula 200, we would like to express our opinion that the proposed highway from Kihei to Upcountry should terminate at Haliimaile Road for the following reasons:

- 1. Locating the terminus at either Five Trees or at the entry to the Kulamalu project would jeopardize the safety of the students at both King Kamehameha and King Kekaulike schools. Upon personal observation, keiki walk along and cross the roads going to and coming from school, and the increased traffic in the area in a hurry to go to or from work is a major threat to them. It seems very unwise and foolhardy to place a highway such as the one proposed in such an area. Rather than wait until children are injured or killed to validate this point, let us look forward and realize it now.
- 2. It appears that construction of such a highway would be much easier and less expensive if it came through gentler land to Haliimaile Road (read: less rugged terrain to build upon). It also takes the traffic out of populated areas, which is a major safety concern. Current traffic on Haliimaile Road would remain the same, as people would use it the way they now use it coming up by way of Haleakala Highway. No matter how cars get to Haliimaile Road, they are either going to use it or they aren't. As an added plus, a signal at that point may certainly help to stop people who tend to exceed the speed limit there. A signal there as is would not be intimidating, as there is no cross traffic to think about. If drivers knew there was cross traffic, they may well be more inclined to slowing down and obeying signal lights.
- 3. As a weak point, but one with the spirit of Hawaii in mind, those of us who chose to live Upcountry did so with a reason, and that is to have a quiet and pastoral setting. To put a major thoroughfare in the middle of the area seems rather like sacrilege and will only serve to alienate voters and supporters of Maui County.

Thank you for your kind consideration in this matter.

Very truly yours,

*Alvin & Candace Barnhart*

1. Had a U2-A or U2-B alternative been identified as the preferred alternative, pedestrian facilities would be provided to the high school. Information regarding these measures is provided in Section 4.3.5 of the EIS. The amount of traffic projected at either of these intersections would not cause a safety problem. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

If a U2-B alternative were identified as the preferred alternative, an urban design with sidewalks would be used on the section of the highway adjacent to Kamehameha School.

2. The U1,K1 alignment has been identified as the preferred alternative, consistent with this comment.

10/26/99

Kazu Hayashida, Director  
State Department of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida,

Thank you for having allowed an additional meeting for further input into the UpCountry-Kihei highway project on Maui.

I represent the King Kekaulike High School PTSA with a current membership of over 370. Also of note is the student body count which is now over 1,400 students. At our General Membership Meeting held on October 21, 1999 a vote was taken indicating a **strong desire not to have the new highway connect any where near the high school facility**, specifically referring to locations U2-A and U2-B.

1 Since our concerns pertain to the anticipated traffic flow caused by this new highway system, it will follow that the U-3 connection is equally undesirable since upcountry traffic using U-3 will need to flow pass our school and the same thing would happen with traffic coming up from Kihei.

Connection identified as U-1 (Haliimaile Road) would dissipate traffic coming up and also collect traffic from a variety of sources with a reduced impact on traffic directly fronting our school. This would be our preferred conjunction of the new highway.

2 It is also our understanding that there are plans currently in place to provide a continuation of a 4-Lane highway system which will extend past King Kekaulike High School. We are hopeful that these plans provide adequate traffic controls to facilitate safe ingress and egress from our school.

Please feel free in contacting me directly if you have any need for clarification.

Cordially,

Mel Ito, President  
King Kekaulike PTSA  
808-242-6800  
121 Kula Highway  
Pukalani, HI 96768

Mr. Mel Ito, President  
King Kekaulike PTSA  
121 Kula Highway  
Pukalani, HI 96768

1. Had a U2-A or U2-B alternative been identified as the preferred alternative, pedestrian facilities would be provided to the high school. Information regarding these measures is provided in Section 4.3.5 of the EIS. The amount of traffic projected at either of these intersections would not cause a safety problem. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

The amount of traffic passing directly in front of King Kekaulike High School would be the same under the U1 and U2-A alternatives because neither alternative would alter traffic patterns fronting the school, disregarding the effect of Omaopio and Pulehu Roads in diverting some traffic. The commenter is correct to note that the traffic volumes passing in front of the school would be higher under a U3 alternative because it would change traffic patterns fronting the school, such as trips by Pukalani residents.

2. Kula Highway is proposed for widening to four lanes from the Five Trees intersection to Pulehu Road. King Kekaulike PTSA and the Department of Education will be consulted on ingress/egress details when planning of this project is initiated.

*"Working Together to Shape our Community's Future"*

Sept. 29, 1999

Mr. Kazu Hayashida, Director  
Department of Transportation  
869 Punchbowl  
Honolulu, HI 96813

Dear Mr. Hayashida:

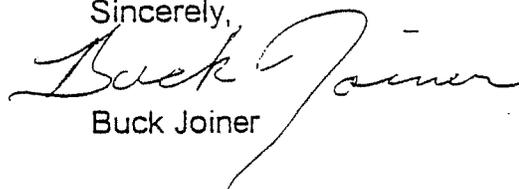

The Kihei to Upcountry Highway has been in the planning stage for several years. I would like to state our position on the Kihei terminus of this road.

Presently, the only access to the ten-mile long, linear community of Kihei/Wailea/Makena is at the North end of this community. Were there to be some catastrophic event in the vicinity of the current intersection of Piilani and Mokulele highway such as a plane crash or gasoline tanker accident, the entire community with a defacto population on the order of 30,000 could be trapped. If the event were a wildfire driven by trade winds, the end result could be a loss of life unparalleled in history. If there were a major tsunami, the absolute inability to evacuate the community could again be cataclysmic.

There are two locations being considered for the Kihei terminus of this highway, in North Kihei at Ka Ono Ulu or in South Kihei at Ke Alii Alanui. The Northern connection is the least expensive. The Southern terminus at Ke Alii Alanui would provide many benefits: 1) it would provide a southern access point to the linear community thereby providing a vast improvement in public safety. 2): The Southern route would run beside the 150-acre regional park location. Presently this site cannot be developed due to the lack of infrastructure. The presence of the terminus of the Kihei-Upcountry Highway would allow development of the park and accessibility to the park for the upcountry people. 3) The Southern terminus would bring the Kihei-Upcountry Highway to within stones throw of the Keokea Hawaiian Homelands. It would then be possible for the Hawaiians that will be on this land to construct small access roads to connect the Keokea/ Ulupalakua region to Kihei. This could be of enormous benefit to the Hawaiian people who will be living on that land.

The downside of the Southern terminus is that it is significantly more expensive due to the need for additional bridges. Also, the Southern terminus would end in the vicinity of an elementary school. There are no perfect solutions but we continue to strongly support the southern most terminus for the Kihei-Upcountry Highway.

Sincerely,

  
Buck Joiner

Mr. Buck Joiner  
Kihei Community Association  
P.O. Box 662  
Kihei, HI 96753

1. The U1,K1 alignment was identified as the preferred alternative. While the Department of Transportation agrees with your facts and analysis, the added cost of a K2 alignment, in addition to the alignment not serving the West Maui travel market, resulted in it being ranked below the K1 alternatives.

Mr. Abraham Wong  
Federal Highway Administration  
300 Ala Moana Boulevard  
P.O. Box 50206  
Honolulu, Hawaii 96850

RE: Kihei - Upcountry Maui Highway

Dear Mr. Wong,

We have reviewed the EIS for the subject project and would like to offer the following comments:

1. Page 2-5, Table 2-1, Columns "U2-A,K1", "U2-A,K2", "U2-B,K1", and "U2-B,K2", Line labeled "Others".

1 The Alternatives U2-A,K1 and K2, and U2-B,K1 and K2 are basically the same with the exception of its respective alignments through the Kulamalu parcel. We feel that the estimated right-of-way requirements for "Others" in the U2-B columns should be zero or substantially less than that represented in the U2-A columns since the U2-B requirements have already been accounted for under the line labeled "Dowling Company".

2. Page 2-7, Paragraph 5

2 Alternative U2-B,K2 should be U2-B,K1.

3. Page 2-11, Table 2-2

3 There is no listing for a bridge at Kaluapulani Gulch for Alternative U2-A. Assuming that U2-A will traverse this gulch utilizing a culvert crossing further investigations to confirm the feasibility of such a crossing should be seriously considered. This should take into account the length and depth of the gulch, the extent of fill needed for the crossing, the impact of this fill on existing burials and archeological sites within the gulch, and the presence of existing utilities running along the bottom of the gulch. Consequently, we feel that Figure 2-4 and Table 2-3 should reflect an additional bridge for Alternatives U2-A,K1 and U2-A,K2.

4. Page 2-16, Table 2-4

4 The construction cost listed under the U2-B alternatives do not reflect the fact that 3000 lineal feet of the roadway through the Kulamalu parcel and the intersection improvements at Kula highway has been completed by KSBE and Kulamalu at cost of approximately 6 million dollars. Additionally, Kulamalu has represented to DOT that it will dedicate at no cost the right-of-way within the Kulamalu project area should Alternative U2-B be selected.

5. Page 2-35, Second paragraph: U2-B

The Kamehameha School Campus opened in August, 1999 and is in operation.

6. Page 2-35, Third paragraph: U2-C

5 This alignment would also bisect the public/quasi-public and commercial parcels within the Kulamalu project.

7. Page 2-35, Fourth paragraph: U2-D

This alignment would also bisect the park parcel within the Kulamalu project.

8. Page 2-36, Table 2-9

6 The "Maximum Height of Fill" and "Maximum Height of Cut" for Alternative U2-B should be decreased due to KSBE and Kulamalu having completed the construction of 3000 lineal feet of the roadway. Pursuant to No. 4, above, Alternative U2-A should include a bridge crossing at Kaluapulani gulch and therefore, "Number of Bridges", "Length of Bridge Required", and "Number of Gulch Crossings" should be revised accordingly.

9. Page 2-37, Top of the page:

"U2-B's disadvantage is that it does not meet AASHTO's recommended seven percent grade for a limited access rural highway. U2-B's maximum grade is 10 percent".

7 The 10 percent grade is near the mauka terminus of the highway, within the Kulamalu project area. The Kulamalu project has been zoned and urbanized. Adjacent land uses will consist of residential, elderly housing, commercial and the recently opened Kamehameha School. Under these conditions, it would be appropriate to characterize the area as mountainous-urban, and use a lower design speed for the highway. Therefore, the design criteria could be adjusted to utilize a design speed of 40 mph (posted 35) and the maximum grade of 10 percent, as shown in Table VII-4, Maximum grades for urban arterials, page 525 of the AASHTO Green Book (A Policy on Geometric Design of Highways and Streets, 1990). Further, since the Kulamalu project is the Upcountry terminus of Alternative U2-B, it is desirable to reduce the highway speed limit

approaching Kula Highway to provide the transition from the open highway to the Stop condition at Kula Highway. Lastly, this section of the roadway has already been constructed.

10. Page 3-24, Section 3.3.5 Public Facilities and Services

8 Kamehameha School, opened in August of 1999 should be added to the inventory of schools in Upcountry Maui.

11. Page 3-33, Second paragraph

9 Kulamalu has completed the drilling and testing of a well in Haiku. The pump capacity, as approved by the State's Water Commission, is 2 million gallons per day. The pump that will be installed will produce 1.64 million gallons per day of which 45% (738,000 gallons ) will be allocated to the Kulamalu project.

12. Page 3-58, Second paragraph

10 The future 14.74 acre Kulamalu park should be added to the inventory of Upcountry parks.

13. Page 4-5, Figure 4-1

11 The Kulamalu area is designated as "Future Urban Areas". This should be reclassified as existing urban areas since the project has been zoned and urbanized. Further, as mentioned earlier, Kamehameha School has opened and is in operation.

14. Page 4-11, Section 4.1.3 Relocation Impacts (under Dowling Company)

12 The Kulamalu project is not vacant. Kamehameha School is in operation and 3000 lineal feet of roadway has been completed. If Alternative U2-B is selected no relocation is required since this alignment has been considered in the Kulamalu development plan.

15. Page 4-23, Table 4-2

13 Alternative U2-B is not listed in the table.

16. Page 4-46, Table 4-9

14 The approximate vegetational displacement listed with U2-B,K1 and U2-B, K2 should be reduced to reflect the 3000 lineal feet of roadway that has been completed within the Kulamalu project.

17. Page 4-48, Table 4-10

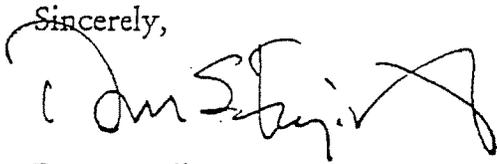

The earthwork quantities listed with Alternatives U2-B,K1 and U2-B,K2 should be reduced to reflect the 3000 lineal feet of roadway that has been completed within the Kulamalu project.

18. Page 4-63, Infrastructure and Utilities

15 The Kulamalu Development has completed the drilling a well in Haiku and is currently in the process of installing the pump and appurtenances. Completion is expected during the first quarter of 2000.

Thank you for the opportunity to comment on this EIS. We look forward to the completion of this project. Please call me should you have any questions regarding our comments.

Sincerely,

Don S. Fujimoto  
Vice President

Mr. Don S. Fujimoto  
Vice President  
Kulamalu, Inc.  
P.O. Box 1417  
Wailuku, HI 96793

1. Thank you. Table 2-1 will be corrected to reflect the information provided.
2. Thank you; corrected in the Final EIS.
3. The selection of a bridge or embankment crossing at the numerous gulches the highway would cross was based on the storm water flow of the affected gulch, not the size of the gulch. This assisted in the cost estimates of the alternatives. These decisions will be reviewed in greater detail during the design phase of the project. Regardless of a bridge or embankment crossing, the study area to determine potential impacts to archaeological and other resources is the same. Therefore, the U2-A alignment, using the embankment concept, avoids the archaeological sites in Kaluapulani gulch. Impacts on existing utilities running along the bottom of the gulch would be examined in more detail in the design phase, but either a bridge or embankment crossing would affect these utility systems. In any case, the U2-A alternative has not been identified as the preferred alternative.
4. Thank you. Definitions of the U2-B alternatives have been revised to reflect the donation of 3000 feet of constructed U2-B alignment by Kulamalu, Inc. and KSBE. The cost estimates as reported on Table 2-4 have been revised in the Final EIS.
5. Thank you; corrected in the Final EIS.
6. The information provided in Table 2-9 describes characteristics of complete U2 concepts. The fact that a portion of one option has already been constructed does not remove that piece of alignment from environmental analysis. Cut and fill elevations are used as numeric measures of potential for visual impact. However, as explained in Section 2.2.2 of the EIS, the U2-B alternatives advanced to detailed consideration in the Draft EIS.

With respect to the crossing of Kaluapulani Gulch, please see prior response.

7. The 10 percent grade of the U2-B alternatives was not a determining feature in the identification of the preferred alternative, which heavily weighted formally-adopted

community planning efforts (see Section 2.2.4 of the Final EIS). Therefore, these alternatives were not penalized for having this characteristic.

8. Thank you; corrected in the Final EIS.
9. Thank you; revised in the Final EIS.
10. Thank you; corrected in the Final EIS.
11. The hatching representing "future urban areas" will remain in Figure 4-1 to set apart areas that are planned for urbanization, such as Kulamalu, from areas already constructed, such as Pukalani. The figure in the Final EIS was corrected to show Kamehameha School.
12. Thank you; corrected in the Final EIS.
13. Thank you; corrected in the Final EIS.
14. Tables 4-9 and 4.10 are intended to address the entire concept of the alternatives. The private donation of a segment of road does not remove that section of road from the environmental review process.
15. Thank you; updated in the Final EIS.

Please make any comments below:

1 | I have submitted comments to FHWA regarding  
some discrepancies in the EIS, mainly that  
3000' of roadway has been constructed by Kulavale  
and KSB&E for alternative U2B at a cost of about  
\$6,000,000. This ~~is~~ should be considered in the final  
analysis. As I have testified before we are  
in support of alternative U2B that passes through  
the Kulavale project.

Mr. Don Fujimoto  
P.O. Box 1417  
Wailuku, HI 96793

1. Thank you. The information provided was used to revise the cost estimates of the U2-B alternatives. The revised costs were considered in the identification of the preferred alternative.

October 19, 1999

Mr. David Atkin  
Parsons Brinckerhoff  
Pacific Tower, Suite 3000  
1001 Bishop Street  
Honolulu HI 96813

Dear Mr. Atkin:

SUBJECT: Kihei Upcountry Maui Highway Project U2B

1 | I would like to voice my opposition to the proposed subject highway. The EIS for the Kihei to Kula Highway through U2B Kulamalu Subdivision does NOT address the opening of Ainalani Street into Pukalani Terrace Country Club Estates. Ainalani Street is not a through street now and I believe it should be kept as such. I like the quiet, low traffic flow in this area and opening up Ainalani Street would just destroy this rural, peaceful existence.

May I suggest you helicopter over this area to get a sense of what is being said here.

Please do not open up Ainalani Street or any other streets in Pukalani to Kulamalu Subdivision.

2 | And may I also say if there is to be a Kihei to Kula access, it should be the original road which is already in existence needing only paving and maintenance. Opening more traffic to already congested areas does not make sense. When traffic flows, which it would if the original road were constructed, there is no congestion and no dumping of traffic into one particular area.

Sincerely,

*Barbara A. Meinke*  
Barbara A. Meinke  
Pukalani Resident

Ms. Barbara A. Meinke  
Pukalani, HI 96768

1. The Five Trees intersection (with the U2-A alternatives) would be the only direct connection between Kihei-Upcountry Maui Highway and Pukalani. If you are providing information that Pukalani Terrace will be directly connected to the Kulamalu development, it is possible that Pukalani Terrace could be indirectly affected by a U2-A or U2-B alternative depending on what kinds of connections, if any, there would be between the highway and Kulamalu. Since neither a U2-A nor U2-B alternative was identified as the preferred alternative, issues surrounding the connection between Pukalani Terrace and Kulamalu are beyond the scope of this project.
2. The suggested alternative is similar to Alternative 7 (see Section 2.2 of the EIS), which was eliminated because it had a poor benefit-cost ratio.

Dear Abraham Wang, (Division Administrator)

1 Thank you for letting me comment on the ~~proposal~~ to Kilauea, Maui Highway. I hope this highway will be built to Federal Highway standards. I'm in favor of a four-lane Highway with shoulders and a median strip. If this project is too costly, the land for a four-lane Highway should be purchase now. Land banking for the future is a good idea. My second choice for the Highway would be a two-lane road with shoulders and a median strip. Thank you for your assistance.

Sincerely,  
Christopher Perreira

Oct. 21, 1999

Christopher Ferreira  
425 KAULANA ST.  
Kahului, HI. 96732-2020

Dear Kazu Hayashida, Dir. of Transportation

My first choice for the Upcountry-to-Kihiki Highway (Mau) would be from Kaonoulu to Onolepo. This route would be the least expensive of the choices, and would be at uncrowded intersections. My second choice would be Haliimaile to Kaonoulu. Haiku and Laie residents would benefit from this choice. The Haliimaile intersection is crowded already.

Thank you for letting me comment on this important issue. This Highway is really needed and will be used a lot. Also, I would support making it a four-lane Highway. If this can't happen, making it a two-lane Highway and giving the property rights for future expansion is okay.

Sincerely,  
Christopher Ferreira

1. Thank you for your input. The type of highway provided must relate to the traffic volumes that are projected. The projected traffic volumes for 2020 do not justify a four-lane highway. However, the project does include acquiring enough right-of-way for a four-lane divided highway at some future point. When initially constructed, the highway will be a two-lane undivided roadway.

Dear Mr. Wong,

As long time residents of South Maui, the construction of a Kula / Kihei road is long awaited. The opportunity of residents, guests, and workers to have access to the "up country" is a priority that needs to be solved. The Kulamalu connection appears the most logical. Would it be possible to see a overlay map of the two sites published in the paper?

Thank you for your concern.

Dorothy Scott

Dear Mr. Hayashida

OCT 21 10 03 AM '99

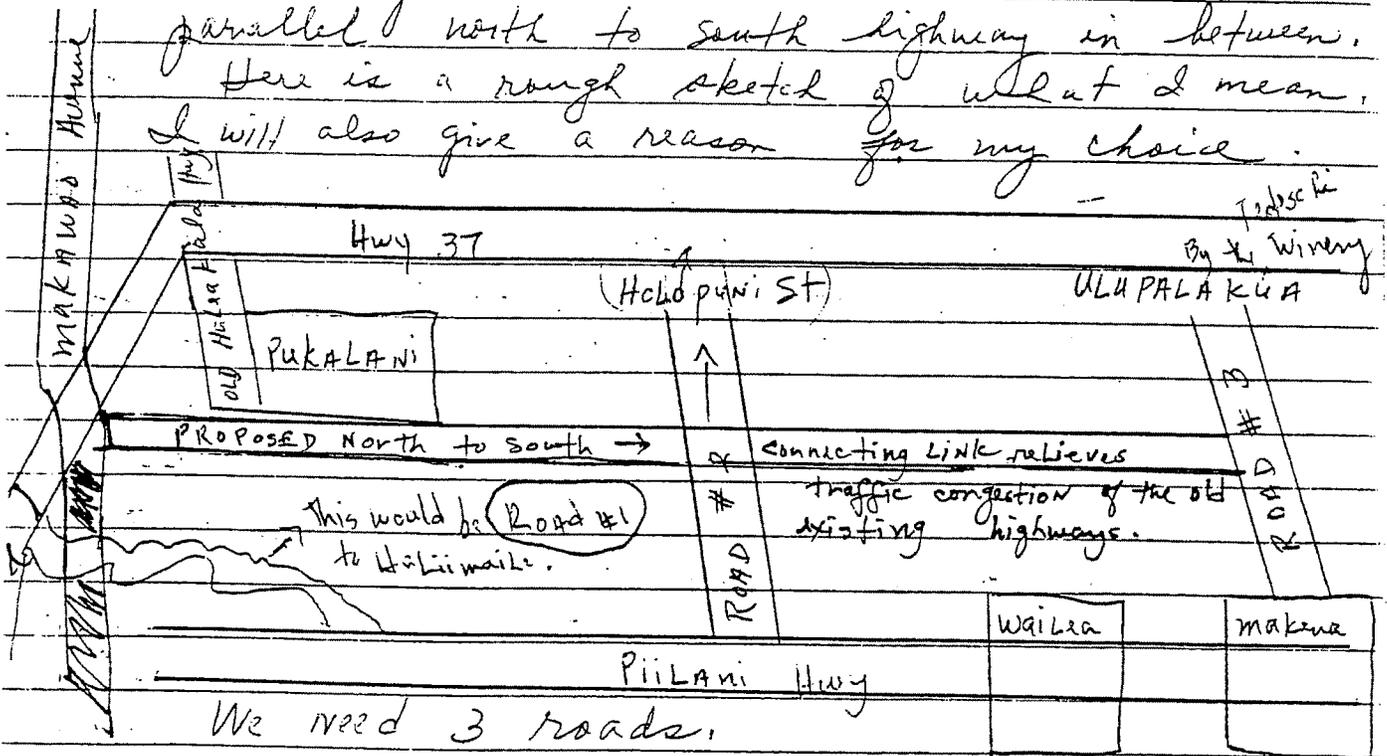

RECEIVED

OCT 21 11 03 AM '99

My name is Julia Shum resident of Maui. I am writing you concerning this proposed road from Kihui to Upcountry Kula. I am in favor of this road but I have a few questions.

My first question is how many roads are being proposed. How many terminals or end points or connecting points to Highway 37 are proposed or planned? I hope there are 3.

I would personally prefer 3 sites for connecting links to Kihui with a parallel north to south highway in between. Here is a rough sketch of what I mean. I will also give a reason for my choice.

We need 3 roads.

When I say we need 3 roads its because when there is a disaster such as a tsunami, the people of Makua, Wailea and all of Kihui will need 3 routes of quick, easy and safe access to escape danger. Also, 3 routes will prevent a traffic congestion; in case of an accident on one of the roads, the people will have 2 remaining

alternatives to choose from.  
Another reason is - if we have a short road from Ulupalakua to Makena, it will save the people money for gas and save travelling time and also save traffic congestion from Ulupalakua to Kahului, etc. since the tourists coming from Hana and Kaupo can now descend to Kihui from Ulupalakua to Makena.

Economically, it will benefit the local people because more tourists will come up this way. The Tedeschi Winery will benefit the most.

Another reason why we need 3 roads with 3 terminals is easy and quick access by the people of Kula who may need to work in Kihui.

I personally would have gone to work in Kihui if there were such roads.

At present I decline to work because I would have to spend almost  $\frac{1}{3}$  of my salary on gas (I have a Jeep Cherokee) and also I would spend  $1\frac{1}{2}$  hrs on the road one way. I live in Keokea near the hospital. Whereas if we had a short road from Ulupalakua to Makena, my travelling time would be 35 mins only (one way). I could save much on gas money.

The people of Kula are really depriving themselves of this great opportunity by opposing this road project. I am saddened by their lack of foresight for the future of our children.

Re: Kihei-Upcountry Road EIS

Dear Mr. Wong:

I have read the recently issued EIS for the proposed Kihei-Upcountry Road and have the following comments.

There were four listed justifications for the road. I believe that all four are false and misleading and none of them in any way justify building the road.

1 **Reduced travel time for scientists and technicians from the MRTC to the summit.** This is a trip of 48 miles using the current road infrastructure. The proposed new road would reduce this to 42 miles, a reduction of only 12%. Most of the time required for this trip is consumed in the upper section through Haleakala Ranch and the National Park, where the speeds are slower and there is considerable bicycle traffic to contend with. The new road will do nothing to reduce the travel time on this section and if it encourages more tourists and bicyclists to use the road the end result may well be a longer travel time. At best it will reduce a 2 hour trip by about 10 minutes. In any event very few scientists or technicians make the trip on a regular basis and the EIS did not make an estimate of the number of daily trips or an estimate of the 'cost saving' that would result from the construction of the road.

2 **Evacuation in the event of a Hurricane or Tsunami.** As the EIS states, hurricanes are rare on Maui and Tsunamis mostly effect the North shore areas. Both of these events have long lead times, at least 4-6 hours, which would allow for orderly evacuation. Many areas of the mainland which are notorious for hurricanes, such as the Florida Keys and the outer banks of North Carolina make due with a single 2 lane evacuation corridor. Of more concern might be a Tsunami generated on Hawaii, however, such events would much more likely propagate toward the mainland and the transit time is so short, just a few minutes, that evacuation would not be possible with any road system. There is certainly no justification here for the construction of a road.

3 **Reduced travel time by tourists going to the summit.** As stated above, the reduction in time is quite minimal, perhaps 10 minutes in a more than 2 hour trip. In addition, the assumptions on the increase in tourists over the next 10 years seems overly optimistic. Tourism is relatively unchanged from the 1990 levels used in the EIS. Where are the additional 28,000 tourists per day going to stay? No new hotel construction is anticipated. Since at least half of the travel time for a trip to the summit from Kihei is spent above Pukalani and since no improvements in that

3 | section of road are anticipated, increasing the number of tourists will actually increase the total trip time independent of whether or not the new road is built. This is hardly justification for the construction of the road.

**Reduced travel time by upcountry residents commuting to jobs in Kihei and Lahina.** This is the most complex and emotionally charged justification for the road. From the above arguments it stands as the only possible justification of the construction so I will examine it in greater detail.

The people who live up country have chosen to live here, those who commute daily to either Kihei or the West Side, do so because of the quality of life here is different from that in Kihei and the West Side. The construction of a road which can only encourage more people to live here and will inevitably cause a change in this bucolic style. We do not want to become more of a bedroom community to Kihei, we live here because we like it the way it is.

4 | The EIS argues that upcountry development will be limited by lack of water. Water is not the issue. There is plenty of water. The problem is lack of storage and/or wells in addition to a poor delivery system. We have already seen with the Kulamalu development that these problems can be solved when there is a commitment to developing the upcountry area. To what end? The people who live here now do not want Kula to look like Wailea or Kapalua. It is illuminating to note that the residents of Kihei have voted in favor of the road, but the residents of Kula have voted against the road.

The EIS argues that the road is needed to decrease congestion at the major intersections during the commuter hours. The worst intersection for commuter delay is the Hana Highway - Haleakala Highway traffic light in the morning commute while school is in session. The solution to this is to eliminate the traffic light by building an overpass/cloverleaf intersection.

5 | The other major Kahalui area of congestion is the area from Costco to the Puunene Ave/Dairy Road intersection. This area has five unsynchronized traffic lights which often develop New York City style gridlock. The only solution to this problem is to separate the thru traffic streams from the local, business generated traffic stream. This is essentially a Kahalui bypass/airport access road and will require an overpass/cloverleaf intersection with the Hana highway. Another way of thinking about this bypass is as a replacement for the accident plagued Hansen Road. The Kuihelani highway and the 4 lane version of the Mokulele highway should merge south of Puunene Ave (no access to Puunene Ave) and continue without any intersections to an overpass/cloverleaf over the Hana Highway continuing to the Airport. Traffic to and from Upcountry/Paia or Kahalui could enter or exit the Hana Highway without a traffic light. Pulehu road would cross underneath without access. Traffic could now proceed from Pukalani or Paia to North Kihei or Maalaea without any traffic lights or left turns. The time savings of such a plan significantly reduces the benefit from any of the Kihei/Upcountry road options.

The effect of the road on the upcountry traffic flow depends on where the road terminates.

6 | If the road terminates at Haliimaile the result will be a terribly dangerous intersection unless either

6 a traffic light or an overpass/cloverleaf intersection is built. Neither of these options are discussed in the EIS. The traffic coming down the Haleakala Highway will have to cross the uphill traffic in order to access the new road. Presumably there will be left turn lanes on both sides of the (now 4 lane) Haleakala Highway with a grass median strip. Coming down the hill in the evening the sun is directly in you eyes for much of the year making it even more difficult to cross the two lanes of the 60 mph up hill traffic all in a hurry to get home. Now add the line of cars coming uphill on the new road trying to cross to the Haliimaile side to go toward Haiku, they have to cross 4 lanes of 60 mph traffic, plus the downhill turning lane plus merge with the uphill left turning lane of traffic. What a mess! Several people died before they put in the light at Makawao Ave, and that was a much simpler intersection. Will that have to happen here? A traffic light will increase the safety of the intersecting streams of cars but at the expense of smooth traffic flow. The only reasonable solution is an overpass/cloverleaf type of intersection; add \$10 million to the cost of this option. There are other effects of this option. The existence of the intersection between the new road and Pulehu road will encourage more traffic to opt for this short cut putting even more traffic onto residential streets that were never designed for even the current traffic load.

7 If the road terminates at point U3, near Holopuni and Pulehu there will be little reason for traffic to use these streets however in will place a greatly increased traffic load onto the Kula Highway. The EIS assumes that the Kula Highway will be widened to 4 lanes, but that process has not started and will require land acquisition, new bridges over the gulches, a few traffic lights and presumably an EIS. It is almost as far from Rice Park to 5 Trees as it is from the Hana highway to Pukalani and look at how hard it has been to add just a 4<sup>th</sup> lane to the Haleakala highway. Where will the money come from for this construction? There will be increased traffic flow from the Makawao side (in the morning) intersecting with the traffic coming up and down the Haleakala highway along with the increased traffic flow to the new Kamehameha school and the new highschool. It has already been pointed out by others that the traffic data used in the EIS was collected before the high school was a full capacity. This will result in a very congested complex of intersections and undoubtedly require several new traffic lights. Upper Pukalani is looking more and more like Kihei or Kahalui. The EIS points out that many first timers will see Pulehuiki or Kimo drive as short cuts with predictably bad results, even more endangered will be the inexperienced and unskilled down hill bikers who venture on this obvious short cut. Clearly, the fact that this option is still being considered in a clear indication that improved travel to and from the summit is not relevant to the construction or siting of the proposed road.

8 We are now left with the U2A and U2B options. Either of these options will result in competition between the thru traffic streams and the local business/school traffic, and both require that traffic from Pukalani travel uphill to 5 trees or beyond to enter the road. Option U2B is particularly bad since uphill bound traffic will have to make a left turn onto the Kula Highway, followed by right turn at 5 trees, with the entrance to the High School in between. It seems clear that there will need to be traffic lights at the entrance to Kulamalu, the terminus of the proposed road if option U2B is used and the entrance to the High School. Within half a mile there are three left turns for the uphill bound traffic (Haleakala Highway, High School and Kula 200) and three left turns for the down hill bound traffic, (Kulamalu, the new road and Pukalani). This is looking more and more like Kihei or Lahaina. It is interesting to note that the High School is not even on the EIS

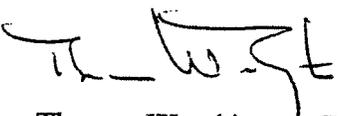

9

detail map of this area. If either option U2A or U2B is selected traffic will be encouraged to use Holopuni, Pulehu and Omaopio in order to avoid the inevitable traffic jams that will develop near 5 trees, the EIS makes only passing mention of this and no attempt to analyze the effect on the residents in these areas.

I have not tried to analyze the effect of the two proposed Kihei termini, however it is clear the selection of K2 significantly reduces the benefit for commuters from Upcountry to the West Side and even K1 will require widening of North Kihei road and the inevitable associated degradation of the sensitive dune and wetlands area it traverses to be have a real benefit for West Side commuters. It seems clear that an improvement of traffic flow thru Kahalui would be more of a benefit to them.

In summary, I have tried to argue that most of the people that the proposed road claims to benefit, i.e. the scientists, the tourists and the evacuees either will not be significantly benefitted or do not have a real need for the road, and that the only remaining potentially benefitted people, the residents of Upcountry have voted against the building of the road. I have also tried to analyze the effect of the various option on local traffic flow and found that this important area has for the most part been neglected or glossed over in the EIS. I also point out that the some obviously needed improvements to the intersections in the Kahalui area would eliminate much current traffic delays that the new road claims to alleviate. I think you should start again and look aggressively at the No Build option to see if it can be make to work because, we don't want Senator Inouye's road up here!

Sincerely,

Thomas Worthington Ph.D.  
233 Naalae Road  
Kula, Maui, HI 96790

cc: Kula Community Association

Mr. Thomas Worthington, Ph.D.  
233 Naalae Road  
Kula, HI 96790

1. The comment correctly notes that the travel distance addressed by the proposed project represents only a portion of the total trip distance between the Maui R&T Park and Science City, and that traffic volumes between the Maui R&T Park and Science City are relatively small. However, there are other project purposes and needs described in Chapter 1 of the EIS. Depending on the alternative, origin and destination travel time savings up to 25 minutes (saving over 11 miles of travel) can be achieved.
2. It is certainly possible to organize an orderly evacuation using the existing roadways out of Kihei. However, as many living in Kihei-Makena have communicated, the region would substantially benefit from additional evacuation capacity. Moreover, coastal hazards are not the only threats requiring evacuations. Large-scale brush fires could also require evacuation.
3. The tourism projections reported in the EIS were taken from reports prepared by the County of Maui and State Department of Business, Economic Development and Tourism. Depending on the alternative, origin and destination travel time savings up to 25 minutes (saving over 11 miles of travel) can be achieved.
4. Despite the recent development of a well in Haiku, which is partially being used for the Kulamalu development, Upcountry will continue to rely on surface water resources, sources that are highly vulnerable to drought conditions. In addition, the cost of providing water transmission lines and storage is comparatively higher in Upcountry because of its elevation. Therefore, the County is unlikely to allow substantial urban development in Upcountry despite the existence of Kihei-Upcountry Maui Highway.
5. Converting the Haleakala Highway and Hana Highway intersection to an interchange, and other transportation improvement suggestions in the Kahului area, would not address all of the purposes and needs of the project.
6. Section 2.1.2 of the EIS states that terminus intersections and will include turning, acceleration, and deceleration lanes. Since two of the terminus options already have traffic

signals (U2-A and K2), these intersections would be modified if one or both of these options were identified as the preferred alternative. Section 2.1.2 also states that for the other alternative termini, the decision to place traffic signals will be made during the design phase, and would will be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. For the U1 terminus intersection, it is likely that it will warrant traffic signals. Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which costs substantially less.

7. The U3 alternatives were evaluated in the Draft EIS because they represent the least cost alternatives.
8. As described in Section 4.4.1 of the EIS, the U2-A and U2-B alternatives would cause the contra-flow of peak directional traffic in Upcountry. Since commuter traffic tend to peak during certain times of the day (i.e., early morning and late afternoon), arterial roadways tend to be over-utilized in one direction, and under-utilized in the other direction. The benefit of the U2-A and U2-B alternatives, and to a lesser extent the U3 alternatives, is that they would cause the directional splits of the highways in Upcountry to be more even.
9. Section 4.4.1 of the EIS discloses that some motorists from Kula would inappropriately use Pulehu (including Holopuni Road) and Omaopio Roads to access Kihei-Upcountry Maui Highway similar to how some motorists currently use these roads to drive to and from Kahului. This impact would be greatest under the U1 alternatives, and less so under either the U2-A or U2-B alternatives. This impact would not likely occur under the U3 alternatives. Section 4.4.1 discloses the potential impacts to residents along these roads from the inappropriate use of these roads.

**Kihei Upcountry Maui Highway Project U2B**

Dear Sirs,

The EIS for the Kihei to Kula Highway going through U2B Kulamula Subdivision does not address the connection to Pukalani Terrace Country Club Estates. The Kulamula Subdivision road starts off the Kula Highway and goes straight down to Aina Lani Street in Pukalani. **TMK (2-3-61) Aina Lani Street is not a through street now but the plans to open it are part of the Kulamalu Subdivision plan.** It is the last street in Pukalani Subdivision. Kulamual Subdivision's main residential housing is located near Aina Lani Street. The commercial part is off Kula highway.

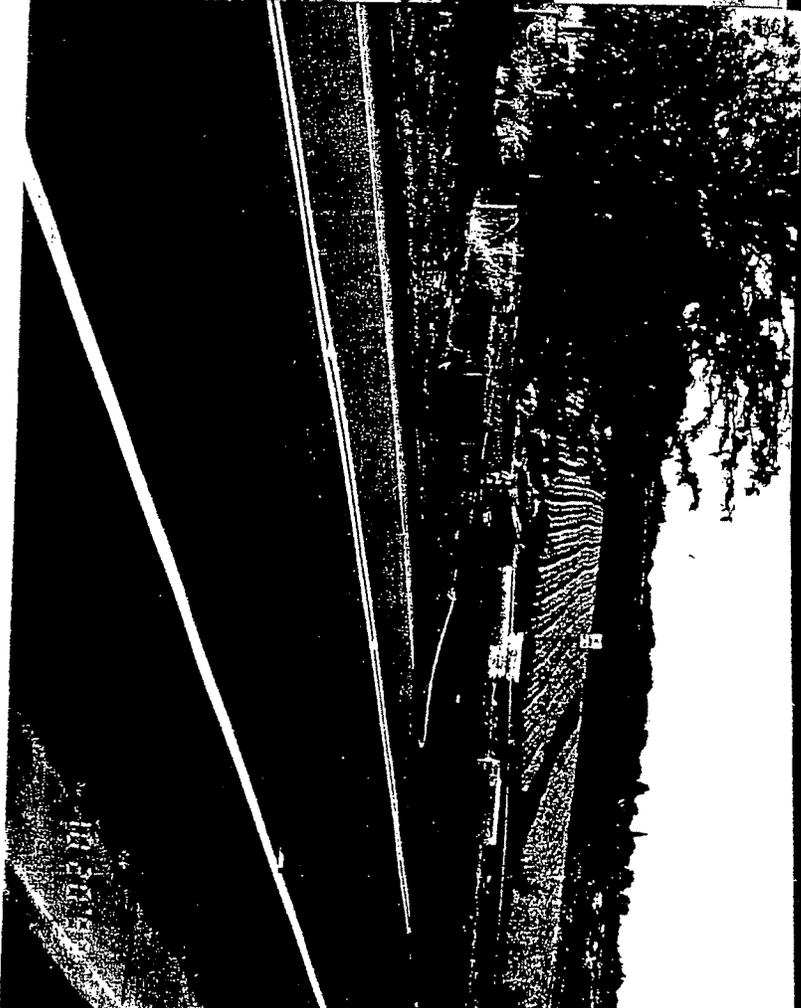

Besides all the traffic from the new homes that are proposed in this new subdivision you would also have the highway traffic. Also, once you enter the Kulamalu road that will meet up with the state highway, you could turn left onto Aina Lani Street, (which is the last street in Pukalani Terrace), then travel through the neighborhoods of Pukalani Terrace to get out. This would be used as a short cut for many local residents of Makawao, Haliimaile, Haiku, and the surrounding areas, directly impacting Pukalani.

Neither Aina Lani Street nor the effect on Pukalani Terrace Country Club Estate was addressed in the EIS report. The impact on Pukalani would be great and needs to be looked into immediately.

A state highway connection has to address the Limit Access Highway. From what I understand a state highway cannot just exit through a subdivision until a study of that area is made. Also if the Aina Lani Street entrance were not opened up then it would not impact Pukalani. Which seems the best solution at this time. Kulamalu Subdivision should not be connected to Pukalani Terrace, and that is by not connecting the end of Aina Lani Street. Nor any other streets in Pukalani Terrace Country Club Estates.

A study on the impact of Aina Lani Street, which will be so used if the Upcountry Highway is selected for this site was not part of the EIS, this is an immense concern of the residents of Pukalani.

cc: Bob Sariat  
Mr. Hayashida  
David Atkins

NO NAME

1. The Five Trees intersection (with the U2-A alternatives) would be the only direct connection between Kihei-Upcountry Maui Highway and Pukalani. If you are providing information that Pukalani Terrace will be directly connected to the Kulamalu development, it is possible that Pukalani Terrace could be indirectly affected by a U2-A or U2-B alternative depending on what kinds of connections, if any, there would be between the highway and Kulamalu. Since neither a U2-A nor U2-B alternative was identified as the preferred alternative, issues surrounding the connection between Pukalani Terrace and Kulamalu are beyond the scope of this project.

re. Kihei-Upcountry Maui Highway  
Draft Environmental Impact Statement

Dear Mr. Wong:

I support the construction of the proposed Kihei-Upcountry highway because it will shorten the travel time and distance for the many people who travel between Kihei and Upcountry daily. I have concerns about the following issues:

- 1 | 1) It is important that aesthetic considerations be given the same weight as safety and other considerations. For the design of bridges, guard rails, signs and landscaping experienced architects and landscape architects should be engaged.
- 2 | 2) Opportunities for roadside stops and lookouts will present themselves during the design stage. Please incorporate as many of them as feasible.
- 3 | 3) The Upcountry terminus should be located as close to where Makawao Ave. ends as possible so that people living in Makawao and beyond will be served by the new highway. I would like to suggest that terminus U2-A be used.
- 3 | 4) Instead of only one terminus at the Kihei end I would like to suggest two (K-1 and K-2). The highway could split at a suitable location above Kihei so that a broader range of the Maalae/Kihei/Wailea area would be served.

Sincerely

Hans Riecke

Hans Riecke, FAIA  
77 Apalapani Lane, Haiku, Maui, Hawaii 96708  
Telephone (808)575-2520, Facsimile (808)575-2077

Mr. Hans Riecke, FAIA  
77 Apalapani Lane  
Haiku, Hawaii 96708

1. The Department of Transportation concurs that aesthetic considerations are important. The details mentioned are typically addressed during the design phase.
2. Scenic stops and lookouts along the alignment will be studied in more detail during the design phase.
3. Only one Kihei terminus is proposed at this time.

D/K 820

Kula Community Association  
P.O.Box 417 - Kula, HI 96790

Kazu Hayashida, Director  
State of Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, HI 96813

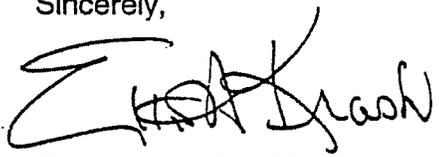

Dear Mr. Hayashida:

The recent announcement of the preferred route for the Kihei-Upcountry Highway culminates one phase of a lengthy process that has been a major concern of Kula residents for many years. On behalf of the Kula Community Association, thank you for including citizens in the decision making process and for being responsive to some of their concerns.

We appreciated your scheduling of a regular public hearing at the request of the community in addition to the "open house" meetings. In particular, we would like to recognize your staff members who have been helpful to us during our review of the draft environmental impact study. Pericles Manthos responded promptly to telephone and written inquiries and attended our community meetings to report on the highway plans. Bob Siarot is always available to listen to our community members' concerns and work with them to resolve problems.

Although the selection of the Haliimaile terminus did not satisfy the significant minority of our community who preferred the "no build" alternative, we realize that your decision must reconcile the competing needs and interests of all stakeholders. We anticipate a complete and satisfactory response to the many issues raised in the Kula Community Association's comments on the draft environmental impact statement (see attachment). We look forward to continuing to work with you and your staff as the environmental impact phase is completed and the design and construction phases begin.

Sincerely,

Elliott Krash, President

October 13, 1999

Dear Mr. Manthos:

**Subject: Kihei-Upcountry Highway Draft Environmental Impact Statement (EIS)**

The Kula Community Association (KCA) Board of Directors wishes to place on the official Draft EIS record two general comments followed by specific comments. We expect that the Final EIS will address both our questions and our concerns.

**GENERAL COMMENTS ABOUT THE EIS**

1. We desire that the Final EIS reflect and respect the legally adopted (July, 1996) "Makawao-Pukalani-Kula Community Plan". Specifically, we urge you to note the following provisions:

Page 31 **"Transportation Objectives and Policies**

***"Give priority consideration to the "no-build" alternative of the proposed Upcountry-Kihei connector highway, and give secondary consideration to the alternative routes with the least negative impact to the Upcountry lifestyle and character by locating the Upcountry terminus in the vicinity of the intersection of Hali'imaile Road and Haleakala Highway."***

Note: **Bold** is ours.

Page 13 **"Interregional Issues**

1 ***"Kihei-Upcountry Highway: The proposed highway between Kihei and the Upcountry region is significant in terms of its land use and transportation impacts. The "no-build" alternative is the preferred option, but it is recognized that the selection of an alignment must consider the growth inducing impacts to the region's agriculture, rural character and open spaces. The need to maintain the unique Upcountry ambience is an essential parameter in analyzing alternative routing schemes. Recognizing that the evaluation of alternatives should weigh transportation costs and benefits as well as community and land use impacts, it is recommended that, if built the Highway's Upcountry terminus intersect Haleakala Highway in the vicinity of Hali'imaile-Road."*** Note: **Bold** is ours

Page 18 In the Land Use section, the Plan states in Objectives and Policies #4

***"Encourage land use patterns which will maintain a separation of character between the Upcountry and the Kihei-Makena regions."***

2. The Kula Community Association position on the proposed Upcountry-Kihei Highway clearly prefers the upgrading of the present highway/road network connecting upcountry Maui to Kihei. We support improvements to the existing highways as a means of solving present and future transportation problems. The exact wording of our position follows:

2      *The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halliimaile terminus the best option available.*

### SPECIFIC COMMENTS ABOUT THE Draft EIS

3. We are concerned with the manner in which the "enhanced widening" alternative (EWR) was dismissed during the Tier 1 screening. The Draft EIS indicated that "Non-satisfaction of project goals eliminated the enhanced widening of existing roadways" (on Page 2-28). The Draft EIS said "enhanced widening" had a "fatal flaw" because it "would not establish a roadway linkage between Kihei and the Upcountry area." Please note that "establish a roadway linkage" is NOT a purpose of the project (See Page 1-5). Rather, "improve roadway system linkage" is a listed purpose. This statement clearly means that the six proposed alternatives do NOT meet the project purpose because they would "establish" a new roadway linkage!! The "enhanced widening" is an improvement and meets the purpose.

3      Elimination at the Tier 1 stage is not merely an error, but it is a deceptive means of avoiding a closer look at the preferred option stated in Maui County's ordinance (See #1 above). We feel that as the many, proposed highway widening projects (Piilani, Mokulele, Haleakala highways) are completed, we will have a series of newly designed, signalized intersections and a four lane highway from/to Upcountry to/from Kihei. The "enhanced widening" alternative needs to be given consideration in the Tier 2 analysis because it will cost effectively solve the traffic problems that the Upcountry-Kihei Highway is supposed to solve.

After being rejected as a viable option, the "enhanced widening" (EWR) alternative subsequently seems to have been superficially evaluated as the base-case, "no build" position.

4. The Draft EIS is totally inadequate in indicating the number, origin, and direction of trips being generated. This information must be included for each of the alternatives as well as for the completed "enhanced widening" alternative.

5. The Final EIS should present a complete benefit-cost analysis. The analysis should include adequate information on the methodology, assumptions, and data used, so that others can determine the accuracy of the calculated benefit-cost ratios. The alternatives should be compared to the completed "enhanced widening" (EWR) alternative.

6. The Draft EIS references traffic only at the various highway termini. Because the design of these intersections has not been specified, the EIS seemingly lacks the ability to present the actual total cost of each alternative. We expect that the Final EIS will address the total cost of each alternative. The relative costs are needed to make a decision among the alternatives.
7. The Final EIS should correct an error in the route between Upcountry and Kihei. The Draft EIS mistakenly selected the busy Dairy Road as part of the route. Few traveling between the two areas would utilize that road. Instead, traffic goes via Hansen Road, a shorter and faster route. According to the Kahului Airport Improvement Final EIS, Hansen Road will be improved.
8. We note (on Page 3-30) the very high accident statistics in the Draft EIS for Mokulele Highway and Dairy Road. We ask that the Final EIS evaluate a divided highway with one lane on each side of the divide. We need not repeat the dangers of Mokulele & Dairy Road by considering or building two lanes with the provision for two additional future lanes on the other side of a divide. We need not repeat the dangers of Mokulele & Dairy Road.
- If the Final EIS doesn't consider a divided highway from the beginning, then it must include the probable accidents on a two lane highway as compared to the safer, four lane, divided highway in the "no build" alternative. Those accident costs should be a part of the benefit-cost analysis.
9. The Final EIS needs to address the impact on traffic of the numerous intersections along the different routes: cane haul roads, Maui Ag Park, Omaopio Road, Pulehu Road, the Kamehameha School, the Kulamalu shopping center, proposed gas station, park, senior citizen housing, etc. The costs of traffic lights, potential grade separations, and other traffic control elements need to be added to the cost of the highway alternatives.
10. The Draft EIS describes the probability of the Haleakala bike tours utilizing a more direct route to Kihei. Unfortunately, the EIS makes no mention of the effect on local Kula road traffic if the bicyclists are diverted onto such totally inadequate residential streets such as Kimo Drive and Pulehuiki Road. The problem is particularly relevant because these bike tours pass through Kula during the hours when school busses are negotiating these narrow streets.
- Compounding the problem and also not addressed in the Draft EIS is the fact that bike tours do NOT use a single lane of traffic. Rather, they have a wide van that trails the cyclists and intentionally blocks traffic for long periods. This problem needs to be addressed in the Final EIS; both for bike tours using the various highway alternatives; and for the bike tours passing through the residential streets of Kula.
- Even if the bike tours do not use the streets mentioned above, they certainly will be passing King Kekaulike High School and interacting with hundreds of young drivers beginning the school day.

11. In a similar manner, many additional cars will be taking shortcuts up and down to/from crater using Pulehuiki RD., Kimo Dr., Lower Kula RD., Holupuni, Pulehu and Omaepio roads. They will be descending on those narrow, winding and steep Kula residential streets after the brakes will have been overheated, having descended twenty-two miles down Crater Rd. In particular, as drivers traverse Pulehuiki Rd. and/or Kimo Drive there is a likelihood of additional fatal accidents to drivers and or pedestrians because of the steep sharp turns that both of these roads provide; there is little warning for the uninitiated. Is the DOT willing to accept the responsibility for the lawsuits that will result from these accidents?

The discussed mitigation measure (i.e. utilizing signage) (See Page 4-32.) will not adequately deter local drivers, scientists, or even tourists. The Draft EIS fails to properly address this issue or to suggest meaningful mitigation measures. In fact, we believe that the dangerous situations that will occur on Kula's residential streets are a "fatal flaw" in the EIS consideration and eventual use of the U-3 terminus.

12. Since the proposed highway is being supported by the federal government with the justification that it is part of our "national security", there should be an accounting from the official Air Force Log at the summit of the number of actual daily trips between KRTP and the summit observatories. Does the volume of trips justify the expenditure of \$50,000,000 of our tax dollars?

13. Very specific concerns that indicate "fatal flaws" with several alternatives:  
U-3 cuts through: the Maui County Ag Park (See Page 4-12); Maui Land and Pine pineapple fields (See Page 4-13); and close enough to minority-owned, Kula vegetable farms (that have been farmed by local families for generations) to disrupt their travel patterns (See Page 4-21). See also #5. & #6. above.

U-2B has a severe 10% grade in the neighborhood of the recently opened Kamehameha School and the elderly housing project. There will be loud and disruptive noise from trucks and tour buses going up the mountain and from the application of (air) brakes as those same vehicles descend. Many of the tour buses will pass the elderly housing project between 3:30AM and 5AM on their way to the Haleakala summit sunrise. Furthermore, this 10% segment lies between Kamehameha School, the proposed park and the proposed large shopping center; we fear for the children who will be walking along the highway.

U-2A is in the immediate proximity to Kekaulike HS, resulting in a number of potential problems: a) many students now walk (without sidewalks) along the highway, since bus service is provided only for students living over one mile from the campus; b) many tourists as they descend from the sunrise will be meeting the high school's arriving students about 7:30AM; and c) there already have been a number of accidents at the "five trees" intersection.

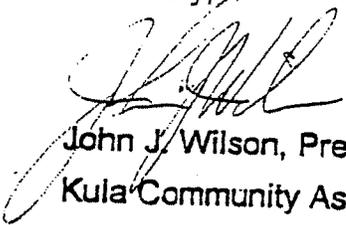

As a matter of public safety, this highway has no place in the proximity of any of the upcountry schools.

14 14. According to the Draft EIS the danger of fires started along the highway and being spread uphill by ascending daytime winds is to be mitigated only by signs. There is no water in the area for fire-fighting or even for a landscaped green-belt on the mauka side of the highway. Because of the area's inaccessibility, a fire could develop a broad front as it moves uphill into the Kula residential community. This danger applies to all the alternatives and needs to be better addressed.

15 15. With regard to funding, we understand that the highway will be financed 80% - 20% by the Federal and State governments respectively. We suspect that the highway, the intersections, the mitigation measures, etc. will be much more expensive than the figures in the Draft EIS. Already the projected costs have risen from an earlier figure of about \$35 million (during a time when the inflation rate was low and housing costs actually decreased on Maui). Consequently, if the "no build" scenario is adopted, we wish to know what highways could be built or improved with the State funds?. Also, who will be responsible for possible cost-overruns? State, Federal government, or 80%/20%? Finally, who will be responsible for the highway's maintenance?

Thank you for your consideration of these comments.

Sincerely,

John J. Wilson, President  
Kula Community Association

Mr. Elliot Krash, President  
Kula Community Association  
P.O. Box 417  
Kula, Hawaii 96790

1. The Makawao-Pukalani-Kula Community Plan was given heavy weight in the identification of the U1,K1 alignment as the preferred alternative.
2. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to wide the Haleakala, Mokulele, Hana, and Piilani Highways. These recommended projects are included in No-Build scenario for the Kihei Upcountry Maui Highway project.
3. The system linkage purpose (see Section 1.2.1) pertains to the connectivity of the roadway system. In this case, the two areas suggested for enhanced connectivity are Kihei-Makena and Upcountry Maui. Therefore, an alternative has to address this purpose to warrant serious consideration. Improvements to an existing circumferential roadway would not satisfy connectivity as well as a direct link.

Please note that the Enhanced Widening of Existing Roadways (EWR) alternative is not the same as the No Build alternative, which includes the expansion of Haleakala, Hana, Mokulele and Piilani Highways. By law, the No Build alternative is automatically retained throughout the environmental review process. The EWR alternative would provide one lane in each direction in addition to the expansions assumed under the No Build alternative. It was eliminated from further study because it would require 32-kilometers (20 miles) of construction at a cost estimated at \$78 million. This could not be justified when a highway directly linking Upcountry and Kihei would only be 15 to 18 kilometers (9 to 11 miles) long and would be substantially better in addressing the system linkage and other purposes and needs.

4. An origin-destination study was conducted for the Maui Long Range Land Transportation Plan (Long Range Plan). The Long Range Plan led to the planning of Kihei-Upcountry Maui Highway. The traffic volume projections that served as the basis of the environmental review are provided in Section 4.4.1 of the EIS.

5. A benefit-cost analysis was used as early screening tool to compare the travel time savings between centroids in Kihei and Upcountry. The methodology and work tables used to calculate the B-C ratios are provided in the Alternatives Analysis report in Appendix E of the Final EIS.
6. Construction of terminus intersections is included in the construction cost estimates of the alternatives. Intersection costs include traffic signals (the intersections are likely to warrant traffic signals, but this will be determined during the design phase), lighting, and turning, acceleration, and deceleration lanes.
7. Motorists traveling between Kihei and Upcountry use both Dairy and Hansen Roads. The route will be described in the Final EIS to include both options. The proposed improvements to Hansen Road consist of a short extension associated with the realignment of Mokulele Highway and Puunene Avenue. This will allow the installation of traffic signals at its intersection with Puunene Avenue.
8. A two-lane highway is being proposed because projected traffic volumes do not justify a four-lane highway by the design year 2020. In its initial two-lane undivided configuration, the highway would be similar to Haleakala or Hana Highway, not Dairy Road or the present Mokulele Highway. (Mokulele Highway will be changed to a four-lane divided configuration, which would substantially reduce the number of incidents on this roadway.) The rate of incidents on Haleakala and Hana Highways is consistent with overall patterns (see Section 3.4.1.2). Kihei-Upcountry Maui Highway will be designed in accordance with American Association of State Highway and Transportation Officials (AASHTO) standards.
9. Section 4.4.1 reports traffic conditions at the alternative termini. The U1,K1 alignment, which was identified as the preferred alternative, would cross cane haul roads and Omaopio and Pulehu Roads. Two underpasses will be constructed to accommodate the cane haul routes. The impact of the U1,K1 alignment crossing Omaopio and Pulehu Road is described in Section 4.4.1.1. The costs to mitigate traffic impacts are included in the estimated costs of the alternatives, such as the cost to construct the two underpasses for the cane haul roads.
10. Section 4.4.1.3 of the Final EIS has been modified to describe the potential for bike tour operators to use local Kula roads, should a U3 alternative be selected. Kihei-Upcountry

Maui Highway will have adequate shoulders for bicyclists. Bicycle tour operators will not be allowed to conduct their tours as described in the comment because the protective van would not be able to maintain the minimum speed requirement.

11. Since a U3 alternative was not identified as the preferred alternative, the inappropriate use of Pulehuiki Road, Kimo Drive, and Lower Kula Road will not occur. Signage could be provided that would be effective in deterring shortcuts. However, the EIS acknowledges that some motorists will use Holopuni, Pulehu, and Omaopio Roads as shortcuts because of the distance between Kula and the U1 terminus. Closing access between these roads and Kihei-Upcountry Maui Highway is not an option because of the burden this would cause on the area farmers.
12. The EIS acknowledges that the number of persons traveling between the Maui R&T Park and Science City using Kihei-Upcountry Maui Highway will be relatively small compared to other travel markets to be served by the roadway. However, there are other important purposes and needs of the project, as described in Chapter 1 of the EIS.
13. A U2-A, U2-B or U3 alignment was not identified as the preferred alternative. However, they were not eliminated for the reasons provided in the comment because the impacts noted would be mitigated had these alternatives been identified as the preferred alternative.
14. Kihei-Upcountry Maui Highway would increase human accessibility to the area, such that the risk of man-made hazards may increase. Section 4.8.4 of the Final EIS discusses the planning process that will continue to address regional fire concerns. Mitigation measures will include signage, which can help to increase driver awareness, and weed control along the shoulders. The highway will enhance emergency response and evacuation capacity, providing regional benefits for responding to a hazardous situation. The highway will also enhance the ability of water and fire-fighting resources to reach the dry forest areas. The preferred alternative traverses irrigated agricultural fields with access to water.
15. The current cost estimate is considered a planning level estimate, which will be improved as further information is developed. While there is always a possibility that the cost estimate could increase, based on the information presently available, the current cost estimate is valid and reasonable.

Regardless of whether the Kihei-Upcountry Maui Highway is constructed, the projects listed in Section 2.1.1 of the EIS are planned for implementation. Near-term projects include the widening of Kuihelani and Mokulele Highways.

The responsibility for overruns varies depending on the reason for the overrun.

The Department of Transportation will be responsible for maintenance of the highway.

Honolulu, Hawaii 96813

Dear Mr. Hayashida:

The Kula Community Association (KCA) recently issued a news letter to the Kula Community which contained a statement of the KCA's Board of Directors position on the proposed Upcountry/Kihei Highway.

The statement was in a format that could be cut out and sent to you. However, twenty nine individuals returned the cutout directly to the KCA. For your information and review, enclosed are the originals of these individuals comments expressing their position, pro or con to the position statement.

Sincerely,

John J. Wilson  
President, Kula Community Association

I agree with the above statement.       I disagree with the above statement

1 | Comments: Kula Highway has nearly 100 private drives and small roads that intersect directly with it. There are many blind curves that compound the difficulty with entering 55 mph traffic. Very dangerous. Not practical to add stoplights at each spot. Please, think ahead on this. No one needs to get hurt if you think logically before doing this.

Kula Community Association's position on the proposed Upcountry/Kihei Highway is:

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Tree termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway to alleviate growing traffic concerns. I disagree with the above statement

Comments:

Improvement should NOT include guard rails running on for miles and over bridges and up to intersections obstructing views of the ocean, traffic and making a dangerous + unsightly hazard which also prohibits people from pulling over to quietly enjoy the spectacular views.

**KIHEI / UPCOUNTRY HIGHWAY**

This is an important opportunity to comment on the proposed Upcountry/Kihei Highway. If you haven't yet shared your opinion, complete the following and mail it on or before Oct. 26<sup>th</sup> to:

DIRECTOR'S OFFICE  
DEPT. OF TRANSPORTATION

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Tree termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement

Comments: *Pulehu, Kulamalu, Five Trees areas are already too congested with traffic. Any more would be hazardous. The Haliimaile area would be best as stop lights would have to be installed and therefore making that area a lot safer than it is now.*

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

MAY 21 1986

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Comments: FOR ALSO THIS IS FINANCIALLY THE CHEAPEST  
BUT MAINLY I MY PROTEST IS - LEAVE THE KIHEI CRIME  
IN KIHEI.  
9 ALSO - WORK ON MAKENA - RANCH ROAD - BUT ONLY OPEN  
FOR EMERGENCY - BUT THE ROAD WILL BE PHYSICALLY  
IN SHAPE

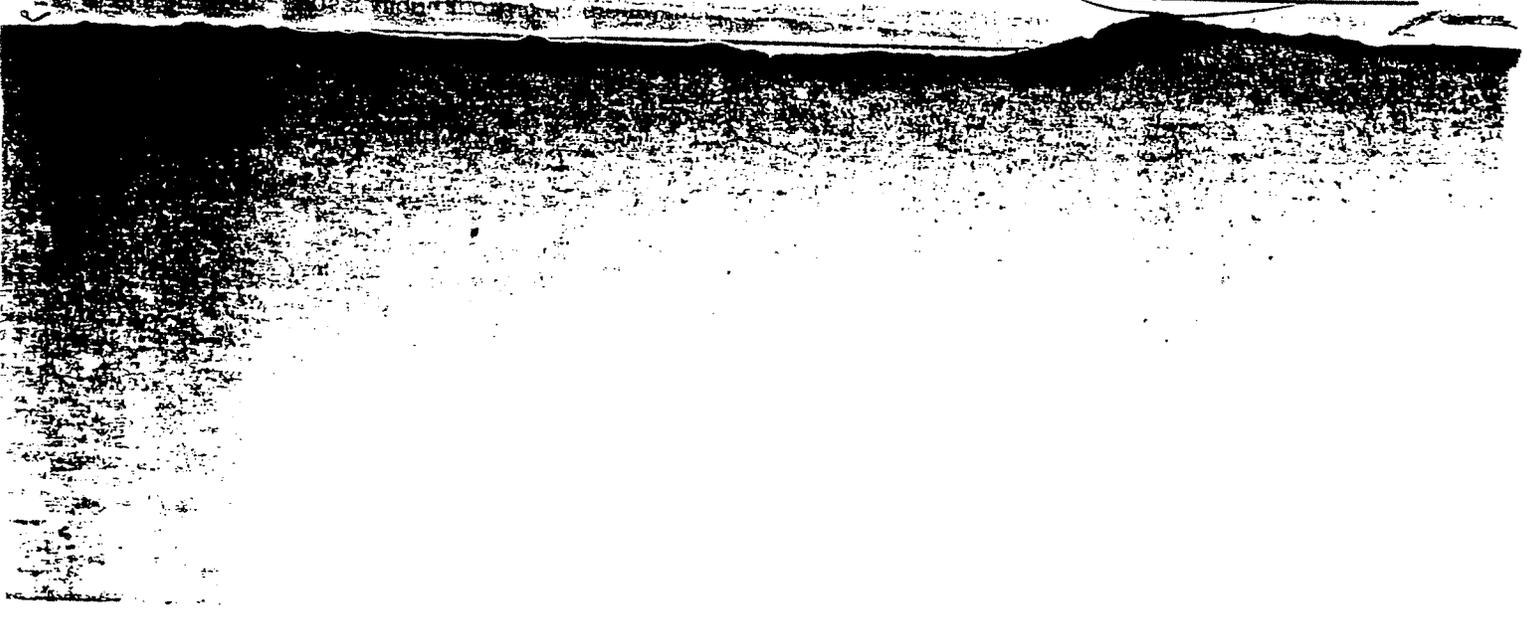

KCA UPCOUNTRY WATER POSITION

The KCA is in the process of developing a position statement on upcountry water. Immediate, critical problems as well as long term needs will be addressed, with special focus on providing adequate water service for current residents and agriculture. We want the position statement to include the issues of greatest concern to Kula residents, so please indicate in numeric order the three most important items.

- 4 drought relief    3 fire control    1 water quality    \_\_\_ water pressure  
2 water reservoirs    \_\_\_ delivery systems    \_\_\_ meter wait list    \_\_\_ rates and fees

Should there be a moratorium on the issuance of new meters until the water system has reserves that are sufficient to meet the needs of current users for six months of drought with no more than 10% usage reduction? No \_\_\_ Yes ←

Comments: ITS ALWA      see back of envelope for name/ no.

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.

I agree with the above statement.

I disagree with the above statement

Comments: I think the Kihei / Upcountry Road should start at Lipoa St in Kihei and come out at Makanao Ave. in Pukalani. Haliimaile is too far down the mountain to make much difference, and Kula Malu in Keokea is a bad choice because that quiet farm community needs to be preserved from commuter traffic. Haliimaile is not a population center, neither is Keokea, but Pukalani is.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement

Comments: The street lights in front of the newly rebuilt Kamenameha School are too much for our rural area too bear. Light pollution to da max! Here is a cry to preserve our upcountry night sky. No more lights, take down the new light posts. Back to the darkness!

18

Kula Community Association's position on the proposed Upcountry/Kihei Highway is: *HWY 310*  
 The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.

DIRECTOR'S OFFICE  
 DEPT. OF TRANSPORTATION  
 816 111  
 819

I agree with the above statement.  I disagree with the above statement

19 Comments: *Any Kula terminus would create traffic hazards at proposed sites. Haliimaile is a central terminus for all of upcountry - Kula to Haiku.*

Mr. Elliot Krash, President, for Mr. John J. Wilson  
Kula Community Association  
P.O. Box 417  
Kula, Hawaii 96790

Thank you for forwarding the comments that you received regarding the KCA's Board of Directors' position on the proposed Kihei Upcountry Maui Highway.

Enclosed are copies of the forms with comments in which the Department would like to respond. The individual comments have been numbered, with the number of the response below corresponding to the number of the comment.

1. Kihei-Upcountry Maui Highway will be a limited-access roadway, unlike Kula Highway. Access to the highway will be allowed only at intersections designed to accepted design standards. It will not be possible to access the Highway from driveways.
2. If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
3. For safety reasons, Kihei-Upcountry Maui Highway will include guardrails at certain locations. Even with guardrails, it will be possible to enjoy views from the highway.
4. The decision to place traffic signals at the terminus intersections will be made during the design phase, and would be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. The U1 terminus intersection will likely warrant traffic signals.
5. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway.
6. The Kihei-Upcountry Maui Highway will not include a feeder road to the Department of Hawaiian Homelands (DHHL) development in Keokea. Such access can be provided in the future, if and when needed. However, the connection to DHHL lands would have to undergo a separate environmental review process

7. Providing a link between central and west Maui is not the purpose of this project. However, regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning projects to improve transportation between central and west Maui.
8. U1 was selected as the preferred Upcountry terminus. Therefore, the inappropriate use (i.e., shortcuts to and from Haleakala Crater) of Pulehuiki Road, Kimo Drive, and Lower Kula Road will not occur.
9. The alternative suggested appears to be similar to Alternative 7, which was eliminated early in the preparation of the Draft Environmental Impact Statement (EIS) because it had a very low benefit-cost ratio. The provision of an emergency access route for Kihei-Makena is just one purpose of the project. The alternatives studied in the EIS address all the project's purposes and needs.
10. All the alternatives with a Kihei terminus at the Piilani Highway / Lipoa Street intersection were eliminated prior to release of the Draft EIS because the Maui R&T Park requested that the highway not traverse the facility. The avoidance of existing communities was a key design guideline in developing alternative alignments. It appears that the suggestion to have the Upcountry terminus at Makawao Avenue would violate this principle.
11. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway to a four-lane divided roadway.
12. If the comment is about Kihei-Upcountry Maui Highway, a two-lane roadway is proposed because traffic projections do not justify a four-lane highway by the design year, 2020. However, the right-of-way for future expansion to four lanes will be reserved.
13. The U3 alternatives would have established the Upcountry terminus in Kula. These alternatives were not selected as the preferred alternative because they would not serve travel markets as well as the other Upcountry terminus options. Alternatives 6A and 6B had an Upcountry terminus in Keokea, and Alternative 7 had an Upcountry terminus in Ulupalakua. These alternatives were eliminated prior to release of the Draft EIS because they had very low benefit-cost ratios.

14. Kihei-Upcountry Maui Highway will not cause development in Kula. The amount and pace of residential development in Upcountry will continue to be controlled by planning and water availability, not transportation infrastructure. Urban growth in Upcountry will be limited to the Pukalani, Makawao, and Haliimaile areas.
15. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway, and Piilani Highway.
16. There will be only one Upcountry terminus. The Upcountry terminus of the U1,K1 alignment, which was selected as the preferred alternative, will be located at the Haleakala Highway / Haliimaile intersection. Traffic projections do not justify several connections between Upcountry and Kihei-Makena at this time.
17. If a U2-A alternative had been selected as the preferred alternative, projections show that traffic conditions at the U2-A terminus (the Five Trees intersection) would have operated at a level of service B (delays in the range of 5 to 15 seconds per vehicle) during the morning and afternoon peak hours. Therefore, traffic congestion in this area is not anticipated.
18. Kihei-Upcountry Maui Highway will not have street lighting, except at the termini. The Kulamalu developer installed the lamps fronting Kamehameha School.
19. None of the Upcountry terminus options would cause traffic hazards.

Please make any comments below:

I believe the best route is U2B, K1.

The estimates to do the construction

do not reflect that Kulumalu has

1 | purchased & built a large portion of

the highway. - Bringing the costs of const. down significantly. Also:

U3 - too far south

U1 - too low

U2A, too congested

Mr. Dan Goodfellow  
165 W. Ikea Moku Pl.  
Kihei, HI 96753

1. The cost estimates for the U2-B alternatives were revised to reflect the 3000 feet roadway already constructed in Kulamalu.

Comment: Concerned about operations and traffic conditions at the U1 terminus (Haliimaile Road / Haleakala Highway intersection).

Response: The U1 terminus would include left turn, acceleration, and deceleration lanes, and would likely warrant traffic signals. Morning peak hour traffic conditions are projected to operate at a level-of-service C, on a scale of A to F.

COMMENT #1 — THIS SHOULD BE ~~POSTPONED~~ POSTPONED UNTIL  
ALL 4-LANES ARE COMPLETED ON HALEAKALA HWY,  
PUUNENE and MOKULELE HWY. also PIILANI HWYS. FIRST!

COMMENT #2 HAILIMAILE U-1 to K-1 at Ke ALII ALANI -  
SHOULD HAVE THE LEAST IMPACT ON RESIDENTIAL AREAS.  
ALSO A SIX-WAY LIGHT INTERSECTION AT U-1 HAILIMAILE  
FOR SAFETY & TRAFFIC FLOWS, EACH COMPUTER TIMED  
FOR MAX. TRAFFIC FLOW!!

COMMENT #3 NO FEEDER ROADS OFF OF THE  
BY-PASS <sup>HWY</sup> OTHER THAN EXISTING PULEHU-OMAPIO ROADS  
TO KULA from KAHULUI "MATAHO"  
*HA*

Mr. Kenneth Hofman  
345 Lokelani Place  
Pukalani, HI 96768

Comment: Does not want direct access onto Kihei-Upcountry Maui Highway from lower Pukalani.

Response: There would be no direct access between any alternative and the lower Pukalani neighborhood. Access to Kihei-Upcountry Maui Highway would be from Haleakala or Kula Highway.

Comment: Kihei-Upcountry Maui Highway will cause development in lower Pukalani.

Response: The Makawao-Pukalani-Kula Community Plan focused much of the future development in lower Pukalani. Therefore, such development would likely occur regardless of whether Kihei-Upcountry Maui Highway is constructed because the Maui Board of Water Supply has indicated it would supply water to this area.. The EIS did evaluate the U1 alternatives as potentially having the greatest development inducement impacts, because they best serve lower Pukalani and Haliimaile, areas designated for growth and improvements to the water supply.

Comment: Does not believe the statement in the EIS that highway noise from the U2-A and U2-B alternatives would not be heard in Pukalani.

Response: The EIS does not state that highway noise would not be heard in Pukalani. It says that predicted noise levels in Pukalani under worst case noise conditions (traffic conditions where many vehicles move fast) does not rise to the threshold of a "noise impact" as defined by the Federal Highway Administration Noise Abatement Criteria. This means that, while there may be an increase in noise, the increase would not be sufficient to trigger consideration of noise mitigation measures. If predicted noise levels generated a "noise impact," as that term is defined, sound barriers or berms would probably need to be constructed to mitigate the impact.

Comment: Suggests widening existing roads and to eliminate the bottleneck in Puunene.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen the existing Haleakala, Hana, Mokulele, and Piilani Highways.

Comment: Existing highways in Haleakala and Puunene should be widened.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, and Mokulele Highway. In addition, the County is planning a Puunene bypass road.

Comment: Does not want highway, feeder roads, or bridges to cut through Pukalani.

Response: None of the alternative alignments cut through Pukalani. In addition, there will be no direct access to Kihei-Upcountry Maui Highway from Pukalani. Access to all of the alternatives under study would be via Haleakala or Kula Highways.

Comment: Two lanes for Kihei-Upcountry Maui Highway will not be enough.

Response: A two-lane highway is proposed because traffic projections indicate that two lanes will be sufficient to accommodate travel demand in 2020. However, right-of-way for a four-lane highway will be reserved. The expansion to four lanes may be accomplished without substantially affecting the original two lanes.

Please make any comments below:

1. As an upcountry resident I feel that the new road **SHOULD NOT** be built. The amount of time saved in construction of the new road will only be approximately 15 minutes. This is not worth the money nor the aesthetic disruption of Haleakala.

2. However, if it should be built I would favor the U2-B route.

1 | 3. I would also favor the U-1 route, however, my concern would be the traffic impact to traffic coming down Haleakala whenever traffic crosses the road. Will there be a stop light at that intersection. If so then I can see a huge back up as soon as the light turns red every morning!!!! And if there is no light planned then I can see a lot of major traffic accidents occurring as there are now.

2 | 4. **IMPORTANT COMMENT!!**

Considering the impact this road will have on all upcountry residents I feel that the DOT needs to make every effort to get the vote of ALL residents, upcountry in particular. The public hearings are good, however, the average resident does not attend this type of meeting. With todays computer environment, I strongly request that a WEB site be made to address all the issues (ie. Routes ) positive and negative and then have the ability to vote. Almost everyone has a computer and you will get a the most feedback. Once the WEB site is made then advertise in radio, paper and TV so that everyone knows it is there.

Please make any comments below:

1 | A new multi million dollar Kula-Kihei highway is not needed. Do not build! Our existing highways now serve us well - but could, and should be improved. Make existing highways safer, and enlarge to 4-lanes where needed.

For Maui, building another major highway to upcountry would be a big, big mistake as well as a waste of taxpayers money, my money. Please listen to us - DO NOT BUILD!

Please see my notes, annotated in red, on "why is the project needed and what is the cost of alternative"

To repeat my position:

- 1 | 1. The project is NOT needed. Where is your cost-benefit analysis?
- 2 | 2. Your cost table is biasly presented. You left out the cost to "NO BUILD!"

# Why is this Project Needed?

## Improve Maui's Roadway System

The circuitous route between Kihei and Upcountry is 16 to 24 miles long, even though the straight-line distance between the regions is only 9 to 12 miles. A highway directly linking these regions could cut travel time and distance up to 50%. *50% time savings equates (for me) to only 1/2 hour; do not feel spending millions to save 1/2 hr is justified.*

## Relieve Congested Conditions on Other Roadways

Many major intersections along the route between Kihei and Upcountry currently operate at or near capacity during peak travel periods. A Kihei to Upcountry highway would divert some of this traffic onto an alternative route, reducing overall congestion. *Existing highways connecting Kula + Kihei are already planned for more lane improvements, and some funding already earmarked!?*

## Address Increasing Travel Demand

Travel demand (Maui Long-Range Land Transportation Plan, February 1996), is projected to increase 70% from 1990 to 2020. Many of these trips would be generated by the visitor industry, including industry workers and visitors. Many of these trips would occur between Kihei and Upcountry.

## Coastal Evacuation

Kihei-Makena is vulnerable to hazards such as tsunami, tropical storms and fire. The limited number of evacuation routes and their close proximity to one another suggests there could be substantial congestion in north Kihei during an evacuation emergency. Therefore, another evacuation route is needed. *This is an excessively expensive route for evacuation. Many alternatives, less costly + practical routes are available for evacuation, if needed!*

## Research Activities at the Maui R&T Park and Science City

Activities at the Maui R & T Park and Science City are helping to diversify Maui's economy by attracting high-tech industries and creating attractive jobs. The proximity of the R & T Park and Science City produces interesting synergies, which are being used by some enterprises and help attract new endeavors. The road would facilitate transportation between these two high-tech centers. *This road "facilitation" is extravagantly out of proportion for the cost involved, and for the results intended! This is decadent opulence for high tech activities especially!*

## Support Maui's Visitor Industry

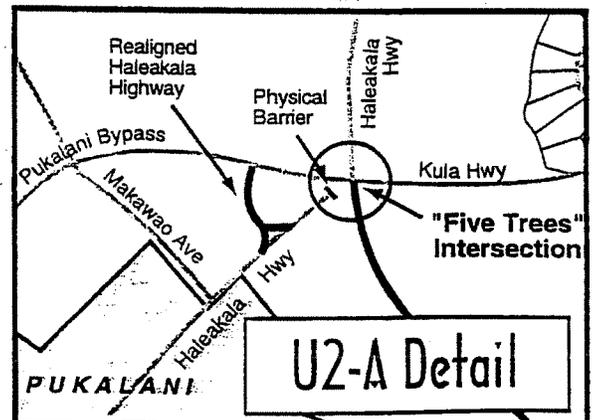

Kihei-Makena is one of Maui's principal visitor attractions. This area has an economic relationship with Upcountry Maui because of Upcountry's tourist attractions, such as Haleakala National Park, and is a popular residential area. *Let the tourist drive or ride the long way + see Maui first hand! Tourist are not clamoring for a shorter route to Haleakala!*

# What are the Alternatives?

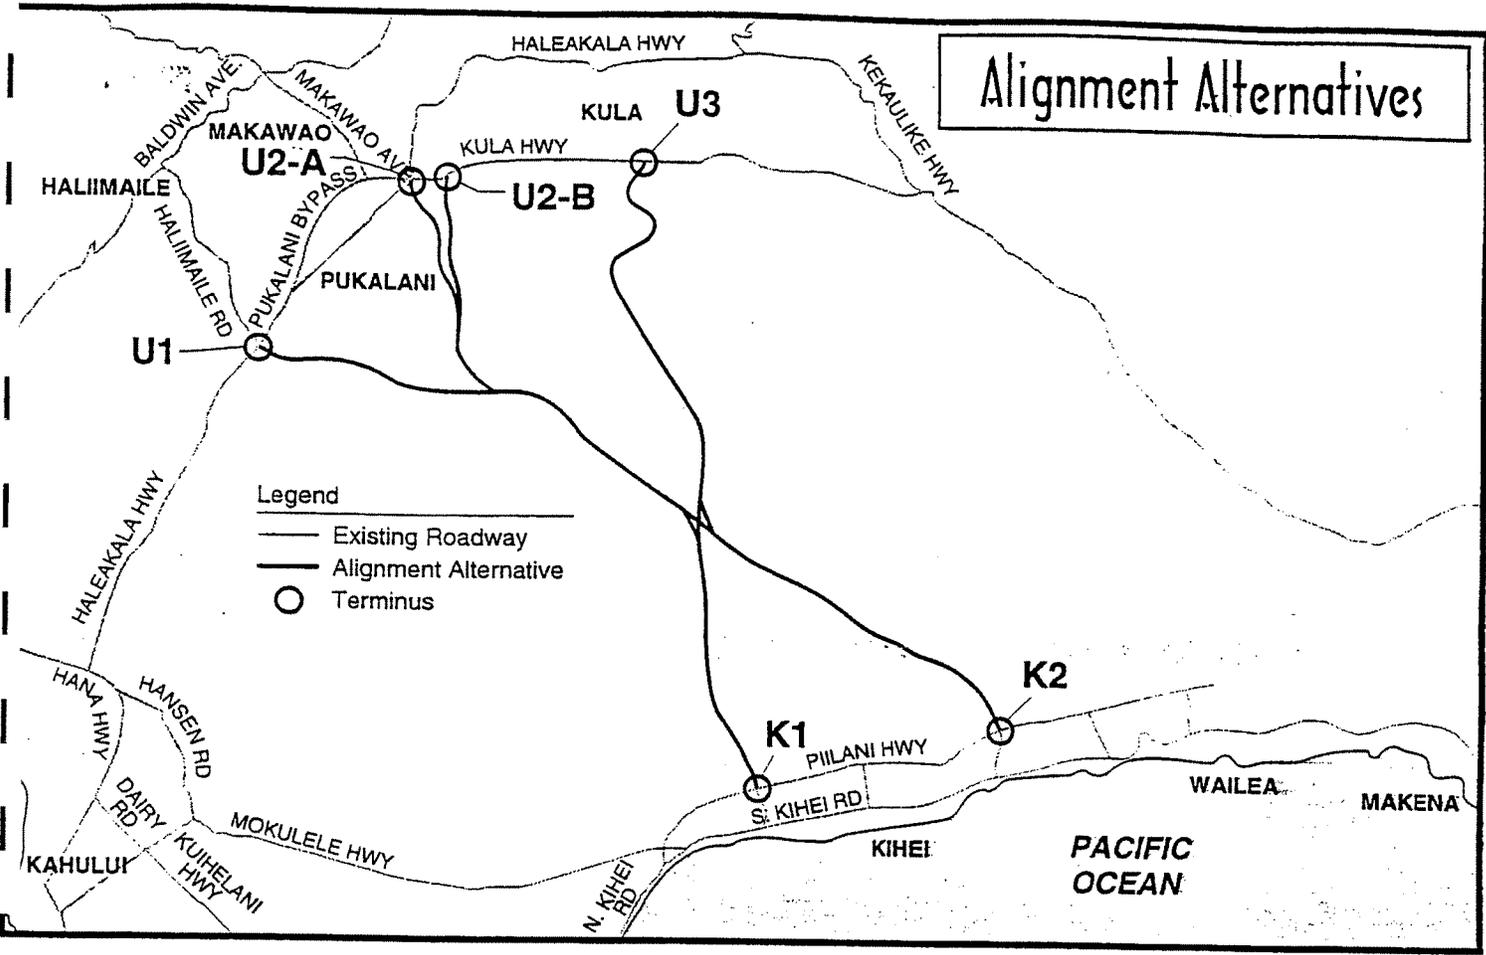

In addition to the "No-Build," eight alternative alignments are being considered that consist of all possible combinations of two Kihei and four Upcountry terminus options (see map). The Kihei termini are named K1 and K2. K1 is located at the Piilani Highway / Kaonoulu Street intersection; K2 is located at the Piilani Highway / Ke Alii Alanui Street intersection. The Upcountry termini are named U1, U2-A, U2-B and U3. U1 is located at the Haleakala Highway / Haliimaile Road intersection; U2-A is located at the Haleakala Highway / Pukalani Bypass / Kula Highway ("Five Trees") intersection; U2-B is located on Kula Highway almost one-half mile south of the Five Trees intersection; and U3 is located on Kula Highway just south of Pulehu Gulch. The names of the alternatives correspond to the termini names, and are listed to the right.

The U2-A alternatives (U2-A,K1 and U2-A,K2) would require the modification of the "Five Trees" intersection (see sketch). Kihei-Upcountry Maui Highway would replace the Haleakala Highway leg (Pukalani side) and Haleakala Highway would be re-aligned to link and form a T-intersection with Pukalani Bypass approximately 1200 feet north of the "Five Trees" intersection.

1. NO-BUILD
2. U1,K1
3. U1,K2
4. U2-A,K1
5. U2-A,K2
6. U2-B,K1
7. U2-B,K2
8. U3,K1
9. U3,K2

# Alignment Alternatives

## What is the Cost of Each Alternative?

The total estimated cost of each alternative is provided below. These costs include construction and right-of-way acquisition:

**Estimated 1997 Dollar Cost (millions)**

Alternative	Total
U1,K1	\$64.8
U1,K2	\$78.8
U2-A,K1	\$69.1
U2-A,K2	\$82.8
U2-B,K1	\$72.0
U2-B,K2	\$86.3
U3,K1	\$53.1
U3,K2	\$66.4

*Handwritten notes:*  
 "a biased presentation! Did you stop by your wife?"  
 "Please add 'NO BUILD' and COST = 'NONE!'"  
 "NO BUILD" and COST = "NONE!"

## What are the Benefits of the Project?

The project would result in substantial travel time savings for motorists traveling between Kihei and Upcountry Maui. Depending on the origin and destination, the new highway could reduce trip length up to 50%. If a K1 alignment is selected, motorists traveling between Upcountry and West Maui would also benefit. As people spend less time traveling, quality of life improves.

The Maui highway system would operate better as whole because a large portion of trips would be diverted onto the new highway, thereby improving traffic operations on other roadways, such as Mokulele Highway, Dairy Road, Hana Highway and Haleakala Highway. A K1 alternative would divert more traffic because it serves the West Maui region better than K2 alternative.

## When Will the Project be Constructed? How Long Will it Last?

If this project proceeds, construction is expected to begin in 2001 and would last about three years.

Kihei-Makena would get another coastal evacuation route. A K2 alternative, with its more southerly terminus, would be better than a K1 alternative with regards to evacuation efficiency.

Kihei-Upcountry Maui Highway would offer motorists spectacular scenic vistas.

## What Will Happen After the Public Hearings?

HDOT and FHWA will select a Preferred Alternative which will be announced and identified in the Final EIS. If the Final EIS is accepted by the Governor of the State of Hawaii and the Division Administrator of the FHWA, a Record of Decision (ROD) will be prepared that will specify all mitigation commitments. The issuance of the ROD by the FHWA marks the completion of the project's planning phase. Next, design and right-of-way acquisition would begin, which is expected to last approximately two years.

## How Can I Comment?

You can provide comments at this public hearing. You can either write your own comments (a comment sheet is available from the sign-in attendant), or you can provide oral comments to a court reporter stationed at this hearing. If you write your own comments, you may drop them in the comment box or send them later to:

Mr. Kazu Hayashida  
Director of Transportation  
State Department of Transportation  
Highways Division  
869 Punchbowl St.  
Honolulu, Hawaii 96813

Written comments will be accepted through  
October 28, 1999.

## Where Can I Get More Information About this Project? Who Can I Contact If I Have Questions?

The Draft EIS for this project, which is available at Wailuku Regional Library, Kihei Public Library, Lahaina Public Library, Makawao Public Library, Kahului Public Library and the Maui District Office of the State Department of Transportation, contains more information about the project. You may also contact Mr. Kenneth Au, HDOT Advance Planning Engineer, at (808) 587-1843 (or Maui's toll-free voice access number 984-2400, ext. 71843), if you have any questions.

Mr. Henry T.S. Lau  
RR 2 Box 83  
Kula, HI 96790

1. A benefit-cost analysis (BCA) is not used in the environmental evaluation of alternatives (*i.e.*, Chapter 4, Environmental Consequences, of the EIS) because of the difficulty of assigning monetary values to many of the benefits, and some of the costs, of the project. However, a simple BCA was used to screen alternatives before their detailed evaluation in the EIS. This early screening eliminated the alternatives that would clearly not be worthwhile. The project's BCA used direct costs (design, construction, and maintenance), and a benefit of only travel time savings. Because this BCA was so simple, an alternative would have needed a very low BC ratio not to pass this simple screening criterion.
2. The No Build alternative was not included on the cost table because it is automatically retained and moves forward to the Final EIS. As such, it was not open to evaluation at that time.

October 16, 1999

First, I compliment all of the people involved in producing this Draft EIS -- a monumental task. The quantity of information presented is impressive as is the effort this required. As you are no doubt aware, however, critic's detection of flaws in the Draft, particularly specious "flaws", seem to come quite easily.

In an effort to be a constructively critical critic, and believing that a highway is needed, I urge your attention to two flaws which I see as serious omissions:

- 1 | (1) Most importantly, the lack of a complete set of benefit/cost ratios by which to compare the alternative routes.
- 2 | (2) Inadequate assessment of the impact of traffic destined beyond the Upcountry termini.

(more)

HIGHWAYS DIVISION  
PLANNING BRANCH

OCT 19 1999  
STATE DEPARTMENT OF TRANSPORTATION  
HIGHWAYS DIVISION

1 Benefit/cost ratios should be the basic criterion for route comparison and selection. Without these ratios -- quantifiable, objective, essential data -- the selection process becomes too dependent on more subjective, and sometimes nebulous, factors. (The Draft does, however, show good effort toward quantifying some of the secondary factors.)

If lack of sufficient O&D information is the problem here, I urge you to obtain that information.

The second flaw relates primarily to termini U2-B and U3 since U1 can feed traffic destined northward onto Haliimaile Road (How do Haliimaile residents feel about this?); and since U2-A meets existing Haleakala Highway.

2 The Draft notes that U3 would encourage motorists to use local residential roads mauka of the terminus; but it fails to mention that these roads are totally inadequate to handle any significant increase in traffic, and that steep grades plus existing development make extension of the route impractical.

The suggested U3 mitigation, signage, might influence a first-time driver, but experienced drivers would be aware of the very long out-of-direction travel required to follow the "proper route".

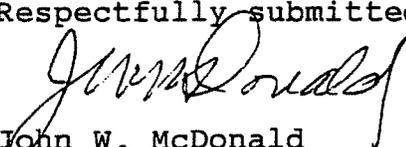

3 With regard to U2-B, the Draft should note that a mauka extension of this route is possible impacting pineapple only. The extension could bypass the high school and avoid direct impact on Kula 200.

4 At both U2-A and U2-B grade separation should be seriously considered.

In summary, the EIS should:

1. Provide benefit/cost ratios.
2. Give additional attention to traffic handling needs mauka of Kula highway.

Respectfully submitted,

  
John W. McDonald  
R.R. 2, Box 230C  
Kula, HI 96790

(808) 878 6906

Mr. John W. McDonald  
RR 2, Box 230C Kula Hwy.  
Kula, HI 96790

1. A benefit-cost analysis (BCA) is not used in the environmental evaluation of alternatives (i.e., Chapter 4, Environmental Consequences, of the EIS) because of the difficulty of assigning monetary values to many of the benefits, and some of the costs, of the project. However, a simple BCA was used to screen alternatives before their detailed evaluation in the EIS. This early screening eliminated the alternatives that would clearly not be worthwhile. The project's BCA used direct costs (design, construction, and maintenance), and a benefit of only travel time savings. Because this BCA was so simple, an alternative would have needed a very low BC ratio not to pass this simple screening criterion.

An origin-destination study was completed for the Maui Long Range Land Transportation Plan. The results of this study were used to estimate the volumes that would use Kihei-Upcountry Maui Highway (see Section 4.4.1.2 in the DEIS).

2. U2-B alternatives were evaluated in the Draft EIS because this alignment is most consistent with the Kulamalu master plan. The U3 alternatives were evaluated in the Draft EIS because they are the least cost alternatives, while still addressing the project's purposes and needs (Alternative U3,K1 has the lowest cost, and Alternative U3,K2 has the third lowest cost).

Section 4.4.1 of the Final EIS will be revised to mention that roads mauka of the Upcountry terminus are residential collectors, and are not able to handle substantial through traffic. If a U3 alternative had been identified as the preferred alternative, the only possible mitigation to prevent the inappropriate use of the Kula residential roads would be signage because these roads are public.

3. The suggested extension of the U2-B alignment mauka of Kula Highway would require the displacement of residences in Kula 200. Such an extension would not be necessary if a U2-B alternative were identified as the preferred alternative.
4. If either a U2-A or U2-B alternative were identified as the preferred alternative, its Upcountry terminus would probably be a signalized intersection (the U2-A terminus would

NO ROAD!!! NO ROAD!!! NO ROAD!!!

If you insist on building a new road, you must not even start it until a traffic light (at terminus) is in place... Please learn from past mistakes (Pukalani bypass) and don't wait until people are maimed, killed before doing a "traffic study" and conceding the road is creating a serious hazard!!!  
I connect at Hailimaile, if you insist on this folly.

1. The decision to place traffic signals will be made during the design phase, and will be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. For the U1 terminus intersection, it is likely that it will warrant traffic signals.
2. Kihei-Upcountry Maui Highway will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards. The highway will have adequate sight distances (*i.e.*, no blind curves), wide shoulders, crosswalks and sidewalks at appropriate locations, and signalized intersections if warranted.

At the upcountry "Open House" I provided oral testimony to the stenographer on the road and my preference for the Upcountry terminus. The purpose of this note is to thank you for responding to Upcountry residents' concerns about the date and format of the hearing by providing another opportunity in the "traditional hearing" format for citizens to express their concerns, questions, and support. Thank you for listening, working with us, and reinforcing confidence in the process.

Mr. Elliott Krash  
331-9 Waiakoa Road  
Kula, HI 96790

Comment: The U1 terminus should be an interchange.

Response: Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized at-grade intersection, which would cost substantially less.

Please make any comments below:

Per the many comments & concerns at the public hearing held on October 13, 1999 at Kahului school I came to a conclusion that may satisfy all parties for animal & environment as well as for safety and development. Development is evident in areas of Paia, Pukalani, Haiku, Kula, & Kihei and to facilitate all areas current roads need to be improved by either adding one lane both ways which include the following:

- 1) Omaopio needs to be improved for safety by adding a few directional signs. Also fences in certain areas can be erected to preserve and prevent the deer from going on to the roads (vine-like plants can be used to cover the fence) so it will not be a sore eye. This road will mostly facilitate the Kula residents that work in Kihei and should be intersect with the UI - K1 choice. *{ 2 roads on each side }*
- 2) Haleakala Highway should expand on both sides by an additional road for each side. As mentioned growth is evident and travelers/drivers should have a choice when driving to/from work or to tourist sites. As the road does now, it facilitates the immediate communities of Hali'imaile, Pukalani, Makawao, & Maui Uplands. Traffic tones down after these communities. *{ 2 roads too and not limit to one road in certain areas }*
- 3) Hana Highway should be set up the way Haleakala Highway is now with by-pass routes during busy hours of travel. If the UI-K1 choice is selected it will probably eliminate some of the heavy traffic flow. This would accomodate Paia & Haiku residents.

It's obvious the UI-K1 choice is the one to be built but funds should be provided to fix the current roads mentioned above and if that proposal can be implemented than I think everyone will be pleased. As the population of Maui increases year after year it's more than ever that more roads will need to be built. So, planning ahead of what the traffic might be like in ten years or so and based on the current and future communities that are to built, I believe your next road improvement will be for residents in Waihee & Waiehu. Please make a wise choice so everyone can benefit the freedom of traveling. Thank you for your attention in this matter.

UI-K1  
also should  
have five  
roads.

Ms. Sharon M. Char  
P.O. Box 880484  
Pukalani, HI 96788

1. Kihei-Upcountry Maui Highway will include measures to minimize the chance of vehicle-deer collisions, such as frequent signage warning motorists of this danger, and stock-proof fencing along the highway.
2. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway.

Please make any comments below:

I am completely shocked that our school system and County failed to acknowledge the fact that children will be greatly affected. Can you imagine Haleakala Highway being put in between Maui High and Kahului Elementary? No, it's completely unacceptable. I'm appalled to think that children walking home from school should be subjected to a roaring highway and speeding motorist. If I was a parent of a high-schooler or an elementary child, I wouldn't want my child to be near a congested intersection. However, there is logic in building it at Healiimaile. Here, there are no schools, no houses and there is a need for a traffic light. You could benefit commuters without endangering the safety of students or community members.

Ms. Lexie Baldisseri  
P.O. Box 1132  
Haiku, HI 96708

1. If a U2-A or U2-B alternative were identified as the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Comment: Concerned that an Upcountry terminus near King Kekaulike High School would jeopardize the safety of students.

Response: Had a U2-A or U2-B terminus been identified as part of the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would have included crosswalks and sidewalks to the high school (see Section 4.4.4 of the Final EIS). Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Comment: Widening existing highways would solve the transportation problem.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen the existing Haleakala, Hana, Mokulele, and Piilani Highways. However, improving these roadways will not address all the purposes and needs that have been identified for this project.

subject: Air Quality analysis Tech memorandum  
by Parsons-Brinckerhoff-Quade+Douglas Inc

1 why aren't pollutants such as oil, fuels, and other chemicals used by automobiles that leak onto roadways included as possible pollutants and impacts (non-source, point pollution) from such leaks?

1 many roadways and intersections have evidence of these chemicals (look at intersections on Kauhuanu Ave.) on the roadways. Rain or street cleaning ~~or~~ washes these pollutants into storm drains creating pollution problems

1 can these impacts be addressed somewhere in the possible environmental section of the draft EIS?

1 can you respond to me in writing if this issue has a place in this draft EIS?

mahealo.

Mr. Walter S. Enomoto  
515 Liholiho St., #7  
Wailuku, HI 96793

1. The subject discussed in the Air Quality Analysis Technical Memorandum is air pollutants. The pollutants you mention are equally important, and are usually considered with water pollutants, which are addressed in Section 4.7.1 of the EIS. This section describes the potential impacts of roadway-related non-point source pollutants, such as petroleum products, rubber, and other materials that wash off of roads during heavy rain. The amount of pollutants from roads is related to the total amount of vehicle travel, usually measured in vehicle-miles traveled. Since Kihei-Upcountry Maui Highway will reduce the total regional vehicle-miles traveled by shortening the travel distance between Upcountry and Kihei-Makena, there would be an overall decrease in non-point source pollution (e.g., environmental improvement), when compared with not constructing the highway.

Please make any comments below: JMJ

1 Discussion of any of the alternatives appears to be a mute point and the whole public hearing of proposals strikes me as a sham in light of the fact that extensive preparations have been made at the U2-B terminus site to accomodate the new road. The lights on the Kula Highway, the road cut into the plantation fields below the new Kamehameha School and the disposition of the presentation team for a terminus at or very near Five Trees suggests that the decision has already been made.

My first choice for a terminus south of U3 to avoid infringing upon the Agricultural Park on Pulehu Road would avoid dangerously increasing traffic on Omaopio and Pulehu Roads which already have an abnormally high incidence of traffic accidents due to sharp turns and unexpected conditions of our rural residential neighborhoods. A U1 terminus makes the second best choice, enabling people to move from one population cluster to another, and could be linked with an extension toward Haiku bypassing Makawao, reducing the existing congestion on Makawao Avenue and preserving what is left of this rural community.

2 Much as I am opposed to the unchecked development we residents have had to accept as a cost of living on Maui in the present political climate, additional road cuts appear to be inevitable. In the most likely event that the powers that be will prevail, a road will be built and terminate at or near Five Trees, I urge you to consider construction of a branch that terminates closer to Kekaulike Highway to enable those living in upper Kula to access the new road more directly (such a branch would provide more direct access to Haleakala National Park for research activity and tourism) and reduce increasingly hazardous conditions on the Omaopio and Pulehu Roads. Guard rails and/or sturdy reflector markers need to be installed now on sharp turns on Omaopio and Pulehu Roads where accidents frequently occur.

Ms. Joan E. Evonuk  
RR3 Box 634 (Omaopio Road)  
Kula, HI 96790-9717

1. The Department of Transportation approached the planning process in a very open manner. In fact, U1,K1 has been identified as the preferred alternative, and not any of the U2-B alternatives. The roadway segment at the U2-B terminus was constructed by the Kulamalu development to provide access to the Kamehameha School site. It has a separate purpose apart from being a portion of the Kihei-Upcountry Maui Highway. During the Draft EIS comment period, no decision had been made regarding the preferred alternative. Consideration of the U2-B alternatives in the Draft EIS is understandable because these alternatives are the most consistent with the Kulamalu master plan.
2. A U2-A or U2-B alternative was not identified as the preferred alternative.
3. Omaopio and Pulehu Roads are County facilities. Additionally, construction of the U1,K1 alternative will likely further increase use of these roads. Maui County is aware of the situation, and you may wish to follow up with them.

1 | The highway needs to be divided  
for safety! Also U-2 A or B  
is by far the best option!

Mr. William Flammer  
2102 Naalae Rd  
Kula, HI 96790

1. When initially constructed, Kihei-Upcountry Maui Highway will not include a median that divides the opposing lanes. When the highway is widened to four lanes, a wide median will be provided. The highway will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards, and will have adequate sight distances and wide shoulders.

Comment: Kihei-Upcountry Maui Highway should be four lanes.

Response: Traffic projections indicate that two lanes will be sufficient for Kihei-Upcountry Maui Highway in the foreseeable future. However, right-of-way sufficient for four lanes will be acquired. In its two-lane configuration, Kihei Upcountry Highway will be more like Haleakala or Hana Highways than Mokulele Highway.

Please make any comments below:

Kihei is growing way too fast. Some roads are in terrible condition and haven't been repaved in 30 years (some not at all). Future growth is headed toward Wailea & Makena and Piilani Highway is already congested, so why put the upcountry road from Lipoa to Pukalani when we need to reduce congestion, not make it worse. The farther toward Makena the road could go and up to Kula will help future growth and traffic. Most tourists and many locals want to go to Kula and around the South side of the island or up to Haleakala that way. In Kihei is there, the cheapest and

Mr. Kimo Galbraith  
P.O. Box 1728  
Kihei, HI 96753

Comment: A Kihei terminus in Wailea should have been considered.

Response: The requested roadway is similar to Alternative 7, which was eliminated prior to the Draft EIS because it had a very low benefit-cost ratio because of its distance from population centers.

Please make any comments below:

1 | According to some of the "Experts" the  
| ~~original~~ State dept. of trans. are almost  
| willing to ~~do~~ do anything to make  
| the proposed highway safe. A line  
| we have heard before, and once the  
| Highway is made suddenly there will  
| be no more funds to correct any  
| hazards that exist.

Ms. Heather Gomes  
639 Omaopio Road  
Kula, HI 96790

1. Kihei-Upcountry Maui Highway will be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) standards. For the U1,K1 Alternative, which was identified as the preferred alternative, the U1 terminus will likely warrant traffic signals. Should construction funding be directed to this project, there will be in additional funds to improve other roads.

Telephone (eve): 874-6441

Please make any comments below:

I oppose the new roadways, any options.

I oppose the assumptions of progress unquestioningly.

I like the fact that Kihei + Makana + Wailea are relatively isolated from upcountry. This is not Oahu + this is not the mainland. If people want those conveniences they can live elsewhere. Please look into mass transit options. It will be much less expensive, have much less impact and will make better use of existing resources. Also please look into leasing the existing private road on the ranch property.

Ms. Debra Greene  
550-A Kupulau Dr.  
Kihei, HI 96753

1. The Department of Transportation supports public transit on Maui because it would provide residents with other transportation options. Implementing public transit is typically the responsibility of the County. A public transit solution would not satisfy the purposes and needs that have been identified for this project.
2. Leasing an existing private road would not address the purposes and needs that have been identified for the project, such as addressing future travel demand.

Comment: Mass transit options should be considered, such as a light rail system, or buses. Also, the project should establish a bike route.

Response: See response to Comment 1. Kihei-Upcountry Maui Highway could accommodate buses if public transit is provided in the future. The highway would also provide six feet wide shoulders that could be used for cycling.

Comment: Consider leasing existing private roads on ranch property instead of constructing a new highway.

Response: See response to Comment 2.

Telephone (eve): Hm: 572-9965

Please make any comments below:

I feel that the Haliomale intersection is the most favorable spot. The worst is 5 trees.

Hali— has the space, is the least costly yet very effective. Developing Haliomale intersection will not only cut down time to Kihei, by 30% but it will also improve the safety conditions at such a dangerous intersection. There have been several fatalities in that area. Traffic lights there will control the speed flow from up country; <sup>pace the traffic better</sup> the people coming up country will encounter less congestion & will pass more businesses along the way up the Haleakala HWY.

5 Trees is congested as is. We don't need anymore traffic in that area. There are kids walking, many cars driven by students

Ms. Linda Javier  
3088 Liholani St.  
Pukalani, HI 96768

1. If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection would have included crosswalks and sidewalks to the high school, and the Pukalani leg of Haleakala Highway would be converted to a pedestrian walkway. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Please make any comments below:

1 | U-3 WILL CAUSE GREATEST DISRUPTION  
TO THE SMALL FARMERS UPCOUNTRY.  
THIS IS REASON ENOUGH TO REJECT THIS  
LOCATION.

2 | U-2 A/B WILL PLACE TOO MUCH  
TRAFFIC AT KING KEKAULIKE. WE WILL  
HAVE FATALITIES IF THIS SITE IS  
CHOSEN.

3 | U-1 IS PREFERRED BUT  
IT IS NECESSARY THAT AN  
INTERCHANGE (NOT A STOP LIGHT)  
BE CONSTRUCTED AT THE HOLEMOILE -  
HALEAKALO HWY. INTERSECTION SO THAT (12)

Mr. Alan Kaufman  
P.O. Box 297  
Kula, HI 96790

1. The agricultural impacts of the U3 alternatives include displacing active pineapple fields and a portion of the Kula Agricultural Park. These impacts would be mitigated if a U3 alternative was identified as the preferred alternative.
2. If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection would have included crosswalks and sidewalks to the high school, and the Pukalani leg of Haleakala Highway would be converted to a pedestrian walkway. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.
3. The U1 terminus intersection will likely warrant traffic signals. However, the final decision to place traffic signals at this intersection will be made during the design phase, and will be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. Several grade-separated intersections (*i.e.*, interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which would cost substantially less.

Mr. Alan Kaufman  
P.O. Box 297  
Kula, HI 96790

Comment: Concerned that Kihei-Upcountry Maui Highway would increase the number of vehicular collisions with axis deer.

Response: Section 4.8.4 of the Final EIS includes measures to minimize the chance of vehicle-deer collisions. Of all the alternatives, the preferred alternative (U1,K1) is furthest from the centers of population of the axis deer.

Please make any comments below: Very thorough presentation.

1 | I support the connector road.  
Want to be sure any intersections  
would have signal lights at  
the beginning <sup>of project</sup> rather than  
after the, quota of accidents  
would eventually be met.

2 | A rest area WITH REST ROOMS  
1/2 way up (or down!) would  
be nice.

3 | Need to avoid 5 Trees (U2A) route  
because of high school.

maps, trees, sheets, etc.

Ms. Gretchen Ladley  
2634 Iolani Street  
Pukalani, HI 96768

1. The final decision to place traffic signals at intersections along the project will be made during the design phase, and will be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. For the U1,K1 Alternative, which was identified as the preferred alternative, both termini intersections will likely warrant traffic signals.
2. Restrooms will not be provided along Kihei-Upcountry Maui Highway because of the substantial increase in roadway maintenance that would be required, in addition to the difficulty of providing water to the site. The possibility of constructing scenic lookouts will be considered in the design phase.
3. If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection would have included crosswalks and sidewalks to the high school, and the Pukalani leg of Haleakala Highway would be converted to a pedestrian walkway. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Please make any comments below:

I strongly oppose all highway options except for K1-U1. This bypass will impact the least number of residences. It will alleviate safety concerns for the 1400 students at King Kekaulike High School. As it is, there are students who cross the Kula Highway, walk along it both to and from school which is already extremely dangerous. Imagine the additional safety concerns with another highway intersecting the Kula Highway anywhere near the vicinity of the school.

any connection to any point in Kula will also draw commuters from Makawao. → (27)

Ms. Rosalyn Loomis  
240 Hoopalua Drive  
Makawao, HI 96768

1. None of alternatives considered in the Draft EIS would displace any residence. If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection would have included crosswalks and sidewalks to the high school, and the Pukalani leg of Haleakala Highway would be converted to a pedestrian walkway. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Road should come from Tedechi Winery  
(Area) to Whalea.

Short.

Cheap.

No bridges

Very functional.

escape route for Kihei residents.

etc.

etc.

etc.

Mr. Jack McGowan  
2495 S. Kihei Road, #336  
Kihei, HI 96753

1. The alternatives similar to an alignment from the area near Tedechi Winery to Wailea are Alternatives 6A, 6B, and 7. These alternatives were eliminated in the screening evaluation discussed in Chapter 2 of the EIS. They had very low benefit-cost ratios because relatively little traffic was projected for these alignments. The low traffic results from the placement of these alignments away from the major travel markets.

Please make any comments below:

- PREFER U2A • K1 OR U2A - K2.
- 1 • SHOULD WE ALSO SHOW (SOMEWHERE) THE BENEFIT/COST RATIOS FOR THE FINAL SELECTION SET SINCE BENEFIT/COST ~~RATIOS~~ ARE SHOWN FOR THE INITIAL TWO-TIERED SCREENING? PEOPLE WANT TO KNOW HOW ~~WERE~~ EFFICIENTLY THEIR TAX PAYING DOLLARS ARE BEING SPENT (NOT ONLY HOW EXPENSIVE OR CHEAP A PARTICULAR ALIGN'T. IS).
- THE FORMAT IS BRAND NEW ~~FOR~~ TO MAUI BUT <sup>1</sup> OF THE PUBLIC HEARING THE RESPONSE IS POSITIVE. GREAT IMPROVEMENT. OVER OLDER APPROACH. WELL ORGANIZED.
- 2 • PUT A SIGN ON VIDEO AREA THAT SAYS "THIS VIDEO IS ~ 12 MIN. LONG & IS LOOPING."
- MAKE EXHIBITS EASIER TO SEE WHERE ALL THE FAMILIAR LANDMARKS ARE (MORE SUBDIV. NAMES, STORES, TOURIST ATTRACTIONS, ETC).

Mr. Clifford N. Mukai  
P.O. Box 974  
Wailuku, HI 96793-0974

1. A benefit-cost analysis (BCA) is not used in the environmental evaluation of alternatives (*i.e.*, Chapter 4, Environmental Consequences, of the EIS) because of the difficulty of assigning monetary values to many of the benefits, and some of the costs, of the project. However, a simple BCA was used to screen alternatives before their detailed evaluation in the EIS. This early screening eliminated the alternatives that would clearly not be worthwhile. The project's BCA used direct costs (design, construction, and maintenance), and a benefit of only travel time savings. Because this BCA was so simple, an alternative would have needed a very low BC ratio not to pass this simple screening criterion.
2. Thank you for your good suggestions.

Telephone (eve): 573-9028

Please make any comments below:

1) MAKE HALIMAILE RD / HALEAKALA RD AN INTERCHANGE WITH AN UNDERPASS TO SMOOTH OUT TRAFFIC FLOW, OTHERWISE, BOTTLENECK AT HANSEN / HALEAKALA RDS INTERSECTION IS ONLY MOVED UPHILL.

2) FROM K1 OR K2 ENDPOINT, <sup>BOTH</sup> A U2-A ~~IS~~ PTS SHOULD BE BUILT TO BETTER DISTRIBUTE TRAFFIC FLOW, OTHERWISE ALL TRAFFIC WILL FLOW ALONG HALEAKALA RD TO HALIMAILE INTERSECTION.

Mr. Ed Orszula  
85 Pi'imauna Street  
Pukalani, HI 96768

1. The decision to place traffic signals will be made during the design phase, and will be based on traffic signal warrants specified in the Manual on Uniform Traffic Control Devices. For the U1 terminus intersection, it is likely that it will warrant traffic signals. However, the phasing of the signals will be determined during the design phase. Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which would cost substantially less.
2. Two Upcountry termini are not proposed at this time.

Mr. Edward Orszula  
83 Pi'imauna Street  
Pukalani, HI 96768

Comment: The intersection of Haliimaile Road and Haleakala Highway should be an interchange.

Response: Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized at-grade intersection, which cost substantially less.

Please make any comments below:

1 As landowners in the proposed alternatives for the Kihei-Upcountry Road, we oppose the road altogether. Money should go towards upgrading the highways we use now. We are opposed mainly to K1/U3 route which goes thru our property. We are prepared for a condemnation, our attorney Hod Greeley will help us if indeed this route is chosen. This route would not service the majority of the upcountry population and would be a waste. Hailemaile would be the best route, if any, as a direct link - part of this road could be funded by a partial toll road that would pay for added cost for an overpass in connecting the highways.

2

3 We want to keep Kula a farming and rural area the road thru U3/K1 would destroy it.

Ms. Deborah von Tempsky  
209 A Mauna PI.  
Kula, HI 96790

1. Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala, Hana, Mokulele, and Piilani Highways.
2. A U3 alternative was not identified as the preferred alternative because, as you point out, it would not serve travel markets as well as the other alternatives. Therefore, discussion of real estate issues is not needed.
3. A toll road is not planned. Also, several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which would cost substantially less while still achieving safety.

Telephone (eve): \_\_\_\_\_

Please make any comments below:

1 | I am surprised that the county failed to recognize the impacts that these highways will have on the upcountry schools - most specifically King Kekaulike High School and Kamehameha Schools. The U2-B proposal is directly connected to the entrance of the former school and that all intersection, better known as 5 trees, cannot handle what ~~the traffic~~ goes through it now - let alone more traffic. The congestion will cause severe accidents and significant harm to the teenagers & Kamehameha's elementary children who will be walking across the streets. Would you want your 7 year old crossing a 2-lane highway during heavy morning traffic?? Of all the options, U2-B has no advantages and must NOT be even remotely considered!

Ms. Morgan Lee Woolley  
455 Ulumalu Road  
Haiku, HI 96708

1. The potential impacts of the highway on the Upcountry area schools were considered in comparing the proposed alternatives. However, it was deemed that even if a U2-A alternative were identified as the preferred alternative, the Five Trees intersection would be modified to include crosswalks and sidewalks to the high school, and the Pukalani leg of Haleakala Highway would be converted into a pedestrian walkway.

If a U2-B alternative were identified as the preferred alternative, an urban design that includes sidewalks would be used in the section of the highway adjacent to Kamehameha School.

- 1 | ① I'd like to be sure that native plant populations aren't disrupted by the road - or are replanted as landscaping along the road, if they're disrupted.
- ② I vote for the intersection @ Haliimaile (up-country) + the road @ the point on the Lahaina-side of the R+D park (for the Kihei bypass)

Ms. Erin Starr  
P.O. Box 33  
Makawao, HI 96768

1. The vegetation along the U1,K1 alignment, the preferred alternative, consists of actively cultivated crops, uncultivated lands covered primarily by kiawe trees, buffelgrass, and other introduced species. Native plant populations would not be affected. Landscaping would consist of native trees and shrubs adapted to local conditions.

DEPT. OF TRANSPORTATION  
HIGHWAYS DIVISION

1 The most logical and cost effective route is U3-K1. The most useless routes involve U1. U2A or U2B will increase traffic congestion in the Five Trees area. I base this statement on fifteen years of personal experience making the drive from Makawao to Kula during peak drive times.

YES, we do need this new highway because 1 Maui is an growing island. 2 Maui has a shortage of roads 3 This new highway will alleviate a lot of traffic on the other roads and will be a convenience to the majority who live in Kihei and Upcountry.

\* THE route most deemed logical and practical is from the Haliimaile Junction to the Kihei Technology Park because it keeps "THE TRAFFIC" away from ~~below~~ the residential areas, schools, and businesses. Plus the fact that Haliimaile Junction will need a better signal control.

Mr. Marshall Mainaga  
200 Alohilani Street  
Pukalani, HI 96768

1. Alternatives that would cross the Maui Research and Technology (R&T) Park on Lipoa Street were eliminated early because the R&T Park did not favor this alignment.

Ms. Gwen Leong  
15 Kulanihakoi St.  
Kihei, HI 96753

1. The alternatives with the more southern Kihei terminus were eliminated in the alternatives screening evaluation, or in the case with the K2 alternatives, not identified as the preferred alternative after the Draft EIS because they would not serve travel markets as well as the alternatives with the more northern Kihei terminus, such as the K1 alternatives.

**Please write any comments below:**

I am a resident living at KULA 200 OHANA. I also work in Lahaina from Monday through Friday each week. I am in favor of the Kihei-Upcountry Maui Highway by way of alignment U1-K1. My reasons for this choice is as follows:

1. It provides a second exit for the Kihei-Wailea residents
2. It meets the Federal requirements for scientists traveling between Kihei and Haleakala.
3. It provides easy access to all in the Kula area. (Kula residents can also access the Highway by way of Omapio Road)
4. It provides reasonable access from Upcountry to Lahaina.
5. Makawao and Haiku residents have to travel "backwards" to access the Highway by way of U2-A, U2-B & U-3.
6. The intersections at U2-A & U2-B have limited space available for improvements, like installing a clover type intersection in these areas.
7. This route is not the most expensive to build.
8. Archeological site interference seems to be minimal.
9. U1 intersection is less intrusive to the Upcountry area.
10. A clover type intersection needs to be installed at intersection U1 to minimize accidents from occurring. Traffic lights cause congestion and accidents. If this is not possible, I am against the installation of the Kihei-Upcountry Maui Highway.

Mr. George Freeland  
49 Lea Lea Place  
Pukalani, HI 96768

1. Several grade-separated intersections (*i.e.*, interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which would cost substantially less.

Please write any comments below:

The bypass road between Piilani Highway and upcountry is too good of an idea to pass up. There are many benefits to this plan and no negatives that I am aware of. This plan would ease congestion to the already congested Haleakala Highway in the mornings and evenings <sup>and</sup> at peak traffic times. The state might even save money in the long run by not having to hire those guys who drop the divider cones every morning. Personally, this plan would cut about an hour a day off of my commute to work. It would also make more of the island accessible to tourists as well as locals. From my point of view, even if you had to charge a toll or fee to help incur the cost of the highway for a few years, the public would be more than happy to take the trade-off.

RECEIVED

OCT 15 1999

HAWAII DIVISION

P.S. This plan would have as much influence on the community as a tunnel through the west Maui Mountains, from Wailuku to Lahaina, but at a fraction of the cost.

Mr. Tyson Kubo  
935 Hiilani Street  
Haliimaile, HI 96768

1. A toll is not part of the financing package currently contemplated for the Kihei-Upcountry Maui Highway.

Mr. Roger D. Hawley  
P.O. Box 756  
Kula, HI 96790

Comment: Kihei-Upcountry Maui Highway should not be a two-lane road because of safety concerns. It should be a four-lane divided roadway.

Response: A two-lane highway is proposed because projections indicate that two lanes would be sufficient to accommodate travel demand in the design year 2020. In its initial two-lane undivided configuration, the highway would be similar to Haleakala or Hana Highway. Kihei-Upcountry Maui Highway will be designed in accordance with accepted standards.

Comment: Concerned about vehicle accidents involving the deer in the project area.

Response: Section 4.8.4 of the Final EIS includes measures to minimize the chance of vehicle-deer collisions, such as stock-proof fencing and signage warning motorists. The preferred alternative, the U1,K1 alignment, would be farthest from the center of the deer population.

Comment: None of the proposed alternatives should be considered until a good four-lane highway from Pukalani down to Kahului and a four-lane highway from the middle of Haleakala Highway down to Kihei are built.

Response: Regardless of whether the Kihei Upcountry Maui Highway is constructed, the Department of Transportation plans to widen Haleakala Highway to four lanes. A highway from the middle of Haleakala Highway down to Kihei would be similar to the U1 alternatives, which would start Upcountry at Haliimaile Road.

Mr. Herb Squires  
P.O. Box 644  
Kula, HI 96790

Comment: Widening Mokulele Highway would solve the transportation problem.

Response: Widening Mokulele Highway alone will not address the purposes and needs that have been identified for this project.

Comment: The proposed road would spur military development on Haleakala.

Response: The amount of military or other development on Haleakala is not dependent on whether Kihei-Upcountry Maui Highway is built or not.

Comment: Construction of Kihei-Upcountry Maui Highway would encourage development.

Response: The potential for urban growth inducement in Upcountry was analyzed in Section 4.1.1 of the EIS. It was determined that the amount and pace of residential development in Upcountry will continue to be controlled by water availability, not transportation infrastructure. Since Kihei does not have the same constraints as Upcountry, including zoning restrictions, some development is expected.

Mr. Rob Parsons  
579A Kawelo Rd.  
Haiku, HI 96708

Comment: Concerned that an Upcountry terminus near King Kekaulike High School would create an unsafe situation for students and motorists.

Response: Had a U2-A or U2-B terminus been identified as part of the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would have included crosswalks and sidewalks to the high school (see Section 4.4.4 of the Final EIS). Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Comment: Public transportation and requiring hotels to pick up visitors at the airport should have been considered as alternatives.

Response: The Department of Transportation supports public transit, paratransit, ride-sharing, and other ways of increasing vehicle occupancy. However, transit alone would not address all the purposes and needs that have been identified for the proposed project. Kihei-Upcountry Maui Highway will be usable by transit vehicles.

The Department of Transportation does not have the authority to require hotels to pick up visitors at the airport.

Comment: How is Kulamalu related to the development of the U2-B alternative?

Response: The U2-B alternative is the alignment in the Kulamalu master plan. The developer has already constructed a portion of this roadway. The costs of the U2-B alternatives have been revised to reflect this construction. The developer stated that the existing road segment would be donated to the State if a U2-B alternative were selected as the preferred.

Comment: Believes that at the time of the public hearings, a decision on the preferred alternative had already been made.

Response: At the time of the Draft EIS comment period, no decision had been made regarding the preferred alternative. Since then, the U1,K1 alignment has been identified as the preferred alternative.

Comment: Existing roads should be widened first.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, and Mokulele Highway. In addition, the County is planning a Puunene bypass road.

Comment: The Draft EIS overlooks or dismisses the preference of the Makawao-Pukalani-Kula Community Plan.

Response: Section 3.1.4.2d of the EIS describes the Makawao-Pukalani-Kula Community Plan. The Department of Transportation views community plans as important expressions of community opinion, but is not required to follow them. In this case, the Makawao-Pukalani-Kula Community Plan was highly influential in the decision to identify the U1,K1 alignment as the preferred alternative.

Comment: Haiku, Makawao, and Pukalani motorists who would travel mauka to access a U2-A, U2-B, or U3 terminus would cause congestion.

Response: The traffic pattern resulting from U2-A, U2-B, or U3 is viewed as beneficial for traffic operations. Since commuter traffic tends to peak during certain times of the day, arterial roadways tend to be over-utilized in the peak direction and under-utilized in the non-peak direction. The benefit of the U2-A and U2-B alternatives, and to a lesser extent the U3 alternatives, is that they would cause the directional splits of the highways in Upcountry to be more even

Comment: Mass transit alternatives should be considered.

Response: The Department of Transportation supports public transit because it provides transportation options. However, public transit would not meet the purposes and needs that have been identified for this project. However, Kihei-Upcountry Maui Highway will accommodate buses if public transit is provided in the future.

Comment: The costs of the U2-B alternatives do not reflect the private donation of the recently completed roadway segment through the Kulamalu project.

Response: The cost estimates of the U2-B alternatives have been revised in the Final EIS to reflect this donation.

Comment: The "open-style" public hearing may be a Chapter 91 violation.

Response: The conduct of the public hearings is not in violation of any State or federal law.

Comment: Believes a final decision on the preferred alternative was previously made.

Response: The preferred alternative had not been identified at the time of the Draft EIS comment period. Since then, the U1,K1 alignment was identified as the preferred alternative.

Comment: Unusable remnant parcels would be created if the U2-A alternative were identified as the preferred alternative.

Response: Remnant parcels were not anticipated with a U2-A alternative. If a U2-A alternative were identified as the preferred alternative, and if an affected landowner believes that unusable remnant parcels will be created, and if investigation confirms the creation of unusable remnant parcels, those parcels would be purchased from the landowner.

Comment: A reliever road to replace Hansen Road should be considered.

Response: All the alternatives considered in the Draft EIS are essentially "reliever" roads for Hansen Road.

Mr. Sam Hironaka  
99 Naniluna  
Wailuku, HI 96793

Comment: Favors reestablishing the roadway that linked Makena and Ulupalakua, which was closed by the County.

Response: The requested roadway is similar to Alternative 7, which was eliminated prior to the Draft EIS because it had a very low benefit-cost ratio because of its distance from population centers. However, as the commentor pointed out, such a roadway would have other benefits not considered in the project's purposes and needs. If achieving the benefits identified by the commentor is determined to be important, then the suggested roadway may be considered as another project. Construction of Kihei-Upcountry Maui Highway does not preclude a Makena to Ulupalakua roadway in the future.

Comment: Suggested a road linking Ulupalakua and Makena should be constructed in addition to Kihei-Upcountry Maui Highway.

Response: The requested roadway is similar to Alternative 7, which was eliminated prior to the Draft EIS because it had a very low benefit-cost ratio because of its distance from population centers. However, as the commentor pointed out, such a roadway would have other benefits not considered in the project's purposes and needs. If achieving these benefits is determined to be important, then the suggested roadway may be considered as another project. Construction of Kihei-Upcountry Maui Highway does not preclude a Makena to Ulupalakua roadway in the future.

Comment: The impacts to agriculture should be considered in selecting the preferred alternative.

Response: Potential agricultural impacts of each alternative measures to mitigate adverse impacts are addressed in Section 4.2 of the EIS. The preferred alternative, the U1,K1 alignment, will bisect sugarcane and pineapple fields. These impacts cannot be avoided. Therefore, construction of this alternative will include measures to lessen the agricultural impact.

Ms. Cindy Lawrence  
Maui County Farm Bureau  
P.O. Box 148  
Kula, HI 96790

Comment: Highly concerned about the agricultural impacts of the project.

Response: Agricultural land could not be completely avoided under any of the build alternatives that were considered in the Draft EIS. The preferred alternative, the U1,K1 alignment, will cross sugarcane and pineapple fields. The Department of Transportation acknowledges that mitigation measures (see Section 4.2.4 of the EIS) will be needed to maintain the productivity of fields next to the new highway. Details of the mitigation measures will be coordinated with the landowners.

Mr. Anselm Pauls  
P.O. Box 1211  
Paia, HI 96779

Comment: Kihei-Upcountry Maui Highway would cause urban development in Upcountry, causing the loss of the Upcountry character.

Response: The amount and pace of residential development in Upcountry is controlled by water availability. Maui County will not allow substantial new urban development in Upcountry as long as water supply constraints persist, even though Upcountry is a popular residential area. Therefore, it is not expected that the project would induce urban growth in Upcountry in addition to growth that would occur without the project.

Comment: Other alternatives should be considered.

Response: The Department considered a wide range of alternatives, with active input from the public. The evaluation of alternatives is described in Chapter 2 of the EIS.

Comment: Providing public transportation should have been considered.

Response: The Department of Transportation supports public transit because it provides transportation options. Kihei-Upcountry Maui Highway can be used for public transportation if the County or other organization were to start public transit service. Transit alone would not address the purposes and needs that have been addressed for this project.

Comment: The alternatives in upper Pukalani (U2-A and U2-B) would cause congestion because motorists from Haiku, Makawao, Pukalani, and Haliimaile would drive mauka to this area.

Response: Contrary to the comment, the U2-A and U2-B alternatives would actually lessen congestion. As described in Section 4.4.1 of the EIS, the U2-A and U2-B alternatives would cause the contra-flow of peak directional traffic in Upcountry. Since commuter traffic tend to peak during certain times of the day (i.e., early morning and late afternoon), arterial roadways tend to be over-utilized in one direction, and under-utilized in the other direction. The benefit of the U2-A and U2-B alternatives, and to a lesser extent the U3 alternatives, is that they would cause the directional splits of the highways in Upcountry to be more even.

Mr. Jack Esker  
2531 South Kihei Road, Apt C502  
Kihei, HI 96753

Comment: Because one of the purposes of the project is to enhance travel between the Maui R&T Park and Science City, what route is favored by those traveling between the Maui Research & Technology Park and Science City?

Response: The Maui Research & Technology Park only asked that the alignment not pass through the technology park. Those who work at Science City have not communicated a preference to the alignment.

Ms. Kathryn Maloney  
300 Lakau Place  
Kihei, HI 96753

Comment: The U1 terminus at the Haliimaile Road / Haleakala Highway intersection would cause unacceptable traffic conditions.

Response: The level-of-service (LOS) D at the U1 terminus during the morning peak hour, as reported in the Draft EIS, was revised to LOS C after closer examination of this future intersection. In the afternoon peak hour, an LOS C is predicted. An LOS C condition is considered to be acceptable.

Mr. Herbert Gries  
P.O. Box 695  
Puunene, HI 96784

Comment: Consider the intersection of Mokulele and Piilani Highways for the makai terminus of the road.

Response: The Mokulele Highway and Piilani Highway intersection was not considered for the makai terminus because Kihei-Upcountry Maui Highway would become the fifth leg of an existing four-legged intersection. This configuration would not be ideal in managing traffic operations, especially since the K1 terminus located at the intersection of Piilani Highway and Kaonoulu Street is only about a mile and a half from this location.

Comment: The roadway projects in this area appear to be uncoordinated and conflicting. The proposed highway should be coordinated with a future bypass road around Kealia Pond.

Response: The Department of Transportation and the County of Maui use the Maui Long Range Land Transportation Plan to program investments in the island's roadway system. The Long Range Plan is prepared using a comprehensive public involvement process. The coordination and compatibility of roadway projects in this area were addressed in the Long Range Plan. A bypass road around Kealia Pond is not in the Long Range Plan.

Mr. and Mrs. Russ and Lora Yanagawa  
2823 Puuhoolai Street  
Kihei, HI 96753

Comment: Recommends that that the public hearings be publicized on the radio.

Response: The Department of Transportation does not normally advertise public hearings on the radio. Public hearings are advertised in the "Hawaii State & County Public Notices" publication, and in a local newspaper with general circulation. Also, notices are mailed to those on the project mailing list, which include those who have attended earlier project meetings or who have indicated an interest in the project. In this case, because the local media covered the hearings, the Department does not think that attendance would have been substantially higher if radio advertisements were used.

Comment: Concern about development along the highway.

Response: Section 4.1.1 of the EIS addresses the potential for land use development due to the construction of Kihei-Upcountry Maui Highway. The highway is not expected to have much of an impact on development in much of Upcountry, particularly in Kula, due to water supply constraints. In Kihei, the highway could facilitate in-fill development between Piilani Highway and Kihei Road.

Ms. Christine Moschetti  
P.O. Box 741  
Kihei, HI 96753

Comment: Kihei-Upcountry Maui Highway should be a four-lane highway, and include a bike path.

Response: A two-lane highway is being proposed because traffic projections for the year 2020 indicate that a two-lane highway would be sufficient. However, right-of-way for a divided four-lane highway would be reserved. Kihei-Upcountry Maui Highway would provide six feet wide shoulders that could be used for cycling.

Mr. Ron Sturtz  
874 Kumulani Drive  
Kihei, HI 96753

Comment: Could the federal government pay for the whole cost of the project?

Response: That will not be possible. The cost sharing for this project would be 80 federal and 20 percent State.

Mr. Jeff Marsh  
2387 South Kihei Road  
Kihei, HI 96753

Comment: Various forms of public transit, including having Kihei-Upcountry Maui Highway operate as a closed busway system, should have been considered. Bicycle transportation should also be encouraged.

Response: The Department of Transportation does not operate public transit, although the Department will support public transit because it leads to a more efficient use of roadways. Since no organization in the near future is proposing to operate a public transit system large enough to justify a busway between Upcountry and Kihei, such an option was not considered. If a bus transit system were started, it would serve a relatively small number of riders in comparison to automobile riders, and would not change the purpose and need for the proposed project. Nevertheless, Kihei-Upcountry Maui Highway will have plenty of capacity to accommodate buses if public transit is provided in the future. Kihei-Upcountry Maui Highway would provide six feet wide shoulders that could be used for cycling.

Comment: A private transportation system operating on existing roadways in Ulupalakua Ranch should be considered.

Response: The Department of Transportation has not received any interest from the private sector to operate a transportation system between Kihei and Upcountry.

Ms. Lucy Feinberg  
483 South Kihei Road  
Kihei, HI 96753

Comment: Kihei-Upcountry Maui Highway should be a four-lane roadway, and include bike lanes.

Response: A two-lane highway is being proposed because traffic projections for the year 2020 indicate that a two-lane highway would be sufficient. However, right-of-way for a divided four-lane highway would be reserved. Kihei-Upcountry Maui Highway would provide six feet wide shoulders that could be used for cycling.

Mr. Kaoru Muraoka  
388 Aliiolani Street  
Pukalani, HI 96768

Comment: Concerned about operations and traffic conditions at the U1 terminus (Haliimaile Road / Haleakala Highway intersection).

Response: The U1 terminus would include left turn, acceleration, and deceleration lanes, and would likely warrant traffic signals. Morning peak hour traffic conditions are projected to operate at a level-of-service C, on a scale of A to F.

Comment: Mokulele and Haleakala Highways should be widened to four lanes.

Response: Regardless of whether or not the Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala and Mokulele Highways.

Mr. Clifford Green  
160 Alohilani Street  
Pukalani, HI 96768

Comment: Concerned that the level of traffic generated by a U2-A alternative would endanger King Kekaulike High School students

Response: If a U2-A alternative were identified as the preferred alternative, the modified Five Trees intersection would include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Comment: Concerned that the level of traffic from a U2-B alternative would endanger Kamehameha School students.

Response: If a U2-B alternative were identified as the preferred alternative, an urban design that includes sidewalks would have been used in the section of the highway adjacent to Kamehameha School.

Comment: Concerned about the highway cutting through active agricultural fields.

Response: As described in Section 4.2.4 of the EIS, mitigation measures will be implemented to lessen the impact on agricultural practices that would be affected by Kihei-Upcountry Maui Highway. Construction of the highway will be coordinated with Hawaiian Commercial and Sugar Company and Maui Land and Pineapple Company.

Mr. Tony Paresa  
27 Aeloa Road  
Pukalani, HI 96768

Comment: Who is liable for damage from vehicle-deer collisions, other than the operator of the vehicle?

Response: Payment for damage from vehicle-deer collisions should come from the insurer of the vehicle.

Ms. Cyrina Brogoitti  
P.O. Box 1276  
Kula, HI 96790

Comment: Widen existing roads first to see what happens to traffic flow.

Response: Regardless of whether or not the Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway, and Piilani Highway.

Mr. Patrick Constantino  
3188 Kilani Place  
Pukalani, HI 96768

Comment: The alternatives with the terminus in the upper section of Pukalani (U2-A and U2-B) would be like Dairy Road, resulting in potential safety concerns.

Response: The U2-A and U2-B alternatives would not be like Dairy Road. They would be similar to Haleakala and Hana Highways. Their terminus intersections would be signalized with adequate left turn, acceleration and deceleration lanes.

Mr. Steve Harman  
826 Alamoku Street  
Haliimaile, HI 96768

Comment: Because the U1 terminus will attract traffic from Haiku, something has to be done about Kaluanui Road, which connects to Haliimaile Road.

Response: Thank you for pointing out this issue. The Department of Transportation will ask the County of Maui to monitor traffic conditions on Kaluanui Road when Kihei-Upcountry Maui Highway is completed.

Ms. Emily Agusti  
361 Nalani Street  
Pukalani, HI 96768

Comment: The U1 terminus should be designed as an interchange.

Response: Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized at-grade intersection, which would cost substantially less.

Comment: Underpasses should be constructed where the new highway crosses cane haul roads.

Response: The U1,K1 alignment, which was identified as the preferred alternative, includes two underpasses for cane haul roads.

Mr. Hari Ajmani  
102-17 Kauai Place  
Kula, HI 96790

Comment: How much traffic is Kihei-Upcountry Maui Highway intending to serve, and what role would this have in selecting the preferred alternative?

Response: As stated in Section 4.4.1 of the EIS, Kihei-Upcountry Maui Highway is projected to serve 7,000 to 13,000 vehicles per day in the design year, 2020. In general, the U3 and K2 alternatives would generate the lower traffic volumes, and the U1, U2-A, U2-B, and K1 alternatives would generate the higher volumes. The differences were due in large measure on how well each alternative serves different travel markets. For example, the K1 alternatives serve the Upcountry-West Maui travel market, whereas the K2 alternatives do not. This was an important factor in selecting the U1,K1 alignment as the preferred alternative.

Comment: Improvement to Hansen Road should be considered as an alternative.

Response: Although improving Hansen Road has the potential to improve the safety of this roadway, it would not address the project's purpose of establishing a direct highway link between Upcountry and Kihei.

Comment: The U2-A and U2-B alternatives would jeopardize the safety of King Kekaulike High School students.

Response: If a U2-A or U2-B alternative were identified as the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Comment: Project does not enhance evacuation capacity in response to brush fires.

Response: The proposed Highway will create a new evacuation route from South Maui. K2 alternatives would be somewhat more effective than K1 alternatives because the alignment is further from the existing escape routes. In addition to providing evacuation capacity, the proposed highway would assist in fire fighting.

Ms. Gina Flammer  
2102 Naalae Road  
Kula, HI 96790

Comment: Concerned about the risk of head-on collisions with a two-lane highway.

Response: Kihei-Upcountry Maui Highway, in its initial two-lane undivided configuration, would be similar to Haleakala or Hana Highway. Kihei-Upcountry Maui Highway will be designed in accordance with current standards.

Comment: Concerned about certain alternatives being near King Kekaulike High School or Kamehameha School.

Response: If a U2-A or U2-B alternative were identified as the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Mr. Perry Margolin  
183A Pukalani Street  
Pukalani, HI 96768

Comment: Two Upcountry termini should be considered, one at Haliimaile Road and the other at Five Trees intersection.

Response: The Kihei-Upcountry Maui Highway will have only one Upcountry terminus because of cost and the volume of projected traffic.

Mr. Sandy Ryan  
1071 Ulele Street  
Makawao, HI 96768

Comment: Please mitigate any damage to Hawaiian archaeological sites.

Response: Section 4.10 of the EIS addresses the potential archaeological impacts of the project, and the proposed mitigation for such impacts. Specifically for the preferred alternative (U1,K1), the mitigation measures will include data recovery of three temporary habitation sites and buffer zones during construction around two petroglyph sites found near the alignment. This mitigation plan was approved by the State Historic Preservation Division.

Comment: Would Kihei-Upcountry Maui Highway eliminate the morning contra-flow lane?

Response: The Department of Transportation (DOT) is planning to widen Haleakala Highway, which would eliminate the need for the contra-flow lane. If Kihei-Upcountry Maui Highway were built first, traffic conditions would be monitored to determine whether maintenance of the contra-flow lane is necessary.

Mr. Dan Evert  
2760 Palalani Street  
Pukalani, HI 96768

Comment: The analysis of alternatives should have ended once the Maui County Mayor approved the Makawao-Pukalani-Kula Community Plan, with either the U1 alternatives (Upcountry terminus at Haliimaile Road / Haleakala Highway intersection) or widening of existing roads moving forward.

Response: The Department of Transportation views community plans as helpful statements of community opinions. Since the project would use federal and State funds, both the National Environmental Policy Act and the Hawaii EIS Law apply. Both laws require the project to consider all reasonable alternatives that would address the project's purposes and needs. Therefore, the project's EIS had to address all reasonable alternative alignments. Adoption of a community plan does not eliminate this obligation to study alternatives. However, in this case, the wishes of the community, as stated in the Makawao-Pukalani-Kula Community Plan, were highly influential in the identification of the preferred alternative.

Comment: Improvement to Hansen Road should have been considered as an alternative.

Response: Improving Hansen Road would not address the project purpose of establishing a direct highway link between Upcountry and Kihei.

Comment: Concerned about certain alternatives being near King Kekaulike High School.

Response: If a U2-A or U2-B alternative were identified as the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would include crosswalks and sidewalks to the high school. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections.

Comment: What is the cost to prepare the EIS for this project?

Response: The EIS is only one part of the planning process for this roadway. Other work performed included preparing conceptual plans and cost estimates of alternatives, preparing technical studies to evaluate the social and environmental impacts of the project, conducting public meetings and hearings, consulting with environmental resources agencies and the

public, and preparing environmental review documents, such as the EIS. The cost to date of all the work performed on all these activities is \$1,665,300.

Ms. Janine Carroll  
217 Pukalani Street  
Pukalani, HI 96768

Comment: Believes that the U2-A and U2-B alternatives would cause unnecessary traffic through Pukalani.

Response: If a U2-A or U2-B alternative were identified as the preferred alternative, there would be no direct connection between Pukalani and the new highway. Access onto the highway from Pukalani would be via Haleakala Highway, and Kula Highway under the U2-B alternatives.

Mr. Jeffrey James  
P.O. Box 182  
Paia, HI 96779

Comment: Requests two Upcountry termini, one at the Haliimaile Road / Haleakala Highway intersection and the other at the Five Trees intersection, and two Kihei termini at either K1 or K2, or K2 and at Lipoa Street.

Response: Only one Upcountry and Kihei terminus each will be provided under this project at this time. However, the project does not preclude the construction of additional connections in the event that they are needed in the future.

Mr. Jonathan Starr  
3150 Wailea Alanui  
Kihei, HI 96753

Comment: Does not want Kihei-Upcountry Maui Highway to have street lighting at its intersections, or at least the type used at the U2-B terminus.

Response: Kihei-Upcountry Maui Highway will not have street lighting, except at the termini, for safety purposes. The type of lighting will be determined in the design phase of the project. There are options to minimize stray light.

Comment: Suggests an alternative similar to the old Ulupalakua-Makena Road.

Response: The suggestion is similar Alternative 7, which was dropped from consideration during the early screening evaluation because of its poor benefit-cost ratio resulting from its location far from major urban areas.

Mr. John Wilson  
Kula Community Association  
121 Holopuni Road  
Kula, HI 96790

Comment: The selection of the preferred alternative should fully conform to the legally adopted Makawao-Pukalani-Kula Community Plan. Existing roads should be improved before this highway is built.

Response: State highway projects are not required to conform to locations set forth in community plans. The Department of Transportation considers community plans to be important expressions of public sentiment, not regulatory documents. Nevertheless, the Makawao-Pukalani-Kula Community Plan was given substantial weight in the identification of the preferred alternative, the U1,K1 alignment.

Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway, Hana Highway, Mokulele Highway and Piilani Highway.

Comment: Disagrees with analysis of the EIS that water availability controls development in Kula, not transportation infrastructure.

Response: Despite the recent development of a well in Haiku, which is partially being used for the Kulamalu development, Kula will continue to rely on surface water sources that are highly vulnerable to drought conditions. In addition, the cost of providing water transmission lines and storage is comparatively high in Kula because of its elevation. Therefore, the County is unlikely to allow substantial urban development in Kula, despite the existence of Kihei-Upcountry Maui Highway. The Department of Transportation stands by its assessment that water supply will be more of limiting factor on Kula development than constraints in transportation infrastructure.

Comment: Alexander & Baldwin has proposed a residential development near the intersection of Haliimaile Road / Haleakala Highway. This proposal appears to be logical in-fill development.

Response: Alexander & Baldwin is planning a 200-unit residential subdivision in Haliimaile. The EIS acknowledges that additional highway capacity, such as a new roadway, can influence urban development. Therefore, the EIS concluded that the U1 alternatives would have the greatest growth-creating impacts because it would directly serve lower Pukalani and Haliimaile, areas that have been designated for development in the Community Plan. Further, the Maui Board of Water Supply has indicated it would supply water to this area for these planned developments.

Comment: The EIS did not identify a park in the Kulamalu development.

Response: Thank you. The park has been identified in the Final EIS.

Comment: Requested grade separation of the highway's intersections with Omaopio and Pulehu Roads.

Response: The Omaopio and Pulehu Road intersections with Kihei Upcountry Maui Highway are not proposed for grade separation. The projected cross-traffic volumes do not warrant the additional cost and the environmental impacts associated with grade separating these intersections.

Comment: Does not want Kihei-Upcountry Maui Highway to have street lighting.

Response: Kihei-Upcountry Maui Highway will not have street lighting, except at the termini, for safety purposes. The details of the lighting will be determined in the next phase of project planning. There are options to minimize stray light.

Comment: The U1 terminus should be an interchange.

Response: Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which cost substantially less. An appropriately designed, at-grade, signalized U1 terminus at Haliimaile Road is projected to operate well.

Comment: Concerned that there would be additional connections to Kihei-Upcountry Maui Highway, or another Upcountry-Kihei highway would be built.

Response: The Kihei-Upcountry Maui Highway is projected to operate well in the design year 2020. Given Upcountry's land use and population projections, the Department of Transportation does not anticipate additional connections or another Kihei-Upcountry highway, at least until 2020.

Mr. Skip St. John  
113 Pekelo Place  
Kula, HI 96790

Comment: Prefers an Upcountry terminus in the vicinity of Rice Park.

Response: The suggestion is similar to Alternatives 6A and 6B. Both alternatives were eliminated because they had poor benefit-cost ratios because of their distance from Upcountry's population center, the Pukalani-Makawao area.

Mr. Erwin DepBonde  
RR4, Box 66-A  
Kula, HI 96790

Comment: The U1 terminus should be an interchange.

Response: Several grade-separated intersections (i.e., interchanges) were considered for the U1 terminus. However, the costs of these options were not justifiable considering their marginal benefits in comparison to a signalized intersection, which cost substantially less. An at-grade, signalized U1 terminus intersection is projected to operate well.

Mr. Mark Brogoitti  
P.O. Box 1276  
Kula, HI 96790

Comment: Believes that the State has already made the decision to construct Kihei-Upcountry Maui Highway.

Response: The State has not has not dedicated any construction funding for the Kihei-Upcountry Maui Highway, and therefore, has not made the decision to move ahead. The legislature must approve the construction budget. The Final EIS identifies the preferred alternative (the U1,K1 alignment) but this does not constitute a decision to construct the highway.

Comment: Haleakala Highway, Mokulele Highway, Piilani Highway and Hansen Road should be widened to four lanes.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala, Mokulele and Piilani Highways. There are no plans to widen Hansen Road.

Comment: The travel time savings provided in the Draft EIS will not materialize because the slow drivers would delay motorists on the proposed two-lane highway.

Response: Travel time savings estimates were based on an assumed average speed. However, even with slow drivers, Kihei-Upcountry Maui Highway would provide substantial travel time savings because of the distance savings for many trips.

Ms. Leslie Gise

Comment: Kihei-Upcountry Maui Highway would encourage development in Upcountry because the water shortage has not been shown to control development.

Response: County officials believe that reliance on surface water resources, and the limited storage and transmission capacity of the water delivery system Upcountry, has curbed urban development in Upcountry, especially Kula. The Board of Water Supply believes that water supply constraints Upcountry will persist because of the high cost of developing water sources and delivering it the higher elevations of Upcountry.

Comment: The U1 terminus will be a "death trap."

Response: The U1 terminus at the Haliimaile Road / Haleakala Highway intersection will likely warrant traffic signals, which is indicated in the EIS. In addition, left turn, acceleration, and deceleration lanes will be provided.

Comment: The U1 terminus will increase traffic on Holopuni and Pulehu Roads.

Response: Under the U1,K1 Alternative, which was identified as the preferred alternative, the EIS acknowledges that some motorists will use Holopuni, Pulehu and Omaopio Roads inappropriately as shortcuts because of the distance between Kula and the U1 terminus, similar to what presently occurs.

Comment: The traffic impact analysis did not take into account traffic generated at King Kekaulike High School and Kamehameha School.

Response: The traffic impact analysis is based on traffic volume projections used to develop the Maui Long Range Land Transportation Plan. The traffic projections are based on assumptions of future land use, including development projects which are known to the County, State, and planners who prepared the long-range plan. The schools you mention were factored in to the long-range traffic projections used in the Long-Range Plan.

Comment: The highways between Pukalani and the U3 terminus would have to be widened to four lanes if a U3 alternative is identified as the preferred.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala and Kula Highways. Nevertheless, a U3 alignment was not identified as the preferred alternative.

Comment: The intersection of Hana Highway and Haleakala Highway needs to be improved.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, both Hana and Haleakala Highways are planned for improvement. However, an interchange at this location is not proposed.

Comment: Hansen Road should be fixed or realigned to direct traffic away from the Hana Highway/ Dairy Road intersection.

Response: The Long-Range Plan did not include widening or realigning Hansen Road.

Mr. Hugh Starr  
P.O. Box 33  
Makawao, HI 96768

Comment: The project area should be expanded to include Haiku, Kokomo, and Kaupakalua.

Response: Depending on the alignment selected, some of these communities would benefit from Kihei-Upcountry Maui Highway. Other projects are also being planned that would serve the communities mentioned, such as the widening of Hana Highway and a project to improve transportation through Paia.

Mr. Thomas Burt  
2771 Olulani Street  
Pukalani, HI 96768

Comment: Haleakala Highway should be widened to four lanes instead of constructing a Kihei-Upcountry Maui Highway.

Response: Regardless of whether Kihei-Upcountry Maui Highway is constructed, the Department of Transportation is planning to widen Haleakala Highway to four lanes.

Mr. David M. Ohta  
2678 Akalani Loop  
Pukalani, HI 96768

Comment: Concerned about U2-A and U2-B being near King Kekaulike High School or Kamehameha School.

Response: If a U2-A or U2-B alternative were identified as the preferred alternative, the modified Five Trees intersection or the new intersection on Kula Highway would include crosswalks and sidewalks to the high school. In addition, if a U2-B alternative were identified as the preferred alternative, an urban design would be used, which includes sidewalks, adjacent to Kamehameha School. Similar situations are encountered elsewhere in the State, and it is possible to accommodate both vehicles and pedestrians at intersections and along roadways.

Ms. Helen Nielsen  
3150 Wailea Alanui  
Kihei, HI 96753

Comment: Does not want the highway to have excessive lighting.

Response: Kihei-Upcountry Maui Highway will not have street lighting, except at the termini, for safety purposes.

Comment: The entire Kihei-Upcountry Maui Highway should provide shoulders wide enough for bicyclists, not just the urban sections where bike lanes would be provided.

Response: In the rural sections of the highway, shoulders would be six to eight feet wide, which is wide enough for bicyclists to use.

IN REPLY REFER TO:

HWY-PA  
2.5470

JAN 28 2002

Aloha,

Subject: Kihei-Upcountry Maui Highway

Thank you for your comments on the Draft Environmental Impact Statement (EIS) for the proposed Kihei-Upcountry Maui Highway project.

For your information, we have identified the "U1, K1" alignment as the preferred alternative for this project. For the "U1, K1" alignment, the Upcountry terminus would be at the Haleakala Highway/Haliimaile Road intersection, and the Kihei terminus would be at the Piilani Highway/Kaonoulu Street intersection. The selection of the "U1, K1" alignment is based on our evaluation of transportation benefits (e.g., travel time savings, travel market served), prior community planning studies, environmental and social impacts, construction costs, and comments generated through an extensive public involvement process.

The project's Final EIS has been approved, and consequently, we anticipate that its design stage will soon be initiated.

Again, we deeply appreciate your interest and participation in this project. If you have any questions, please contact Wayne Kawahara, Highways Division, Planning Branch, at (808) 587-6357, or you can contact him using Maui's toll-free voice access number 984-2400, extension 7-6357.

Very truly yours,

Handwritten signature of Brian K. Minaai in black ink.

RE: Upcountry Highway....Position is for support

Aloha Mr. Hayashida,

The Maui Hotel Association represents approximately 37 properties and 120 businesses on the island of Maui. That translates to some 12,000 plus employees. Those employees use Maui's roads everyday to travel from their place of residence to their place of work. As you might conclude improvements are always looked upon as a blessing to those who spend time on our roads.

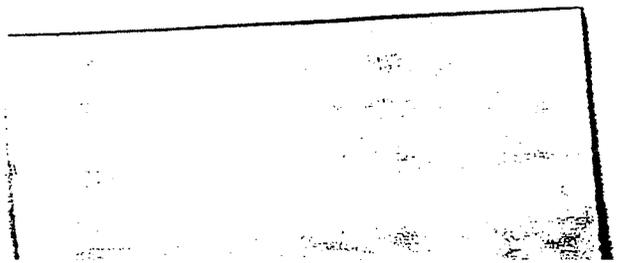

Due to the planning and geography of our island, resorts reside in and around the ocean areas and our employees live inland. Consequently, we have a large cluster of employees living in the "upcountry", Paia, Makawao & Pukalani areas who work down in the resort areas of Kihei, Wailea, Kaanapali and Kapalua. Therefore as you would imagine any additional roadway to split the flow of traffic would meet with a great deal of support from our organization.

While we are totally supportive of "a" new roadway to assist in the flow of traffic, we have not determined a preference for any particular site or corridor. We believe there are pros and cons to all suggested routes and our belief is that a roadway from upcountry to Kihei is definitely needed. We believe the site should benefit as many people as possible and split the traffic as much as possible. If the new roadway could be expected to handle half of the current traffic, the burden on the Haleakala Highway would be reduced and thus each roadway would be better, safer and beneficial.

Thank you for the opportunity to comment.

Sincerely,

Terry Vencil  
Executive Director

DIRECTOR'S OFFICE  
DEPT. OF  
TRANSPORT

Dear Sirs -

SEP 20 10 43 AM '99  
Regarding the Kihai upcountry highway.  
I was on the 60 member committee formed at  
the beginning of this. After much thought  
and study of the routes - (I live upcountry  
between Halemaili & Jui trees) I think  
we should consider one of two things  
Improve Halemaili Hwy as it should  
have been done originally - develop & improve  
Hansen road as a connector to Makelulu  
Kihai Hwy, (since that highway is already  
slated for 4 lane improvement) or put  
it at Halemaili. This would make sense  
to funnel what will be another 1400+ cars  
coming from the developments planned at  
Halemaili and Spreckelsville. Basing this  
on 2 1/2 cars per family. (Husband wife, grown  
children) The most expensive routes and  
hardest to build will be the two at Jui  
trees the terrain is steep and rocky with  
deep gulches - <sup>& add traffic too close to the high school.</sup> Thank you for your consideration.

Respectfully,

Carol Thuro.

Dear Sir:

Yes we need a road linking directly Kihei to upcountry. The best route would be from K2 in south Kihei to U2 in Pukalani.

My reasons are;

1. Our community needs more alternative routes. When one goes down for some reason there is no alternative out of Kihei. South Maui becomes stranded without any exit when the North Kihei route is blocked.
2. Business and commerce and tourism will be facilitated by this route.
3. It would remove some of the congestion through Kahului for the South Maui to Upcountry traffic.

Re: The proposed Kihei-Upcountry Road

The following is my recommendation for which route to connect Kihei with Upcountry Maui and my reasons which are based primarily on traffic flow considerations:

The Kihei origin should be at the Ke Alii Alanui intersection (K-2)

1. The road connects to the center of the population base. The population of Kihei can get to the intersection faster - utilizing both lanes of Pi'ilani Highway to get to the intersection - saving gas, pollution, etc.
2. It would also be easier and closer for tourists staying in hotels/condos in the Kihei/Wailea area to get to the intersection.

The Upcountry origin should be at the Five Trees intersection (U-2A)

1. Traffic into/out of the Pukalani/Makawao area is bad now. The Five Trees location would be bypassing/going above this area of traffic congestion. The Haili'imaile intersection would just add to traffic congestion in the area.
2. I assume there would be turn offs from the proposed highway into Pukalani which would also alleviate traffic congestion for Pukalani area motorists.
3. The Five Trees intersection connects directly to the Upper Kula road which connects to Crater Road. This would give tourists coming from the Kihei/Wailea area, who would likely not be familiar with the roads, a straight shot directly to Haleakala.
4. Again, as with the Kihei location, motorists would be moving in three directions - Upper Kula, Lower Kula and Pukalani/Makawao - from the Five Trees intersection. From the proposed Haili'imaile intersection all traffic would be turning up to the Upper Kula, Lower Kula and Pukalani/Makawao areas.

Dear Sir:

I write to comment on the proposed Kihei-Upcountry Maui Highway. I strongly support the highway and would like to see it built as soon as possible. I have no strong preferences as to the route, although as a Maui Meadows resident, K2 to U3 would be the most convenient. The factors which I think are most important are cost and the preservation of agricultural land.

Sincerely,

## **TESTIMONY IN SUPPORT OF THE KIHEI-UPCOUNTRY MAUI HIGHWAY PROJECT**

My name is Daniel Tamura and I am here on behalf of Mr. Nolan G. Moriwaki, Business Manager/Financial Secretary, of the Hawaii Masons Unions Local #1 and Local #630, and its 3500 members and their families throughout the State.

**We are in support of the Kihei-Upcountry Maui Highway Project.**

This project plays a role in the future of Maui, its people and its economy.

For now this project will provide the much needed **JOBS** for Hawaii's workers. All of our members work, live and pay taxes in Hawaii.

The present economy is very dismal. This project will provide a **BOOST IN THE ECONOMY** through the jobs and tax revenues generated. Now is also the time to build since it is a buyers' market. The cost of building now is more advantageous for the owners. Do you remember H-3? It had an original price tag of \$38 million about 30 years ago. The delays because of litigation and political banterings caused the H-3 to be one of the highest costing highways in the nation. The final price tag is over \$1 billion.

Please get this project on line.

*Attn:*  
*Kazu Hayashida*

Respectfully,

Daniel Tamura

Department of Transportation  
Mr. Kazu Hayashida, Director  
State Department of Transportation, Highways  
869 Punchbowl Street  
Honolulu, Hi. 96813

Dear Mr. Hayashida:

Although I am not a resident of Kihei or the Kula here on Maui, I have lived in Lahaina for more than thirty years and have more than average appreciation of how things have changed and grown on the Island. I think that a connecting road between Kihei and Kula is essential to the continuation of smooth traffic flow on that side of the Island. Without it the growing congestion on the Kihei roads and the area of Dairy Road and Hana Highway will increase beyond their capacity to handle the load.

If you need my vote to make it happen it is yours.

Sincerely,

Jim Shefte  
Vice president and  
General Manager

Dear Mr. Hayashida:

As you can see I am a real estate Broker in Kihei and a 20 year property owner here as well. I am writing to you to OPPOSE ANY road linking upcountry with Kihei. We will live to regret ANY such link as we would add yet another nail in Maui's tourist base economy. Visitors and new residents DO NOT relocate to Maui because of the road system.

Let's do as much as we can to SAVE what is left. To spend millions for an unwanted and un needed road would be a huge waste of taxpayers money. On the same subject forget about lengthening the runway as well. The State should listen to the people paying the bills and get the message before it's too late.

Very truly yours,

SUBJECT: Kihei-Upcountry highway, Maui

Please add our names to your register of citizens who support approval of this highway. Our preference is for the Upcountry route to be to Omaopia.

We believe this highway will service local people who work in one part of the island and reside in another. Also, we see it as a important to the local economy by benefiting the development of our high-tech industry and encouraging tourism.

This additional route will help create safer driving conditions for all travelers on our island.

Aloha,

Subject: Testimony Regarding the Draft EIS for the Upcountry/Kihei  
Maui Highway Project

I am submitting this testimony in support of the Draft EIS relating to the construction of the Upcountry/Kihei Highway Project and the proposed routing designated as U3-K1. This option takes the highway from Kula Highway, at a location known as Pulehu Gulch, a short distance from the Pulehu Road/Kula Highway intersection to Kaonoulu Street in Kihei.

I believe that the Draft EIS adequately addresses the environment impacts of the U3-K1 proposed routing and provides for all necessary mitigating measures to reduce any negative impacts caused by the project. The U3-K1 routing imposes the lowest degree of environmental impact and is the most economical alternative of the various proposed routing alternatives.

There is an increasing need in the Kihei-Makena area for an alternate coastal evacuation route in the event of hazards such as tsunami, tropical storms, and fire. The U3-K1 route would also improve Maui's roadway system and reduce travel time up to 50 percent. The Upcountry/Kihei Highway would also support Maui's visitor industry and result in a positive economic impact for the people of Maui County.

The environmental review process should move forward to a positive conclusion and acceptance by federal, state and county authorities. Efforts to secure funding appropriations for this project should be expedited and construction of the U3-K1 route should commence as soon as possible. The alternative of not constructing the Upcountry/Kihei Highway Project will result in far greater environmental, social, and economic impacts to the people of this County.

Thank you,

*Malcolm L. Dodson*

Mr. Hayashida,

I submit the following as written testimony in regard to the subject Kihei-Upcountry Highway. My name is Steven P. Newhouse, I live in Keokea, Maui, at the Keokea Farm Lots Phase I, (DHHL) and have done so for the last five plus years. I also lived in Makawao for the previous 15 years. I have witnessed the changes in traffic patterns, the increase in fatal as well as non fatal auto accidents, and the changes in attitudes of the driving public.

In 1978 when I first moved to Maui from Oahu, I worked at the Kahului Airport for Air Cargo Enterprises. My shift started at 5 p.m. and ended at 6 a.m., when I left for work from Makawao, I would count the vehicles going up the "Hill" on less than 2 hands. Likewise, in the morning I could see from the airport, and while driving home, count the vehicles coming down the "Hill". I imagine that if ADT counts exist, they would indicate that the daily traffic count has been multiplied, several times over. Haleakala Highway needs 4 lanes, with jersey barriers protecting a median strip.

Every year without fail, lives are lost on Haleakala Highway. The causes vary, but when it happens every year, at what point does something have to be done? Those in the community who oppose even the widening of Haleakala Highway with a inclusion of a median undoubtably are not bothered by this. I wonder what do they think, maybe addition lanes or a new highway might be the answer. My question is how long must it continue, how many more lives?

In the last 4 years I have noticed a marked increase in ;the "road rage" incidents, and the growing trend of drivers who do not pay attention to pavement markings, signs, signals, and various traffic laws. Courtesy is all but fogotten on Maui's Highways.

All of these subjects directly relate to a new highway linking Kihei with the upcountry area. The proposed new highway would definitely reduce the ADT on Haleakala Hwy., more than likely also reduce fatalities. I believe that the road rage, which is a growing trend, can attributed to in part to the high volume of traffic encountered at peak travel times.

At public meeting last year I remember a resident of Kula, who explained that he worked in Wailea at a resort, and didn't mind the drive through Central Maui. This does not make economic, or ecological sense. Not to mention the time involved. When my daughter has to dance at the resorts in Wailea for a luau show, we have to drive through central Maui to Wailea, which is less than 7 miles away, and can be seen clearly from our home. If we want to go to the beach, or fishing again drive through central. Any road option which would result in lowering my costs of commuting any where I travel, has my endorsement. I can save gasoline, tires, maintenance, repairs, and most of all time. This would allow for more time to do the things I want to do.

I understand that many people don't want a new "highway", I wonder how many of them have economic ties to the monies which would be infused into the economy of Maui? I have worked in the heavy construction industry on the contracting side, and now with Maui County DPWWW-Engineering Division. While working for several general contractors we had to endure "bad times", when construction was slow, and enjoyed the prosperity of "good times". If asked which proposal I would like, my answer is simple, the one that brings more money into the economy, and if possible has a spur which terminates in our ag subdivision.

I have also noticed it seems as if some individuals who "have a piece of the rock" want to keep it status quo. While reading the Maui News last week, I noticed a comment made by a business owner in Kula. He stated that he bought his property in Kula because it was rural and didn't want to see a new highway. While he may have his piece of the rock, most other average people do not, and are working very hard to buy their piece of the rock. Any reduction in costs effects not only myself and my family, but a great number of the members of our community.

I can remember when I was an apprentice operating engineer, if I had worked in anything but construction, my family would not have been able to - enjoy vacations, off island trips, Disney Land, and I would have to worry about keeping my vehicle's running, and not being able to afford a home of our own. Construction allowed me to build a home in Keokea, on Hawaiian Homelands. We cannot continue to burn what seems to be unlimited amounts of fuel, oil, rubber, and money when the issue can be solved with a new highway.

Progress is inevitable, but with planning, and good design work, it can offer the community many assets which would not be derived if the highway were not built. This not only about me and my "piece of the rock", but about the pieces of the rock for the generations to come. I hope to see this highway built, a new bypass of Honoapiilani Hwy, (Lahaina), and continuation of Piilani Hwy. (Wailea) to Ulupalakua.

As I see it, you can't beat the price. Build it, build it now, prices in general never go down, instead they go up. Let's not waste any more time, or taxpayer dollars.

sincerely,

A handwritten signature in cursive script that reads "Steven P. Newhouse".

Dear Mr. Hayashida,

I am writing this letter to state that I am opposed to the construction of the proposed Kihei-Upcountry Maui Highway.

I have reviewed each alternative route and evaluated the pros and cons each choice would entail.

Considering the agricultural, environmental and archaeological impact this project would create, compared with the benefits it would offer, I feel the costs are too great.

After much deliberation, I must state my opinion as follows:

"No Build."

Sincerely,

*Tricia Morris*

Kazu Hayashida  
Director  
State Department of Transportation Highways Division

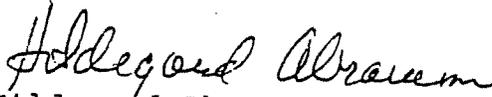

Dear Mr. Hayashida,

I am very interested in having another means of exiting from this area. When I first came to visit my friends who lived in Makena in either '75 or '76 I remember talking about an article that had appeared in the Maui News. It mentioned the desire expressed by the Intercontinental and Stouffers to have a road that would cut across the cane fields to the airport. Years later Piilani Highway was built.

I think a road from KIhei to up-country is wrong. It will not serve the greatest need. If the road were to go to the Haleakala Highway somewhere near Haliimaile it would serve several functions. The people wanting to go up-country could turn right, and those wanting to go to the airport or Kahalui could turn left. Perhaps the road could bisect closer to the Hana Highway. We need another exit out of this area. Those people years ago had the right idea. Go with it.

I understand that the money for this road has been allocated. Why not use it. Make it two lane with some passing lanes as they have on many of the road in California where cost does not permit a divided four lane road.

Mahalo,

  
Hildegard Abramson

Subject: Upcountry/Kihei Highway

Aloha,

Go ahead and build the road. Go ahead and make the road. Then each member of the final approval committee will be able to look at themselves in the mirror each morning and will be able to say WOW that was a great decision. I was part of a wonderful decision.

From Kula most any new road into Kihei/Wailea would certainly save about 15 minutes driving time. Would those same people who are concerned about the 15 minutes arrive to work any earlier? Would those same people still drive too fast. Would those same people still be the people who are constantly tailgating? Now, perhaps the extra few minutes would save fuel? Now that question would certainly be fuel for thought. Now would this potential new road disrupt people's lives? Would the new road disrupt the plant & animal life? Would the proposed new highway be beautiful and help shape Maui's landscape?

Anyone that has moved here to Maui from the mainland should ask themselves, why did I/we move here? Was the reason the traffic? Or was the reason too much smog? Or perhaps the reason was all of those highways? Or perhaps it was all of that extra blacktop & concrete? Billboards? 4-lane highways? Anyone that was born & raised here should ask themselves those same questions.

Maui does not need this proposed highway. What we do need is more consideration of others. We all put our pants on the same way and we are all going to die. We are all brothers & sisters. We really just need to be nicer to one another and stop being so greedy.

Thank you for your time,

Mahalo,

Michael Cannon

MAUI ECONOMIC DEVELOPMENT BOARD, INC.

October 28, 1999

Mr. Kazu Hayashida  
Director of Transportation  
State of Hawaii Department of Transportation  
869 Punchbowl Street  
Honolulu, Hawaii 96813

Dear Mr. Hayashida,

**PUBLIC COMMENT**  
**Kihei-Upcountry Maui Highway**  
**County of Maui, Hawaii**  
**Department of Transportation, Highways Division, State of Hawaii**

As you are aware of, the Maui Economic Development Board, Inc. (MEDB) has been working to facilitate the Kihei-Upcountry Maui Highway (Highway) being built. At the June 21, 1999 MEDB Board of Directors meeting, the Board adopted the following Resolution for the Kihei Upcountry Island Road:

***"Be it resolved that the MEDB Board of Directors supports the construction and completion of the Kihei Upcountry Island Road and urges the Federal Highways Division and the State Department of Transportation to expedite their efforts to complete the highway which is vital to the development of the high tech industry and to the economic health of the island of Maui."***

The Kihei-Upcountry link is very important to the local economy. Not only will it help tourists get around the island, it will help the workers who support that industry. As importantly, the Highway will also support the growth of the high tech industry on Maui, particularly on Haleakala, by providing direct access to the complementary activities at the Maui Research and Technology Park.

Our work on the Highway included conducting surveys, the results of which we would like to share with you. In August/September 1999, we surveyed the employees of the Maui Hotel Association member and allied properties. Attachment #1 is a sample of MEDB survey #1. The results and analysis of MEDB survey #1 is shown below (actual surveys are on file at MEDB for inspection):

Mr. Kazu Hayashida

October 28, 1999

Page two

- **I LIVE IN:** – 945 responses
  - 40.0% in South Maui
  - 25.5% in Central Maui
  - 19.6% in Upcountry Maui
  - 14.0% in West Maui, North Maui and other areas
  
- **I WORK IN:** – 951 responses
  - 64.4% in South Maui
  - 19.8% in West Maui
  - 11.5% in Central Maui
  - 4.4% in Upcountry Maui, North Maui and other areas
  
- **KIHEI – THE PROPOSED ISLAND ROAD SHOULD START AT:** – 842 responses
  - 59.7% the K2 terminus
  - 40.3% the K1 terminus
  
- **KIHEI – THE PROPOSED ISLAND ROAD SHOULD START AT:** – 786 responses
  - 27.0% the U1 terminus
  - 23.9% the U2-A terminus
  - 25.3% the U2-B terminus
  - 23.8% the U3 terminus

While there is no consensus from this survey on the termini, the results indicate overwhelming support for the Highway. Those who added comments expressed a clear cry for relief in regard to their long travels from both Upcountry to West and South Maui.

Another survey conducted by MEDB in September/October 1999 of the employees of the County of Maui, the Maui Technology and Research Park, and local businesses again recorded an overwhelming support of the Kihei-Upcountry Maui Highway. Attachment #2 is a copy of MEDB survey #1. The results and analysis of MEDB survey #2 is shown below (actual surveys are on file at MEDB for inspection):

- **I LIVE IN:** – 477 responses
  - 35.0% in Upcountry Maui
  - 33.8% in Central Maui
  - 17.8% in South Maui
  - 8.8% in North Maui
  - 2.9% in West Maui
  - 1.7% in multiple areas on the island and other areas

Mr. Kazu Hayashida  
October 28, 1999  
Page three

- **I WORK IN:** – 477 responses
  - 55.6% in Central Maui
  - 19.3% in South Maui
  - 10.3% in multiple areas on the island and other areas
  - 5.9% in West Maui
  - 5.2% in North Maui
  - 3.8% in Upcountry Maui
  
- 83.2% support the Highway
  - 6.9% do not support the Highway
  - 7.5% doesn't matter
  - (2.3% did not respond)

We hope this information will be helpful in your decision making. We again urge you to move as quickly as possible toward completion of the Highway.

Sincerely,

Jeanne Unemori Skog  
President & CEO

## KIHEI-UPCOUNTRY ISLAND ROAD SURVEY

The Federal Government, the State of Hawaii, and the County of Maui are working together on the design and funding of a proposed new island road between the Kihei and Upcountry areas. We are collecting information to find out what is most important to you in terms of where the proposed island road might be located. Please assist us by providing the information requested below. You may also make any comments or suggestions on the lines provided below.

### I LIVE IN:

RE: Proposed Kihei-Upcountry Maui Highway project

Dear Mr. Hayashida:

In reference to the above project, I feel that this highway should not be built. As stated in the draft Environmental Impact Statement, the roads along the route from Kihei to Upcountry will be widened to four-lanes. These improvements to the existing roads would lessen the congestion presently encountered during morning and afternoon "rush hour" traffic, as well as provide motorists the ability to pass slower moving traffic that are presently causing the traffic to back-up.

As a life-long resident of Maui, I would rather spend the few extra minutes traveling on the existing route than have more roads built.

Sincerely,

Debbie K. Anthony

---

Mr. Hayashida:

Although I am currently attending college in Philadelphia, I would like to express my strong concern over the building of the Kihei-Kula Highway.

I have called Maui home for my entire life, minus my stay at Kamehameha and here, in college, and intend on returning after to spend my life. I enjoy many of the things that Maui has to offer that the mainland cannot offer, including the absence of urban sprawl. If the highway is built, much of upcountry will lose the qualities that make it unique. An endless potential for urbanizing in this beautiful and pristine area of Maui is startling. With the development comes the problems of infrastructure, which has not been planned for, not to mention the constant water shortage. Please don't build the Highway, it will ruin far beyond what it could ever hope to give.

Sincerely,

Nicholas Goodness '03

I live in Pukalani and I work in Kihei, I support the highway. This highway will most likely benefit upcountry residents more than Kihei residents. There are more employment opportunities in Kihei and easier access to Kihei beaches from up country would also be nice. The tourist from Wailea/Kihei/Makena would use the highway to visit Haleakala, this would help to alleviate some of the traffic on Mokulele and that congested intersection at Dairy Road and Hana Highway. I also support the connection through Kula Malu, though it is one of the more expensive routes, the other connections don't make sense to me. The connection past the Kula Post Office, this one doesn't make sense at all, most of the population of upcountry is concentrated in Pukalani/Makawao, I would continue to use the by-pass and Mokulele to get to work, plus this connection would most affect the character of Kula. The Hali'imaile connection continues to add traffic to Haleakala Hwy, it also traverses prime ag. lands, and access coming down the mountain will induce an overhead/underway connection or traffic light, we don't need that. The Five Trees connection will stop the old Haleakala Highway and reroute to the by-pass, this idea seems weak, leave the road as is, also putting the intersection there will only confuse the tourist and we will have another Hana Hwy/Dairy Road situation. The Kula Malu connection seems the most appropriate alternative. It is close enough to the major population of upcountry, yet far enough away from the Five Tree intersection and most importantly leaves intact the character of Kula going to Ulupalakua. The connection in Kihei is a different story, my wife works in Makena so naturally she likes the connection near the Kamalii Elementary School, I work in North Kihei so I would like it near the Ka Ono Ulu intersection. Actually I would use any of them and she would too. Thank you for allowing me to express my feelings about this matter.  
aloha and mahalo

My wife and I both live Upcountry and work in Kihei. We support this project, and so do alot of my neighbors. Our recommendation for the connection would be from Kulamalu (U2-B) to Kaono ulu (K-1).  
Let's get busy!

In my opinion the U3 - K1 route would best serve the residents of both South Maui and Up-Country Maui.

On the Kihei end the K1 termination makes the most sense because it will allow those up-country to west-end travelers a reduced travel time without causing excessive traffic in central Kihei.

For those Kihei to Up-Country travelers, K1 or K2 will make little difference.

On the Up-Country end the U3 termination best, it won't add congestion in and around the High School, get will service all of Up-Country.

I would like to see the Kihei-Upcountry Hwy  
to be built soon. A great location for the upcountry  
section would be through the Kulamau Development.  
Reason is \$... The state would not have to spend  
extra money for a portion of this Hwy because  
there already exist a road. I would like to see  
the highway terminate at Piloni Hwy & Ka'ona'ua  
St.

I am in favor of route:

U2-~~X~~ A, K1

Reasons:

U2-~~X~~ A

Infrastructure already in place - any cost (additional) would be minimal compared to starting in a "new" area.

K-1

Destinations to & from Lahaina would be best suited for upcountry, ~~to~~ Lahaina, ~~the~~ ~~travelers~~ travelers - ~~also~~ also

I live in Haiku, work in Kihei. No matter which alignment is chosen, I will not be using the new road. I will benefit from the reduced traffic along Hanalei, Hansen Rd., and Mokulele.

I am in favor of the U2-B / K2 alignment U2B because its the most central to Upcountry and will serve the community best. I selected K2 for two reasons - first, the central Kihei location and secondly, there is a light at that intersection. I don't want to see more lights on the Piilani 'Bypass'.  
Thankyou. 1/12/00

Please make any comments below:

*It would be foolish to come in at Haelinak  
It does nothing to alleviate traffic at Pukaha  
and above. Part of the rd. is already built & the  
owner will do every thing he can to make it  
cheaper for the State. It serves more people and is  
the ideal location. There will be less environ-  
disturbance. There is already urban zoning so it won't  
change. No need for more urbanization. It also  
provide easy access to Kamehameha schools.*

Being a resident of Kula for over 20 years  
it's all we have been hearing is that we are  
going to get a Kihei-Upcountry Highway.  
I drive to Kihei everyday to go to work  
by building the highway that goes thru  
K-2 & comes thru via K-1 or K-2  
will make my commute safer & quicker.  
so it is now it takes me 1 hour to get  
home - with the new highway in place  
from these points it would take me only  
30 minutes. Thank you for your time -

PREFERRED ROUTE - "K2 - U2.B"

Kihei Benefit:

- 1) Reduce Traffic Congestion in Center of Kihei/Waikoa Area, i.e. Traffic going up Country will be relieved from Piilani Hwy faster
- 2) In case of emergency K2 is located in the Center of population

Up Country Benefit:

- 1) U2.B location has infrastructure to accept the Termination point better than others
- 2) U2.B location is a Centered location for relief of up Country. i.e. Traffic going to Kihei won't have to go through pullouts or the pullouts By Pass on the S trees

SEPT. 30, 1999.

I ATTENDED THE INFORMATION HEARING @ PUKALANI COMMUNITY CENTER & FOUND IT TO BE VERY INFORMATIVE AND WELL PRESENTED.

I AM IN FAVOR OF ALIGNMENT U2-A K-1.

THE REASONS FOR MY SELECTION ARE AS FOLLOWS

1. K-1 OFFERS LAHAIUA TRAVELLERS A MORE DIRECT ROUTE THAN K-2.
2. K-2 REQUIRES 3 ADDITIONAL BRIDGES ∴ MORE COSTLY.
3. U2-A CONNECTS DIRECTLY TO HALEAKALA HIGHWAY ∴ DIRECT ACCESS.
4. U2-A K-1 WILL OFFER US A SCENIC DRIVE TO KIHAI, NOT LIKE MOKULELE.

Please make any comments below:

I PREFER THE U2-A, KI ROUTE BECAUSE OF THE FOLLOWING:

- 1) MAKAWAO - PUKALANI IS THE UPCOUNTRY POPULATION CENTER, THE U2-A CONNECTION WOULD SPLIT THE TRAFFIC. THE U1 CON. WOULD FORCE ALL THE TRAFFIC DOWN THE PUKALANI BYPASS UNTIL HALIIMAILE.
- 2) PROVIDES BETTER ACCESS FOR TOURIST AND HIGH-TECH WORKERS TRAVELING TO HALEAKALA.
- 4) THE KI CONNECTION PROVIDES BETTER ACCESS TO WEST MAUI.
- 5) REASONABLY PRICED (OUR TAX DOLLARS).

Please make any comments below: I favor K1-U2B

Haliimaile intersection defeats purpose of road. U2-A screws up the "Five Trees" intersection.

Kulamalu is the more central spot to better serve unserved areas of upcountry--Lower Kula, Upper Kula, Pukalani, Olinda, & Makawao.

It would have less impact on agriculture and give a direct route to Haleakala.

Please make any comments below:

I believe the best alignment for the new Kihei/Upcountry Highway is U2B Kulamalu through KI Kaonoukia.

- 1) It would redirect the traffic flow from Haleakala Highway and provide an alternative route for upcountry & Kihei/Wailua residents.
- 2) Direct access for tourist traveling to the Haleakala Crater from Kihei/Wailua & Lahaina.
- 3) Emergency access in case 1 route is closed due to an accident. (The Haliimaile access will not provide an alternative route if a portion of Haleakala Highway was closed.)

After much studying I think that U1 to K1 would be the best plan because it will be used by Haiku, Makawao, Pukalani + Kula residents. Where as routes from Kula will be traveled only by Kula people.

I really hope the cost of the project will be largely funded by federal funds.

I am in favor of alternative U2-B to K1, I guess for more personal reasons than any other. But at the same time this will relieve +/or reduce overall congestion at many other locations between kihei + upcountry, no matter which alternative is selected. I also like the idea of reduced travel time and also it is an excellent means of evacuation or alternate route in case of emergency

Its about time that the SOT - D.O.T. is in the planning for the Kihei-Upcountry Highway project. (Maui) I would like to see it constructed from Haliimaile Junction straight into Kihei. Without going into any residential areas, such as Pukalani + Rula. We have enough traffic congestion already. In the event of a traffic accident on the Mokuake Highway, people coming out are trapped for hours. at Least with this by-Pass people of the Up Country Area will be able to get out of Kihei at a sensible time, without delay.

I can't believe this Hwy has not been built yet! I work in Kihei and it takes me 45-60 minutes one way for a total of 31 miles each way. Why??? If you look from Kula Hwy down to Kihei there is nothing but wasteland. NO Pineapple fields, sugar cane or housing projects. I would like to see the Hwy even further toward Kekaula Hwy. This would be a shorter route and not disturb anything or anyone. Even if the road would intersect at the Hawaiian housing project that would be better. There are roads half way down the hill now. If built something from Kihei to there (save \$ and time) that the most important thing is to just build something soon!!!

Please make any comments below:

THE U3, K2 ALTERNATIVE WOULD BE ~~BETTER~~ A BETTER WAY TO GO BECAUSE:

- 1). IT WOULD DIVERT TRAFFIC AWAY FROM MAJOR INTERSECTIONS THAT MAY CAUSE TRAFFIC CONGESTIONS.
- 2). THE K2 WAY WOULD PUT THE CONNECTION IN THE MIDDLE OF KIHEI AND MAKENA MAKING IT EVENLY ACCESSABLE FOR BOTH NORTH AND SOUTH KIHEI AND MAKENA. RESIDENCES AND VISITORS IN CASE OF EVACUATION ~~AND~~ PURPOSES, ETC.
- 3). THE U3 WAY WOULD PUT THE CONNECTION IN THE MIDDLE OF KULA HIGHWAY MAKING IT AN EASIER WAY FOR PEOPLE AND VISITORS WHO WANT TO GO STRAIGHT TO ULLIPALAKUA, OR PEOPLE WHO WANT TO GO STRAIGHT TO MAKAWAO, OR ~~THE~~ HAILIIMAILE, OR PUKALANI AND RIGHT TO KULA OR HALEAKALA. THIS WAY WOULD SAVE A LOT OF TIME AND MONEY FOR MAUI COUNTY PEOPLE.

THIS HIGHWAY PROJECT SHOWS ONLY GOOD ~~AND~~ POTENTIAL REASONS WHY WE SHOULD HAVE IT BUILT AS SOON AS POSSIBLE (ASAP).

BUSINESSES, VISITORS, AND RESIDENCES ALIKE WILL BENEFIT FROM IT.

THE PROJECT WILL CAUSE MORE JOBS FOR MAUI COUNTY AND NEW OPPORTUNITIES, PAVING THE WAY FOR FUTURE DEVELOPMENT.

BUILD IT,  
AND THEY WILL COME.

THE HALIMAILE (UI) TO (KI) SEEMS TO  
HAVE THE LEAST IMPACT ON RESIDENTIAL AREAS. ALSO  
+ LIGHT (INTERSECTION) ON AT (UI) WOULD BE BEST, AND  
NEEDED. IF (KI) SKIRTS RESIDENTS THEN MOVE TO  
K-2). NO ONE REALLY WANTS A MAJOR ROADWAY  
CUT TO OUR RESIDENTIAL STREETS, OR OUR BACK  
YARD! THIS WOULD BE ACCEPTABLE ONLY AFTER  
MAKING THE EXISTING ROADS INTO FOUR LANES FIRST!  
ON THE WAY TO KAIHI!

Please make any comments below:

A ROAD CONNECTING KIHEI TO UPCOUNTRY IS DESCRIBED. ~~WE~~ WE DO NOT WANT A ROAD THAT ONLY DOES HALF THE JOB (A ROAD COMING OUT AT HAZZIMALE DOES NOT MAKE SENSE). WE FAVOR KIHEI TO UPCOUNTRY USING THE OPTIONS U2-B K2 OR ~~U2-B K1~~ U2-B K1, WITH U2-B K2 THE BETTER OF THE TWO.

EVALUATING THE OPTIONS :

U1 - NO GOOD, 1/2 THE JOB.

U2A - INTERSECTION VERY BUSY, HALEAKALA HWY. AS WELL.

U2B - GOOD INTERSECTION, NOT AS BUSY AS U2-A BUT NOT THAT FAR FROM THE HALEAKALA HWY.

U3 - TOO FAR FROM CONTINUING UP THE HALEAKALA HWY.

K1 & K2 - GOOD K2 A GOOD COMP. BETWEEN KIHEI &

Please make any comments below:

MAUI DEFINITELY NEEDS A KIHAI UPCOUNTRY HIGHWAY!!

THE KI TO UZA ROUTE WOULD SERVICE THE GREATEST NUMBER OF TRAVELERS IN THE MOST EFFICIENT WAY.

THIS PROJECT IS LONG OVERDUE.

IN ADDITION TO THE OBVIOUS BENEFITS OF TRAVEL TIME SAVINGS, EVACUATION EFFICIENCY, AND HIGHWAY SYSTEM EFFICIENCY; I FEEL THAT WITH A MORE EVEN DISTRIBUTION OF VEHICULAR TRAFFIC THE HIGHWAY SYSTEM WILL BE SAFER.

MAUI TRAVELERS AND THE PLANTATIONS ARE VERY FAMILIAR WITH AGRICULTURAL VEHICLE CROSSINGS ON MAJOR HIGHWAYS, SO THIS HIGHWAY DOES NOT POSE ANY NEW THREAT TO MOTORISTS.

I believe the proposed routes for a "new" highway from Kihei to Kulua are not as good as the proposed plan to "improve" the existing highway upcountry. Improvements would help Halemaile residents.

RECEIVED  
OCT 19 10 54 AM '99  
HIGHWAYS DIVISION  
PLANNING BRANCH  
STATE DEPARTMENT OF TRANSPORTATION

By new roads) up the gulch is not needed - the improvement is urban sprawl is the bane of the mainland - it is not for Maui - we can plan better than that!

Please make any comments below:

I am in favor of the U1 and K2 termini. By using the U1 terminus people from Haiku, Makawao, Haliimaile and Pukalani would not have to back track as much. The K2 is closer to Wailea and Makena and also central Kihei, which I believe are the destinations of most of the upcountry people.

I am definitely in favor of a by-pass road to alleviate the the down hill traffic and also spur the economy in many ways.

I strongly feel that the Kihei - Upcountry highway should come out at either Malimaile or 5 trees. It definitely should not go through Omaopio, or somewhere in Kula. That way all the Pukalani, Makawao, Haiku traffic wouldn't have to go through Kula.

Please make any comments below:

**Choice #1: No road**

- If it is true that the DOT is planning to make Haleakala, Puunene, and Mokulele Hwys. four lanes, that would relieve most of the congestion. The worst bottle neck is the connection to Mokulele from Hana Hwy or Haleakala Hwy.
- Improving existing roads would have the least negative impact on all areas.
- People make choices where they live and work. If you choose to work in Kihei, but want the serenity of living upcountry, you will need to drive, period. Live in Kihei if you don't want to commute.

**Choice #2: Haliimaile to either Kaonoulu or Ke Alii Alanui**

- It makes the most sense for ALL commuters: moving the access to either of the Pukalani sights or particularly to Omaopio would be pretty useless for Paia and Haiku folks.
- Haliimaile splits the traffic with Haiku and Paia coming up and Kula, Pukalani and Makawao coming down.
- Haleakala Hwy. is in and will be widened.
- Omaopio is a terrible choice. Serious road improvements would have to be made from the new Pukalani by-pass to Omaopio, taking all sorts of people by the new high school and residential areas. An Omaopio road would have the serious negative impacts on farming and residential communities. Omaopio is also a pretty bad choice for tourists trying to find the crater for sunrise.

I am not a no-growth fanatic. I understand the necessity of improving traffic flow. Let's just be very careful how we go about it to help preserve a sense of what people come to Maui to experience and to keep Maui the place we have all chosen to live. The cost issue should not dictate the route.

PREFERENCE - U1 - HALIIMAILE

REASON - TRAFFIC COMING TO HALEAKATA HWY. FROM HALIIMAILE AND PUKALANI, ETC. HAS NO HOUSES, SCHOOLS ETC NEARBY. WITH A TRAFFIC LIGHT, THIS AREA WOULD BE MORE CONVENIENT AND MANAGEABLE. AS FOR WHERE IT WILL EXIT FROM UPCOUNTRY, THE LEAST CONGESTED AREA IN KIHEI, K1 - KA ONO ULU

I prefer the road ending at 5-Trees. This site is on a highway that could accept the increased traffic. I feel the intersection there now is not quite right. By terminating the road at the 5 Trees it would give the state a chance to prepare the area properly for the 2nd school opening in the near future. Also, 5 Trees is more upcountry where Haliimaile is mid-country. On addition there would be less interruption of agriculture at 5 Trees.

Suggest: U2A ↔ K1

Makes more sense!

best route is southward to help everyone.  
20 years from now you could build another  
road to Punalani. (That's how long this has  
been going on with no results except  
meetings! Get it built, it's already too  
late!!

I'd prefer U3, K2 to relieve us from the Kula raceway team pressure on Haleakala Hwy.

My convenience would best be served by a U2-A or B, K2 route.

Regardless build something!

Telephone (eve): 7667-6105

Please make any comments below:

I think we should see<sup>a)</sup> the costs: 1.) U3-K1 2.) U1-K1  
b) most of people living: 1.) U1-K1 2.) U3-K1  
c) lowest impact on individual farming + ranching 1.) U1-K1 2.) U2-K1  
d) lowest impact on residential sites 1.) U1-K1 2.) U3-K1

overall: 1.) U1-K1

Many of my friends are living in Mahalo + Pukalani and many of them are working in Kihei. For them the alternative U1-K1 is the best. I think you should eliminate the alternatives U2 a/b, because it has too much impact on school and residential areas in Pukalani. So I think the U1-K1 alternative is the best, much better than the others.

! You did a fantastic job !!

Please make any comments below:

I FAVOR K1-U3 Route:

1. Cost Less
2. area at the intersection can stand some development
3. an escape route in case of storms, tsunami, etc.
4. Spread the traffic versus the jamming a national & streets

My family and I ARE IN FAVOR OF THE  
NEW Road upcountry. We feel that it  
is sorely needed. Beside being needed FOR  
relief of normal TRAFFIC ON EXISTING Roads, IT  
IS IMPORTANT THAT ANOTHER ROUTE FOR EVACUATION  
FROM THE KIHEI & WAILEA AREA be provided.

I disagree WITH THE ONE STARTING POINT IN  
KIHEI BEING KAONOIO, SINCE IT IS ALREADY  
being used AS A RACE TRAIL FROM SOUTH KIHEI  
Road TO Pihani Highway. People FROM OUR END  
OF TOWN CAN USE MOKULELE HIGHWAY AND  
THE PEOPLE CLOSER TO WAILEA WOULD HAVE THEIR  
OWN ACCESS UP COUNTRY. Please - use common sense  
and SPLIT THE TRAFFIC TO BOTH ENDS OF  
KIHEI. KIHEI IS STILL GROWING & HAS ALREADY  
\_\_\_\_\_ R-1. (16)

Please make any comments below:

I think that the U1-K1 is the best route proposed. All my opinion is based on its first hand experience of all the problems mentioned with the new highway.

The U1-K1 route passes the least amount of homes. Having a highway going through a sub-division will decrease the highway's acceptance as well as decrease the likely hood of new housing projects because the highway will take up optimum space. U1-K1, it seems, avoids the least of this. It is also the second most cost-efficient road. If compared with Hali'imaile, it can handle the most traffic (28) since Hali'imaile already has...

Please make any comments below:

I feel the Kula-Kihei Highway will benefit the island of Maui in a lot of aspects. Residents who commute everyday from Kihei to Upcountry and vice-versa will cut down travel time and have alternate routes to work. Traffic will also be minimized on Haleakala Highway, Piilani Highway and Makulaka Highway.

Please write any comments below:

HAVING THE ROAD WILL BE REALLY NICE. WOULD PROBABLY CUT my TRAVELING TIME BY AT LEAST 1/4 hr. IT WILL ALSO BE A GOOD BACK UP ROUTE IN CASE OF A ACCIDENT WHERE THE ROADS CLOSE UP IN KIHEI. I THINK ITS A GOOD IDEA

I Believe The addition of this road would help alleviate road Fatigue for those of us who live in the up-country area and possibly result in fewer car accidents, also in light of higher fuel prices would help everyone financially.

Please write any comments below:

We support the new Hwy project.

We think it will reduce the # of accidents that occur in the dark hours.

It will facilitate those workers of the Kihei-Wailea area hotels that commute from Upcountry daily.

It will bring businesses Upcountry more tourist flow.

If well designed and studied, the environmental impact that many community members worry about can be monitored and kept to a minimum.

We do not want Maui to become excessively urbanized (like Oahu) but the increasing growth of the resident population requires some inevitable changes that the whole community should support.

I WISH TO EXPRESS MY STRONG SUPPORT for  
the KIHAI-UPCOUNTRY MAUI HIGHWAY PROJECT.  
THIS A MOST NECESSARY LINK IN MAUI'S  
HIGHWAY INFRASTRUCTURE. IT IS AN OPPORTUNITY  
FOR FEDERALLY FINANCING WE SHOULD NOT MISS.  
IMPORTANT CONSIDERATIONS - THE HIGHWAY WILL  
AID TRAFFIC TO HALEAKALA, REDUCE FLOW THRU  
KAHOLUI & AID WORKERS FROM UPCOUNTRY TO  
REACH EMPLOYMENT IN KIHAI + WALAEA. VISITOR  
TRAFFIC WILL BE ENHANCE WITH SIGNIFICANT  
SAVINGS IN TIME & GASOLINE USED.  
IT IS TIME TO MOVE AHEAD

Please write any comments below:

I believe U3-K1 will best serve the upcountry / Kihei communities with the least budgetary impact. Anything at 5 fees or below would have serious impact on upcountry to town traffic.

Mahalo!

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**  
 The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piliiani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Hallimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement.

Kula Community Association's position on the proposed Upcountry/Kihei Highway is:  
 The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Pili'ani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halimalie terminus the best option available.

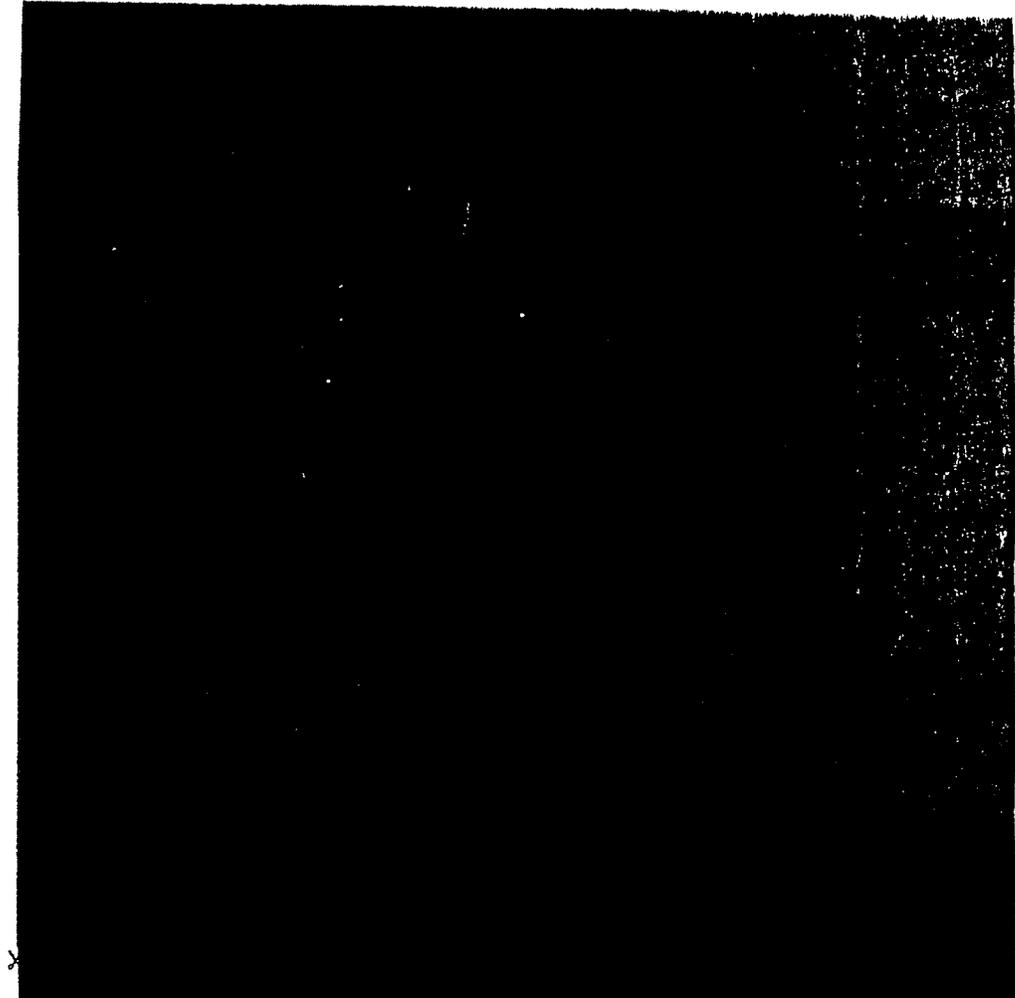

I agree with the above statement.  I disagree with the above statement.

Comments: *1. Road should not be built. Determination to build should be through Pulehu. 2. If built, it should be through Pulehu.* M. VALES

Kula Community Association's position on the proposed Upcountry/Kihei Highway is:  
 The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. **Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**  
 The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piihoni Highway, Mokulele Highway, Hansen Road, and Haleakala Highway to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement

Comments: My ~~husband~~ husband works in Mahele we live in upper Kula  
The Halimaile route makes the most sense - convenience at  
shopping at Kauaiana for groceries etc.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**  
 The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piihoni Highway, Mokulele Highway, Hansen Road, and Haleakala Highway to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement

Comments: I believe that a majority of the Upcountry  
residents do not want this road. If you don't believe  
perhaps you should put the issue to a vote.

Comments: We do not need a road leading directly into Kula. We want our road area preserved.

**KCA UPCOUNTRY WATER POSITION**

The KCA is in the process of developing a position statement on upcountry water. Immediate, critical problems as well as long term needs will be addressed, with special focus on providing adequate water service for current residents and agriculture. We want the position statement to include the issues of greatest concern to Kula residents, so please indicate in numeric order the three most important items.

- drought relief
- water reservoirs
- fire control
- delivery systems
- meter wait list
- water quality
- water pressure
- rates and fees

Should there be a moratorium on the issuance of new meters until the water system has reserves that are sufficient to meet the needs of current users for six months of drought with no more than 10% usage reduction? No  Yes

Comments: This is common sense. We need to take care of the people who currently reside here.

**KIHEI / UPCOUNTRY HIGHWAY**

**KIHEI/UPCOUNTRY HIGHWAY**

This is an important opportunity to comment on the proposed Upcountry/Kihei Highway. If you haven't yet shared your opinion, complete the following and mail it on or before Oct. 26<sup>th</sup> to:

Mr. Kazu Hayashida, Director of Transportation  
State Department of Transportation  
869 Punchbowl St.  
Honolulu, HI 96813

I agree with the above statement.  I disagree with the above statement.  
The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piilani Highway, Mokuiele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halimaile terminus the best option available.

Comments: IF THE UP COUNTRY/KIHEI ROAD IS TO BE BUILT UP COUNTRY BRIDGES SHOULD BE BUILT TO CROSS THE RIVERS ON THEIR END, OF THE BRIDGES.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

**KCA UPCOUNTRY WATER POSITION**

The KCA is in the process of developing a position statement on Upcountry water problems as well as long term needs will be addressed, with special focus on providing service for current residents and agriculture. We want the position statement to be the greatest concern to Kula residents, so please indicate in numeric order the three most important items.

- drought relief
- fire control
- water quality
- meter quality
- water pressure
- water reservoirs
- delivery systems
- meter wait list
- rates and fees

Should there be a moratorium on the issuance of new meters until the water system has reserves that are sufficient to meet the needs of current users for six months of drought with no more than 10% usage reduction? No  Yes

**KULA COMMUNITY ASSOCIATION GENERAL MEETING**

The next KCA General Meeting is Thursday, November 18, 1999, 7 p.m., at the Kula Community Center. All community members are welcome. Please come, meet your Kula neighbors, discuss our community's problems, and help develop solutions. Refreshments will be served. We look forward to seeing you there! For information, call 878-1342. The agenda includes the following:

**State Legislative Issues**

State Senator Avery Chumbley and Representatives Chris Halford and David Morihiro will be our presenters. They will address topics that directly and indirectly affect Kula and Kula residents, including such issues as education initiatives, 24 hour ambulance service, Haleakala summit development plans, water system projects, and the state's economy and fiscal challenges. Opportunity will be provided for you to share your interests and concerns with our legislators and to provide them feedback on upcoming issues.

**Election Officers and Board Members**

The candidates for office are: Elliott Krash - President; Tom Jewell - Vice President; John McDonald - Treasurer; and Gina Flammer - Secretary. All current Board Members are standing for reelection. They are listed below along with the current officers. If you are interested in serving as an officer or board member, please call Alan Kaufman at 878-6682. Current Executive Committee: John Wilson - President; Elliott Krash - Vice President; Sue Guille - Secretary; John McDonald - Treasurer. Board of Directors: Emma Abihal, Alan Kaufman, Edwin DePonte, Gina Flammer, Tom Jewell, Alan Kaufman, Henry Lau, Verna Nahulu, Dick Mayer, Jerry McBarnet, Cathy Ross, Mitch Silver, Steve Sutrov.

**KCA WEBSITE**

Our pages can be viewed at <http://www.kulamaui.com>. Position statements, minutes, links and more are available on the website.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

OCT 27 10

I agree with the above statement. I disagree with the above statement.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**  
The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Fines Street termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Pilihi Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halimalie terminus the best option available.

I agree with the above statement. I disagree with the above statement.

Comments: We do not need more roads! We need improvements to existing roads! I have lived in Kula 22 yrs.

Kula, HI 96796-9721

**KCA UPCOUNTRY WATER POSITION**

The KCA is in the process of developing a position statement on upcountry water. Immediate, critical problems as well as long term needs will be addressed, with special focus on providing adequate water service for current residents and agriculture. We want the position statement to include the issues of greatest concern to Kula residents; so please indicate in numeric order the three most important items.

- drought relief
- fire control
- water quality
- water pressure
- water reservoirs
- delivery systems
- meter wait list
- rates and fees

Should there be a moratorium on the issuance of new meters until the water system has reserves that are sufficient to meet the needs of current users for six months of drought with no more than 10% usage reduction?  No  Yes

Comments: Because they are still allowed to build.

Mr. Kazu Hayashida, Dir  
State Department of Tra  
869 Punchbowl St.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piliani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement.

Comments: *There is no need for another road upcountry. There are engineering problems and congestion on the highway from Kahului to Lahaina. Last week there were 4 car accidents on the rd. 2 of them the road had to be closed. I want in the traffic along with thousands of other cars on something about West Maui.*

**KCA UPCOUNTRY WATER POSITION**

The KCA is in the process of developing a position statement on upcountry water. Immediate, critical problems as well as long term needs will be addressed, with special focus on providing adequate water service for current residents and agriculture. We want the position statement to include the issues of greatest concern to Kula residents, so please indicate in numeric order the three most important items.

drought relief  fire control  water quality  water pressure  
 water reservoirs  delivery systems  meter wait list  rates and fees

Should there be a moratorium on the issuance of new meters until the water system has reserves that are sufficient to meet the needs of current users for six months of drought with no more than 10% usage reduction? No  Yes

Comments: *Small Upcountry agriculture should be exempt from drought restrictions - Let SUBARU/PINEAPPLE agribusiness should not be exempt!!*

If you haven't yet joined the KCA, please do so now. Here is the 1999 membership form.  
**Yes, your year 2000 membership dues are now payable!**

1999 Dues expire on Dec. 31, 1999

Kula Community Association's position on the proposed Upcountry/Kihei Highway is:

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Piliiani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Halimalle terminus the best option available.

I agree with the above statement.  I disagree with the above statement

Comments:

The proposed road is a waste of 60-100 million dollars and is responsible even for an ongoing water problem and need to upgrade existing road.

**Kula Community Association's position on the proposed Upcountry/Kihei Highway is:**

The Kula Community Association Board of Directors opposes the Pulehu, Kulamalu, and Five Trees termini options of the Upcountry/Kihei Highway. Further, the Kula Community Association Board supports as its highest priority the upgrading and improvements to existing roads connecting Upcountry and Kihei - Pili'ani Highway, Mokulele Highway, Hansen Road, and Haleakala Highway - to alleviate growing traffic concerns. If an Upcountry/Kihei road is to be built, the Kula Community Association Board considers the Haliimaile terminus the best option available.

I agree with the above statement.  I disagree with the above statement

Comments: *Don't waste good money on a project that is so controversial. Let Kula be Kula. We have almost no tourist destinations and the National Park is fragile enough w/o more traffic.*

X I agree with the above statement.

I disagree with the above statement

Comments: We work in Honokouai (a line in Kula) really feel that the Pili Highway deserves some very serious consideration as to how a widening can be accomplished. When an accident in effect shuts down the highway the Pili have an obligation to get that info to ALL RADIO STATIONS
